- 6.3 Hydrogen peroxide is an irritant of the eyes, mucous membranes, and skin. Inhalation of high concentrations of the vapor or mist may cause extreme irritation of the nose and throat. Lab coat, gloves and safety eyewear must be worn while working with this reagent.

## 7) Sample Collection, Containers, Preservation, and Storage

- 7.1 Aqueous samples are preserved with nitric acid ( $\text{pH} < 2$ ), then stored at room temperature from receipt until analysis. If properly acid preserved, the sample can be held up to 6 months before analysis.
- 7.2 Samples acidified at the laboratory must be held for 24 hours, then the pH verified as  $< 2$  prior to digestion.
- 7.3 Metals holding time is six months from sample collection until analysis.

## 8) Apparatus and Equipment

- 8.1 Class 10,000 clean room equipped with Class 100 High Efficiency Particulate Air (HEPA) filter equipped laminar flow hoods.
- 8.2 Hot Blocks
- 8.3 Powder free PVC gloves
- 8.4 16 mL plastic autosampler (digestion) tubes (Evergreen 214-2380-030).
- 8.5 Reflux caps for 14 mL digestion tubes (VWR 101093-898).
- 8.6 Evergreen disposable tubes and caps, 50 mL. Check tubes for accuracy on a per Lot basis at each of the volumes being used (i.e. 10 mL, 25 mL, and 50 mL) by filling a tube to the appropriate mL mark and measuring the water's mass in ten different tubes. The measured mass must be accurate to plus or minus 3%, if not obtain a new lot of tubes and re-test. Refer to the SOP for *Checking Volumetric Labware* (ADM-VOLWARE) for detailed instructions on performing the accuracy test.
- 8.7 Hot Plates.
- 8.8 Glass watch glasses, ribbed watch glasses.
- 8.9 Glass Beakers.
- 8.10 Infrared Thermometer.

## 9) Standards, Reagents, and Consumable Materials

- 9.1 Reagent grade chemicals shall be used in all tests. Other grades may be used, provided it is first ascertained that the reagent is of sufficiently high purity to permit its use without lowering the accuracy of the determination. The preparation for all laboratory prepared reagents and solutions must be documented in a laboratory logbook. Standards, reagents and consumable material documentation shall indicate traceability to purchased reagents or compounds. Refer to the SOP *Reagent/Standards Login and Tracking*, for the complete procedure and documentation requirements.
- 9.2 All stocks, working solutions and sample dilutions should be prepared using deionized water (DI) conforming to ASTM Type I or ASTM Type II reagent water. For more information on reagent water generation, refer to the related SOP, Operation and Maintenance of Laboratory Reagent Water Systems.
  - 9.2.1 Reagent water: ASTM Type I water (resistivity  $\geq 18$  M $\Omega$ -cm, conductivity  $\leq 0.056$  uS/cm).
  - 9.2.2 Concentrated Nitric Acid - demonstrated to be free of impurities
  - 9.2.3 Concentrated hydrochloric acid - demonstrated to be free of impurities
  - 9.2.4 Ultrex concentrated hydrochloric acid - demonstrated to be free of impurities
- 9.3 Standards
  - 9.3.1 Stock standard solutions may be purchased from a number of vendors. All reference standards, where possible, must be traceable to SI units or NIST certified reference materials. The vendor-assigned expiration date is used.
  - 9.3.2 Metals spiking solutions: 12 solutions are needed to prepare the matrix spiking standards: SS1, SS2, SS3, SS4, SS5, K-MET Hydride, QCP-CICV-1, QCP-CICV-3, 1/100 QCP-CCV-1, 5  $\mu$ g/mL Sb, 1/100 QCP-CICV-3 and Mo/U 5 ppm.
    - 9.3.2.1 QCP-CICV-1 and QCP-CICV-3 are purchased as prepared standards.
  - 9.3.3 Follow the formulations laid out on the "Metals Spiking Solutions Concentrations Form" and "ICPMS LCSW and spiking Solutions Form" (See Tables A and B). These solutions are prepared in acid rinsed Class A volumetric flasks using purchased custom mixed standards and 1000ppm and 10,000 ppm, single analyte standards. Aliquots are made using acid rinsed Class A volumetric pipettes of the appropriate size.
    - 9.3.3.1 SS1 (Al, Ag, Ba, Be, Cd, Co, Cr, Cu, Fe, Pb, Mn, Ni, Sb, V and Zn).  
Fill a 1000 mL Volumetric flask approximately half full with reagent water. Add 50 mL of nitric acid and mix. Next add 50 mL of 1000 ppm Sb. In addition add 100 mL of the custom mixed standard (CAS-CAL-14) purchased from Inorganic Ventures. Dilute to volume with reagent water and transfer to a 1000 mL Teflon bottle for storage. The solution expiration date is determined by the earliest expiration date of any single component in the solution.
    - 9.3.3.2 SS2 (As, Cd, Se, Pb, Tl and Cu): Fill a 500 mL volumetric flask approximately half full with reagent water, add 25 mL of nitric acid and mix. Next add 2.0 mL each of 1000 ppm Arsenic,

Cadmium, Lead, Selenium, Thallium and Copper. Dilute to volume with reagent water, mix thoroughly and transfer to a 500 mL Teflon bottle for storage. The solution expiration date is determined by the earliest expiration date of any single component in the solution.

- 9.3.3.3 SS3 (As, Se, Tl and Hg) Fill a 500 mL volumetric flask approximately half full with reagent water, add 25 mL of nitric acid and mix. Next add 50 mL of each of 1000 ppm Arsenic and Selenium. In addition add 10 mL of 1000 ppm Thallium and 6 mL of 1000 ppm Hg.
- 9.3.3.4 SS4 (B, Mo, U): Fill a 500 mL volumetric flask approximately half full with reagent water, add 25 mL of nitric acid and mix. Next add 25 mL of 1000 ppm Boron, 50 mL of 1000 ppm Molybdenum and 10 mL of 1000 ppm Uranium. Dilute to volume with reagent water, mix thoroughly and transfer to a 500 mL Teflon bottle for storage. The solution's expiration date is determined by the earliest expiration date of any single component in the solution.
- 9.3.3.5 SS5 (Fill a 200 mL volumetric flask approximately half full with reagent water. Next add 10.0 mL of nitric acid. Next add 20.0 mL of 10,000 ppm individual standards K, Na, Mg and Ca. Dilute to volume with reagent water, mix thoroughly and transfer to a 1000 mL Teflon bottle for storage. The solution expiration date is determined by the earliest expiration date of any single component in the solution.
- 9.3.3.6 K-met 1/100 QCP-CICV-1: Fill a 500 mL volumetric flask approximately half full with reagent water. Next add 5.0 mL of QCP-CICV-1 and 5 mL of Ultrex nitric acid. Dilute with reagent water mix thoroughly and transfer to a 500 mL Teflon bottle for storage. The solution expiration date is determined by the earliest expiration date of any single component in the solution.
- 9.3.3.7 K-met 1/100 QCP-CICV-3: Fill a 500 mL volumetric flask approximately half full with reagent water. Next add 5.0 mL of QCP-CICV-3 and 5 mL of Ultrex nitric acid. Dilute with reagent water mix thoroughly and transfer to a 500 mL Teflon bottle for storage. The solution expiration date is determined by the earliest expiration date of any single component in the solution.
- 9.3.3.8 K-met 1 µg/mL Sb: Fill a 500 mL volumetric flask approximately half full with reagent water. Next add 1% HNO<sub>3</sub> acid. Add 0.50 mL of 1000 ppm Sb, dilute with reagent water, mix thoroughly and transfer to a 500 mL HDPE bottle for storage.
- 9.3.3.9 K-met Mo/U 5ppm: Fill a 200 mL volumetric flask approximately half full with reagent water. Next add 1% HNO<sub>3</sub> acid. Add 1.00 mL of 1000 ppm Mo and 1000 ppm U, dilute with reagent water, mix thoroughly and transfer to a 500 mL HDPE bottle for storage.

## 10) Preventative Maintenance

### 10.1 Facility and Equipment Preparation

- 10.1.1 Laboratory equipment (i.e. centrifuge tubes, filtration apparatus, etc.) which comes in contact with the sample or digestate during the analysis must be thoroughly pre-cleaned with 1:5 HCl, and rinsed with DI water. All laboratory equipment used for trace metals analysis shall be stored in the clean room, and shall not be used for any other purpose.
- 10.1.2 All clean room work areas, including bench tops and laminar flow hoods, should be frequently washed and wiped dry with lint free; class-100 wipes to remove contamination.
- 10.2 Each block digester is uniquely identified and the temperature is verified with each batch of samples. The temperature is turned to the 95°C setting and the block is allowed to come to temperature. The analyst will verify that the block gives a temperature of  $95 \pm 2^\circ\text{C}$  using a semi-annually-calibrated traceable handheld infrared thermometer. If not at the right temperature, the thermostat is adjusted until the IR thermometer reads  $95 \pm 2^\circ\text{C}$ .

## 11) Procedure

- 11.1 Sample Digestion (25 mL Volume)
  - 11.1.1 Set up the sample batch in LIMs and print the *Preparation Information Sheet*. All digestion and sample information on this benchsheet.
  - 11.1.2 Shake the sample and measure a 25 mL aliquot into a 50 mL centrifuge tube. Use DI water for the MB and LCS.
  - 11.1.3 Add the appropriate spiking solutions directly into the designated MS and LCS samples prior to addition of reagents. The amount and mix of spiking solutions are determined during the initial batch set up in LIMs. Typically this is 0.1 mL - 0.5 mL appropriate spiking solution. Fill out a spiking data sheet and keep it with the digestion data sheets.
    - 11.1.3.1 Pipette tips used for ICP-MS analysis require pre-cleaning. This is done by rinsing once (1X) with diluted Ultrex HNO<sub>3</sub> and once (1X) with DI water. Dispose of the rinse into an acid waste container.
  - 11.1.4 The amount of type of reagents added for digestion will vary depending upon the method used for the final determination. The follow table list the amount and type of reagent to add:

Method	HNO <sub>3</sub>	HCL	Ultrex HCL
200.7 & 6010	0.25 mL	1.25 mL	
200.8	0.25 mL		0.05 mL
6020	0.25 mL		0.05 mL

- 11.1.4.1 If the sample is being prepared for analysis by ICP, add 0.25 mL of concentrated HNO<sub>3</sub>, and 1.25 mL of concentrated HCL. Cap centrifuge tube with open reflux caps.
- 11.1.4.2 If sample is being prepared for analysis by ICP-MS aliquot 25 mL into an acid rinsed centrifuge tube and add 0.25 mL of concentrated nitric acid and 0.05 mL of Ultrex hydrochloric acid. Cap centrifuge tube with centrifuge tube caps.

- 11.1.5 Place the centrifuge tube containing the sample in the “Block Digester”, located in the Clean Room laminar flow hood, and heat at 95°C for two hours, or until the volume has been reduced to between 15 and 25 mL.
- 11.1.6 Allow the sample to cool and dilute to the 25 mL mark with ASTM Type I - DI water.
- 11.1.7 Insoluble material is allowed to settle overnight, or the digestate may be centrifuged.
- 11.1.8 The digestates are ready for analysis.
- 11.2 Sample Digestion (10 mL Volume)
  - 11.2.1 Set up the sample batch in LIMs and print the *Preparation Information Sheet*. All digestion and sample information on this benchsheet.
  - 11.2.2 Reflux caps used during the digestion procedure require pre-cleaning. First soak the caps in a 5% HNO<sub>3</sub> solution for at least 30 minutes, preferably overnight. Then DI rinse the caps 6 times. 16 mL tubes are rinsed once with DI water.
  - 11.2.3 Shake the sample and measure a 10 mL ± 3% aliquot into a 16 mL digestion tube by pouring sample directly into the tube and using an adjacent pre-marked “template” tube to achieve the desired volume. The template tube has graduations at 9.7 and 10.3 mL.  
  
Note: The “template” tube must be from the same manufacturer’s lot as the tubes being used for samples
  - 11.2.4 Use DI water for the MB and LCS for all test codes except 'As Se SeaH20'. For test code 'As Se SeaH20' use 8 mL of DI and 2 mL of 10-11% NaCl.
  - 11.2.5 Add the appropriate spiking solutions directly into the designated MS and LCS samples prior to addition of reagents. The amount and mix of spiking solutions are determined during the initial batch set up in LIMs. Typically this is 0.02 mL - 0.1 mL appropriate spiking solution. Fill out a spiking data sheet and keep it with the digestion data sheets.
    - 11.2.5.1 Pipette tips used for ICP-MS analysis require pre-cleaning. This is done by rinsing once (1X) with diluted Ultrex HNO<sub>3</sub> and once (1X) with DI water. Dispose of the rinse into an acid waste container.
  - 11.2.6 The amount of type of reagents added for digestion will vary depending upon the method used for the final determination. The follow table list the amount and type of reagent to add:

Method	HNO <sub>3</sub>	HCL	Ultrex HCL
200.7 & 6010	0.1 mL	0.5 mL	
200.8	0.1 mL		0.02 mL
6020	0.1 mL		0.02 mL

- 11.2.6.1 If the sample is being prepared for analysis by ICP, add 0.1 mL of concentrated HNO<sub>3</sub>, and 0.5 mL of concentrated HCL. Cap digestion tube with reflux cap.

- 11.2.6.2 If the sample is being prepared for analysis by ICP-MS, add 0.1 mL of concentrated  $\text{HNO}_3$ , and 0.02 mL of Ultrex concentrated HCl. Cap digestion tube with reflux cap.
- 11.2.7 Place the digestion tube containing the sample in the "Block Digester", located in the Clean Room laminar flow hood, and heat at  $95^\circ\text{C}$  for two hours, or until the volume has been reduced to between 6 and 10 mL.
- 11.2.8 Remove the sample from the block digester and allow it to cool.
- 11.2.9 The final volume is determined multiplying the initial 10 mL volume by the experimentally derived factor below:
  - 11.2.9.1 ICP sample digest factor - 1.05
  - 11.2.9.2 ICP matrix spike factor - 1.09
  - 11.2.9.3 ICP LCSW factor - 1.07
  - 11.2.9.4 ICPMS sample digest factor - 1.00
  - 11.2.9.5 ICPMS matrix spike factor - 1.03
  - 11.2.9.6 ICPMS LCSW factor - 1.03
- 11.2.10 Insoluble material is allowed to settle overnight, or the digestate may be centrifuged.
- 11.2.11 The digestates are ready for analysis.
- 11.3 Procedure for Arizona Samples
  - 11.3.1 For the determination of total recoverable analytes in aqueous samples, transfer a 100 mL ( $\pm 1$  mL) aliquot from a well-mixed, acid preserved sample to an acid/DI rinsed 150 mL borosilicate beaker.
  - 11.3.2 Add 1 mL concentrated nitric acid and 0.5 mL concentrated hydrochloric acid to the beaker containing the measured volume of sample. Place the beaker on a 95 degree Hot Plate, located in a clean room laminar flow hood, for solution evaporation.
  - 11.3.3 Reduce the volume of the sample aliquot to about 20 mL by gentle heating. DO NOT BOIL. This step takes about two hours for a 100 mL aliquot with the rate of evaporation rapidly increasing as the sample volume approaches 20 mL.
  - 11.3.4 Cover the beaker with a glass watch glass to reduce additional evaporation and gently reflux the sample for 30 minutes. (Slight boiling may occur, but vigorous boiling must be avoided to prevent loss of the HCl-H<sub>2</sub>O azeotrope).
  - 11.3.5 Allow the sample to cool then dilute with reagent water to a final volume of 50 mL in a centrifuge tube. Seal the tube with an acid/DI rinsed cap and mix.
  - 11.3.6 Allow any undissolved material to settle overnight, or centrifuge a portion of the prepared sample until clear. (If after centrifuging or standing overnight the sample contains suspended solids that would clog the nebulizer, a portion of the sample may be filtered for their removal prior to analysis. However, care should be exercised to avoid potential contamination from filtration).

11.3.7 Prior to analysis, adjust the chloride concentration by diluting the sample 2.0 fold. (If the dissolved solids in this solution are >0.2%, additional dilution may be required to prevent clogging of the extraction and/or skimmer cones.) The sample is now ready for analysis. Because the effects of various matrices on the stability of diluted samples cannot be characterized, all analyses should be performed as soon as possible after the completed preparation.

## 12) QA/QC Requirements

12.1 This method shall operate under the formal Quality Assurance Program established at ALS and must maintain records that define the quality of data that is generated. Data shall be compared to established criteria in order to determine if the results of the analyses meet the performance characteristics of the method. It is required that an initial demonstration of capability and periodic analysis of laboratory reagent blanks, laboratory fortified blanks, and other QC solutions as a continuing check on performance. The accuracy and precision of the procedure must be validated *before* analyses of samples begin, or whenever significant changes to the procedures have been made.

### 12.2 Initial Precision and Recovery Validation

12.2.1 The accuracy and precision of the procedure must be validated before analyses of samples begin, or whenever significant changes to the procedures have been made. To do this, four water samples are spiked with the LCS spike solution, then prepared and analyzed using the applicable method.

12.3 Ongoing QC Samples required are described in the ALS-Kelso Quality Assurance Manual and in the SOP for Sample Batches. Additional QC Samples may be required in project specific quality assurance plans (QAPP). General QA requirements for DoD QSM are defined in the laboratory SOP, *Department of Defense Projects - Laboratory Practices and Project Management*. General QC Samples are:

#### 12.3.1 Method Blank

12.3.1.1 A method blank is extracted and analyzed with every batch of 20 (or fewer) samples to demonstrate that there are no method interferences. If the method blank shows any hits above the reporting limit, corrective action must be taken. Corrective action includes recalculation, reanalysis, system cleaning, or re-extraction and reanalysis. For some project specific needs, exceptions may be noted and method blank results above the MRL may be reported for common lab contaminants.

#### 12.3.2 Lab Control Sample (LCS)

12.3.2.1 Digest one laboratory control sample with each sample batch. Use the appropriate dilution of Inorganic Ventures ICV solutions for the liquid laboratory control sample (LCSW).

#### 12.3.3 Matrix Spike and Sample Duplicates

12.3.3.1 Digest one duplicate and one spiked sample with each sample matrix. For 6010 and 6020, prepare one duplicate and spiked

sample on a five percent frequency per twenty samples. For 200.7 and 200.8, prepare a duplicate and spiked sample on a ten percent frequency per twenty samples, or per SDG group, whichever is more frequent. Specific samples may be assigned as duplicates or spikes depending on client requirements.

### 13) Data Reduction and Reporting

13.1 Digestion data sheets including sample weights and volumes used are completed and a batch lot number is assigned and attached to the data sheet. The Manufacturer's lot numbers for the reagents used are added to the digestion data sheet as well as the spiking solutions and amount.

### 14) Method Performance

14.1 Available method performance data is given in the reference method. In addition, this procedure was validated through single laboratory studies of accuracy and precision as in the determinative procedure. The method detection limit(s) and method reporting limit(s) are established for the determinative procedure. See *Performing and Documenting Method Detection Limit Studies and Establishing Limits of Detection and Quantitation*.

### 15) Pollution Prevention and Waste Management

15.1 The laboratory will comply with all Federal, State and local regulations governing waste management, particularly the hazardous waste identification rules and land disposal restrictions as specified in the ALS Lab Waste Management Plan.

### 16) Contingencies for Handling Out-of-Control or Unacceptable Data

16.1 Refer to the SOP for *Nonconformance and Corrective Action Procedure* (ADM-NCAR) for procedures for corrective action. Personnel at all levels and positions in the laboratory are to be alert to identifying problems and nonconformities when errors, deficiencies, or out-of-control situations are detected.

### 17) Training

17.1 All analysts performing this analysis are required to read and understand this SOP.

17.2 Training is documented following the *Employee Training and New Employee Orientation* (ADM-TRAIN).

### 18) Method Modifications

18.1 This SOP contains no known modifications to the reference method.

## 20) Changes Since the Last Revision

Summary of Revision Changes			
Revision Number	Effective Date	Document Editor	Description of Changes
20.0	12/4/2020	T. Caron	Updated SOP signatories. Minor typographical changes to improve readability and consistency, not affecting technical content. Section 8: Updated Metals equipment list to reflect current procedure. Section 10: Added the use of an infrared thermometer to verify hot block operating temperature. Section 11: Removed former reference to pre-cleaning centrifuge tubes for ICP-OES/ICP-MS analyses. Added 16 mL tube rinse.

	STANDARD OPERATING PROCEDURE	TCLP Extraction
	ALS   Environmental - Kelso	MET-TCLP, Revision 11.0
		Effective: 2/09/2021
		SOP Review: 1/27/2021
		Page 2 of 13

## 1) Scope & Applicability

- 1.1 This Standard Operating Procedure (SOP) describes procedures for performing the extraction (excluding zero headspace extraction) of samples requiring Toxicity Characteristic Leaching Procedure (TCLP) analysis. The TCLP-ZHE procedure is described in *Zero Headspace Extraction* (EXT-ZHE). The TCLP procedure is designed to determine the mobility of organic and inorganic analytes present in various waste matrices. The results of a “total” analysis of the waste may be used to evaluate if the TCLP needs to be performed.
- 1.2 The determinative procedures for TCLP analysis, with the exception of a few special considerations, will be referenced in the appropriate determinative method.

## 2) Summary of Procedure

- 2.1 The sample is characterized as to its moisture content, size, physical state and miscibility in water (in cases of liquid samples). The flowcharts found in Appendix B should be used to aid in determination of these sample characteristics.
- 2.2 Liquid waste (those containing less than 0.5% solid material) is defined as the TCLP extract after passing through a 0.6 to 0.8 µm filter. For wastes containing greater than or equal to 0.5% dry solids, the liquid, if any, is separated from the solid phase. The solid phase is extracted with a proportionate amount of extraction fluid and subsequently analyzed. If compatible, the initial liquid phase of the waste is added to the liquid extract and these are analyzed together. If incompatible, the liquids are analyzed separately.

## 3) .Definitions

- 3.1 For laboratory definitions applicable to most analyses, refer to the SOP for *Sample Batches*.

## 4) Responsibilities

- 4.1 It is the responsibility of the analyst to perform the analysis according to this SOP and to complete all documentation required for data review. Analysis and interpretation of the results are performed by personnel in the laboratory who have demonstrated the ability to generate acceptable results utilizing this SOP. This demonstration is in accordance with the training program of the laboratory. The department supervisor/manager or designee performs final review and sign-off of the data.
- 4.2 It is the responsibility of the department supervisor/manager to document analyst training as described in the *Employee Training and Orientation* (ADM-TRAIN). Documenting method proficiency, as described in SW-846, is also the responsibility of the department supervisor/manager.

## 5) Interferences

- 5.1 Some samples such as paints, thick oils or fine particulates may cause problems due to their physical characteristics. Potential interferences that may be encountered during analysis are discussed in the determinative methods.
- 5.2 Filters used in various stages of the procedure should be pre-washed to reduce interferences. This may include acid washing to reduce metals contaminants.

	STANDARD OPERATING PROCEDURE	TCLP Extraction
	ALS   Environmental - Kelso	MET-TCLP, Revision 11.0
		Effective: 2/09/2021
		SOP Review: 1/27/2021
		Page 3 of 13

## 6) Safety

- 6.1 Chemicals, reagents and standards must be handled as described in the ALS safety policies, approved methods and in SDSs where available. Refer to the ALS Chemical Hygiene Plan
- 6.2 Sodium Hydroxide (NaOH) is a strong caustic and a severe health and contact hazard. Use nitrile or latex gloves while handling pellets or preparing solutions.
- 6.3 Hydrochloric and/or Nitric Acid are used in this method. These acids are extremely corrosive and care must be taken while handling them. A face shield must be used while pouring acids.

## 7) Sample Collection, Containers, Preservation, and Storage

- 7.1 Samples should be collected (received) in glass jars with a minimum of headspace. Samples may be refrigerated at  $4 \pm 2^{\circ}\text{C}$  until analysis, unless damage to the physical characteristics of the sample will result. Preservatives shall not be added to samples prior to extraction.
- 7.2 Refer to subsequent sections for procedures for handling TCLP samples and extracts, including specification of holding times.

## 8) Apparatus and Equipment

- 8.1 Balance: accurate to within 0.1 gram
- 8.2 Beaker or Erlenmeyer flask (various sizes ranging from 100 mL to 500 mL)
- 8.3 Extraction Bottles: Borosilicate glass, Teflon, or plastic. Plastic bottles should not be used when organics are being determined. For TCLP Extractions performed for inorganic analyses only, disposable one time use extraction bottles are used.
- 8.4 Graduated Cylinders: various sizes 250 mL to 2000 mL
- 8.5 Drying Oven: capable of maintaining a constant temperature of  $100 \pm 20^{\circ}\text{C}$
- 8.6 Magnetic Stirrer and Stir Bar
- 8.7 pH Meter: accurate to  $\pm 0.05$  units at  $25^{\circ}\text{C}$ , calibrated as described in Appendix A.
- 8.8 Filtration Apparatus and filters suitable for filtration (vendors may sell pre-cleaned filters designed specifically for the method). Filters are borosilicate glass fiber and have an effective pore size of 0.6 to 0.8  $\mu\text{m}$ . When samples are to be analyzed for metals, filters shall be acid-washed prior to use by rinsing with 1N nitric acid, followed by three consecutive rinses with DI water. Glass fiber filters are fragile and should be handled with care.
- 8.9 Tumbler: Must be capable of rotating the extraction vessel end-over-end at  $30 \pm 2$  rpm.
- 8.10 Stopwatch, preferably digital for tumbler rotation checks.
- 8.11 Checkpoint Temp Sys<sup>®</sup> probe for temperature measurement during tumbler rotation.
- 8.12 Hot plate, capable of maintaining  $50^{\circ}\text{C}$ .
- 8.13 Infrared thermometer, Fluke Model 572-2.

	STANDARD OPERATING PROCEDURE	TCLP Extraction
	ALS   Environmental - Kelso	MET-TCLP, Revision 11.0
		Effective: 2/09/2021
		SOP Review: 1/27/2021
		Page 4 of 13

## 9) Standards, Reagents, and Consumable Materials

- 9.1 Reagent grade chemicals shall be used in all tests. Other grades may be used, provided it is first ascertained that the reagent is of sufficiently high purity to permit its use without lowering the accuracy of the determination. The preparation for all laboratory prepared reagents and solutions must be documented in a laboratory logbook. Refer to *Reagent/Standards Login and Tracking* for the complete procedure and documentation requirements.
- 9.2 Reagent water: ASTM Type II, or equivalent, water which is free of target analytes at the levels determined in section 5.2 of the TCLP method (Appendix A).
- 9.3 Glacial Acetic Acid: ACS reagent grade.
- 9.4 Hydrochloric Acid: Reagent grade concentrated acid ( Fill 1000 mL volumetric flask with 50 mL of deionized water; add 83.3 mL of reagent grade concentrated HCL; using deionized water - bring the solution to a final volume of 1000 mL .
- 9.5 Nitric acid: 1N, made from reagent grade concentrated acid.
- 9.6 Sodium Hydroxide: 1N, prepared from ACS reagent grade.
- 9.7 Extraction Fluid (#1): Add 5.7 mL glacial acetic acid ( $\text{CH}_3\text{CH}_2\text{OOH}$ ) to 500 mL of reagent water; add 64.3 mL of 1N sodium hydroxide (NaOH); dilute to 1 liter. Larger amounts of reagents may be combined, in correct proportion, if larger amounts of the extraction fluid are needed. When correctly prepared the pH of this fluid will be  $4.93 \pm 0.05$ . Record date prepared and pH in the preparation log.
- 9.8 Extraction Fluid (#2): Dilute 5.7 mL glacial acetic acid ( $\text{CH}_3\text{CH}_2\text{OOH}$ ) with reagent water to a volume of 1 liter. Larger amounts of reagents may be combined, in correct proportion, if larger amounts of the extraction fluid are needed. When correctly prepared the pH of this fluid will be  $2.88 \pm 0.05$ . Record date prepared and pH in the preparation log.
- 9.9 pH buffers, 2.00, 4.00, and 7.00. Expiration dates for the buffers are listed on the container. Buffers are replaced and disposed of before the expiration date passes. Portions poured into secondary containers for daily use are discarded daily. After calibration, the calibration of the pH meter is verified using a second source pH buffer solution.

## 10) Preventative Maintenance

- 10.1 Maintenance activities are generally limited to routine metrological checks of balances, monitoring of extraction room temperature, and verification of tumbler rotation speed. Documentation of this monitoring is maintained in either metrological logbooks kept by the QA department, or in lab records.
- 10.2 pH Probe Cleaning and Maintenance - The glass bulb should be cleaned every other week, or more, by placing it in a centrifuge tube with approximately 30 mL of 0.1N HCL. (The 0.1N HCL is made by adding 250  $\mu\text{l}$  of concentrated acid to 20 mL of de ionized water in a graduated centrifuge tube. Dilute to 30 mL with deionized water in the graduated centrifuge tube) and allowed to sit while stirring for approximately 5 minutes. Then rinse the probe with DI water 3 times and blot with a kimwipe.

## 11) Procedure

STANDARD OPERATING PROCEDURE ALS   Environmental - Kelso	TCLP Extraction
	MET-TCLP, Revision 11.0
	Effective: 2/09/2021
	SOP Review: 1/27/2021
	Page 5 of 13

- 11.1 Preliminary Evaluations: These procedures should be performed in cases where the waste is not obviously solid (contains a liquid phase that cannot be completely mixed into the solid phase without a phase separation occurring) and/or when the waste cannot be extracted without size reduction.
- 11.1.1 Determine the percent solids.
- 11.1.1.1 If the sample contains moisture that may produce liquids when subjected to pressure filtration, the following steps are taken. If not, proceed to the particle size reduction section (11.1.4).
- 11.1.1.2 Pre weigh the filter and the container that will receive the filtrate. Record the filter lot number and masses.
- 11.1.1.3 Assemble the filter holder and filter as per manufacturer's instructions.
- 11.1.1.4 Weigh out a minimum of 100 g of the sample and record the mass.
- 11.1.1.5 Allow slurries to settle prior to filtration, centrifuge to aid in filtration if necessary.
- 11.1.1.6 Quantitatively transfer the waste to the filter (both the liquid and the solid). Apply gentle pressure (<10 psi) to the filter holder, if no solution has passed through the filter for two minutes, increase the pressure in increments of 10 psi until air passes through the filter or 50 psi is reached. Use only one filter. The portion remaining on the filter is considered the solid phase.
- 11.1.1.7 Determine the weight of the liquid phase by weighing the filtrate container and subtracting the initial mass of the container.
- 11.1.1.8 Subtract the mass of the liquid from the mass of sample filtered to get the mass of the solid phase.
- 11.1.1.9 Calculate the percent solids.
- 11.1.2 If the percent solids is <0.5, then the filtered sample is considered to be the TCLP extract and further manipulation of the sample is unnecessary. If the sample is >0.5 percent solids go to the next step.
- 11.1.2.1 In standard cases (i.e. liquids which will not pass through the filter are not present) remove the solid phase and the filter from the filtration apparatus, continue to the particle size reduction section (11.1.4).
- 11.1.2.2 Dry the solid phase with the filter at  $100 \pm 20^{\circ}\text{C}$  until two successive weighings yield the same value within  $\pm 1\%$ . Record the final mass.
- Note: If the amount of material remaining on the filter will obviously yield solids >0.5 percent note this on the extraction bench sheet, skip the drying step, and proceed to section 11.1.4 and subsequent extraction with this aliquot of waste.
- 11.1.2.3 Calculate the percent dry solids.
- 11.1.3 If the percent dry solids are < 0.5, the filtrate is considered the TCLP extract and further manipulation of the sample is unnecessary. If the percent dry solids is >0.5, then continue with a fresh portion of waste.

#### 11.1.4 Does the solid portion of the waste require particle size reduction?

11.1.4.1 Using the solid portion of the waste, see if all of the sample will pass through a 9.5mm sieve or if the surface area is  $> 3.1 \text{ cm}^2$  per gram. If these criteria are not met, the sample must be ground, cut, or crushed to fulfill the requirements. For samples that are pieces of wire, cloth, wire mesh, etc., the surface area criteria are not met if the pieces are too large (as estimated by the analyst) and so must be reduced in size to increase the surface area.

#### 11.1.5 Determine the extraction fluid to be used.

11.1.5.1 Weigh out 5.0 g sample of the solid waste to 500 mL beaker or Erlenmeyer flask. If not already accomplished with previous steps, reduce the solid to a particle size of approximately 1 mm in diameter or less.

11.1.5.2 Add 96.5 mL of reagent water to the beaker, cover with a watch glass, and stir vigorously for five minutes using a magnetic stirrer. Measure and record the pH. If the pH is  $< 5.0$ , use extraction fluid #1. If the pH is  $> 5.0$ , continue.

11.1.5.3 Add 3.5 mL 1N HCl, slurry briefly, cover with a watch glass, heat to  $50^\circ\text{C}$  for ten minutes. Let the solution cool to room temperature and record the pH. If the pH is  $< 5.0$ , use extraction fluid #1, if the pH is  $> 5.0$ , use extraction fluid #2.

#### 11.2 Extraction procedures

11.2.1 Due to the very detailed nature of the TCLP method, the following procedures represent an outline of the procedure for extraction. Refer to the TCLP method for specific instructions. Note the discussion of matrices such as oily wastes, paint wastes, etc. on page 1311-12.

11.2.2 Refer to section 7.1.5 of the TCLP method to determine if the aliquot from the preliminary evaluation may be used for extraction. If a fresh portion of the waste has been established from section 11.1.3 above then continue.

11.2.3 Extractions for 100 percent solids when only organics or metals are requested:

11.2.3.1 Determine if particle size reduction is required. If so, refer to section 11.1.4.

11.2.3.2 Weigh the sample into the extraction vessel and add the appropriate extraction fluid. Record the extraction fluid lot number.

11.2.3.3 Extract the sample by rotating the tumbler for  $18 \pm 2$  hours at  $30 \pm 2$  rpm. Check for pressure in the bottle after 15 minutes and release if necessary. If pressure is present, subsequently check for pressure at 15 minute intervals until pressure buildup is minimized. Measure and record on the bench sheet the tumbler rotation (RPM) and room temperature ( $^\circ\text{C}$ ) when the tumbling is in process. Room temperature must be maintained at  $23 \pm 2^\circ\text{C}$ .

11.2.3.4 Filter the sample, record filter lot number and the pH of the extract.

STANDARD OPERATING PROCEDURE ALS   Environmental - Kelso	TCLP Extraction
	MET-TCLP, Revision 11.0
	Effective: 2/09/2021
	SOP Review: 1/27/2021
	Page 7 of 13

11.2.3.5 For metals analysis, take a small portion of the extract (~5 mL) and add some nitric acid. If a precipitate forms, do nothing further with the extract and analyze as soon as possible.

Note: For metals analysis, the aliquot of TCLP extract that is to be used for the matrix spike analysis must be spiked prior to preservation.

11.2.3.6 If no precipitate forms, acidify the extract to a pH of < 2 and store until time of analysis. For organics, the extract is ready for preparation for analysis, do not acidify.

11.2.4 Extractions for 100 percent solids when both organics and metals are requested.

11.2.4.1 Determine if particle size reduction is required. If so, refer to section 11.1.4.

11.2.4.2 Weigh the sample into the Teflon extraction vessel and add the appropriate extraction fluid, and record extraction fluid lot number and vessel ID.

11.2.4.3 Extract the sample by rotating the tumbler for  $18 \pm 2$  hours at  $30 \pm 2$  rpm. Check for pressure in the bottle after 15 minutes, release if necessary. If pressure is present, subsequently check for pressure at 15 minute intervals until pressure buildup is minimized. Measure and record on the bench sheet the tumbler rotation (RPM) and room temperature ( $^{\circ}\text{C}$ ) when the tumbling is in process. Room temperature must be maintained at  $23 \pm 2^{\circ}\text{C}$ .

11.2.4.4 Filter the sample, record the filter lot number, and record the pH of the extract. Separate the samples, an aliquot for organics and an aliquot for metals. For metals fraction, take a small portion of the extract (~5 mL) and add some nitric acid. If a precipitate forms, do nothing further with the extract and analyze as soon as possible. If no precipitate forms, acidify the extract to a pH < 2 and store until analysis. For organics, the extract is ready for preparation for analysis.

Note: For metals analysis, the aliquot of TCLP extract that is to be used for the matrix spike analysis must be spiked prior to preservation.

11.2.5 Less than 0.5% solids (liquids only) when metals and/or organics are requested.

11.2.5.1 Measure out the required amount of sample.

11.2.5.2 Assemble the filtration apparatus, rinse, and filter the measured aliquot of waste into a borosilicate glass bottle.

11.2.5.3 Separate the fractions, if necessary. Take a small portion of the metals fraction (~5 mL) and add some nitric acid. If a precipitate forms, do nothing further with the extract and analyze as soon as possible. If no precipitation occurs, acidify the metals fraction to a pH < 2 and store of analysis.

Note: For metals analysis, the aliquot of TCLP extract that is to be used for the matrix spike analysis must be spiked prior to preservation.

11.2.5.4 The samples are ready for preparation for analysis.

	STANDARD OPERATING PROCEDURE	TCLP Extraction
	ALS   Environmental - Kelso	MET-TCLP, Revision 11.0
		Effective: 2/09/2021
		SOP Review: 1/27/2021
		Page 8 of 13

11.2.6 For 0.5 to less than 100 percent solids when either organics or metals, or both, are requested.

11.2.6.1 Pre weigh the container that will receive the filtrate. If a fresh portion of the waste is to be used (section 11.1.3) weigh out a subsample of the waste and record the mass and go to 11.2.6.2, else go to 11.2.6.3. Determine the sample size and amount of extraction fluid as specified in the method.

11.2.6.2 Assemble the filtration apparatus, rinse, and filter. Allow slurries to settle prior to filtration, centrifuge to aid in filtration if necessary. Quantitatively transfer the waste to the filter (both the liquid and the solid). Apply gentle pressure (<10 psi) to the filter holder, if no solution has passed through the filter for two minutes, increase the pressure in increments of ten psi until air passes through the filter or 50 psi is reached. Use only one filter.

11.2.6.3 The portion remaining on the filter is considered the solid phase. If a significant amount of waste remains in the transfer vessel, this should be taken into account by subtracting the amount left behind from the total amount of waste.

11.2.6.4 Collect the filtrate and determine if it will be miscible with the extraction fluid. If not, separate it into two fractions of ratio 1:5 (one part for metals and five parts for organics), preserve the metals fraction and analyze. If the filtrate will be miscible with the extractant, store the filtrate until the two portions can be mixed.

11.2.6.5 Reduce particle size of the solid portion if necessary.

11.2.6.6 Quantitatively transfer the solid portion of the waste to either a plastic (Metals Analysis) or a Teflon (Organics Analysis) extraction vessel.

11.2.6.7 Slowly add the determined amount of the appropriate extraction fluid and seal the extraction vessel.

11.2.6.8 Extract the sample by rotating the tumbler for  $18 \pm 2$  hours at  $30 \pm 2$  rpm. Check for pressure in the bottle after 15 minutes and release if necessary. If pressure is present, subsequently check for pressure at 15 minute intervals until pressure buildup is minimized. Measure and record on the bench sheet the tumbler rotation (RPM) and room temperature ( $^{\circ}\text{C}$ ) when the tumbling is in process. Room temperature must be maintained at  $23 \pm 2^{\circ}\text{C}$ .

11.2.6.9 Filter the sample and record the pH of the extract.

11.2.6.10 If applicable, mix the extract with the filtrate from section 11.2.5.3.

11.2.6.11 If both metals and organics are requested, separate the fractions for organics and for metals. For metals fraction, take a small portion of the extract (~ 5 mL) and add some nitric acid. If a precipitate forms, do nothing further with the extract and analyze as soon as possible. If no precipitate forms, acidify the extract to a pH of < 2 and analyze. For organics, the extract is ready for preparation for analysis.

Note: For metals analyses, the aliquot of TCLP extract that is to be used for the matrix spike analysis must be spiked prior to preservation.

	STANDARD OPERATING PROCEDURE	TCLP Extraction
	ALS   Environmental - Kelso	MET-TCLP, Revision 11.0
		Effective: 2/09/2021
		SOP Review: 1/27/2021
		Page 9 of 13

11.2.6.12 If only organics is requested, the extract is now ready for further preparation for analysis.

11.2.6.13 If only metals are requested, take a small portion of the extract (~ 5 mL) and add some nitric acid. If a precipitate forms, do nothing further with the extract and analyze as soon as possible. If no precipitate forms, acidify the extract to a pH of < 2 and analyze.

Note: For metals analyses, the aliquot of TCLP extract that is to be used for the matrix spike analysis must be spiked prior to preservation.

11.2.7 If the liquid portion of the waste and the extraction fluid are not miscible, the results from the analysis of the two fractions must be mathematically combined to give the final TCLP result for the waste.

## 12) QA/QC Requirements

12.1 Method Blank: A minimum of one extraction blank must be prepared with each batch of 20 samples or less. Do not designate specific extraction bottles to use for extraction blanks. Each Teflon bottle has a unique identifying number associated and must be used for the extraction blank at a minimum once per every 20 extractions conducted in that vessel. This is documented in a Laboratory Notebook 14-MET-TCLP-VESSEL-001. If a method blank contains a positively identified target analyte above the MRL, all samples that contain that analyte will be re-extracted, unless the sample results are greater than 20x the level detected in the method blank.

12.2 For TCLP Extractions performed for Inorganic analyses disposable one time use extraction bottles are used.

12.3 Matrix Spike: A matrix spike shall be performed for each waste type unless the result exceeds the regulatory level and the data is being used solely to demonstrate that the waste property exceeds the regulatory level. At a minimum, use the guidelines for addition of matrix spikes found in the determinative methods. Refer to section 8.2 of the TCLP method (Appendix A) for specific guidance on addition of matrix spikes.

**Note:** For metals analyses, the aliquot of TCLP extract that is to be used for the matrix spike analysis must be spiked prior to preservation.

12.4 All quality control measures described in the determinative methods shall be followed.

12.5 Refer to section 9.0 of the TCLP method for method performance information.

## 13) Data Reduction and Reporting

13.1 Following primary data interpretation and calculations, all data is reviewed by a secondary analyst. Following generation of the report, the report is also reviewed. Refer to SOP *Laboratory Data Review Process* (ADM-DREV) for details.

13.2 Reports are generated out of the applicable analytical departments. Refer to the analytical SOPs for the analyses used.

## 14) Method Performance

14.1 This method was validated through single laboratory studies of accuracy and precision. Refer to the reference method for additional available method performance data.

	STANDARD OPERATING PROCEDURE	TCLP Extraction
	ALS   Environmental - Kelso	MET-TCLP, Revision 11.0
		Effective: 2/09/2021
		SOP Review: 1/27/2021
		Page 10 of 13

14.2 The Method Detection Limits (MDLs) for the analytical procedures are established using the procedure described in the SOP for *Performing and Documenting Method Detection Limit Studies and Establishing Limits of Detection and Quantification*. Method Reporting Limits are established for this method based on MDL studies and as specified in the ALS Quality Assurance Manual.

## 15) Pollution Prevention and Waste Management

15.1 The laboratory will comply with all Federal, State and local regulations governing waste management, particularly the hazardous waste identification rules and land disposal restrictions as specified in the ALS Lab Waste Management Plan.

## 16) Contingencies for Handling Out-of-Control or Unacceptable Data

16.1 Refer to the SOP for *Non Conformance and Corrective Action* ADM-NCAR for procedures for corrective action.

16.2 Personnel at all levels and positions in the laboratory are to be alert to identifying problems and nonconformities when errors, deficiencies, or out-of-control situations are detected.

## 17) Training

17.1 All analysts performing this analysis are required to read and understand this SOP.

Training is documented following the *Employee Training and New Employee Orientation* (ADM-TRAIN).

## 18) Method Modifications

18.1 There are no known modifications in this laboratory standard operating procedure from the reference method.

## 19) References

## APPENDIX A

### pH Meter Calibration Procedure

- 1) Reagents: pH buffer 2.00, 4.00 and 7.00.
- 2) Calibration:
  - 2.1 Buffers in 50 mL plastic centrifuge tubes need to be replaced with buffer from the primary container daily.
  - 2.2 Once a manufacturer's cubitainer is open it is viable for three months.
  - 2.3 Perform calibration daily. Record calibration, buffer checks and buffer temperatures in instrument logbook or bench sheet with date and analyst's initials.
  - 2.4 The slope percentage of the calibration points should be between 95 and 105%, the meter displays the slope of calibration.
    - 2.4.1 Pour the buffer calibration solutions into labeled calibration vessel. The label must have the date and pH buffer solution name, pH buffer solution lot #.
    - 2.4.2 Rinse the probe with deionized water and put the probe into the first calibration vessel. Make sure that there are no air bubbles under the probe tip.
    - 2.4.3 From the standby screen press CALIBRATE.
    - 2.4.4 Press READ to measure the first calibration solution. Record the measurement in the pH calibration logbook 2001-MET-pH. When the measurement is stable, the instrument will request the next calibration solution.
    - 2.4.5 Rinse the probe with deionized water and put the probe into the second calibration vessel. Make sure that there are no air bubbles under the probe tip.
    - 2.4.6 Press READ to measure the second calibration solution. Record the measurement in the pH calibration logbook 2001-MET-pH.
    - 2.4.7 If the calibration is correct the meter will display the message CALIBRATION OK and will save the calibration data.
    - 2.4.8 From the standby screen press CALIBRATE.
    - 2.4.9 Press CAL.DATA
    - 2.4.10 Select CURRENT CALIBRATION option. The data from the last calibration is shown.

ALS | Environmental - Kelso

TCLP Extraction

MET-TCLP, Revision 11.0

Effective: 2/09/2021

SOP Review: 1/27/2021

Page 13 of 13

- 2.4.11 Record the slope percentage of the calibration points in the pH calibration logbook 2001-MET-pH.
- 2.4.12 After calibration, a second source pH solution is used to verify calibration of the pH meter. The acceptance criteria are 70-105%. The result is recorded in the pH calibration logbook.
- 2.5 If the slope exceeds the above end points either the buffer(s) is contaminated or the probe is no longer functioning properly.
- 2.6 Replace buffers, and then re calibrate.
- 2.7 If after replacing the buffer solutions slope percentage of the calibration points is not between 95 and 105% follow the directions for cleaning the probe and re calibrate.
- 2.8 If cleaning the probe does not correct the calibration slope percentage error the probe needs to be replaced.

## Analysis of Water, Solids, and Soluble Waste Samples for Semi-volatile Fuel Hydrocarbons

DOCUMENT ID: PET-SVF, REV 17.0

Prepared By:   
Organics Manager, Jonathon Walter

Date: 12/2/2020

Prepared By:   
Quality Assurance Manager, Kurt Clarkson

Date: 12/2/2020

Approved By:   
Laboratory Director, Charles (Pat) Byrne

Date: 12-2-20

## 1) Scope & Applicability

- 1.1 This Standard Operating Procedure (SOP) describes the method used for analysis of semi-volatile petroleum hydrocarbons using EPA Method 8015C and state-specific methods, as listed in Table 1.
- 1.2 The analysis is used for detection and quantification of semi-volatile fuel hydrocarbons ranging from gasoline through fuel oils and lubricating oils. The SOP is applicable for quantitative analysis of Total Petroleum Hydrocarbons as Diesel, Diesel Range Organics, Motor Oil and Residual Range Organics. The SOP is applicable for semi-quantitative analysis of more volatile petroleum products ranging chiefly from n-C8 through n-C11 (e.g., Gasoline). The SOP is also applicable for qualitative identification of petroleum products ranging from n-C8 through n-C44. Normally only the following analytes are reported under this SOP: Diesel Range Organics (various ranges), Residual Range Organics (various ranges) and C8-C12 Gasoline Range Organics. Other petroleum products are reported (quantitatively, semi-quantitatively or qualitatively) when and as requested by the client.
- 1.3 This SOP describes both the sample preparation and chromatographic procedures used to determine the target analytes in water, soil, sediment and unknown waste (product) matrices. The SOP may be applied to other miscellaneous sample matrices providing that the analyst demonstrates the ability of the SOP to give data of acceptable quality in that matrix. The Method Reporting Limits (MRLs) for target analytes in water and soil are presented in Table 2. Method Detection Limits which have been achieved are also given.

## 2) Summary of Procedure

- 2.1 Samples are solvent extracted using methylene chloride; the extracts are injected into the GC system using a micro-syringe. Target analytes are separated using a chromatographic column and quantitation is made by comparison of target analyte response to the response of calibration standards over a known concentration range. Integrations are performed over an extended hydrocarbon range. Chromatographic fingerprints are compared to known fuel and other hydrocarbon and petroleum product fingerprints for qualitative identification. Table 3 provides a list of fingerprints maintained on file in the lab. More fingerprints are generated as necessary, from purchased materials and from suspected contaminants often supplied by clients.
- 2.2 The SOP is applicable to the analysis of target analytes and meets method criteria for the methods listed in Table 1. The SOP may be applied to qualitative analysis and identification of a wide variety of hydrocarbon products.
- 2.3 The requested target analyte list is analyzed meeting established method criteria for the compounds of interest as set forth in sections 11 and 12 of this SOP. Calibration standards used to quantitate the various target analytes are listed in Table 1..

## 3) Definitions

- 3.1 For laboratory definitions applicable to most analyses, refer to the SOP for *Sample Batches*, ADM-BATCH.

## 4) Responsibilities

- 4.1 It is the responsibility of the analyst to perform the analysis according to this SOP and to complete all documentation required for data review. Analysis and interpretation of the

results are performed by personnel in the laboratory who have demonstrated the ability to generate acceptable results utilizing this SOP. This demonstration is in accordance with the training program of the laboratory. Final review and sign-off of the data is performed by the department supervisor/manager or designee.

- 4.2 It is the responsibility of the department supervisor/manager to document analyst training and method proficiency, as described in the SOP *Employee Training and New Employee Orientation* (ADM-TRAIN).

## 5) Interferences

- 5.1 Solvents, reagents and labware may yield artifacts that will cause responses in various hydrocarbon ranges integrated in the SOP. These materials should be checked and cleaned to prevent positive biases to the data. For interpretive analyses, obvious artifacts resulting from contaminated solvents, reagents, and glassware will not be reported as petroleum products.
- 5.2 Direct exposure of samples and sample extracts to unregulated labware (such as polymeric tubing attached to a laboratory reagent water spigot), personal protective equipment (such as surfactant-coated nitrile gloves) and human contact (such as skin oils and personal hygiene products) generally yields artifacts that will cause responses in various hydrocarbon ranges integrated in the SOP. Such exposures are to be avoided.
- 5.3 Contamination by carryover can occur when high level samples immediately precede samples containing significantly lower levels of contamination. This can be minimized by running system blanks after samples that are suspected to contain high levels of target analyte. For purposes of evaluating sequencing criteria during an analytical batch, these system blanks are not defined as samples and therefore are not counted in the ten sample groupings.
- 5.4 An optional sulfuric acid/silica gel cleanup procedure is provided for removal of chiefly biogenic polar interferences. A state specific (AK 102 and AK 103 tests only), silica gel only cleanup procedure is also provided for, usually to be performed only upon client request.
- 5.5 This SOP provides for the qualitative identification and quantitative or semi-quantitative measurement of various petroleum products in samples. In practice, a great variety of different organic compounds, many of which are not part of petroleum products, are analyzed. In all cases, all chromatographic responses (exclusive of those due to surrogate compounds) that occur within a hydrocarbon range are reported; a qualitative evaluation of the result is then made and an appropriate Petroleum Hydrocarbon Specific Data Qualifier is added to the reported result.

## 6) Safety

- 6.1 Chemicals, reagents and standards must be handled as described in the ALS safety policies, approved methods and in SDSs where available. Refer to the ALS Chemical Hygiene Plan and the appropriate SDSs prior to beginning this method.
- 6.2 This method uses Methylene Chloride, a suspected human carcinogen. Viton gloves should be used while rinsing, pouring or transferring the solvent; if solvent is spilled on the glove surface, remove the glove immediately. Nitrile gloves are more practical for sample preparation but provide only momentary protection; if solvent (especially methylene chloride) is spilled on the glove surface, remove the glove immediately. Latex and vinyl gloves do not provide adequate protection from methylene chloride and

should not be worn during procedures involving large quantities of solvent. All procedures involving the transfer of organic solvents should be performed in a fume hood.

## 7) Sample Collection, Containers, Preservation, and Storage

### 7.1 Aqueous Samples:

- 7.1.1 For methods other than AK102/103 (i.e. 8015, NWTPH-Dx) the default sample size is 500 mL. Samples should be collected (received) in 500 mL glass amber bottles.
- 7.1.2 For AK102/103 the default sample size is 1L for aqueous samples and it is intended that samples are collected in 1L glass amber bottles, and these are the size provided by the laboratory.
- 7.1.3 This procedure also includes a “small volume” option for method AK102 only. When requested by the client, 250 mL is the intended sample size and 250 mL glass amber bottles will be used.
- 7.1.4 Samples should be preserved to pH <2 with hydrochloric acid. Samples will be refrigerated to  $4 \pm 2^{\circ}\text{C}$  upon sample login.

7.2 Solid samples should be collected (received) in glass jars with PTFE-lined septa. Alternatively, soil samples may be received in brass sleeves prepared in the field. Samples will be refrigerated to  $4 \pm 2^{\circ}\text{C}$  upon sample login.

7.3 Waste samples such as products can be collected (received) in a variety of sample containers. Typically, glass bottles with PTFE-lined septa are preferred.

7.4 Analytical and Sample Preparation Holding Times: See Table 4 for method specific maximum recommended holding times.

## 8) Standards, Reagents, and Consumable Materials

### 8.1 Reagents

8.1.1 Reagent grade chemicals shall be used in all tests. Other grades may be used, provided it is first ascertained that the reagent is of sufficiently high purity to permit its use without lowering the accuracy of the determination. The preparation for all laboratory prepared reagents and solutions must be documented in a laboratory logbook. Refer to the SOP *Reagent/Standards Login and Tracking* (ADM-RLT) for the complete procedure and documentation requirements.

#### 8.1.2 Acids and Bases

8.1.2.1 Hydrochloric Acid, concentrated

8.1.2.2 Sulfuric Acid, concentrated

8.1.3 Glass wool: baked overnight at  $280^{\circ}\text{C}$ .

8.1.4 Reagent Water: Laboratory reagent water that is free of contaminants of interest. The laboratory reagent water is produced by passing water through a series of deionizers followed by activated carbon filters in series.

8.1.5 Sodium Sulfate ( $\text{Na}_2\text{SO}_4$ ): Powdered and granular, baked overnight at  $400^{\circ}\text{C}$ .

- 8.1.6 Solvents: Reagent Grade acetone, hexane and methylene chloride (DCM). Histological grade acetone (for rinsing prior to DCM rinsing only).
- 8.1.7 Silica Gel: 100-200 Mesh, Baked for 4 hours at 130°C before use.
- 8.2 Standards: Standards should be labeled as follows: logbook ID number, compounds or compound mix, concentration, solvent, date prepared, expiration date, and analyst's initials.
  - 8.2.1 Neat Standard Material: non-fuel standards are purchased from a reliable source (e.g., Chem Service). Neat petroleum product is only routinely used to calibrate for Residual Range Organics (30 weight motor oil) but can be used when requested to calibrate for a suspected petroleum product contaminant (e.g., mineral spirits). Neat material used for quantitative analysis is given an expiration date equal to the manufacturer's recommendation, or if no expiration date is provided, the expiration date shall be five years.
  - 8.2.2 Stock Standards: Purchased as solutions from a reliable source (e.g., Supelco) or prepared in high concentration from neat material. Stock standards are generally prepared in methylene chloride. A stock standard is defined as any standard that requires additional dilution prior to being used in the analysis. To prepare stock standards from neat material, accurately weigh the neat material using a four-place analytical balance into a tared volumetric flask. Dilute to volume using methylene chloride. Stopper and invert several times to mix. Transfer the solution to an appropriate storage vial, label and refrigerate. When preparing stock standard mixes from neat material, it is recommended that each component of the mix be prepared individually at high concentration and then combined as a complete mix at a secondary dilution. Stock standards used for quantitative analysis are given an expiration date equal to the manufacturer's recommendation (purchased, sealed solutions) or one year for laboratory prepared stocks and purchased solutions that have been opened for use. The following stock standards are used in this SOP:
    - 8.2.2.1 Aliphatic Hydrocarbon Marker Mix: Multi-State hydrocarbon window defining standard from AccuStandard (or equivalent vendor) containing n-Alkanes from C8-C40, Pristane, and Phytane.
    - 8.2.2.2 Aromatic Hydrocarbon Marker Mix: Purchased or prepared solution containing discrete aromatic and non-aromatic hydrocarbons in methylene chloride. The solution must include Ethylbenzene, *o*-Xylene, *m*-Xylene, *p*-Xylene, 1,2,3-Trimethylbenzene, Fluoranthene, Pyrene,  $\alpha$ -Pinene,  $\beta$ -Pinene. It is useful, but not necessary, to include other compounds for characterization of products.
    - 8.2.2.3 Gasoline: Purchased solution containing a three-source composite of gasoline at 50,000 ppm (total) in methanol. Alternately, may be purchased at 5,000 ppm (total).
    - 8.2.2.4 Kerosene: Purchased solution containing kerosene at 50,000 ppm in methylene chloride. Alternately, may be purchased at 20,000 ppm.
    - 8.2.2.5 Diesel #2: Purchased solution containing a three-source composite of diesel #2 at 50,000 ppm (total) in methylene chloride. Alternately, may be purchased at 20,000 ppm (total).

- 8.2.2.6 SAE 30 Motor Oil: Prepared solution containing 30-weight motor oil at 10,000 ppm in methylene chloride.
- 8.2.2.7 SAE 30/SAE 40 Motor Oil Mixture: Purchased solution containing 30-weight motor oil and 40-weight motor oil at 50,000 ppm (total) in methylene chloride.
- 8.2.2.8 Other petroleum products (e.g., Mineral Spirits, Bunker C) may be purchased at a high concentration from a reliable vendor (usually in methylene chloride), or may be prepared from neat material.
- 8.2.2.9 Fuel Fingerprints: A wide variety of petroleum and other hydrocarbon products may be characterized by this SOP. Table 3 lists fuel fingerprints currently on file or available for qualitative analysis.
- 8.2.3 Working Standards: Purchased as solutions from a reliable source (e.g., Supelco) or prepared from stock standards. A working standard is defined as any standard that is used directly in sample analysis. Working standards are prepared from stock solutions by accurately transferring a volume of stock standard into a volumetric flask or graduated cylinder partially filled with the dilution solvent (usually methylene chloride). The volume is further adjusted using the dilution solvent to a known level. Working standards used for quantitative analysis are given an expiration date equal to the manufacturer's recommendation (purchased, sealed solutions), or 6 months for purchased solutions that have been opened and for laboratory prepared solutions.
  - 8.2.3.1 Calibration Standards: A series of standards prepared from a common stock ranging in concentration from a value representing the method reporting limit (or lower) to a value near the high end of the linear calibration range. Calibration standards (and continuing calibration standards) are prepared in methylene chloride. Calibrations will contain a minimum of five concentration levels. Recommended calibration standards are listed in Table 5.
  - 8.2.3.2 Surrogate Solution: Using neat products, prepare a solution containing 500 ppm each of *o*-Terphenyl, 4-Bromofluorobenzene, and n-Triacontane in methylene chloride. Since the solution is in a relatively volatile solvent, it is suggested that the working solution be stored in a bottle with a neck that is as narrow as practical, in order to minimize concentration.
  - 8.2.3.3 Working Analyte Spike Solution: Using neat products, prepare a solution in methylene chloride containing Diesel #2 at a concentration of 16,000 ppm and 30-weight Motor Oil at a concentration of 8,000 ppm. Since the solution is in a relatively volatile solvent, it is suggested that the working solution be stored in bottles with necks that are as narrow as practical, in order to minimize concentration.
  - 8.2.3.4 Working AK Analyte Spike Solution: Prepare a solution in methylene chloride containing Diesel #2 at 16,000 ppm, 30-weight motor oil and 40-weight motor oil at 8,000 ppm (total).
- 8.2.4 Independent Calibration Verification Standard (ICV), also known as Second Source Verification Standard (SSV): A stock standard should be prepared for

each analyte from a second source independent of that used in preparing the calibration curve; this is subsequently used to create a working standard to verify the curve accuracy. Recommended ICVs for the various calibration standards used in this SOP are listed in Table 1.

## 9) Apparatus and Equipment

### 9.1 Balance

- 9.1.1 Analytical Balance
- 9.1.2 Top Loading Balance

### 9.2 Centrifuge

### 9.3 Gas Chromatography System

- 9.3.1 Gas Chromatograph (GC): analytical system equipped with gas supplies, column inlet, programmable oven, heated detectors (FID), and a data system for determining peak areas. Hewlett-Packard 5890, Agilent 6890, or equivalent.
- 9.3.2 Chromatographic Column: Phenomenex ZB-1, 15 m x 0.25 mm ID, 1.0  $\mu$ m film thickness, or equivalent column of comparable chromatographic performance.
- 9.3.3 Autosampler Device: Designed for operation in conjunction with the gas chromatographic systems used in this SOP, Hewlett-Packard 7673 or Agilent 7683.
- 9.3.4 Compressed Gases or Gas Generators: Hydrogen (column flow and flame gas), Air (flame gas), and Nitrogen or Helium (make-up gas).

### 9.4 Labware and Syringes

- 9.4.1 Beakers: various sizes (125 mL, 250 mL, 400 mL, 600 mL)
- 9.4.2 Disposable Test Tubes: 15 mL (100 mm x 10 mm), 20 mL (150 mm x 10 mm)
- 9.4.3 Disposable Test Tubes Caps: Polypropylene, 10 mm
- 9.4.4 Disposable Pipettes: Pasteur and serological (1 mL, 2 mL, 5 mL, 10 mL)
- 9.4.5 Erlenmeyer Flasks: 500 mL
- 9.4.6 Brandtech Pipettors (or equivalent): 50 $\mu$ l, 100 $\mu$ l, 500  $\mu$ l, and 1000  $\mu$ l
- 9.4.7 Fleakers: 1000 mL and 500 mL
- 9.4.8 Graduated cylinders, 1 liter and 50 mL, Class A, TC
- 9.4.9 PTFE stoppers: of appropriate size for 50 mL graduated cylinder
- 9.4.10 Inject Vials: 1.8 mL glass autosampler vials with aluminum crimp tops with PTFE-lined silicone septa
- 9.4.11 Kuderna Danish (KD) Concentration Units:
  - 9.4.11.1 Flask: 500 mL
  - 9.4.11.2 Keck Clip (blue)
  - 9.4.11.3 Receiving Tube (collector): 15mL
  - 9.4.11.4 Snyder Column: 3 or 2 Ball

- 9.4.12 Microsyringes: various sizes (10  $\mu$ l, 25  $\mu$ l, 100  $\mu$ l, 250  $\mu$ l, 500  $\mu$ l, 1000  $\mu$ l)
- 9.4.13 Separatory Funnels: 1 liter, 2 liter
- 9.4.14 VOA vials (40 mL): capped, with PTFE-Lined Septa
- 9.4.15 Volumetric Flasks: various sizes (1 mL, 2 mL, 5 mL, 10 mL, 25 mL, 50 mL, 100 mL)
- 9.4.16 Large stainless steel tablespoon
- 9.5 N-EVAP Nitrogen Evaporation Unit
- 9.6 pH Paper: narrow range (0-4 pH units) for measuring aqueous sample pH
- 9.7 PTFE Filters: leur-locking, 0.45 micron
- 9.8 S-EVAP Concentration Unit
- 9.9 Sonication Device
  - 9.9.1 Lab Jack
  - 9.9.2 Sonic Controller
  - 9.9.3 Sonic Horn (4 x 1/4" microtip couple or 3/4" tip)
  - 9.9.4 Sonibox
- 9.10 Stainless Steel Scoopulas
- 9.11 Ultrasonic Bath
- 9.12 For AK 102 and AK 103 cleanup: Pre-packed Restek silica gel column: 0.5 g silica gel in a 3 mL total volume, PP barrel with PE frits.

## 10) Preventative Maintenance

- 10.1 A maintenance log will be kept documenting maintenance performed on each analytical system. Log entries will include the date maintenance was performed, symptoms of the problem, serial numbers of major equipment upgrades or replacements (defined as any non-consumable part essential to operation), phone logs from technical support contacts, a description of the maintenance performed, a description of the check performed to assure the system has returned to acceptable levels of operation, and the analyst's initials.
- 10.2 Autosampler: Maintenance is generally limited to cleaning or replacing dirty, clogged or otherwise malfunctioning syringes, and cleaning other moving components with methanol when necessary.
- 10.3 GC System: Maintenance of the GC system is generally limited to, in declining order of frequency:
  - 10.3.1 Replacement or cleaning of the injection port liner, or (more frequently) replacement of the glass wool plug therein. This is indicated by a significant drop in heavier range product (Motor Oil) and alkane (Triacontane) responses without a coincident drop in lighter range product and surrogate responses.
  - 10.3.2 Replacement of the injection port septum. Leaks may occur here.
  - 10.3.3 Replacement or cleaning of the injection port liner seal. This can be indicated by a change in surrogate responses without a coincident or proportionate change in hydrocarbon product responses. Note that the seal usually

functions satisfactorily even when obviously dirty in appearance because petroleum products are generally composed exclusively of 'non-polar' components and are thus not significantly affected by active sites; two notable exceptions are brake fluids, which are composed exclusively of glycol ethers, and Fuel Oil #6 (Bunker C), which contains significant quantities of sulfur-containing compounds.

- 10.3.4 Column trimming. This is indicated by surrogate peak broadening. Removal of less than two inches of the column at a time is usually sufficient.
- 10.3.5 Replacement of ferrules or o-rings (or tightening associated connections). Leaks may occur at these points.
- 10.3.6 Detector cleaning – scrubbing of the detector jet, collector and (less importantly) chimney. This is indicated by a steady increase or decrease (depending on the nature of the acquisition method) in all responses over time with no other discernable cause; or by the appearance of random spikes in chromatograms. This is also necessary if the flames fail to remain lit.
- 10.3.7 Column replacement. This generally becomes necessary if significant broadening and diminution of responses of early-eluting peaks (and responses of products), especially at lower concentrations (resulting in quadratic curves) is observed. Ready disintegration of the column upon handling is another indication.

## 11) Procedure

- 11.1 Cleaning of Labware: Non-disposable labware (except for syringes) used in sample analyses is washed with hot soapy water, rinsed three times with hot tap water, rinsed three times with reagent water, and either allowed to air dry or rinsed with histological grade acetone. Immediately prior to sample preparation, labware must be rinsed with methylene chloride. Syringes are rinsed with the appropriate solvent(s).
- 11.2 Sample Preparation: A preparation (or extraction) batch is defined as a group of field samples and QC samples processed together with the same reagents. Each preparation batch will consist of no more than 20 field samples. Every preparation batch will include one laboratory method blank (MB) and one laboratory control sample (LCS) at a frequency of not less than one each per 20 client samples. Additional QC sample requirements depend on the methodology (or matrix) employed:
  - EPA 8015C: matrix spike (MS) and duplicate matrix spike (DMS) samples are required at a frequency of not fewer than one each per 20 client samples. If insufficient sample is available for a DMS or both MS and DMS, a duplicate laboratory control sample (DLCS) must be prepared at the same frequency.
  - AK102/AK103: MS/DMS and DLCS are all required at a frequency of not fewer than one each per 20 client samples.
  - NWTPH-DX: a duplicate client sample (DUP) is required at a frequency of not fewer than one per 10 client samples (note higher frequency requirement). If insufficient sample is available for a DUP, a DLCS must be prepared at a frequency of not less than one per 20 client samples. Note that although a client may request MS/DMS as additional QC, the DUP (or DLCS) is still required.
  - WASTE or PRODUCT dilutions, all methods: a duplicate client sample (DUP) should be prepared with each batch. It is not necessary to prepare a MS or MS/DMS set (but do prepare a DLCS for EPA 8015C and AK102/AK103).

11.2.1 Aqueous Samples: EPA 3510 Liquid-Liquid Extraction

- 11.2.1.1 Prepare KD extract collection apparatuses: For each sample, tightly fit a 500 mL KD flask with a 15 mL collector, and secure these with a blue Keck clip. Place this assembly in a secure rack. Drop a clean PTFE boiling chip into the collector. Prepare a modified funnel thus: place a small glass wool plug at the bottom of the funnel (rinse the assembly 3 times at this point with methylene chloride, as the glass wool can be a significant source of contamination), and add about 3 or 4 heaping tablespoons of muffled, granular  $\text{Na}_2\text{SO}_4$  to the funnel. Place the funnel in the top of the KD flask. Arrange the KD apparatuses in a fume hood.
- 11.2.1.2 Allow the sample to warm to room temperature and shake to mix. Note that mixing of the sample may in some cases not be desirable. If a significant portion of the sample volume is solid material, consult with the supervisor or Project Manager for guidance.
- 11.2.1.2.1 Method 8015, NWTPH-Dx (500 mL or 1 L samples) and default AK102/103 (1L samples): Mark the meniscus on the side of the bottle and pour the entire contents of the bottle into a 1 L separatory funnel (2L funnel if more than approximately 600 mL of sample was received in one bottle). Save the bottle for solvent rinsing and sample volume determination (11.2.1.5). Laboratory QC (MB, LCS and DLCS) are each prepared from 500 mL (or 1 L, if any client samples are greater than approximately 600 mL in volume) laboratory reagent water.
- 11.2.1.2.2 Small volume option (AK102 only – 250 mL bottle): Mark the meniscus on the side of the bottle and pour the entire contents into a 1L separatory funnel. Save the bottle for solvent rinsing and sample volume determination (11.2.1.5). Laboratory QC (MB, LCS and DLCS) are each prepared from 250 mL laboratory reagent water.
- NOTE:** For AK102, if the client provides less than approximately 600 mL (e.g. limited volume at sampling site) in a 1 L or smaller bottle, the small volume option will be used. In this case, 250 mL of sample is measured in a graduated cylinder, transferred to the separatory funnel, and the graduated cylinder solvent rinsed and transferred to the funnel.
- 11.2.1.3 Check pH of sample. If sample pH is not  $< 2$ , acidify to pH  $< 2$  with concentrated HCl.
- 11.2.1.4 Add the working surrogate spike to all client and QC samples. Add the working analyte (matrix) spike to all MS, DMS, LCS and DLCS samples. Use the working AK analyte (matrix) spiking solution for the AK102 and 103 methods.
- 11.2.1.5 Add 60 mL of methylene chloride (DCM) to the empty sample bottle, swirl (in order to extract organics adhering to the bottle), and then pour the mixture into the funnel containing the sample; for laboratory QC, add 60 mL directly to the funnel.

- 11.2.1.6 Determine the sample volume (when the entire sample volume was used) by filling the sample bottle with water to the marked meniscus. Transfer the contents of the bottle to a graduated cylinder to measure the volume of the sample prepared. Record the volume prepared to at least 2 significant figures.
  - 11.2.1.7 Stopper and shake the funnel for 1-2 minutes with periodic venting. Allow the solvent layers to separate.
  - 11.2.1.8 Drain the Extract into an Erlenmeyer flask.
  - 11.2.1.9 If an unresolvable emulsion is encountered, first drain the emulsion into another vessel for mechanical resolution, preliminary drying employing granular  $\text{Na}_2\text{SO}_4$ , or centrifugation, followed by pipetting off of aqueous layer; then collect the DCM layer as in 11.2.1.8.
  - 11.2.1.10 Repeat the extraction twice more in sequence, starting each with a fresh 60 mL portion of DCM added directly to the sample in the separatory funnel. Pour the 3 extracts in the KD apparatus for concentration. Rinse the extract flask 3 times with DCM, adding to the appropriate KD apparatus each time. Finally, rinse the contents of the modified with DCM thoroughly and use a vacuum to pull remaining extract into the KD apparatus.
  - 11.2.1.11 Remove the modified funnel from the KD and fit the KD with a Snyder column. Concentrate the extract by means of a hot water bath (S-Evap) at 70°C-75°C. Remove the KD apparatus from the bath when the apparent solvent level in the collector is approximately 5 mL. Do not allow the extract in the collector to evaporate to dryness.
  - 11.2.1.12 Carefully remove the collector from the KD and further concentrate the extract, using a gentle  $\text{N}_2$  stream and < 40°C water bath (N-Evap) or TurboVap or micro-snyder, to 1 mL in DCM (if the sample volume was approximately 500 mL; 2 mL if sample volume was approximately 1L). Again, do not allow the extract to evaporate to dryness. If the extract is particularly dark, viscous and/or obnoxious smelling, it may be advisable to take the extract to a higher final volume. A graduated, disposable pipet or syringe may be used to measure the final volume.
  - 11.2.1.13 Place 1 mL of extract in a 1.8 mL autosampler vial and cap tightly with a PTFE-lined, silicone septum (natural rubber septa introduce irremovable, MDL/MRL level artifacts into the extract upon injection, and should not be used. Archive any remaining extract in a capped, disposable test tube.
  - 11.2.1.14 Mark the extract meniscuses. Complete paperwork, taking care to note all problems, difficulties or deviations from the standard operating procedure.
- 11.2.2 Solid Samples: Sonication
- 11.2.2.1 Prepare and arrange KD extract collection apparatuses as in 11.2.1.1.
  - 11.2.2.2 Sample aliquots are prepared by the appropriate group according to (SOILPREP-ALIQUOT) and (SOLPREP-SUBS). Determinations of sample % dry weight - In certain cases, sample results are desired based on dry

weight basis. Refer to the SOP for *Total Solids* (GEN-160.3) for water samples or *Total, Fixed, and Volatile Solids in Solid and Semisolid Samples* (SOILPREP-SOLIDS) for solid samples. If the determination is performed by the organics preparation personnel, a portion of the sample for this determination should be weighed out at the same time as the portion used for analytical determination..

- 11.2.2.3 Less sample may be prepared if the sample obviously contains high levels of petroleum product, and a homogeneous mixture can be attained. Muffled laboratory matrix sand is employed as the LCS/DLCS matrix; no matrix is employed for the MB (except a typically employed amount of muffled  $\text{Na}_2\text{SO}_4$ , which is added to all samples). Record weight prepared to at least 3 significant figures.
- 11.2.2.4 Add approximately 30 g muffled, granular  $\text{Na}_2\text{SO}_4$  to the sample in the beaker, stir the mixture thoroughly with a scoopula until the mixture is dry and free flowing, and no material adheres to the beaker or scoopula. After initial mixing, it will be necessary to allow the mixture to sit at room temperature for at least 15 minutes (often longer), followed by further mixing, in order to ensure that the  $\text{Na}_2\text{SO}_4$  has been allowed to dry the sample as effectively as possible.
- 11.2.2.5 Tune the sonic horn controller(s) in accordance with the manufacturer's instructions and record the action on the benchsheet.
- 11.2.2.6 Arrange the sample mixtures in a fume hood and keep them in the hood during the following steps (11.2.2.7 through 11.2.2.14) in order to minimize personal solvent exposure. Add working surrogate spike to all client and QC samples. Add working analyte (matrix) spike to all MS, DMS, LCS and DLCS samples.  

Note: The AK103 methods require the use of the working analyte matrix spiking solution described in sec 7.2.3.4.
- 11.2.2.7 As soon as practicable, add approximately 100 mL of DCM to the mixture. Add more or less solvent as necessary, such that the solid mixture is immersed under at least 2 cm of solvent. Since DCM is quite volatile, it will be necessary to cover those sample mixtures (with Al foil or watch glasses, e.g.) which are not immediately taken to the next step in order to minimize evaporation and consequent exposure.
- 11.2.2.8 Place the sonic horn tip in the solvent layer above the top of the solid mixture and sonicate for 3 minutes at a 2 second pulse interval.
- 11.2.2.9 Decant as much of the extract as possible off the solid mixture into a KD apparatus.
- 11.2.2.10 Rinse the top of the  $\text{Na}_2\text{SO}_4$  bed in the funnel (and whatever solid mixture was transferred with the extract) with approximately 20 mL of DCM.
- 11.2.2.11 Repeat the extraction (steps 11.2.2.8 through 11.2.2.10) twice more in sequence, starting each with a fresh portion of DCM sufficient to cover the solid mixture under at least 2 cm of solvent. Combine the 3 extracts in the same KD apparatus for concentration.

- 11.2.2.12 After the third decantation, and before rinsing the  $\text{Na}_2\text{SO}_4$  bed, transfer the entire solid matrix (or as much as will fit) to the modified funnel (a stream of DCM squirted into the beaker as it is held over the funnel is usually sufficient to accomplish the transfer); then thoroughly rinse the mixture in the funnel with approximately 30 mL of DCM. A vacuum pump may be employed to maximize extract collection in the KD apparatus.
  - 11.2.2.13 Remove the modified funnel from the KD and fit the KD with a Snyder column. Concentrate the extract by means of a hot water bath (S-Evap) at 70°C-75°C. Remove the KD apparatus from the bath when the apparent solvent level in the collector is approximately 5 mL. Do not allow the extract in the collector to evaporate to dryness.
  - 11.2.2.14 Carefully remove the collector from the KD and take the extract to 10 mL in DCM in a disposable test tube. If the extract is particularly dark, viscous and/or obnoxious smelling, it may be advisable to take the extract to a higher final volume. If further concentration of the extract is necessary, use a gentle  $\text{N}_2$  stream and < 40°C water bath (N-Evap) or TurboVap. Again, and more importantly at this point, do not allow the extract to evaporate to dryness. A graduated, disposable pipet is used to measure the final volume.
  - 11.2.2.15 Place 1 mL of extract in a 1.8 mL autosampler vial and cap tightly with a PTFE-lined, silicone septum (see note about natural rubber septa in 11.2.1.13). Cap and archive the test tube containing the balance of the extract.
  - 11.2.2.16 Mark the extract meniscuses. Complete paperwork, taking care to note all problems, difficulties or deviations from the standard operating procedure.
- 11.2.3 Extract Cleanups (for removal of mostly biological interferences)
- Note: If a sample cleanup is performed, a portion of each of all associated laboratory QC and common client QC must also undergo the same cleanup.
- 11.2.3.1 Sulfuric Acid/Silica Gel (for EPA 8015C and NWTPH methods):
  - 11.2.3.2 Measure a volume (usually 1 or 2 mL) of the extract at final volume into a disposable test tube. Note: if the extract is not in DCM, it will be necessary to exchange the portion to be cleaned up by this method into DCM before proceeding further.
  - 11.2.3.3 Add 2-3 mL of concentrated  $\text{H}_2\text{SO}_4$ . Tightly cap the test tube and vigorously but carefully vortex the mixture for approximately 15 seconds.
  - 11.2.3.4 Centrifuge the mixture (at least 200 G for 5 minutes is recommended) in order to maximize separation of the layers; the extract will be the top layer.
  - 11.2.3.5 Add 1-2 g activated silica gel to a separate test tube (cooling to room temperature, if directly from oven). Carefully (avoiding the  $\text{H}_2\text{SO}_4$ ) draw off as much of the extract layer as practicable from the acid layer in the  $\text{H}_2\text{SO}_4$ -cleanup tube and transfer it to the silica gel-cleanup tube.

- 11.2.3.6 Tightly cap the test tube and gently swirl the contents. Allow the mixture to sit for at least 30 minutes at room temperature.
- 11.2.3.7 Carefully (avoiding the silica gel) transfer an aliquot of the extract to a 1.8 mL autosampler vial. Cap the vial tightly with a PTFE-lined, silicone septum (see note about latex septa in 11.2.1.13).
- 11.2.3.8 Mark the extract meniscus. Complete paperwork, taking care to note all problems, difficulties or deviations from standard operation procedure.
- 11.2.4 Silica Gel (ADEC Technical Memorandum 06-001 for AK102/AK103):
  - 11.2.4.1 Place a pre-packed Restek silica gel column (0.5 g silica gel in a 3 mL total volume PP barrel with PE frits) in a disposable, 150 mm x 10 mm (length x diameter) test tube (the waste collection vessel). The lip at the top of the barrel will allow it to sit at the top of the test tube without falling in. Alternatively, a handmade column may be used.
  - 11.2.4.2 Precondition the column with at least 12 mL DCM, draining eluent to waste: DO NOT FORCE THE SOLVENT THROUGH THE COLUMN; allow the solvent to drip under the force of gravity ONLY. After the last of the DCM has eluted (the PE frit atop silica gel can go dry; it takes about a minute for the silica gel itself to start drying), remove the column from the waste collection vessel and place it in an extract collection vessel (another 150 mm x 10 mm test tube).

**Note:** The entire silica gel bed at this point should have a translucent appearance, and it should also appear darker than when new.
  - 11.2.4.3 Introduce exactly 0.50 mL extract to the column, collecting the eluent. Allow the PE frit to just go dry.
  - 11.2.4.4 Add approximately 1.5 mL DCM to column, collecting the eluent. Allow the PE frit to just go dry.
  - 11.2.4.5 Repeat step 11.2.4.1. Stop collecting eluent once it stops dripping from column: UNDER NO CIRCUMSTANCES SHOULD THE COLUMN BE FORCED TO DRYNESS by vacuum or pressure. Remove the column from the extract collection vessel: there will still be some solvent adhering to column exit. This is normal, and its presence does not imply the loss of any desired compounds of interest.
  - 11.2.4.6 Gently concentrate the now cleaned-up (approximately 3.5 mL) extract, using a gentle N<sub>2</sub> stream and < 40°C water bath (N-Evap), to 0.50 mL in DCM, and transfer to a 1.8 mL autosampler vial. Do not allow the extract to evaporate to dryness. Cap the vial tightly with a PTFE-lined, silicone septum (see note about natural rubber septa in 11.2.1.13).
  - 11.2.4.7 Mark the extract meniscus. Complete paperwork, taking care to note all problems, difficulties or deviations from standard operation procedure.
- 11.2.5 TCLP leachates are prepared as aqueous samples. Prepare a leachate blank in addition to the laboratory blank.

### 11.3 Gas Chromatography

- 11.3.1 See Table 6 for suggested GC operating conditions. Samples are analyzed as part of an analytical sequence. Sequencing guidelines are described in section 3.2. Sequences are programmed in the GC operating software and run on user command. Prior to initiating an analytical sequence, check that gas supplies and autosampler rinse cup reservoirs are adequate to last the entire sequence.
- 11.3.2 Establish retention time windows for hydrocarbon ranges. For hydrocarbon range analytes, start and end times are established by analyzing a marker solution containing individual compounds that define the quantitation range. See Table 7 for guidance on establishing windows for the various method specified ranges. The aliphatic hydrocarbon marker mix should be analyzed at least once every 24 hours to verify no significant retention time shift has occurred with respect to start and end times for the quantitation ranges. The aromatic hydrocarbon marker mix should be analyzed at least once every 24 hours.
- 11.3.3 Method 8015C also describes background subtraction that should be performed, as follows: "Because the chromatographic conditions employed for DRO analysis can result in significant column bleed and a resulting rise in the baseline, it is appropriate to perform a subtraction of the column bleed from the area of the DRO chromatogram. In order to accomplish this subtraction, analyze a methylene chlorine blank during each 12-hour analytical shift which samples are analyzed for DRO. Measure the area of this chromatogram in the same fashion as is used for samples by projecting a horizontal baseline across the retention time range for DRO. Then subtract this area from the area measured for the sample and use the difference in areas to calculate the DRO concentration". Automated software functions (e.g. the instrument's column compensation feature) are typically used to perform this column bleed subtraction from a blank run. Perform column compensation between analytical batches once baseline has stabilized or as needed (CCB concentration approaching MDL).
- 11.3.4 Calibration

**NOTE:** The calibration procedure(s) and options chosen must follow the ALS protocols. Any exceptions to the calibration procedures detailed in *SOP Calibration of Instruments for Organics Chromatographic Analyses (SOC-CAL)* are described as follows:

- 11.3.4.1 Average of Response Factor: Calibration factors are calculated as the total area of the peak or integration range divided by the amount injected. If the percent relative standard deviation (%RSD) of all points is less than 20% (25% for Alaska Methods AK 102 and AK 103), linearity through the origin may be assumed and the average calibration factor may be used in quantifying sample data.

Note: For fuel analytes the integrated area for the surrogate compound is subtracted from the total area for the fuel pattern. This is done to eliminate the contribution of the surrogate area within the fuel range. The EnviroQuant software automatically performs this operation.

- 11.3.4.2 Calibration Curve, Linear Regression: This option may be used if the correlation coefficient is greater than or equal to 0.995 ( $r > 0.995$ ,  $r^2 > 0.990$ ). This method of quantitation uses the equation of a line

( $y=mx+b$ ). It will generally provide an acceptable fit when %RSD is < 30% and is therefore a useful option in evaluating the acceptability of the calibration curve for generating quantitative values.

- 11.3.5 Evaluation of calibration curves for use in quantitative analysis should be performed in the following manner.
  - 11.3.5.1 If %RSD for the compound is less than 20% (25% for Alaska Methods AK 102 and AK 103) use average of response factor from the calibration. If %RSD exceeds this value but is less than 30%, plot a linear regression.
  - 11.3.5.2 For the NWTPH method: the measured result of every calibration standard employed in the initial calibration must be within 15% of its true value. For the 8015C method, the measured result of the lowest concentration calibration standards used must be within 30% of its true value; other calibration standards must be within 20% of the true value.

**Note:** For NWTPH-Dx analysis, when evaluating the initial calibration linearity the linear model is used, and when quantifying results the average response factor is used.
  - 11.3.5.3 If these guidelines are exceeded, obtain a secondary opinion from a senior analyst or supervisor. The calibration may need to be reanalyzed.
- 11.3.6 Verify the calibration by analyzing an independent calibration verification standard. Acceptance criteria for the ICV are  $\pm 20\%$  for 8015C,  $\pm 25\%$  for Alaska Methods AK 102 and AK 103; and  $\pm 15\%$  for NWTPH.
  - 11.3.6.1 Analyze a CCB to establish that the instrument is free of target analyte contamination.
  - 11.3.6.2 The first set of 10 samples in an analytical sequence may be analyzed immediately following an acceptable calibration and analysis of a CCB. This set of samples is bracketed with continuing calibration verification (CCV) standard. This pattern is continued until the sequence is complete, or a CCV fails to meet acceptance criteria described below.
  - 11.3.6.3 Verify the calibration each working day by the analysis of a CCV (mid-level concentration of the calibration curve). A mid-level standard (CCV) must be injected at the start of each sequence and after each set of sample extracts (every 10 samples or every 12 hours, whichever is first) in the analysis sequence. Table 8 lists method specific criteria for evaluating the acceptability of a CCV. See the SOP for *Calibration of Instruments for Organic Chromatographic Analyses* (SOC-CAL) for allowable exceptions.
- 11.3.7 Evaluation of the Analytical Sequence
  - 11.3.7.1 Check that CCVs and CCBs were interspersed throughout the sequence at the proper frequency. Nonconformances must be documented and obtain supervisory approval before data is accepted.

- 11.3.7.2 Check retention times in the aliphatic hydrocarbon marker mix and aromatic hydrocarbon marker mix. Update retention times as needed
- 11.3.7.3 Check that CCVs and CCBs are acceptable. CCV acceptance criteria are described in Table 8. CCBs should be free of all target analyte contamination at a level less than the MRL.
- 11.3.7.4 Check Method Blanks for potential extraction batch contamination. Extraction Method Blanks should be free of all target analyte contamination at a level less than the MRL. In the event that a Method Blank contains target analyte greater than or equal to the MRL, samples testing positive for that compound at levels less than 20 times the level detected in the Method Blank should be reanalyzed or the associated data must be flagged to indicate potential laboratory contribution.

**Note For DOD Projects:** If the Method Blank contains target analyte(s) greater than or equal to  $\frac{1}{2}$  the MRL, the associated samples, where the analyte(s) are detected at a concentration greater than or equal to the LOD and is less than 10 times the amount detected in the Method Blank, require re-analysis or the data must be flagged with appropriate qualifiers. This project-specific requirement may apply to other projects as well.

- 11.3.7.5 Check Method Blank and LCS surrogate recoveries. Surrogate recoveries for MBs and LCSs are used to make inferences about associated environmental samples. Low recoveries in the MB and/or LCS constitute an out-of-control event for the entire batch of samples and all samples in the batch testing positive for any target analyte should be re-analyzed or the data must be flagged to indicate potential laboratory contribution. High recoveries in the MB and/or LCS show a potential high bias. However, if all target analyte concentrations (in associated samples) are below the MRL, no corrective action is required other than flagging the high surrogate recoveries in the analytical report.
- 11.3.7.6 In order to report the associated sample results, all LCS recoveries must be within acceptance criteria. If the LCS recovery is outside the criteria due to chromatographic problems (injection problem, etc.) take the necessary corrective action and reanalyze. If reanalysis does not correct the problem or if the LCS recovery is outside the criteria due to extraction/preparation failure, re-extract and reanalyze the associated samples.
- 11.3.7.7 If matrix spike recoveries are outside acceptance criteria, examine corresponding sample results for potential matrix interferences such as high levels of target analyte (spike levels should be a minimum of 4 times the background concentration). If no obvious matrix interferences are observed, evaluate the recovery of the laboratory control sample (LCS). Reanalyze if deemed appropriate. Do not re-extract the matrix spike unless required by the project.
- 11.3.7.8 Check RPD values on duplicate sample analyses (sample/duplicate or MS/DMS). If values exceed the criteria, examine the chromatograms, bench sheet comments and the actual sample for potential matrix

interferences. Examples include product layers on aqueous samples that may result in non-homogenous sub-sampling, severe emulsions, non-homogenous solid samples, inefficient extraction in one sample compared to another as indicated by significantly different surrogate recoveries. Flag RPD values that are outside of acceptance criteria and explain the anomalies in the form of a case narrative. Reanalysis and/or re-extraction and reanalysis may be required, see supervisor.

- 11.3.7.9 Check RPD values on duplicate LCS/DLCS analyses (when applicable). If values exceed criteria, examine the data for obvious problems. Reanalyze one or the other LCS if deemed appropriate. If reanalysis does not correct the problem, re-extract and reanalyze the associated samples.
- 11.3.8 Evaluation of Sample Analysis - ALS acceptance criteria are established based on either the method criteria or on control charting of analytical results. Unless specific criteria are required by the method, or stated in project specific data quality objectives, ALS-generated criteria will be used in evaluating acceptability of the analysis.
  - 11.3.8.1 Calculate surrogate recovery as the amount detected in the sample (solution concentration) divided by the true value (solution concentration). If surrogate recovery is outside acceptance criteria examine the chromatogram for obvious matrix interferences such as high levels of target analyte or co-eluting peaks. If the problem is the result of obvious matrix interference, flag the recovery value as outside acceptance criteria due to matrix interference. If no obvious interference is observed, reanalyze (or re-extract and reanalyze if deemed more appropriate) the sample. If surrogate recovery is again outside criteria (or acceptable but within 5% of the primary analysis), report the original value and flag the recovery as being outside of acceptance criteria due to matrix interference. Otherwise, report the reanalysis.
  - 11.3.8.2 Examine solution concentrations of target analytes in the samples. If the concentration is greater than the high calibration standard, reanalyze the sample at a dilution. Preferably, dilutions should be performed to keep target analytes in the top half of the calibration range.
  - 11.3.8.3 Check for possible carryover. Pay particular attention to situations where samples containing low levels of target analyte were analyzed one or two runs after samples containing levels of target analyte near or above the high end of the calibration range. Reanalyze as needed.
  - 11.3.8.4 Check integrations. Where possible, all integrations should be performed consistent with integration of the corresponding calibration standards. Hydrocarbon ranges are integrated baseline to baseline, dropped to the lowest point in the chromatographic window. The integration software currently in use is usually capable of performing the integrations (and subtracting any responses contributed by added surrogates) satisfactorily.
  - 11.3.8.5 Perform qualitative evaluation of the chromatographic fingerprint. This is done by comparing the fingerprint of the sample to the two

marker mixes and the fingerprint library. The marker mixes are used to assess qualitatively the presence of common fuel components. The qualitative evaluation is used to report specific hydrocarbon products in the interpretive analyses (EPA Method 8015C) and to qualitatively flag the results for hydrocarbon range analyses. The following guidelines are provided:

- Gasoline is present if ethylbenzene, xylenes, and 1,2,3-trimethylbenzene, and a small hump of unresolved responses eluting about and after 1,2,3-trimethylbenzene are observed. Ethylbenzene and the xylenes should have the same pattern as the calibration standard (i.e. relative peak height to each other). Weathered gasoline is indicated by relative ethylbenzene and xylene responses that are different than in the calibration standard.
- Diesel is present if the fingerprint shows a recognizable n-alkane pattern that includes the isoprenes pristane and phytane, and a large hump of unresolved responses that elute from C10-C23 with its apex at about C15. 1,2,3-trimethylbenzene is usually distinguishable. Weathered diesel is indicated by (1) pristane/C17 and phytane/C18 response ratios greater than those in the calibration standard, (2) the later shifting of the unresolved response hump relative to that in the standard (yet pristane and phytane are observed) or (3) the presence of pristane and phytane with the lack of any recognizable n-alkanes. In the latter case, the unresolved hump is typically later eluting than in the standard, but should still be primarily within the diesel window; if most of the hump is outside the diesel window, the responses may be due to another fuel oil.
- Bunker C is present if the fingerprint shows a recognizable n-alkane pattern that includes pristane, phytane and contains fluoranthene and pyrene in approximately the correct ratio for Bunker C. Note that the aromatic compounds are more susceptible to weathering than the isoprenes, yet less susceptible to weathering than the n-alkanes.
- Lubricating range oil is present if the responses are chiefly a large hump of unresolved responses that resembles that of the 30-wt. Motor Oil calibration standard and usually elutes in approximately the same or heavier carbon range as that of the hump in the standard. The humps of lubricating oils of higher viscosity than the motor oil calibration standard elute later than that of the standard while those of lighter viscosity elute earlier, but still mostly within the motor oil range.
- Hydraulic fluids fingerprints resemble that of motor oil, and can indeed resemble 30-wt. motor oil in appearance and retention times, but often elute earlier, mostly in the latter half of the diesel range, and sometimes possess more than one, yet unresolved, hump (a large hump with a large shoulder).
- Transformer oil fingerprints also resemble that of motor oil, and are typically one simple hump, but elute earlier than hydraulic fluids, entirely within the early to middle regions of the diesel range.

- Turpentine is present if alpha pinene and beta pinene are observed in the chromatogram, in high concentrations (especially alpha pinene) relative to other extracted organics in the approximate elution range.
- Creosote is present if the chromatographic responses are due chiefly to PAHs, with many resolvable yet unidentifiable individual responses from C12-C36.
- Mineral spirits elute in a very short window approximately between C8-C14 with, in a relatively unweathered sample, the top of the hump centered between C10-C11, and the individual n-alkanes between C9-C12 especially prominent.
- Kerosene (and Jet A fuel; the two are chromatographically indistinguishable) is present if the fingerprint shows a recognizable n-alkane pattern that includes the isoprenes pristane and phytane (though all components eluting this late are at very low relative concentration and thus may not be observed if the concentration is relatively low), and a large hump of unresolved responses that elute from C8-C17 with its apex at about C12. 1,2,3-trimethylbenzene is more prominent than in diesel.
- Military jet fuels: Fingerprints can vary from site to site (and from supplier to supplier), and can have additives not present in kerosene, specifically ethylbenzene and xylenes. JP-5 tends to resemble kerosene, eluting at a slightly (extent can vary) earlier retention time; pristane/C17 and phytane/C18 are just distinguishable if the concentration is high enough. JP-4 resembles kerosene much less, and elutes at a much earlier retention time; pristane/C17 and phytane/C18 are not usually observed. JP-8 tends to resemble kerosene, eluting within the same window but with a flatter appearing hump; pristane/C17 can be observed but phytane/C18 usually cannot be observed.
- Weathered products: All fuels generally demonstrate weathering characteristics similar to those enumerated above for diesel. As a fuel is weathered, (1) its hump tends to shift later in the chromatogram, due to evaporation, (2) individual, semi-resolved, peaks in the hump become less resolved (the hump looks smoother) due to microbial weathering, (3) n-alkanes become much less prominent or disappear, also due to microbial action, and (4) individual marker compounds become more prominent relative to the total chromatographic responses due to their greater resistance to microbial weathering. For the purposes of this SOP (that is, among those marker compounds identifiable in this SOP), survivability of compounds increase in the following order:
  - 1 - n-alkanes < aromatics < branched alkanes
  - 2 - branched alkanes include the isoprenes pristane and phytane.
- Field samples often contain mixtures of many different petroleum products. Interpretation of petroleum product mixtures includes a

significant amount of analytical judgment and should be confirmed by an analyst experienced with interpretation or the supervisor.

**Note:** Alaska DEC requires both pre- and post-silica gel cleanup results be provided. The extract(s) must be analyzed per the standard AK102/AK103 methods, silica gel cleanup performed, re-analyzed and both results reported. Therefore, LIMS test codes AK\_DRO\_SGT or AK\_RRO\_SGT mean that both the non-SGT and SGT treated analyses will be reported.

## 12) QA/QC Requirements

### 12.1 Initial Precision and Recovery Validation

- 12.1.1 The accuracy and precision of the procedure must be validated before analysis of the samples begins, or whenever significant changes to the procedures have been made. IPR studies should be performed in order to be equivalent to NELAC's Initial Demonstration of Capability.
- 12.1.2 Perform IPR studies by preparing and analyzing four replicate laboratory control samples spiked at a level of 1 to 4 times the MRL. Calculate average percent recovery and relative standard deviation for the four replicate analyses. Unless specified by the method, acceptance criteria are the control limits used for LCS percent recovery and % RSD.
- 12.1.3 Calculate the average concentration found ( $\bar{x}$ ) in  $\mu\text{g/mL}$ , and the standard deviation of the concentrations ( $s$ ) in  $\mu\text{g/mL}$  for each analyte. Calculate the MDL for each analyte. Refer to CE-QA011, *Performing Method Detection Limit Studies and Establishing Limits of detection and Quantification*. The MDL study must be verified annually.

### 12.2 Limits of Quantification (LOQ)

- 12.2.1 The laboratory establishes a LOQ for each analyte as the lowest reliable laboratory reporting concentration or in most cases the lowest point in the calibration curve which is less than or equal to the desired regulatory action levels, based on the stated project requirements. Analysis of a standard or extract prepared at the lowest point calibration standard provides confirmation of the established sensitivity of the method. The LOQ recoveries must be within laboratory established acceptance range to verify the data reporting limit. Refer to CE-QA011, *Performing Method Detection Limit Studies and Establishing Limits of detection and Quantification*.
- 12.3 The Method Reporting Limits (MRLs) used at ALS are the routinely reported lower limits of quantitation which take into account day-to-day fluctuations in instrument sensitivity as well as other factors. These MRLs are the levels to which ALS routinely reports results in order to minimize false positive or false negative results. The MRL is normally two to ten times the method detection limit.
- 12.4 Ongoing QC Samples required are described in the ALS-Kelso Quality Assurance Manual and in the SOP for *Sample Batches* (ADM-BATCH). Additional QC Samples may be

required in project specific quality assurance plans (QAPP). For example projects managed under the DoD ELAP must follow requirements defined in the DoD *Quality Systems Manual for Environmental Laboratories*. General QA requirements for DoD QSM are defined in the laboratory SOP, *Department of Defense Projects - Laboratory Practices and Project Management* (ADM-DOD/ADM-DOD5). General QC Samples are:

- 12.4.1 QA/QC Sample Analysis: Each sample preparation batch will contain a maximum of 20 field samples, one Method Blank, and one Laboratory Control Sample. Additional QC analyses are performed at a rate of one set per 20 field samples. Unless stated in project specific data quality objectives, the standard QA/QC sample set for aqueous and solid matrices is Matrix Spike/Duplicate Matrix Spike. A Duplicate client sample is required for the NWT PH method at a rate of no less than one per 10 field samples. A Duplicate Laboratory Control Sample is required for Alaska Methods AK 102 and AK 103, and when the appropriate Matrix Spike/Duplicate Matrix Spike or Duplicate client sample requirements cannot be met (due to limited sample volume). The standard QC sample set for miscible waste samples is a Duplicate client sample.
- 12.4.2 QC Analyses: The acceptance criteria for QC analyses are listed in Table 9. The acceptance criteria are established based on method-required criteria or from control charting of analytical results. Surrogate recoveries for new compounds or analyses not charted are set at 70-130%. Unless criteria are required by the method or stated in project specific data quality objectives, ALS criteria determined from historical results will be used in evaluating acceptability of the analysis.
- 12.5 Section 11 provides guidelines for corrective action when QC sample recoveries are outside acceptance criteria.

### 13) Data Reduction and Reporting

- 13.1 External Standard Calibration: The concentration of each compound in the sample is determined by calculating the amount of analyte injected using the calibration curve or the calibration factor. Calculations for determining specific analyte concentrations in the sample are described below.

#### Calibration Factors

For external calibration, the calibration factor is calculated as:

$$Cf = \frac{Rx}{Ax}$$

Where:  $Cf$  = Calibration factor

$Rx$  = Response of the analyte (area)

$Ax$  = Concentration of analyte injected ( $\mu\text{g/mL}$ ).

- 13.2 Results based on average of response factor or a linear regression is calculated as:  
Solution Concentration of Analyte Detected

$$C_{sol} = \frac{R_{cmpd}}{C_f}$$

Where:  $C_{sol}$  = Solution concentration of the compound (mg/L)  
 $R_{cmpd}$  = Response of the compound (area)  
 $C_f$  = Calibration factor

#### Sample Concentration of Analyte Detected

Aqueous Samples:  $Result(ug / L) = C_{sol} \times \frac{(Fvol \times Df)}{V_{smp}}$

Solid and Waste Sample:  $Result(mg / Kg) = C_{sol} \times \frac{(Fvol \times Df)}{W_{smp}}$

Where:  $Result$  = Sample result (ppm)  
 $C_{sol}$  = Solution concentration of the compound (mg/L)  
 $Fvol$  = Final volume of the extraction (mL)  
 $Df$  = Dilution factor (if no dilution was performed  $Df = 1$ )  
 $C_f$  = Calibration factor  
 $V_{smp}$  = Volume of sample extracted (L)  
 $W_{smp}$  = Weight of sample extracted (g), in dry weight or wet weight, depending on the reporting basis of the data.

- 13.3 Results of extracted solid and waste samples are reported in mg/Kg (ppm). Solid sample results are usually reported on a dry-weight basis.
- 13.4 Data Review
- 13.4.1 Following primary data interpretation and calculations, all data is reviewed by a secondary analyst. Following generation of the report, the report is also reviewed. Refer to SOP *Laboratory Data Review Process* (ADM-DREV) for details.
- 13.5 Reporting
- 13.5.1 Reports are generated in the ALS LIMS reporting software by compiling the SMO login, sample prep database, instrument date, and client-specified report requirements (when specified). The forms generated may be ALS standard reports, DOD, or client-specific reports. The compiled data from LIMS are also used to create EDDs.
- 13.5.2 Sample concentrations are reported when all QC criteria for the analysis have been met or the results are qualified with an appropriate footnote. Refer to the SOP for *Data Reporting and Report Generation* (ADM-RG) for specific procedures and guidelines used for reporting analytical results and generating analytical reports.

### 13.5.3 Data Qualifiers

- 13.5.3.1 Data should be qualified when significant information regarding the analysis needs to be communicated to assist the user in determining the usability of the results. Acceptable qualifiers should comply with standard ALS (Kelso) data qualifiers.
- 13.5.3.2 When it is requested that results for Gasoline or lighter analytes be reported, these results are to be reported as estimated values and appropriately narrated.
- 13.5.3.3 Always use data qualifiers to describe hydrocarbon products. Refer to *Data Reporting and Report Generation* (ADM-RG), Appendix B for the specific hydrocarbon qualifiers:
- F-The chromatographic fingerprint of the range in question approximately matches that of the calibration standard used to quantify the result.
  - Y-The chromatographic fingerprint of the range in question resembles a petroleum product that elutes approximately within the range of integration of the calibration standard used to quantify the result but does not match the chromatographic fingerprint of the standard. A sufficiently weathered product that would otherwise match the appropriate calibration standard also falls into this category.
  - L,H-The chromatographic fingerprint of the range in question mostly matches that of a petroleum product, but is actually a partial contribution of a product which elutes mostly in a lighter or heavier range (e.g., motor oil partially eluting in the diesel range), respectively.
  - O-The chromatographic fingerprint in a range later than the Diesel range resembles that of oil, but does not match that of the calibration standard used to quantify the result.
  - Z-The hydrocarbon responses in the range in question are primarily not due to response from a petroleum product.

## 14) Contingencies for Handling Out-of-Control or Unacceptable Data

- 14.1 Personnel at all levels and positions in the laboratory are to be alert to identifying problems and nonconformities when errors, deficiencies, or out-of-control situations are detected.
- 14.2 Refer to the SOP for *Non Conformance and Corrective Action* for documentation practices and proper action for *Out of Control* events.

## 15) Method Performance

- 15.1 This method was validated through single laboratory studies of accuracy and precision. Refer to the reference method for additional method performance data available.
- 15.2 The method detection limit (MDL) is established using the procedure described in the SOP *Performing and Documenting Method Detection Limit Studies and Establishing*

*Limits of Detection and Quantification* (CE-QA011/ADM-MDL). Method Reporting Limits are established for this method based on MDL studies and as specified in the ALS Quality Assurance Manual.

## 16) Pollution Prevention and Waste Management

16.1 The laboratory will comply with all Federal, State and local regulations governing waste restrictions as specified in the ALS Lab Waste Management Plan.

## 17) Training

17.1 Training is documented following the *Employee Training and New Employee Orientation* (ADM-TRAIN).

## 18) Method Modifications

18.1 There are no known modifications in this laboratory standard operating procedure from the reference methods.

## 19) References

## 20) Changes Since the Last Revision

Summary of Revision Changes			
Revision Number	Effective Date	Document Editor	Description of Changes
17.0	12/2/2020	T Caron	Reformatted SOP to current ALS format. Updated signatories. Minor typographical changes to improve readability and consistency. Section 11: Numerous edits throughout the section including sample extraction, sample analysis. Updated References. Former Table 9 was removed (DQO, surrogate and MS recoveries, RPD for duplicate analysis).

	STANDARD OPERATING PROCEDURE	OC Pesticides by GC
	ALS   Environmental – Kelso	SOC-8081, Rev. 22.0
		Effective 2/18/2021
		SOP Review: 2/15/2021
		Page 2 of 23

## 1) Scope & Applicability

- 1.1 This Standard Operating Procedure (SOP) describes the procedure used to determine the concentrations of Organochlorine Pesticides in liquid and solid matrices using EPA Method 8081B.
- 1.2 Table 1 indicates compounds that are routinely determined by this procedure and lists the method reporting limits (MRLs) in water and a low-level water option. Table 2A lists the MRLs in soil/sediment, and those for a low-level sediment option. Table 2B lists the MRLs in tissue. Additional analytes may also be determined as required by specific projects. The reported MRL may be adjusted if required for specific project requirements; however, the capability of achieving other reported MRLs must be demonstrated. Method Detection Limits (MDLs) that have been achieved are listed in the ALS-Kelso DQO tables. The MDL/LODs may change as repeat studies are conducted.
- 1.3 In cases where there is a project-specific quality assurance plan (QAPP), the project manager identifies and communicates the QAPP-specific requirements to the laboratory. In general, project specific QAPPs supersede method specified requirements. An example of this are projects falling under DoD ELAP. QC requirements defined in the *SOP Department of Defense Projects – Laboratory Practices and Project Management (ADM-DOD)* may supersede the requirements defined in this SOP.

## 2) Summary of Procedure

- 2.1 This procedure provides gas chromatographic conditions for the detection of low concentration (typically parts-per-billion level organochlorine pesticides) pesticides. Target analytes are extracted from the sample and isolated via extract cleanup if needed. Liquid samples are extracted using shaker table microextraction (Method 3511, SOP EXT-3511). TCLP leachates are extracted using separatory funnel (Method 3510, SOP EXT-3510). In general, solid samples are extracted using automated microwave extraction (Method 3546, SOP EXT-3546).
- 2.2 A portion of the extract is analyzed using a gas chromatograph (GC) equipped with dual column fused silica capillary columns and dual electron capture detectors (ECD). Identification is based on comparison of sample retention times to the retention times of known target compounds. Quantitative analysis is performed by using certified standards to produce a calibration curve response factor. Analyte concentration can then be calculated using the response factor of the calibration curve. Sample concentration is calculated using the extract concentration and the extracted sample weights, volumes and dilution factors.

## 3) Definitions

- 3.1 For general definitions applicable to most analyses refer to the SOP for *Sample Batches*, ADM-BATCH.

## 4) Responsibilities

- 4.1 It is the responsibility of the analyst to perform the analysis according to this SOP and to complete all documentation required for data review. Analysis and interpretation of the results are performed by personnel in the laboratory who have

	STANDARD OPERATING PROCEDURE	OC Pesticides by GC
	ALS   Environmental – Kelso	SOC-8081, Rev. 22.0
		Effective 2/18/2021
		SOP Review: 2/15/2021
		Page 3 of 23

demonstrated the ability to generate acceptable results utilizing this SOP. This demonstration is in accordance with the training program of the laboratory. Final review and sign-off of the data is performed by the department supervisor/manager or designee.

- 4.2 It is the responsibility of the department supervisor/manager to document analyst training. Documenting method proficiency, as described in the *SOP Employee Training and Orientation*.

## 5) Interferences

- 5.1 Solvents, reagents, glassware, gases, and sample processing hardware may yield discrete artifacts and/or elevated baselines, causing misinterpretation of the chromatograms. All of these materials must be demonstrated to be free from interferences, under the conditions of the analysis, by running method blanks.
- 5.2 Interferences from phthalate esters introduced during sample handling can pose a problem with pesticide determinations. Analysts should take precautions not to introduce phthalates during the analysis and sample preparation process. Much interference can be removed using GPC (SOP SOC-3640A) and/or Florisil cleanup (SOP EXT-FLOR). Florisil cleanup is typically used to reduce matrix interferences caused by polar compounds. The presence of elemental sulfur will result in peaks interfering with early eluting pesticides. Cleanup via method 3660 (SOP SOC-3660) may be used for the removal of sulfur if GPC cleanup is inadequate. Other co-extractables such as lipids, waxes, etc., are removed via GPC cleanup. A cleanup procedure using carbon cartridges (SOP EXT-CARCU) that eliminates non-polar compounds that interfere with gas chromatographic analyses may also be utilized.

## 6) Safety

- 6.1 Chemicals, reagents and standards must be handled as described in the ALS safety policies, approved methods and in SDSs where available. Refer to the ALS Kelso Chemical Hygiene Plan and the appropriate SDSs prior to beginning this method.

## 7) Sample Collection, Containers, Preservation, and Storage

- 7.1 Containers used to collect samples should be purchased pre-cleaned containers. Alternatively, containers used to collect samples for the determination of semivolatile organic compounds may be soap and water washed followed by methanol (or isopropanol) rinsing. The sample containers should be of glass or Teflon and have screw-top covers with Teflon liners. In situations where Teflon is not available, solvent-rinsed aluminum foil may be used as a liner. Highly acidic or basic samples may react with the aluminum foil, causing eventual contamination of the sample. Plastic containers or lids may not be used for the storage of samples due to the possibility of sample contamination from the phthalate esters and other hydrocarbons within the plastic. Sampling should be performed according to SW-846 guidelines or project-specific procedures.
- 7.2 Water and soil samples must be iced or refrigerated at  $\leq 6^{\circ}\text{C}$  from time of collection until extraction. Water samples must be extracted within 7 days of collection and soil/sediment samples must be extracted within 14 days of collection.
- 7.3 Sample extracts are stored at  $4^{\circ}\text{C}$  in the dark and must be analyzed within 40 days

## 8) Standards, Reagents, and Consumable Materials

### 8.1 Standards

8.1.1 The following commercially prepared stock standards and ICV stock standards are purchased from various vendors and must be certified by the manufacturer. The ICV stock standards are obtained from a different source from the initial calibration. The expiration date for unopened ampules is the manufacturer's assigned expiration date. If the manufacturer does not assign a date, an expiration date of 1 year from receipt is assigned. Stock standards are stored at the recommended temperature from the vendor. The intermediate stock standards prepared by the analysts are stored in freezer.

Standard	Concentration	Use
8081	1000 µg/mL	ICAL
8081 Surrogate <sup>a</sup>	200 µg/mL	ICAL
Isodrin	100 µg/mL	ICAL
Hexachlorobenzene	100 µg/mL	ICAL
8081 Misc. compounds*	250 µg/mL	ICAL
Chlordane	100 µg/mL	ICAL
Toxaphene	1000 µg/mL	ICAL

8081	1000 µg/mL	ICV
Isodrin	100 µg/mL	ICV
Hexachlorobenzene	100 µg/mL	ICV
8081 Misc. compounds	250 µg/mL	ICV
Chlordane	1000 µg/mL	ICV
Toxaphene	1000 µg/mL	ICV

8081 Internal Standard<sup>b</sup> 5000 µg/mL Internal standard  
 Surrogates are Decachlorobiphenyl (DCB) and 2,4,5,6-Tetrachlorometaxylene (TCMX).  
 Internal standard is 1-Bromo-2-nitrobenzene.

8.1.2 Intermediate standard solutions and ICV solutions are made in hexane by diluting stock standards to intermediate concentrations listed below. The ICV intermediates are prepared from the ICV stock standards obtained from a different source from the initial calibration stocks.

ICAL Intermediate	Concentration	Preparation
Combined 8081, isodrin, hexachlorobenzene, and surrogate.	1.0 µg/mL	1:1000 dilution of 8081 stock, 1:100 dilution of isodrin & hexachlorobenzene stocks, 1:100 dilution of surr. stock.
8081 Misc. compounds*	1.0 µg/mL	1:250 dilution of stock
Chlordane	1.0 µg/mL	1:1000 dilution of stock
Toxaphene	2.0 µg/mL	1:500 dilution of stock

Intermediate ICV Standard	Concentration	Preparation
Combined 8081, isodrin,	1.0 µg/mL	1:1000 dilution of 8081

and hexachlorobenzene

stock, 1:100 dilution of isodrin & hexachlorobenzene stocks.

8081 Misc. compounds*	1.0 µg/mL
8081 Internal Standard	1.0 µg/mL
Chlordane	1.0 µg/mL
Toxaphene	2.0 µg/mL

1:1000 dilution of stock  
1:500 dilution of stock

8.1.3 Working Standard Solutions

8.1.3.1 Calibration standards are prepared containing surrogates and analytes in hexane. Calibration standards are stored at 4°C for up to six months. A series of standards are prepared from a common intermediate representing the MRL (or lower) to a value near the high end of the linear range. See Table 4 for preparation and concentrations, including standards designated as CCVs.

8.1.3.2 The independent calibration verification (ICV) standards are prepared from stock solutions from a different source from the initial calibration as listed below. Expiration periods are the same as for equivalent stock and calibration standards.

ICV Standard	Concentration	Preparation
Combined 8081, isodrin, and hexachlorobenzene	2.0 µg/L	1:500 dilution of combined 8081 ICV intermediate.
8081 Misc. compounds	2.0 µg/L	1:500 dilution of 8081 misc. compounds intermediate.
Chlordane	50 µg/L	1:20 dilution of Chlordane ICV stock.
Toxaphene	200 µg/L	1:10 dilution of Toxaphene ICV stock.

8.1.3.3 A surrogate spiking solution is prepared at 0.5µg/mL for water and 0.8 µg/mL for solids. The surrogate solution is stored at 4° C or up to six months.

8.1.3.4 An internal standard solution is prepared at 10 µg/ml (1 µg/ml for low-level) by diluting the internal stock standard in hexane. 10.0 µL of internal standard is added to each 1 mL of standard, blank and sample prior to analysis for a final concentration of 100 ng/mL.

8.1.3.5 All matrix spike solutions are prepared by diluting the stock solution in methanol. This solution is stored at 4°C. The 8081-Isodrin-HCB spike is good for 4 weeks, while the others are good for 6 months. The matrix spike solution is added to all matrix spikes and lab control samples as outlined in section 12.

Spiking Solution	Concentration	Preparation
8081, isodrin, and hexachlorobenzene.	0.5 µg/mL	1:2000 dilution of 8081, isodrin & hexachlorobenzene

		stocks.
8081 Misc. compounds*	0.5 µg/mL	1:500 dilution of stock
Chlordane**	10 µg/mL	1:100 dilution of stock
Toxaphene	20 µg/mL	1:50 dilution of stock
*Prepare only as needed for projects requiring non-routine additional compounds.		
**Prepare only as needed for project requirements.		

8.1.4 Solvents: Hexane, acetone, methylene chloride, isooctane, and methanol. Pesticide grade or equivalent.

## 9) Apparatus and Equipment

### 9.1 GC Instrumentation - Dual Column

9.1.1 The dual column approach involves a single injection split between two columns mounted in a single gas chromatograph (Hewlett Packard 6890, 7890 or equivalent) equipped with split/splitless, temperature programmable, or multi-mode injection system; with dual ECDs. See Table 3 for typical chromatographic conditions. Hydrogen is used as the carrier gas. Nitrogen is used as the detector make-up gas. Current instrumental systems are identified as follows:

Instrument I.D.	Analytical System	Routine Matrix
GC23	Agilent 6890	Water/Solid
GC34	Agilent 7890A	Water/Solid
GC37	Agilent 7890A	Water/Solid

9.1.2 Columns, J&W columns typically are used;

Column 1: DB-XLB 30 m x 0.32 mm ID, 0.50 µm df or equivalent\*  
 Column 2: DB-35MS 30 m x 0.32 mm ID, 0.25 µm df or equivalent\*

**Note:** Column diameter and film thickness may vary depending on instrument. Refer to the instrument maintenance logbook for the columns used for a specific instrument configuration.

9.1.3 Autosampler, capable of reproducible injections, Hewlett Packard/Agilent 7673 or equivalent.

9.2 Data System - A computer data system must be interfaced to the GC/ECD. The system must allow the continuous acquisition and storage on machine-readable media of all chromatographic data obtained throughout the duration of the chromatographic program. The computer must have software that includes automated calibration, identification, and quantitation routines. The software must also be capable of integrating the chromatographic peaks abundances.

## 10) Preventative Maintenance

10.1 All maintenance activities are recorded in a maintenance logbook kept for each instrument. Pertinent information (serial numbers, instrument I.D., etc.) must be in the logbook. This includes the routine maintenance described herein. The entry in

Effective 2/18/2021

SOP Review: 2/15/2021

Page 7 of 23

the log must include: date of event, the initials of who performed the work, and a reference to analytical control..

10.2 Carrier gas - Inline purifiers or scrubbers should be in place for all sources of carrier gas. These are selected to remove water, oxygen, and hydrocarbons. Purifiers should be changed as recommended by the supplier.

10.3 Gas Chromatograph

10.3.1 Whenever GC maintenance is performed, care should be taken to minimize the introduction of air or oxygen into the column. Injection port maintenance includes changing the injection port liner, seal, washer, o-ring, septum, column ferrule, and autosampler syringe as needed. Liners and seals should be changed when recent sample analyses predict a problem with chromatographic performance. In some cases liners and seals may be cleaned and re-used.

10.3.2 Clipping off a small portion of the head of the column often improves chromatographic performance. When cutting off any portion of the column, make sure the cut is straight and “clean” (uniform, without fragmentation) by using the proper column cutting tool.

10.3.3 Over time, the column will exhibit poorer overall performance, as contaminated sample matrices are analyzed. The length of time for this to occur will depend on the samples analyzed. When a noticeable decrease in column performance is evident and other maintenance options do not result in improvement, the column should be replaced. This is especially true when evident in conjunction with calibration difficulties.

## 11) Procedure

### 11.1 Sample Preparation

11.1.1 Water samples, (100 mL for LL, 200 mL for ULL) are extracted via shaker table microextraction (SOP EXT-3511) or solid phase extraction (SOP EXT-3535). TCLP leachates are extracted using separatory funnel (SOP EXT-3510). Refer to the applicable extraction SOP for the applicable procedure. For extraction by 3535, acidification of the sample prior to extraction may be allowable if project objectives and performance requirements of methods 3535 and 8081 are met.

**Note:** For projects originating from Alaska and South Carolina use the 3535 extraction method only.

11.1.2 Soil/sediment samples are extracted using EPA Method 3546 (SOP EXT-3546). Refer to the applicable extraction SOP.

11.1.3 Additional sample cleanup procedures may be used as appropriate for the samples. See Section 4.2 and refer to the applicable cleanup SOP.

### 11.2 Calibration

STANDARD OPERATING PROCEDURE

ALS | Environmental – Kelso

OC Pesticides by GC

SOC-8081, Rev. 22.0

Effective 2/18/2021

SOP Review: 2/15/2021

Page 8 of 23

- 11.2.1 Refer to the SOP *Sample Batches* (ADM-BATCH) for guidance on analytical calibration and sample batches. Refer to the SOP *Calibration of Instruments for Organics Chromatographic Analyses* (SOC-CAL), where calibration procedures and policies are described. The calibration procedure(s) and options chosen must follow the SOP SOC-CAL.
- 11.2.2 Check for degradation of 4,4'-DDT and Endrin by injecting a standard containing only 4,4'-DDT at 10ppb and Endrin at 5 ppb.

$$\% \text{ Breakdown} = \frac{\text{Total DDT degradation peak area (DDE + DDD)}}{\text{Total DDT peak area (DDT + DDE + DDD)}} \times 100$$

$$\% \text{ Breakdown} = \frac{\text{Total endrin degradation peak area} \\ \text{endrin aldehyde + endrin ketone}}{\text{Total endrin peak area} \\ \text{endrin + endrin aldehyde + endrin ketone}} \times 100$$

If degradation of either DDT or Endrin exceeds 15%, perform any necessary maintenance before proceeding with calibration. The breakdown of DDT and Endrin must be measured before samples are analyzed and at the beginning of each analytical sequence.

- 11.2.3 After determining that degradation is within acceptance, calibrate the system immediately prior to conducting any analyses. Analyze each calibration standard (containing internal standards) and tabulate the area against concentration for each compound. For multi-component analytes, only those specified in the project plan or work specification are used for calibration. Calculate response factors (RFs) for each compound relative to the internal standard as follows:

$$RF = (Ax/Cis)/(Ais/Cx)$$

where:

Ax = Area of the compound being measured.

Ais = Area of the specific internal standard.

Cis = Concentration of the specific internal standard (ng/μL).

Cx = Concentration of the compound being measured (ng/μL).

Note: For Chlordane, a minimum of 3 peaks must be chosen and for Toxaphene a minimum of 4 peaks must be chosen. The peaks must be characteristic of the compound of interest.

- 11.2.3.1 Calculate the mean response factor ( $\overline{RF_x}$ ) for each analyte and surrogate from the calibration levels. Calculate standard deviation (SD) and the percent relative standard deviations (%RSD) for each analyte from the mean with:

- 11.2.3.2 The % RSD should be less than 20% for each compound.

STANDARD OPERATING PROCEDURE

ALS | Environmental – Kelso

OC Pesticides by GC

SOC-8081, Rev. 22.0

Effective 2/18/2021

SOP Review: 2/15/2021

Page 9 of 23

- 11.2.3.3 If the % RSD for a given compound is 20% or less, linearity can be assumed over the calibration range, and the relative response factor for each analyte and surrogate is used to quantitate sample analytes.
- 11.2.3.4 If the % RSD exceeds 20%, then a linear curve or a quadratic calibration with a coefficient of determination (COD,  $R^2$ ) of 0.990 or greater may be used.
- 11.2.4 Following initial calibration, analyze an ICV standard. The ICV solution must contain all analytes in the calibration standards. Calculate the concentration using the typical procedure used for quantitation. Calculate the percent difference (%D) from the ICV true value. Evaluate the ICV as described in the SOC-CAL SOP. The acceptance criterion is  $\pm 20\%$  from the analytes assigned value.
- 11.2.5 Continuing Calibration Verification
- 11.2.5.1 The working calibration curve or calibration response factors must be verified on each analytical sequence by the analysis of one or more mid-range calibration standards (CCV). A CCV must be injected at the start of each 12 hour shift or every 20 samples, whichever is first. The 12 hour window starts with the injection time of the first CCV. The use of internal standard calibration technique does not require that all sample results be bracketed with calibration verification standards.
- Note:** DoD projects require a CCV analysis every 10 field samples. Work under QSM versions 5.x of the QSM require a closing CCV for single-component analytes.
- 11.2.5.2 The acceptance criteria for all analytes in the CCV analysis are a response (RF or concentration) within  $\pm 20\%$  D of the expected value, as compared to the initial calibration. Refer to the SOP SOC-CAL.
- Note:** For samples originating in Arizona and results reported for compliance purposes, the CCV criteria is  $\pm 15\%$  D, per Method 8081A. However, response factor averaging is not allowed for analysis of Arizona samples.
- 11.2.5.3 The measured area of the internal standard must be no more than -50% to + 100% difference from the average area calculated during initial calibration.
- 11.2.5.4 The retention time of the internal standard must also be evaluated. A retention time shift of >30 seconds necessitates system maintenance and reanalysis of CCV.
- 11.2.6 Retention Time Windows

	STANDARD OPERATING PROCEDURE	OC Pesticides by GC
	ALS   Environmental – Kelso	SOC-8081, Rev. 22.0
		Effective 2/18/2021
		SOP Review: 2/15/2021
		Page 10 of 23

11.2.6.1 Establish retention time windows with the GC system in acceptable operating conditions. Make three injections of all analytes throughout the course of a 72-hour period. Serial injections over less than a 72-hour period may result in retention time windows that are too tight. Using retention times from these analyses, calculate retention time windows. Refer to EPA Method 8000 for detailed instructions.

11.2.6.2 The retention time window is defined as  $\pm 3x$  the standard deviation of the absolute retention times for each standard; however, the experience of the analyst should weigh heavily in the interpretation of chromatograms. In those cases where the standard deviation for a particular standard is zero, the laboratory may use a default window of  $\pm 0.03$  minutes. If the peak width is  $> 0.06$  minutes, use a default window of 0.1 minutes.

11.2.6.3 Calculate retention time windows for each standard on each GC column and whenever a new GC column is installed. Retain this data in the method file.

### 11.3 Sample Analysis

11.3.1 Table 3 indicates the typical operating conditions for the GC. Setup the analysis sequence of sample and QC samples. Also, refer to the SOP *Sample Batches* (ADM-BATCH) for guidance.

11.3.2 Calibrate the system as described in Section 11.2. Evaluate the CCVs as discussed in Section 11.2.5. If any standard falls outside of their daily retention time window, evaluate the chromatogram for possible causes such as carryover from a highly contaminated sample. If a problem related to GC system has been determined to be the cause of retention time shift, perform whatever maintenance is necessary before re-injecting a CCV or recalibrating and proceeding with sample analysis.

11.3.3 Spike 10 $\mu$ l of the internal standard 1-Bromo-2-nitrobenzene at 10 ppm into each 1ml of sample extract to give a final concentration of 100 ng/ml. The measured area of the internal standard must be -50% to +100% as measured from the average of the most recent calibration. Any samples falling outside of this criterion require reanalysis.

11.3.4 The retention time of the internal standard must also be evaluated. A retention time shift of  $>30$  seconds requires reanalysis of all affected samples.

### 11.4 Identification of Analytes

11.4.1 Tentative identification of an analyte occurs when a peak from a sample extract falls within the daily retention time window and the s/n ratio of the peak is  $>3$ . A tentatively identified compound is confirmed when the retention time for the compound on the confirmatory detector is within the retention time window on that system.

	STANDARD OPERATING PROCEDURE	OC Pesticides by GC
	ALS   Environmental – Kelso	SOC-8081, Rev. 22.0
		Effective 2/18/2021
		SOP Review: 2/15/2021
		Page 11 of 23

11.4.2 Confirmation of all tentative hits should be made. Confirmation is made by injecting the sample extract on two columns with dissimilar phases simultaneously. If the retention time matches on both columns, then the hit for the analyte is considered a confirmed hit. Refer to the SOP *Confirmation of Organic Analytes* (SOC-CONF).

11.4.3 For Chlordane, a minimum of 3 peaks must be chosen and, for Toxaphene, a minimum of 4 peaks must be chosen for identification purposes. Refer to Section 13.2 for quantitation procedures for multi-response analytes.

11.5 Perform all necessary calculations as described in Sections 12 and 13.

## 12) QA/QC Requirements

### 12.1 Initial Precision and Recovery Validation

12.1.1 The precision of the extraction procedure and the GC procedure must be validated before analysis of samples begins, or whenever significant changes to the procedures have been made. To do this, four reagent water samples are spiked at a level near the midpoint of the calibration range (typically the LCS level), then extracting and proceeding with Section 11. The spiking solution may be prepared from pure standard materials, or purchased as certified solutions. If prepared by the laboratory, stock standards prepared independently from those used for calibration should be used. The concentration of the analytes to be spiked is 20x the MRL.

### 12.2 Method Detection Limits and Method Reporting Limits

12.2.1 A method detection limit (MDL) study must be undertaken before analysis of samples can begin. To establish detection limits that are precise and accurate, the analyst must perform the following procedure. Spike seven blank matrix (water or soil) samples with MDL spiking solution at a level below the MRL. Follow the analysis procedures in Section 11 to analyze the samples.

12.2.2 Calculate the average concentration found ( $\bar{x}$ ) in  $\mu\text{g/mL}$ , and the standard deviation of the concentrations ( $s$ ) in  $\mu\text{g/mL}$  for each analyte. Calculate the MDL for each analyte. Refer to the SOP *Performing and Documenting Method Detection Limit Studies and Establishing Limits of Detection and Limits of Quantitation*. The MDL/LOD must be verified annually.

#### 12.2.3 Limits of Quantification (LOQ)

12.2.3.1 The laboratory establishes a MRL/LOQ for each analyte as the lowest reliable laboratory reporting concentration or in most cases the lowest point in the calibration curve which is less than or equal to the desired regulatory action levels, based on the stated project requirements. Analysis of a standard or extract prepared at the lowest point calibration standard provides confirmation of the established sensitivity of the method. The LOQ recoveries should be within 50-150% of the true values to verify the data reporting limit. Refer to the SOP *Performing and*

	STANDARD OPERATING PROCEDURE	OC Pesticides by GC
	ALS   Environmental – Kelso	SOC-8081, Rev. 22.0
		Effective 2/18/2021
		SOP Review: 2/15/2021
		Page 12 of 23

*Documenting Method Detection Limit Studies and Establishing Limits of Detection and Limits of Quantitation.*

- 12.2.4 The Method Reporting Limits (MRLs) used at ALS Kelso are the routinely reported lower limits of quantitation which take into account day-to-day fluctuations in instrument sensitivity as well as other factors. These MRLs are the levels to which ALS Kelso routinely reports results in order to minimize false positive or false negative results. The MRL is normally two to ten times the method detection limit.
- 12.3 Ongoing QC Samples required are described in the ALS-Kelso Quality Assurance Manual and in the SOP for Sample Batches. Additional QC Samples may be required in project specific quality assurance plans (QAPP). General QA requirements for DoD QSM are defined in the laboratory SOP *Department of Defense Projects – Laboratory Practices and Project Management (ADM-DOD)* or *Department of Defense Projects – Laboratory Practices and Project Management*. General QC Samples are:

12.3.1 Method Blank

- 12.3.1.1 A method blank is extracted and analyzed with every batch of 20 (or fewer) samples to demonstrate that there are no method interferences. If the method blank shows any hits above the reporting limit, corrective action must be taken. Corrective action includes recalculation, reanalysis, system cleaning, or re-extraction and reanalysis. For some project specific needs, exceptions may be noted and method blank results above the MRL may be reported for common lab contaminants (phthalate esters, etc.).

**Note:** DoD projects require that no analyte be detected > ½ the RL or 1/10 the regulatory limit, whichever is greater.

- 12.3.2 Lab Control Sample (LCS) must be extracted and analyzed with every batch of 20 samples. The LCS is spiked as follows:

3511 LL: 50 µL of 8081 Pest, 8081 Misc., 24-DDX, Toxaphene and Chlordane to 100 mL of reagent water.

3511 ULL: 10 µL of 8081 Pest, 8081 Misc., 24-DDX, Toxaphene and Chlordane to 200 mL of reagent water.

3535A: 20 µL 8081 Pest, 8081 Misc., 24-DDX, Toxaphene and Chlordane to 1 L of reagent water.

3546: 100 µL of 8081 Pest, 8081 Misc., 24-DDX, Toxaphene and 50 µL Chlordane to 2 g.

For project-specific low-level extractions, spiking amounts can be adjusted accordingly.

- 12.3.2.1 Calculate the LCS recovery as follows:

$$\%R = X/TV \times 100$$

Where X = Concentration of the analyte recovered  
TV = True value of amount spiked

STANDARD OPERATING PROCEDURE

ALS | Environmental – Kelso

OC Pesticides by GC

SOC-8081, Rev. 22.0

Effective 2/18/2021

SOP Review: 2/15/2021

Page 13 of 23

12.3.2.2 Current ALS QC acceptance criteria for lab control samples are listed in the current ALS-Kelso DQO tables. Project-specific or program-specific acceptance criteria may supersede ALS criteria. For example, for samples requiring South Carolina DHEC certification the acceptance criteria are 70-130 % recovery. If the lab control sample (LCS) fails acceptance limits for any of the compounds, corrective action must be taken. Corrective action includes recalculation, reanalysis, or re-extraction and reanalysis. Refer to the ALS-Kelso Quality Assurance Manual for guidance in evaluating recoveries that exceed LCS limits.

12.3.3 Matrix Spike

12.3.3.1 A matrix spike (MS) and duplicate matrix spike (DMS) must be prepared and analyzed with every batch of 20 (or fewer) samples. The MS/DMS is prepared by adding the same volume of the matrix spike solution to the sample as listed for the LCS, then proceeding with Section 11. Calculate percent recovery (%R) as:

$$\%R = \frac{X - X1}{TV} \times 100$$

Where X = Concentration of the analyte recovered

X1 = Concentration of unspiked analyte

TV = True value of amount spiked

12.3.3.2 Calculate Relative Percent Difference (RPD) as:

$$RPD = \frac{|R1 - R2|}{(R1 + R2) / 2} \times 100$$

Where R1= Higher Result

R2= Lower Result

12.3.3.3 Current QC acceptance criteria for MS/DMS are listed in the current ALS-Kelso DQO tables. Project-specific acceptance criteria may supersede lab criteria. If the MS/DMS recovery is out of acceptance limits for reasons other than matrix effects, corrective action must be taken. Corrective action includes recalculation, reanalysis, or re-extraction and reanalysis.

12.3.3.4 Following analysis of the MS the percent recovery is calculated and compared to acceptance limits. If the recovery is within control limits the results may be reported. If not, and the LCS is within control limits, this indicates that the matrix potentially biases analyte recovery. It is verified that the spike level is at least five times the background level. If not, the results are reported with a qualifier that the background level is too high for accurate recovery determination. If matrix interferences are present or results indicate a potential problem with sample preparation, steps may be taken to improve results; such as

	STANDARD OPERATING PROCEDURE	OC Pesticides by GC
	ALS   Environmental – Kelso	SOC-8081, Rev. 22.0
		Effective 2/18/2021
		SOP Review: 2/15/2021
		Page 14 of 23

performing any additional cleanups, dilution and reanalysis, or re-preparation and reanalysis. Results that do not meet acceptance limits are reported with an appropriate qualifier.

#### 12.3.4 Surrogate

12.3.4.1 Surrogate spike is added to every sample, blank and spike prior to extraction. Two surrogate standards (Tetrachloro-m-xylene and Decachlorobiphenyl) are added to each sample. The surrogate spike amounts are:

3511 LL:	50 µL of 0.5 ppm to 100 mL
3511 ULL:	10 µL of 0.5 ppm to 200 mL
3535A:	20 µL of 0.5 ppm to 1 L
3546:	50 µL of 0.8 ppm to 2 g

12.3.4.2 Calculate surrogate percent recovery (%R) as:

$$\%R = S/V \times 100$$

Where S = Amount of surrogate recovered  
V = Amount spiked

12.3.4.3 Current QC acceptance criteria for surrogates are listed in the current ALS-Kelso DQO tables. Project-specific acceptance criteria may supersede lab criteria. Both surrogate recoveries must be within the acceptance limits. If either (or both) surrogate is outside of acceptance limits for reasons other than matrix interferences, corrective action must be taken. Corrective actions include recalculation, reanalysis, or re-extraction and reanalysis. The acceptance criteria listed are current criteria, but are subject to change as control limits are updated.

12.3.5 Control charts for QC results should be reviewed periodically for trends in results. Control limits for QC analyses may be determined using the control charts or similar mechanism on an annual basis.

### 13) Data Reduction and Reporting

13.1 Both detectors are used as primary and/or confirmatory systems when not interfered with by the sample matrix.

#### 13.2 Calculations

13.2.1 Quantitation of analytes in sample extracts is performed by comparing total area of residue peaks to total area or peaks from the appropriate reference materials.

13.2.2 Quantitation of multi-response analytes:

	STANDARD OPERATING PROCEDURE	OC Pesticides by GC
	ALS   Environmental – Kelso	SOC-8081, Rev. 22.0
		Effective 2/18/2021
		SOP Review: 2/15/2021
		Page 15 of 23

13.2.2.1 The quantitation of Chlordane, Toxaphene, and other multi-response analytes is accomplished by comparison of the sample chromatogram to that of the authentic standard. All calibration acceptance criteria as described in section 11 must be met before reporting any results. Sample results should then be reported according to the SOP *Confirmation of Organic Analytes* (SOC-CONF). Results may be reported from either of the columns as long as all calibration acceptance criteria are met.

13.2.2.2 Once the analyte pattern has been identified, compare the responses of the major peaks in the calibration standard with the peaks observed in the sample extract. The amount of analyte is calculated using the individual calibration factor for each peak and the calibration model selected in section 11. The concentration is determined using the characteristic peaks and then the concentrations are averaged to determine the concentration. If there are interfering peaks that cause the average to be falsely overstated, then that interference peak is Q-Q-deleted using the data system, provided 3 peaks remain for Chlordane and 4 peaks for Toxaphene. The average is then recalculated so that the average more truly represents the concentration in the sample.

13.2.3 The concentration of each analyte in the sample extract ( $C_{ex}$ ) is computed. When  $\overline{RF}_x$  is used, calculate the extract concentration as follows:

$$C_{ex} = \frac{(Resp_x)(Amt_{ISTD})}{(Resp_{ISTD})(\overline{RF}_x)}$$

Where:

- $C_{ex}$  = the concentration in the sample extract (ppb);
- $Resp_x$  = the peak area of the analytes of interest;
- $Resp_{ISTD}$  = the peak area of the associated internal standard;
- $Amt_{ISTD}$  = the amount, in ppb, of internal standard added
- $\overline{RF}_x$  = the average response from the initial calibration.

13.2.4 The concentration of analytes in the original sample is computed using the following equations:

**Aqueous Samples:**  $Concentration (\mu g / L) = \frac{(C_{ex})(V_f)(D)}{(V_s)}$

Where

- $C_{ex}$  = Concentration in extract in  $\mu g/mL$
- $V_f$  = Final volume of extract in mL
- $D$  = Dilution factor
- $V_s$  = Volume of sample extracted, liters

	STANDARD OPERATING PROCEDURE	OC Pesticides by GC
	ALS   Environmental – Kelso	SOC-8081, Rev. 22.0
		Effective 2/18/2021
		SOP Review: 2/15/2021
		Page 16 of 23

**Non aqueous Samples:**  $Concentration (mg / Kg) = \frac{(C_{ex}) (V_f) (D)}{(W)}$

Where	$C_{ex}$	=	Concentration in extract in $\mu\text{g/mL}$
	$V_f$	=	Final volume of extract in mL
	$D$	=	Dilution factor
	$W$	=	Weight of sample extracted in grams.

### 13.3 Data Review

13.3.1 Following primary data interpretation and calculations, all data is reviewed by a secondary analyst. Following generation of the report, the report is also reviewed. Refer to the SOP *Laboratory Data Review Process* (ADM-DREV) for details. The person responsible for final review of the data report and/or data package should assess the overall validity and quality of the results and provide any appropriate comments and information to the Project Chemist to inclusion in the report narrative.

### 13.4 Reporting

13.4.1 Reports are generated using the STEALTH Data Reporting System which compiles the SMO login information. This compilation is then transferred to a file, which STEALTH uses to generate a report. The forms generated may be ALS standard reports, DOD, or client-specific reports. The compiled data from LIMS is also used to create EDDs.

13.4.2 Sample concentrations are reported when all QC criteria for the analysis have been met or the results are qualified with an appropriate footnote. For Arizona projects the appropriate Arizona qualifier must be used.

## 14) Contingencies for Handling Out-of-Control or Unacceptable Data

14.1 Refer to the SOP for *Non Conformance and Corrective Action* for corrective action.

14.2 Personnel at all levels and positions in the laboratory are to be alert to identifying problems and nonconformities when errors, deficiencies, or out-of-control situations are detected.

## 15) Method Performance

15.1 This method was validated through single laboratory studies of accuracy and precision. Refer to the reference method for additional method performance data available. In addition, this procedure was validated through single laboratory studies of accuracy and precision as specified in Section 12.1.

15.2 The method detection limit (MDL) is established using the procedure described in the SOP *Performing and Documenting Method Detection Limit Studies and Establishing Limits of Detection and Quantification*. Method Reporting Limits are established for this method based on the low calibration point and the MDL study results.

	STANDARD OPERATING PROCEDURE	OC Pesticides by GC
	ALS   Environmental – Kelso	SOC-8081, Rev. 22.0
		Effective 2/18/2021
		SOP Review: 2/15/2021
		Page 17 of 23

## 16) Pollution Prevention and Waste Management

16.1 The laboratory will comply with all Federal, State and local regulations governing waste management, particularly the hazardous waste identification rules and land disposal restrictions as specified in the ALS Lab Waste Management Plan.

## 17) Training

17.1 All analysts performing this analysis are required to read and understand this SOP.

17.2 Training is documented following the SOP for *Employee Training and New Employee Orientation*.

## 18) Method Modifications

18.1 There are no known modifications in this laboratory standard operating procedure from the reference method.

## 20) Changes Since the Last Revision

Revision Number	Effective Date	Document Editor	Description of Changes
22.0	2/15/2021	T. Caron	Updated SOP signatories. Standard paragraph edits. Reference Section has been edited to include ISO 17025. Section 8.1.3.4: 10 ul of internal standard is added to each 1ml of standard, blank and sample prior to analysis for a final concentration of 100 ng/ml has been added. Section 9.1.1: Added GC37. Sections 11 and 12: Edited to reference 3511 LL. Section 11/1/1: Water samples (100 mL for LL, 200 mL for ULL). Procedural change form submitted by UA 2.27.20.

## PCBs as Aroclors

DOCUMENT ID: SOC-8082AR, REV 20.0

Prepared By:   
Organics Manager, Jonathon Walter

Date: 12/2/2020

Prepared By:   
Quality Assurance Manager, Kurt Clarkson

Date: 12/2/2020

Approved By:   
Laboratory Director, Charles (Pat) Byrne

Date: 12-2-20

## 1) Scope & Applicability

- 1.1 This procedure is used to determine the concentrations of PCBs as Aroclors using EPA Method 8082A. This procedure is typically applied to water, sediment, and soil matrices but may also be applicable to tissue or various miscellaneous waste samples. Tables 1 and 2 lists the analytes that are determined by this procedure and lists the method reporting limits (MRLs) for each compound in water and soil. Equivalent nomenclature for MRL includes Estimated Quantitation Limit (EQL). Therefore, MRL=EQL. The reported MRL may be adjusted if required for specific project requirements; however, the capability of achieving other reported MRLs must be demonstrated. MDLs may change as repeat studies are conducted.
- 1.2 In cases where there is a project-specific quality assurance plan (QAPP), the project manager identifies and communicates the QAPP-specific requirements to the laboratory. In general, project specific QAPPs supersede method specified requirements. An example of this are projects falling under DoD ELAP. QC requirements defined in the SOP *Department of Defense Projects – Laboratory Practices and Project Management* may supersede the requirements defined in this SOP.

## 2) Summary of Procedure

- 2.1 This procedure provides gas chromatographic conditions for the detection of parts-per-billion (ppb) levels of PCBs. The target PCBs are extracted from samples using the appropriate procedure for the sample matrix (see applicable SOP), analyzed, and reported as Aroclors.
- 2.2 An aliquot of the extract is injected into the gas chromatograph (GC). The compounds are separated on a fused silica capillary column. Compounds of interest are detected by an electron capture detector. Identification of the analytes of interest is performed by comparing the retention times of the analytes with the respective retention times of an authentic standard and by comparison of elution patterns to those of Aroclor standards. Quantitative analysis is performed by using the authentic standard to produce a calibration factor or calibration curve, and using the calibration data to determine the concentration of an analyte in the extract. The concentration in the sample is calculated using the sample weight or volume and the extract volume.
- 2.3 The sensitivity of this method usually depends on the level of interferences rather than on instrument limitations. If interferences prevent detection of the analytes, GPC, Florisil cleanup, sulfur cleanup, or concentrated sulfuric acid cleanups are used to eliminate interferences in the analysis. Refer to section 4.2 for cleanup procedure references.

## 3) Definitions

- 3.1 For laboratory definitions applicable to most analyses, refer to the SOP for *Sample Batches*.

## 4) Responsibilities

- 4.1 It is the responsibility of the analyst to perform the analysis according to this SOP and to complete all documentation required for data review. Analysis and interpretation of the results are performed by personnel in the laboratory who have demonstrated the ability to generate acceptable results utilizing this SOP. This demonstration is in accordance with the training program of the laboratory. Final review and sign-off of the data is performed by the department supervisor/manager or designee.

- 4.2 It is the responsibility of the department supervisor/manager to document analyst training and method proficiency, as described in Method 8082A and the SOP *Employee Training and New Employee Orientation* (ADM-TRAIN).

## 5) Interferences

- 5.1 Interferences by phthalate esters can pose a major problem in PCB determinations when using the electron capture detector. These compounds generally appear in the chromatogram as large, late-eluting peaks, especially in the 15% and 50% fractions from the Florisil cleanup. Common flexible plastics contain varying amounts of phthalates. These phthalates are easily extracted or leached from such materials during laboratory operations. Phthalate contamination is not usually a problem in our laboratory operation.
- 5.2 Co-extractables such as lipids, waxes, etc., can be removed via GPC cleanup (SOC-3640A). Certain fractionation cleanups can be used to selectively remove organochlorine pesticides, aiding in Aroclor determination (SOC-3665). The presence of elemental sulfur will result in interferences for most Aroclors. If GPC cleanup is insufficient, cleanup via Method 3660 (SOC-3660) may be used for the removal of sulfur. If interferences from polar compounds is evident, cleanup using Florisil (EXT-FLOR) can be utilized.
- 5.3 A standard of the DDT analogs must be injected with each initial calibration to determine which of the PCB or Aroclor peaks may be subject to interferences on the analytical columns used. There may be substantial DDT interference with the last major Aroclor 1254 peak in some soil and sediment samples.

## 6) Safety

- 6.1 Chemicals, reagents and standards must be handled as described in the ALS safety policies, approved methods and in SDSs where available. Refer to the ALS Chemical Hygiene Plan and the appropriate SDSs prior to beginning this method.

## 7) Sample Collection, Containers, Preservation, and Storage

- 7.1 Containers used to collect samples should be purchased pre-cleaned containers.
- 7.2 Samples should be tested for residual chlorine at the time of sampling. For aqueous samples with residual chlorine present, add 3-mL 10% sodium thiosulfate solution per gallon (0.008%).
- 7.3 Water and soil samples must be iced or refrigerated at  $<6^{\circ}\text{C}$  from time of collection until extraction. Tissue samples should be stored in accordance with project requirements, typically refrigerated or frozen.
- 7.4 There are no holding time requirements for this method.

## 8) Standards, Reagents, and Consumable Materials

- 8.1 Reagent grade chemicals shall be used in all tests. Other grades may be used, provided it is first ascertained that the reagent is of sufficiently high purity to permit its use without lowering the accuracy of the determination. The preparation for all laboratory prepared reagents and solutions must be documented in a laboratory logbook. Refer to the SOP *Reagent/Standards Login and Tracking* (ADM-RTL) for the complete procedure and documentation requirements.

- 8.2 Solvents: Hexane, acetone, methylene chloride, isooctane, and methanol. Pesticide grade or equivalent. Solvents must be of sufficient purity to permit usage without lessening the accuracy of the determination or introducing interferences.
- 8.3 Stock Standard Solutions
- 8.3.1 Stock standard solutions may be purchased from a number of vendors. All reference standards, where possible, must be traceable to SI units or NIST certified reference materials.
- 8.3.2 Stock standard solutions for each target Aroclor are purchased from AccuStandard at 1000 µg/mL. Other vendors may be used providing they meet the requirements in sec 8.3.1. Unopened stock standard solutions are stored as directed by manufacturer's recommendation. If no storage instructions are provided, the standards are stored at ambient and protected from light. Opened ampoules are stored in crimp-sealed vials at  $4 \pm 2^\circ\text{C}$ . The expiration date for unopened ampoules is the manufacturer's assigned expiration date. If the manufacturer does not assign a date, an expiration date of 1 year from receipt is assigned. Check opened stock standards frequently for signs of degradation or evaporation, especially just prior to preparing calibration standards from them.
- 8.3.2.1 Intermediate calibration standard solutions are made for the following Aroclor mixtures by diluting 1000 µg/mL stock standards 1:20 in hexane:
- Aroclor 1016/Aroclor 1260
  - Aroclor 1221/Aroclor 1254
  - Aroclor 1232/Aroclor 1262
  - Aroclor 1242/Aroclor 1268
  - Aroclor 1248
- 8.3.2.2 Prepare calibration standards at a minimum of five concentration levels for each Aroclor by dilution of the intermediate standards with hexane. One of the concentration levels should be at or below a concentration representing the method reporting limit (MRL). The remaining concentration levels should correspond to the expected range of concentrations found in real samples or should define the working range of the GC. See Table 4 for preparation and concentrations. A calibration standard of Aroclor 1016/Aroclor 1260 and the surrogates at mid-range concentration is used for the CCV.
- 8.3.2.3 Calibration standard solutions are stored at  $4 \pm 2^\circ\text{C}$  and must be replaced after six months, or sooner, if comparison with check standards indicate a problem.
- 8.3.3 The independent calibration verification (ICV) standards for each target Aroclor are purchased from Ultra Scientific at 100 µg/mL. Other vendors may be used providing they meet the requirements in sec 7.3.1. Unopened stock standard solutions are stored as directed by manufacturer's recommendation. If no storage instructions are provided, the standards are stored at ambient and protected from light. Opened ampoules are stored in crimp-sealed vials at  $4^\circ\text{C} \pm 2^\circ\text{C}$ . The expiration date for unopened ampoules is the manufacturer's assigned expiration date. If the manufacturer does not assign a date, an expiration date of 1 year from receipt is assigned. Check opened stock standards frequently for signs of degradation or evaporation, especially just prior to preparing calibration standards from them.

- 8.3.3.1 Working ICV standards at 1000 µg/L are prepared as described in Table 4. ICV Standards are stored at 4°C ± 2°C for up to six months.
- 8.3.4 Surrogate solutions are prepared from stock solutions of Tetrachloro-m-xylene (TCMX) and Decachlorobiphenyl (DCB) purchased from Ultra Scientific at 200 µg/mL. Other vendors may be used providing they meet the requirements in sec 7.3.1.
  - 8.3.4.1 An intermediate surrogate standard is prepared with the Aroclor 1016/Aroclor 1260 intermediate standard by diluting the 200 µg/mL surrogate stock 1:40 with hexane.
  - 8.3.4.2 A surrogate spiking solution is prepared at 2 µg/mL by making a 1:100 dilution of the surrogate stock standard in acetone. The surrogate solution is stored in the refrigerator for up to six months.
- 8.3.5 Matrix spike solution: Prepare a spiking solution at 40 µg/mL containing both Aroclors 1016 and 1260 by diluting the 1000 µg/mL stock standards 1:25 with acetone.

## 9) Apparatus and Equipment

### 9.1 Gas Chromatograph (GC)

- 9.1.1 Analytical system complete with gas chromatograph suitable for splitless or split automated injection into a wide bore capillary column with an electron capture detector (ECD). Use of Large Volume Injection (LVI) is optional. Helium is used as the carrier gas; argon/methane mixture is used for the detector makeup gas (auxiliary gas).
- 9.1.2 GC Autosampler: The GC system should be configured with a compatible autosampler for automated injection of standards, samples, and QC samples.
- 9.1.3 GC Columns - fused silica capillary columns

Column 1: DB-35MS 30 m x 0.32 mm ID, 0.25 µm df or equivalent\*  
Column 2: DB-XLB 30 m x 0.32 mm ID, 0.50 µm df or equivalent\*

**Note:** Column diameter and film thickness may vary depending on instrument. Refer to the instrument maintenance logbook for the columns used for a specific instrument configuration.

- 9.2 Data System - A computer data system must be interfaced to the GC/ECD. The system must allow the continuous acquisition and storage on machine-readable media of all chromatographic data obtained throughout the duration of the chromatographic program. The computer must have software that includes automated calibration, identification, and quantitation routines. The software must also be capable of integrating the chromatographic peaks abundances.

## 10) Preventative Maintenance

- 10.1 All maintenance activities are recorded in a maintenance logbook kept for each instrument. Pertinent information (serial numbers, instrument I.D., etc.) must be in the logbook. The entry in the log must include: date of event, the initials of who performed the work, and a reference to analytical control.

- 10.2 Carrier gas - Inline purifiers or scrubbers should be in place for all sources of carrier gas. These are selected to remove water, oxygen, and hydrocarbons. Purifiers should be changed as recommended by the supplier.
- 10.3 Gas Chromatograph
  - 10.3.1 Whenever GC maintenance is performed, care should be taken to minimize the introduction of air or oxygen into the column. Injection port maintenance includes changing the injection port liner, seal, washer, o-ring, septum, column ferrule, and autosampler syringe as needed. Liners and seals should be changed when recent sample analyses predict a problem with chromatographic performance. In some cases liners and seals may be cleaned and re-used. Additionally, disassembly and sonication of the septum-less head may be performed if indicated.
  - 10.3.2 Clipping off a small portion of the head of the column often improves chromatographic performance. When cutting off any portion of the column, make sure the cut is straight and "clean" (uniform, without fragmentation) by using the proper column cutting tool.
  - 10.3.3 Over time, the column will exhibit poorer overall performance, as contaminated sample matrices are analyzed. The length of time for this to occur will depend on the samples analyzed. When a noticeable decrease in column performance is evident and other maintenance options do not result in improvement, the column should be replaced. This is especially true when evident in conjunction with calibration difficulties.

## 11) Procedure

### 11.1 Sample Preparation

11.1.1 Water samples (1L or less) are extracted at a pH of 5-9 with methylene chloride, using either continuous Liquid-Liquid extraction (EPA Method 3510C or 3520C); with hexane by microextraction (SW-846 Method 3511). Refer to the applicable extraction SOP.

**Note:** Project-specific or regulation-specific extraction methods may apply. For projects originating from South Carolina and under the SC DHEC lab certification, use the EPA Method 3520C extraction method only.

11.1.2 Soil/sediment samples are extracted using either a automated Soxhlet extraction, (EPA Method 3541, EXT-3541) or by microwave extraction (SW-846 Method 3546, EXT-3546). Refer to the applicable extraction SOP.

11.1.3 Waste samples (organic liquids) may be prepared using the waste dilution method (EPA Method 3580A, EXT-3580). Refer to the extraction SOP for specific parameters.

11.1.4 Additional sample cleanup procedures may be employed as appropriate for the samples. Refer to the section on interferences and the appropriate ALS SOP.

### 11.2 Calibration

**Note:** The calibration procedure(s) and options chosen must follow the ALS protocols. Any exceptions to the calibration procedures detailed in *Calibration of Instruments for Organics Chromatographic Analyses* (SOC-CAL) are described as follows:

**Note:** Certain state or program protocols have specific procedures for calibration. The analyst must ensure that the correct procedures are used. Known exceptions are as follows:

- The use of quadratic regression calibration is not allowed for projects (samples) originating from South Carolina and under the SC DHEC lab certification.

**Note:** DOD QSM requires the quantitation for Aroclors must be performed using a 5-point calibration. Results may not be quantitated using a single point.

11.2.1 For each target Aroclor, select three to six characteristic peaks to use for quantitation. Choose peaks that are at least 25% of the height of the largest Aroclor peak and do not coelute with any of the DDT analogs. For each Aroclor, select at least one quantitation peak that is unique to that Aroclor. Use at least five peaks for the Aroclor 1016 and Aroclor 1260 mixture, none of which should be found in both of these Aroclors. Establish the retention time window position using the mid-point of the ICAL range before processing the calibration curve.

11.2.2 Calibrate the system immediately prior to conducting any analyses. Refer to Table 3 for instrument conditions. Starting with the standard of lowest concentration, analyze each calibration standard and tabulate response (peak area) versus the concentration in the standard. Calculate the ratio of the response to the amount injected the (calibration factor) for each analyte at each standard concentration. The Relative Standard Deviation (RSD) must be less than 20% when average response factor is used.

11.2.3 The calibration of each Aroclor is verified by an independent source. Prepare an independent calibration verification standard (ICV) by dilution of a stock solution purchased from a different vendor and analyze immediately after each initial calibration. Calculate the concentration using the typical procedure used for quantitation. Calculate the percent difference (%D) from the ICV true value. Evaluate the ICV as described in *Calibration of Instruments for Organics Chromatographic Analyses* (SOC-CAL).

### 11.3 Calibration Verification

11.3.1 The working calibration curve or calibration factor must be verified on each analytical sequence by the analysis of one or more mid-range calibration standards (CCV) containing Aroclors 1016/1260 and the surrogates. A standard (CCV) must be injected at the start of each sequence and after each set of sample extracts (every 10 samples or every 12 hours, whichever is first) in the analysis sequence. Evaluate the CCV as described in SOC-CAL. The %D for Aroclor 1016 is a control for Aroclors 1016, 1221, 1232, 1242, and 1248. The %D for Aroclor 1260 controls for Aroclors 1254, 1260, 1262, and 1268.

**Note:** DOD projects require a CCV analysis every 10 field samples.

### 11.4 Retention Time Windows

11.4.1 Pattern recognition/matching and retention times are used for the identification of PCBs as Aroclors.

11.4.2 Establish retention time windows for the peaks used for quantitation with the GC system in acceptable operating condition. Make three injections of all analytes throughout the course of a 72 hour period. Serial injections over less than a 72 hour period may result in retention time windows that are too tight. Using retention times from these analyses, calculate retention time windows. Refer to

EPA Method 8000C for detailed instructions.

11.4.3 Plus or minus three times the standard deviation of the absolute retention times for each standard will be used to define the retention time window; however, the experience of the analyst should weigh heavily in the interpretation of chromatograms. In those cases where the standard deviation for a particular standard is zero, the laboratory may use a default window of  $\pm 0.03$  minutes. If the peak width is  $> 0.06$  minutes, use a default window of 0.1 minutes.

11.4.4 Calculate retention time windows for each standard on each GC column and whenever a new GC column is installed. Retain this data in the method file.

11.5 Gas Chromatography

11.5.1 Set up an analytical sequence for the standards and samples to be analyzed. Calibrate the system as described in Section 11.2. Refer to Table 3 for typical instrument operating conditions. The same conditions must be used for samples as for calibration and QC analyses. Ensure that the instrument configuration is correct and that any necessary maintenance has been performed. Figure 1 shows a typical analysis sequence.

11.5.2 Evaluate the CCVs as indicated in Section 11.3. Use the standards interspersed throughout the sample analysis sequence to evaluate the qualitative performance of the GC system including positioning of the retention time window. If any retention time shift which would impede analyte identification is evident (as shown by Aroclor pattern irregularities or the surrogate falling outside of the retention time window), evaluate the chromatogram for possible causes such as carryover from a highly contaminated sample. If a problem related to GC system has been determined to be the cause of retention time shift, perform whatever maintenance is necessary before reanalyzing the CCV or recalibrating and proceeding with sample analysis. All samples that were injected after the sample exceeded the criteria must be re injected if initial analysis indicated the presence of any analytes of interest.

**Note:** For DOD projects, the CCB must be analyzed following the CCV. Instrument blanks and CCBs may not be analyzed prior to QC samples or standards.

#### 11.6. Troubleshooting

11.6.1. Initial calibration – If the initial calibration fails to meet the criteria, or the ICV fails (indicating a calibration problem), the following steps may be taken, depending on nature of the problem.

- Recheck the information entered into the software used for calibration and quantitation. Verify the standard values are correct and data files are correct. If incorrect, repeat the calibration with the correct information.
- Recheck standards preparation to ensure that standards are correct. Re-prepare and reanalyze if needed.
- Ensure that proper preventive maintenance was performed. Repeat the preventive maintenance if necessary and reanalyze the calibration.
- If calibration problems persist or more substantial calibration problems exist, corrective maintenance or repair may be needed. This includes such measures as column changes, detector maintenance, or GC repair. This will depend on the nature of the problem. Following any such maintenance, repeat the calibration.

11.6.2. Continuing calibration – If the CCV analysis fails to meet the criteria, the following steps may be taken, depending on nature of the problem.

- Recheck the information entered into the software used for calibration and quantitation. Verify the standard values are correct and data files are correct. If incorrect, repeat the calibration with the correct information.
- Recheck standards preparation to ensure that standards are correct and that the correct standard is used as the CCV. Re-prepare and reanalyze if needed. Note that NELAC and DOD requirements apply when multiple CCVs are analyzed.
- Ensure that proper preventive maintenance was performed. Repeat the preventive maintenance if necessary and reanalyze the CCV.
- If calibration problems persist or more substantial calibration problems exist, corrective maintenance or repair may be needed. This includes such measures as column changes, detector maintenance, or GC repair. This will depend on the nature of the problem. Following any such maintenance, repeat analysis of the CCV and necessary samples. Major maintenance will require recalibration. Note that some samples may quickly deteriorate the system to the point that closing CCVs will not pass. This should be verified through a second run of the samples and documented.

## 12) QA/QC Requirements

### 12.1 Initial Precision and Recovery Validation

12.1.1 The precision of the extraction procedure and the GC procedure must be validated before analysis of samples begins, or whenever significant changes to

the procedures have been made. To do this, four reagent water samples are spiked at a level near the midpoint of the calibration range (typically the LCS level), then extracting and proceeding with Section 11. The spiking solution may be prepared from pure standard materials, or purchased as certified solutions. If prepared by the laboratory, stock standards prepared independently from those used for calibration should be used. The concentration of the analytes to be spiked is 20x the MRL.

## 12.2 Method Detection Limits and Method Reporting Limits

12.2.1 A method detection limit (MDL) study must be undertaken before analysis of samples can begin. To establish detection limits that are precise and accurate, the analyst must perform the following procedure. Spike seven blank matrix (water or soil) samples with MDL spiking solution at a level below the MRL. Follow the analysis procedures in Section 11 to analyze the samples.

12.2.2 Calculate the average concentration found ( $\bar{x}$ ) in  $\mu\text{g/mL}$ , and the standard deviation of the concentrations ( $s$ ) in  $\mu\text{g/mL}$  for each analyte. Calculate the MDL for each analyte. Refer to the SOP *Performing and Documenting Method Detection Limit Studies and Establishing Limits of Detection and Limits of Quantitation* (CE-QA011/ADM-MDL).

### 12.2.3 Limits of Quantification (LOQ)

12.2.3.1 The laboratory establishes a MRL/LOQ for each analyte as the lowest reliable laboratory reporting concentration or in most cases the lowest point in the calibration curve which is less than or equal to the desired regulatory action levels, based on the stated project requirements. Analysis of a standard or extract prepared at the lowest point calibration standard provides confirmation of the established sensitivity of the method. The LOQ recoveries should be within 50-150% of the true values to verify the data reporting limit. Refer to the SOP *Performing and Documenting Method Detection Limit Studies and Establishing Limits of Detection and Limits of Quantitation* (CE-QA011/ADM-MDL).

12.2.4 The Method Reporting Limits (MRLs) used at ALS Kelso are the routinely reported lower limits of quantitation which take into account day-to-day fluctuations in instrument sensitivity as well as other factors. These MRLs are the levels to which ALS Kelso routinely reports results in order to minimize false positive or false negative results. The MRL is normally two to ten times the method detection limit.

12.3 Ongoing QC Samples required are described in the ALS-Kelso Quality Assurance Manual and in the SOP for Sample Batches. Additional QC Samples may be required in project specific quality assurance plans (QAPP). General QA requirements for DoD QSM are defined in the laboratory SOP *Department of Defense Projects – Laboratory Practices and Project Management* (ADM-DOD) or *Department of Defense Projects – Laboratory Practices and Project Management – QSM 5.0* (ADM-DOD5). General QC Samples are:

### 12.3.1 Method Blank

12.3.1.1 A method blank is extracted and analyzed with every batch of 20 (or fewer) samples to demonstrate that there are no method interferences. If the method blank shows any hits above the reporting limit, corrective action must be taken. Corrective action includes recalculation, reanalysis, system cleaning, or re-extraction and reanalysis. For some project

specific needs, exceptions may be noted and method blank results above the MRL may be reported for common lab contaminants (phthalate esters, etc.).

**Note:** DoD projects require that no analyte be detected > ½ the RL or 1/10 the regulatory limit, whichever is greater.

### 12.3.2 Laboratory control Sample

12.3.2.1 A lab control sample (LCS) must be extracted and analyzed with every batch of 20 samples. The water LCS is prepared by adding 50 µL of the matrix spike solution to 1L of reagent water, resulting in a concentration of 2.0 µg/L. The soil LCS is prepared by adding 100 µL of spike solution to 20 g of sand, resulting in a concentration of 200 µg/kg. For project-specific low-level extractions, spiking amounts can be adjusted accordingly. Calculate percent recovery (%R) as follows:

$$\%R = X/TV \times 100$$

Where X = Concentration of the analyte recovered  
TV = True value of amount spiked

12.3.2.2 Current ALS QC acceptance criteria for lab control samples are listed in the current laboratory DQO tables. Project-specific or program-specific acceptance criteria may supersede ALS criteria. For example, for samples requiring South Carolina DHEC certification the acceptance criteria are 70-130 % recovery. If the lab control sample (LCS) fails acceptance limits for any of the compounds, corrective action must be taken. Corrective action includes recalculation, reanalysis, or re-extraction and reanalysis. Refer to the ALS-Kelso Quality Assurance Manual for guidance in evaluating recoveries that exceed LCS limits.

### 12.3.3 Matrix Spike

12.3.3.1 A matrix spike (MS) and duplicate matrix spike (DMS) must be prepared and analyzed with every batch of 20 (or fewer) samples. The MS/DMS is prepared by adding the same volume of the matrix spike solution to the sample as listed for the LCS, then proceeding the entire extraction and analysis as specified in Section 11. Calculate percent recovery (%R) as:

$$\%R = \frac{X - X1}{TV} \times 100$$

Where X = Concentration of the analyte recovered  
X1 = Concentration of unspiked analyte  
TV = True value of amount spiked

12.3.3.2 Calculate Relative Percent Difference (RPD) as:

$$RPD = \frac{|R1 - R2|}{(R1 + R2) / 2} \times 100$$

Where R1 = % recovery of the MS  
R2 = % recovery of the DMS

12.3.3.3 Current QC acceptance criteria for MS/DMS are the same as the LCS as listed in the lab DQO tables. Project-specific acceptance criteria may supersede lab criteria. If the MS/DMS recovery is out of acceptance limits for reasons other than matrix effects, corrective action must be taken. Corrective action includes recalculation, reanalysis, or re-extraction and reanalysis.

12.3.3.4 Following analysis of the MS the percent recovery is calculated and compared to acceptance limits. If the recovery is within control limits the results may be reported. If not, and the LCS is within control limits, this indicates that the matrix potentially biases analyte recovery. It is verified that the spike level is at least five times the background level. If not, the results are reported with a qualifier that the background level is too high for accurate recovery determination. If matrix interferences are present or results indicate a potential problem with sample preparation, steps may be taken to improve results; such as performing any additional cleanups, dilution and reanalysis, or re-preparation and reanalysis. Results that do not meet acceptance limits are reported with an appropriate qualifier.

#### 12.3.4 Surrogate

12.3.4.1 Surrogate spike is added to every sample, blank and spike prior to extraction. Two surrogate standards (Tetrachloro-m-xylene and Decachlorobiphenyl) are added to each sample. For water, 100 µL of the surrogate spike is added to 1 L, resulting in 0.2 µg/L. For soil, 200 µL of the surrogate spike is added to 20 g, resulting in 20 µg/Kg. Calculate surrogate percent recovery (%R) as:

12.3.4.2 Calculate surrogate percent recovery (%R) as:

$$\%R = S/V \times 100$$

Where S = Amount of surrogate recovered  
V = Amount spiked

12.3.4.3 Current QC acceptance criteria for surrogates are listed in the current laboratory DQO tables. Project specific acceptance criteria may supersede lab criteria. Both surrogate recoveries must be within the acceptance limits. If either (or both) surrogate is outside of acceptance limits for reasons other than matrix interferences, corrective action must be taken. Corrective actions include recalculation, reanalysis, or re-extraction and reanalysis. The acceptance criteria listed are current criteria, but are subject to change as control limits are updated.

12.3.5 QC results should be reviewed periodically for trends in results. Refer to the SOP *Trending, Control Limits, and Uncertainty* (ADM-TREND) for guidance. Control limits for QC analyses may be determined using the control charts or similar mechanism on an annual basis.

### 13) Data Reduction and Reporting

#### 13.1 Identification of PCBs as Aroclors

13.1.1 To identify Aroclors, compare the chromatographic pattern of the sample to known Aroclor standards. Tentative identification of PCBs as Aroclors is made when the pattern of peaks in the sample chromatogram matches the pattern of

peaks in the Aroclor standard itself. There also needs to be agreement between the retention times and response ratios of the 3-6 selected quantitation peaks in the sample chromatogram and the Aroclor standard.

- 13.1.2 Tentative identification of analytes must be confirmed using a second GC column of dissimilar phase. Identify the Aroclor by comparing the chromatographic pattern of the sample to known Aroclor standards analyzed on the same column. Confirmation of the Aroclor is made when the sample chromatogram matches the pattern of peaks in the Aroclor being confirmed. Quantitation results for the 2 columns must agree ( $\leq 40\%$  RPD) to confirm the identification. If interferences or other sample anomalies make the RPD value  $>40\%$  but the analyst makes a positive identification, the basis of the identification must be documented and the data user notified of the discrepancy (see section 13.2).
- 13.2 Sample matrix difficulties
  - 13.2.1 Weathering of PCBs in the environment and changes resulting from waste treatment processes may alter the pattern of a specific Aroclor so it does not closely match an Aroclor standard. The earlier eluting peaks will often diminish in comparison to the later eluting peaks. If this is observed, alternate peaks may be selected to aid identification to reduce quantitation bias.
  - 13.2.2 Metabolism by organisms may also alter the pattern since individual PCB congeners are metabolized at different rates. When working with tissue samples, the 40% RPD criteria for confirmation may not be met.
  - 13.2.3 Samples may also include mixtures of two or more Aroclors. To the extent possible, identify and quantify each Aroclor.
  - 13.2.4 High amounts of organochlorine pesticides in the sample may interfere with identification. If this is observed, alternate peaks may be selected to aid identification and to reduce quantitation bias.
  - 13.2.5 For all of these reasons a high level of analyst expertise is required to interpret complex chromatograms.
- 13.3 Quantitation of PCBs as Aroclors:
  - 13.3.1 The quantitation of PCBs as Aroclors is accomplished by comparison of the sample chromatogram to that of the most similar Aroclor standard or standards. All calibration acceptance criteria as described in section 11 must be met before reporting any results. Sample results should then be reported according to *Confirmation Procedures for GC and HPLC Analyses* (SOC-CONF). Results may be reported from either column if all calibration acceptance criteria as described in section 11 are met.
  - 13.3.2 Once the Aroclor pattern has been identified, compare the responses of 3 to 6 major peaks in the calibration standard of that Aroclor with the peaks observed in the sample extract. The amount of Aroclor is calculated using the individual calibration factor for each of the 3 to 6 peaks and the calibration model selected in section 11. The concentration is determined using the 3 to 6 characteristic peaks and then the concentrations are averaged to determine the concentration of the Aroclor. If there are interfering peaks with the 3 to 6 quantitation peaks that cause Aroclor average to be falsely overstated, then that interference peak is Q-deleted using the data system and the average is recalculated so that the average more truly represents the concentration in the sample. This often occurs when there are more than one Aroclor in a sample extract or if pesticides are

present. Quantitation of mixed Aroclors will require the selection of peaks that are not shared in common by both Aroclors.

- 13.3.3 For samples with severe matrix interferences, the quantitation may be performed by measuring the total area of the PCB pattern and quantifying on the basis of the Aroclor standard that is most similar to the sample. Any peaks that are not identifiable as PCBs should be subtracted from the total area. When the quantitation option is used, the sample problems should be described for the data user and quantification procedure documented.
- 13.3.4 Using the data system, calculate the concentration in the extract using the calibration model chosen for calibration from *Calibration of Instruments for Organics Chromatographic Analyses* (SOC-CAL).
- 13.3.4.1 Using the data system, calculate the concentration of each analyte in the sample extract ( $C_{ex}$ ) in  $\mu\text{g/ml}$  units using the calibration factor or calibration curve (Section 11). The sample concentration computed using the following equations:

$$\text{Aqueous Samples: Concentration } (\mu\text{g} / \text{L}) = \frac{(C_{ex}) (V_f) (D)}{(V_s)}$$

Where

$C_{ex}$	=	Concentration in extract in $\mu\text{g/ml}$
$V_f$	=	Final volume of extract in mL
$D$	=	Dilution factor
$V_s$	=	Volume of sample extracted, liters

$$\text{Non-aqueous Samples: Concentration } (\text{mg} / \text{Kg}) = \frac{(C_{ex}) (V_f) (D) \times 1,000}{(W) \times 1,000}$$

Where

$C_{ex}$	=	Concentration in extract in $\mu\text{g/ml}$
$V_f$	=	Final volume of extract in mL
$D$	=	Dilution factor
$W$	=	Weight of sample extracted in grams.

- 13.4 Sample concentrations are reported when all QC criteria for the analysis have been met or the results are qualified with a footnote.
- 13.5 Data Review
- 13.5.1 Following primary data interpretation and calculations, all data is reviewed by a secondary analyst. Following generation of the report, the report is also reviewed. Refer to the SOP *Laboratory Data Review Process* (ADM-DREV) for details. The person responsible for final review of the data report and/or data package should assess the overall validity and quality of the results and provide any appropriate comments and information to the Project Manager to inclusion in the report narrative.
- 13.6 Reporting
- 13.6.1 Reports are generated using the STEALTH Data Reporting System which compiles the SMO login information. This compilation is then transferred to a file, which STEALTH uses to generate a report. The forms generated may be ALS standard

reports, DOD, or client-specific reports. The compiled data from LIMS is also used to create EDDs.

13.6.2 Sample concentrations are reported when all QC criteria for the analysis have been met or the results are qualified with an appropriate footnote. For Arizona projects the appropriate Arizona qualifier must be used.

#### 14) Contingencies for Handling Out-of-Control or Unacceptable Data

14.1 Refer to the SOP for *Non Conformance and Corrective Action* (CE-QA008/ADM-NCAR) for procedures for corrective action. Personnel at all levels and positions in the laboratory are to be alert to identifying problems and nonconformities when errors, deficiencies, or out-of-control situations are detected.

#### 15) Method Performance

15.1 This method was validated through single laboratory studies of accuracy and precision. Refer to the reference method for additional method performance data available. The method detection limit (MDL) is established using the procedure described in the SOP *Performing and Documenting Method Detection Limit Studies and Establishing Limits of Detection and Quantification*. Method Reporting Limits are established for this method based on the low calibration point and the MDL study results.

#### 16) Pollution Prevention and Waste Management

16.1 The laboratory will comply with all Federal, State and local regulations governing waste management, particularly the hazardous waste identification rules and land disposal restrictions as specified in the ALS Lab Waste Management Plan.

#### 17) Training

17.1 All analysts performing this analysis are required to read and understand this SOP.  
17.2 Training is documented following the *Employee Training and New Employee Orientation* (ADM-TRAIN).

#### 18) Method Modifications

18.1 There are no known modifications in this laboratory standard operating procedure from the reference method.

## STANDARD OPERATING PROCEDURE

ALS | Environmental – Kelso

Chlorinated Herbicides

SOC-8151, Rev. 19.0

Effective 12/2/2020

SOP Review: 2/12/2021

Page 2 of 18

### 1. Scope and Applicability

- 1.1. This procedure is used to determine the concentrations of chlorinated herbicides in water and soil samples using EPA Method 8151A. Compounds that may be determined by this method and the associated method reporting limit (MRL) or Lower Limit of Quantitation (LLOQ) for each compound in water and soil are listed in Table 1. The reported MRL may be adjusted if required for specific project requirements; however, the capability of achieving other reported MRLs must be demonstrated. Method detection are listed in the laboratory DQO tables.
- 1.2. The form of each acid herbicide (salts and esters) occurring in the sample is not distinguished by this method. The results are calculated and reported for each analyte as the total free acid herbicide.
- 1.3. In cases where there is a project-specific quality assurance plan (QAPP), the project manager identifies and communicates the QAPP-specific requirements to the laboratory. In general, project specific QAPP's supersede method specified requirements. An example of this are projects falling under DoD ELAP. QC requirements defined in the SOP *Department of Defense Projects – Laboratory Practices and Project Management* (ADM-DOD/ADM-DOD5) may supersede the requirements defined in this SOP.

### 2. Summary of Procedure

- 2.1. This procedure provides gas chromatographic (GC) conditions for the detection of chlorinated herbicides. Prior to GC analysis, an appropriate sample extraction technique must be used to recover the analytes. Water and soil samples are adjusted to a pH <2, and the herbicides in both acid and derivatized forms are extracted with ethyl ether. Derivatives of the phenoxy acid herbicides in the extract are hydrolyzed to the acid form by the addition of sodium hydroxide and, for soils, heat. The sample is acidified, and the acid herbicides are extracted. The acids are then converted to their methyl esters using diazomethane. For extraction of soil/solid samples, modifications to method 8151A are made to minimize chromatographic interferences from aldol condensation products. Also, the Dichloromethane extraction (wash) is not used for water samples since it has been shown that certain target analytes are lost during this step.
- 2.2. A 2  $\mu$ L aliquot of the derivatized extract is injected into the gas chromatograph (GC). The compounds are separated on a fused silica capillary column and detected by an electron capture detector. Identification of the analytes is performed by comparing the retention times of the analytes with the respective retention times of an authentic standard, which has been derivatized to the methyl ester. Quantitative analysis is performed by using the authentic standard to produce a calibration factor or calibration curve, and using the calibration data to determine the concentration of an analyte in the extract. The concentration in the sample is calculated using the sample weight or volume and the extract volume.
- 2.3. The sensitivity of this method usually depends on the level of interferences rather than on instrument limitations.

### 3. Definitions

- 3.1. For laboratory definitions applicable to most analyses, refer to the SOP for *Sample Batches*.

## STANDARD OPERATING PROCEDURE

ALS | Environmental - Kelso

Chlorinated Herbicides

SOC-8151, Rev. 19.0

Effective 12/2/2020

SOP Review: 2/12/2021

Page 3 of 18

### 4. Responsibilities

- 4.1. It is the responsibility of the analyst to perform the analysis according to this SOP and to complete all documentation required for data review. Analysis and interpretation of the results are performed by personnel in the laboratory who have demonstrated the ability to generate acceptable results utilizing this SOP. This demonstration is in accordance with the training program of the laboratory. Final review and sign-off of the data is performed by the department supervisor/manager or designee.
- 4.2. It is the responsibility of the department supervisor/manager to document analyst training and method proficiency as described in *Employee Training and New Employee Orientation* (ADM-TRAN).

### 5. Interferences

- 5.1. Organic acids, especially chlorinated acids, cause the most direct interference with the determination. Phenols, including chlorophenols may also interfere with this procedure.
- 5.2. The herbicides, being strong organic acids, react readily with alkaline substances and may be lost during analysis. Therefore, glassware may need to be acid-rinsed and then rinsed to constant pH with organic-free reagent water. Sodium sulfate must be acidified.
- 5.3. Sample extracts should be dry prior to methylation or else poor recoveries

### 6. Safety

- 6.1. Chemicals, reagents and standards must be handled as described in the ALS safety policies, approved methods and in SDSs where available. Refer to the ALS Chemical Hygiene Plan and the appropriate SDSs prior to beginning this method.
- 6.2. The toxicity or carcinogenicity of each compound or reagent used in this method has not been precisely determined; however, each chemical compound should be treated as a potential health hazard. Exposure to these compounds should be reduced to the lowest possible level. A reference file of Safety Data Sheets (SDS) is available to all personnel involved in these analyses. ALS also maintains a file of OSHA regulations regarding the safe handling of the chemicals specified in this method.
- 6.3. Chemicals, reagents and standards must be handled as described in the ALS safety policies, approved methods and in SDSs where available. Refer to the ALS Kelso Chemical Hygiene Plan and the appropriate SDS prior to beginning this method.
- 6.4. Sodium Hydroxide (NaOH) is a strong caustic and a severe health and contact hazard. Use nitrile or latex gloves while handling pellets or preparing solutions.
- 6.5. The use of Diazomethane requires special consideration. It is a toxic carcinogen, which can explode under certain conditions. The following precautions must be followed:
  - 6.5.1. Use only a well-ventilated hood - do not breathe vapors.
  - 6.5.2. Use a safety screen.
  - 6.5.3. Use mechanical pipetting aides.

## STANDARD OPERATING PROCEDURE

ALS | Environmental - Kelso

Chlorinated Herbicides

SOC-8151, Rev. 19.0

Effective 12/2/2020

SOP Review: 2/12/2021

Page 4 of 18

- 6.5.4. Do not heat above 9°C - Explosion may result.
- 6.5.5. Avoid grinding surfaces, ground glass joints, sleeve bearings, glass stirrers; Explosion may result.
- 6.5.6. Store away from alkali metals - Explosion may result.
- 6.5.7. Solutions of diazomethane decompose rapidly in the presence of solid materials such as copper powder, calcium chloride, and boiling chips.
- 6.5.8. Store in a freezer at -10°C.
- 6.6. Refer to diazomethane SOP (EXT-DIAZ) for preparation and holding times.

## 7. Sample Collection, Containers, Preservations and Storage

- 7.1. Containers used to collect samples should be purchased pre-cleaned containers.
- 7.2. Water and soil samples must be iced or refrigerated at  $4 \pm 2^\circ\text{C}$  and protected from light from time of collection until extraction.
- 7.3. Water and soil samples must be iced or refrigerated at  $<6^\circ\text{C}$  and protected from light from time of collection until extraction.

## 8. Standards, Reagents, and Consumable Materials

- 8.1. Sodium hydroxide (NaOH), 10N.
- 8.2. Sulfuric Acid ( $\text{H}_2\text{SO}_4$ ), 1:1.
- 8.3. Concentrated Hydrochloric Acid (HCl).
- 8.4. Silicic Acid.
- 8.5. Solvents: ethyl ether, methanol, isooctane (pesticide quality or equivalent).
- 8.6. Acidified sodium sulfate (anhydrous),  $\text{Na}_2\text{SO}_4$ . Pre-clean by heating at  $400^\circ\text{C}$  for 4 hours. Acidify as directed in Method 8151A. Once prepared, place the sodium sulfate in an oven at  $\geq 130^\circ\text{C}$ . Store at this temperature when not in use. If the oven is also used for other purposes, verify the oven temperature while stored.
- 8.7. Acidified glass wool. Pre-clean by solvent rinsing. Acid wash prior to use.
- 8.8. Stock Solutions
  - 8.8.1. Stock solutions are purchased from Accustandard (M-8151), Ultra Scientific (HBM-8150A) or other vendors. The concentration of analytes varies from 100 - 10,000 ppm in methanol. The stock standards used to make the calibration standards are the herbicide methyl esters. The analyte concentration for calibration standards is converted to acid equivalent based on molecular weight. This allows for accurate quantitation of target analytes on an acid equivalent basis. Stock solutions are stored in the freezer until the manufacturer's expiration date.

## STANDARD OPERATING PROCEDURE

ALS | Environmental – Kelso

Chlorinated Herbicides

SOC-8151, Rev. 19.0

Effective 12/2/2020

SOP Review: 2/12/2021

Page 5 of 18

8.8.2. 2,4-Dichlorophenyl acetic acid is the surrogate and is purchased as the acetate for preparing the calibration standards at 1000 ppm. The acid form is purchased for spiking.

### 8.9. Working Solutions

8.9.1. A working solution is prepared by diluting the stock solutions (targets and surrogate) of the methyl esters 1:100 in isooctane. The working solution is stored in a refrigerator and has a 6 month expiration date.

8.9.2. A minimum of 5 calibration standards are made for initial calibration by diluting the working solution. The suggested calibration range is 10 ppb to 200 ppb, except for MCPP and MCPA which are at 1000 ppb to 20000ppb.

### 8.10. QC Standards

8.10.1. The surrogate spiking solution is prepared at 5 µg/mL in isooctane. For water and soil samples, 500 µl of surrogate solution is added to each sample and blank. For soils, 1000 µl of surrogate solution is added to each sample and blank. The surrogate is used to evaluate the effectiveness of the extraction procedure. The standard is stored at  $4 \pm 2^\circ\text{C}$  for up to 6 months.

8.10.2. A matrix spike solution containing all analytes (at various concentrations) is prepared in acetone (Absolute Standard or equivalent). This solution contains the free acid forms of the analytes. For water, 500 µl of matrix spike solution is added to all matrix spikes and lab control samples, and 1000 µl for and soil MS/LCS samples. The standard is stored at  $4 \pm 2^\circ\text{C}$  for up to 6 months.

8.10.3. Independent Calibration Verification (ICV) standard. A stock standard from a second source, independent of that used for preparation of calibration standards, is prepared. Using this stock standard, dilute to give a working standard, which is a mid-calibration concentration. The standard is used to verify accuracy of the calibration.

## 9. Apparatus and Equipment

9.1. Gas Chromatograph - Analytical system complete with gas chromatograph (GC) suitable for splitless or on-column automated injection into guard and analytical columns with an electron capture detector (ECD). The gas chromatograph can be configured with two analytical columns and two ECDs connected to the same guard column. Helium is used as the carrier gas; argon/methane mixture is used for the detector makeup gas (auxiliary gas).

### 9.2. GC Columns

9.2.1. Column 1: 30m x 0.32mm x 0.30u RTX-C1 Pesticides.

9.2.2. Column 2: 30m x 0.32mm x 0.25u RTX-CLPesticides.

9.3. Data system - A computer system must be interfaced to the GC. The system must allow the continuous acquisition and storage on machine-readable media of all chromatographic data obtained throughout the duration of the chromatographic program. The computer must have software that can search any GC data file and plot such response versus time. Must be

## STANDARD OPERATING PROCEDURE

Effective 12/2/2020

SOP Review: 2/12/2021

Page 6 of 18

capable of performing calibrations and quantitation calculations. HP Enviroquant is the current software in use.

- 9.4. Analytical balance (0.0001 g).
- 9.5. Volumetric flasks, syringes, vials, and bottles for standards preparation.

## 10. Preventative Maintenance

- 10.1. All maintenance activities are recorded in a maintenance logbook kept for each instrument. Pertinent information (serial numbers, etc.) must be in the logbook. Maintenance entries should include date, symptom of problem, corrective actions, a description of maintenance, date, and name. The log should contain a reference to return to analytical control.
- 10.2. Carrier gas - Inline purifiers or scrubbers should be in place for all sources of carrier gas. These are selected to remove water, oxygen, and hydrocarbons. Purifiers should be changed as recommended by the supplier.
- 10.3. Gas Chromatograph
  - 10.3.1. Whenever GC maintenance is performed, care should be taken to minimize the introduction of air or oxygen into the column. Injection port maintenance includes changing the injection port liner, seal, washer, O-ring, septum, column ferrule, and autosampler syringe as needed. Liners and seals should be changed when recent sample analyses predict a problem with chromatographic performance. In some cases liners and seals may be cleaned and re-used.
  - 10.3.2. Clipping off a small portion of the head of the column often improves chromatographic performance. When cutting off any portion of the column, make sure the cut is straight and "clean" (uniform, without fragmentation) by using the proper column-cutting tool.
  - 10.3.3. Over time, the column will exhibit poorer overall performance, as contaminated sample matrices are analyzed. The length of time for this to occur will depend on the samples analyzed. When a noticeable decrease in column performance is evident and other maintenance options do not result in improvement, the column should be replaced.
- 10.4. The autosampler should be cleaned periodically. This includes turret cleaning and cleaning or replacing the syringe. Refer to manufacturer's instructions for autosampler restarting.
- 10.5. The detector should be leak-checked and serviced as specified by the manufacturer.

## 11. Procedure

- 11.1. Sample Preparation - Water samples
  - 11.1.1. Extract 1 L aqueous sample. Mark the water meniscus on the side of the sample bottle for later determination of sample volume. Pour the entire sample into a 2 L separatory funnel. Add surrogate and matrix spike as needed.
  - 11.1.2. Add 250 g NaCl to the sample, seal, and shake to dissolve salt.

STANDARD OPERATING PROCEDURE

ALS | Environmental - Kelso

Chlorinated Herbicides

SOC-8151, Rev. 19.0

Effective 12/2/2020

SOP Review: 2/12/2021

Page 7 of 18

- 11.1.3. Add 7 mL of 10N NaOH to the sample, seal, and shake. Check the pH of the sample with pH paper; if the sample does not have a pH  $\geq 12$ , adjust the pH by adding more 10N NaOH. Let the sample sit at room temperature for a minimum of 1 hour, shaking the separatory funnel and contents periodically.
- 11.1.4. Add 7 mL of 1:1 H<sub>2</sub>SO<sub>4</sub> to the sample, seal, and shake to mix. Check the pH of the sample with pH paper; if the sample does not have a pH  $\leq 2$ , adjust the pH by adding more H<sub>2</sub>SO<sub>4</sub>.
- 11.1.5. Add 100mL ethyl ether to the sample, seal, and extract by shaking or tumbling the funnel for 2 minutes with periodic venting to release excess pressure. Allow the organic layer to separate from the water phase. If the emulsion interface between layers is more than one-third the volume of the solvent layer, the analyst should employ mechanical techniques to complete the phase separation. The optimum technique depends upon the sample, but may include stirring, filtration through glass wool, centrifugation, or other physical methods. Remove the aqueous phase to a 1 L beaker and collect the ether phase in a beaker containing approximately 10 g of acidified anhydrous sodium sulfate. Periodically, shake the sample and drying agent.
- 11.1.6. Return the aqueous phase to the separatory funnel, add a 50 mL volume of ethyl ether to the sample, and repeat the extraction procedure a second time, combining the extracts in a beaker. Perform a third extraction with 50 mL of ethyl ether in the same manner. Allow the extract to remain in contact with the sodium sulfate overnight.
- 11.1.7. Determine the original sample volume by refilling the sample bottle to the mark and transferring the water to a 1000 mL graduated cylinder. Record the sample volume to the nearest 10 mL.
- 11.1.8. Quantitatively transfer the extract into a pre-rinsed K-D apparatus via funnel with small amount of acidified muffled anhydrous sodium sulfate (add more sodium sulfate, if necessary).
- 11.1.9. Evaporate the extract down to approx. 5mL on the S-Evap. keeping the temperature 55-70°C.
- 11.1.10. Esterification
  - 11.1.10.1. Bring to a 10 mL volume in ethyl ether.
  - 11.1.10.2. Remove 1 mL of extract to a second 15ml test tube for derivatization. Store the remaining 9 mL in a sealed and labeled test tube.
  - 11.1.10.3. Derivatize with 1 mL of diazomethane, let stand for 30 minutes, repeat if yellow color is not present.
  - 11.1.10.4. Solvent exchange to iso-octane by adding 1-2 mL of iso-octane then concentrating down to exactly 2 mL on the N-Evap. This gives a true final volume of 20 mL.

11.2. Sample Preparation - Soil samples

## STANDARD OPERATING PROCEDURE

ALS | Environmental – Kelso

Chlorinated Herbicides

SOC-8151, Rev. 19.0

Effective 12/2/2020

SOP Review: 2/12/2021

Page 8 of 18

- 11.2.1. Add 30 g dry weight of the well mixed soil sample into a 250 mL Teflon shaker bottle, utilize acidified sulfate to dry (approx. 10g). Weigh out the method blank using acidified sulfate and the laboratory control sample using matrix sand and acidified sulfate.
- 11.2.2. Adjust to pH 2 using up to 5 mL of concentrated HCl. Add HCl and mix thoroughly. Check with pH strips and record the pH. Add surrogates and matrix spikes as needed.
- 11.2.3. Add 100 mL of ethyl ether and shake sample using wrist action shaker for 30 min.
- 11.2.4. Transfer 20 mL of extract to a large culture tube. Evaporate extract down to ~3ml using N-evap. It is now ready for saponification.
- 11.2.5. Hydrolysis
  - 11.2.5.1. Add 5 mL of Deionized H<sub>2</sub>O to the sample extract in the culture tube.
  - 11.2.5.2. Add 1 mL of 37% (w/v) KOH, and vortex for one minute.
  - 11.2.5.3. Check pH of all samples; if not  $\geq 12$ , repeat 11.2.5.2.
  - 11.2.5.4. Heat on N-Evap., under a gentle stream of nitrogen, for one hour at 60°C, vortex every 20 minutes. When done, cool by letting stand for 10 minutes.
  - 11.2.5.5. The phenoxy acid herbicides remain soluble in the water as potassium salts.
- 11.2.6. Acid Extraction
  - 11.2.6.1. Adjust the pH to 2 by adding 1 mL cold (4°C) sulfuric acid (1:3) to the culture tube. Check pH and add more acid if necessary.
  - 11.2.6.2. Extract the herbicides three times with 5,3,3 mL of ethyl ether, by vortexing for 30 seconds, allowing phases to separate, and collecting the ether layer in another culture tube. Bring to 10 mL volume using iso-octane.
- 11.2.7. Esterification
  - 11.2.7.1. Remove 1 mL of extract for derivatization. Store remaining 9 mL in extract refrigerator.
  - 11.2.7.2. Derivatize with 1 mL of diazomethane, let stand for 30 minutes, repeat if yellow color is not present.
  - 11.2.7.3. Solvent exchange to iso-octane by adding 1-2 mL of iso-octane then concentrating down to exactly 1 mL on the N-Evap (this gives a calculated final volume of 50 mL). Vial exactly 1 mL of extract and mark the meniscus. Archive remaining 9 mL of extract in ether fridge with the meniscus marked.

### 11.3. Initial Calibration

## STANDARD OPERATING PROCEDURE

ALS | Environmental – Kelso

Chlorinated Herbicides

SOC-8151, Rev. 19.0

Effective 12/2/2020

SOP Review: 2/12/2021

Page 9 of 18

**NOTE:** The calibration procedure(s) and options chosen must follow the ALS protocols. Any exceptions to the calibration procedures detailed in the ALS SOP for *Calibration of Instruments for Organics Chromatographic Analyses* (SOC-CAL) are described as follows:

- 11.3.1. Using the GC conditions given in Table 2, calibrate the system prior to conducting any analyses. Starting with the standard of lowest concentration, analyze each calibration standard and tabulate response (peak area or height) versus the concentration in the standard. The results can be used to determine a response factor (RF) for each compound. The average response factor ( $RF_a$ ) is then calculated. The Relative Standard Deviation (RSD) must be less than 20% when average response factor is used.
- 11.3.2. Following initial calibration, analyze an ICV standard. The ICV solution must contain all analytes in the calibration standards. Calculate the concentration using the typical procedure used for quantitation. Calculate the percent difference (%D) from the ICV true value. Evaluate the ICV as described in the SOP for *Calibration of Instruments for Organics Chromatographic Analyses* (SOC-CAL).

### 11.4. Calibration Verification

- 11.4.1.1. The working calibration curve or calibration factor must be verified on each analytical sequence by the analysis of one or more mid-range calibration standards (CCV). A mid-level standard (CCV) must be injected at the start of each sequence and after each set of sample extracts (every 10 samples or every 12 hours, whichever is first) in the analysis sequence.
- 11.4.1.2. The acceptance criterion for all analytes in the CCV analysis is a response (RF or concentration) within  $\pm 20\%$  D of the expected value, as compared to the initial calibration. Refer to the ALS SOP for Calibration of Instruments for Organics Chromatographic Analyses for allowable exceptions.
- 11.4.1.3. Use the mid-level standards interspersed throughout the analysis sequence to evaluate the qualitative performance of the GC system. If any standard falls outside of their daily retention time window, evaluate the chromatogram for possible causes such as carryover from a highly contaminated sample. If a problem related to GC system has been determined to be the cause of retention time shift, the analysis sequence is ended. Perform whatever maintenance is necessary and inject another CCV. If the standard still falls outside of the daily retention time window, recalibrate and proceed with sample analysis. All samples that were injected after the sample exceeded the criteria must be re injected.

### 11.5. Retention Time Windows

- 11.5.1. Establish retention time windows with the GC system in acceptable operating conditions. Make three injections of all analytes throughout the course of a 72-hour period. Serial injections over less than a 72-hour period may result in retention time windows that are too tight. Using retention times from these analyses, calculate retention time windows. Refer to EPA Method 8000D for detailed instructions.
- 11.5.2. Plus or minus three times the standard deviation of the absolute retention times for each standard will be used to define the retention time window; however, the

## STANDARD OPERATING PROCEDURE

ALS | Environmental – Kelso

Chlorinated Herbicides

SOC-8151, Rev. 19.0

Effective 12/2/2020

SOP Review: 2/12/2021

Page 10 of 18

experience of the analyst should weigh heavily in the interpretation of chromatograms. In those cases where the standard deviation for a particular standard is zero, substitute the standard deviation of a close eluting, similar compound to develop a valid retention time window.

11.5.3. Calculate retention time windows for each standard on each GC column and whenever a new GC column is installed. Retain this data in the method file.

### 11.6. Gas Chromatography

11.6.1. Table 2 indicates the operating conditions for the gas chromatograph. Samples and standards are analyzed in an analysis sequence in which continuing calibration (CCV) standards are analyzed every 10 analyses or 12 hours.

11.6.2. Calibrate the system as described in Section 11.3. Evaluate the CCVs as indicated in Section 11.4.

11.6.3. Use the mid-level standards interspersed throughout the analysis sequence to evaluate the qualitative performance of the GC system. If any standard falls outside of their daily retention time window, evaluate the chromatogram for possible causes such as carryover from a highly contaminated sample. If a problem related to GC system has been determined to be the cause of retention time shift, the analysis sequence is ended. Perform whatever maintenance is necessary before reevaluating the CCV or recalibrating and proceeding with sample analysis.

#### 11.6.4. Identification of Analytes

11.6.4.1. Identify a sample component by comparison of its retention time to the retention time of the daily standard chromatogram.

11.6.4.2. Tentative identification of an analyte occurs when a peak from a sample extract falls within the daily retention time window. Confirmation is done on a second GC column or by GC/MS if concentration permits.

11.6.4.3. A tentatively identified compound is confirmed when the retention time for the compound on the confirmatory column/detector system is within the retention time window on that system.

11.6.5. Perform all necessary calculations as described in Section 13.

## 12. QA/QC Requirements

**Note:** The analyst should refer to *Sample Batches (ADM-BATCH)* and *Performing and Documenting Method Detection Limit Studies and Establishing Limits of Detection and Quantitation*.

12.1. Refer to Section 8.0 of Method 8151A for general QC protocol. In addition to instrument criteria for calibration, the ability of each analyst/instrument to generate acceptable accuracy and precision must be documented prior to sample analysis (IPR study). This must be validated before analysis of samples, or whenever significant changes to the procedures have been made. To do this, four reagent water samples are spiked with each target analyte, extracted, and analyzed. Refer to Method 8151A for these requirement and acceptance criteria.

STANDARD OPERATING PROCEDURE

ALS | Environmental - Kelso

Chlorinated Herbicides

SOC-8151, Rev. 19.0

Effective 12/2/2020

SOP Review: 2/12/2021

Page 11 of 18

12.2. Method Detection Limits

12.2.1. A method detection limit (MDL) study must be undertaken before analysis of samples can begin. To establish detection limits that are precise and accurate, the analyst must perform the following procedure. Spike a minimum of seven blank replicates with a MDL spiking solution (at a level below the MRL) for each target analyte, extract, and analyze. The MDL studies should be done for each matrix, prep method, and instrument. Refer to the SOP *Performing and Documenting Method Detection Limit Studies and Establishing Limits of Detection and Quantitation*. Calculate the average concentration found (x) in the sample concentration, and the standard deviation of the concentrations for each analyte. Calculate the MDL for each analyte using the correct T value for the number of replicates. The MDL study must be verified annually.

12.3. Limits of Quantification (LOQ)

12.3.1. The laboratory establishes a LOQ for each analyte as the lowest reliable laboratory reporting concentration or in most cases the lowest point in the calibration curve which is less than or equal to the desired regulatory action levels, based on the stated project requirements. Analysis of a standard or extract prepared at the lowest point calibration standard provides confirmation of the established sensitivity of the method. The LOQ recoveries must be within 50% of the true values to verify the data reporting limit. Refer to the SOP *Performing and Documenting Method Detection Limit Studies and Establishing Limits of Detection and Quantitation*.

12.4. Ongoing QC Samples required are described in the ALS-Kelso Quality Assurance Manual and in the SOP for *Sample Batches* (ADM-BATCH). In general, these include:

12.4.1. Method blank - A method blank is extracted and analyzed with every batch of 20 or fewer samples to demonstrate that there are no method interferences. The method blank must demonstrate that interferences from the analytical and preparation steps minimized. No target analytes should be detected above the MRL in the method blank. For some project specific needs, exceptions may be noted and method blank results above the MRL may be reported for common lab contaminants (phthalate esters, etc.).

12.4.2. A lab control sample (LCS) must be extracted and analyzed with every batch of 20 or fewer samples. The LCS is prepared by spiking a blank with the matrix spike solution, and going through the entire extraction and analysis. Calculate percent recovery (%R) as follows:

$$\%R = X/TV \times 100$$

Where X = Concentration of the analyte recovered  
TV = True value of amount spiked

Evaluate the recovery using the acceptance criteria in the criteria in the current ALS-Kelso DQO spreadsheets. If the lab control sample (LCS) fails acceptance limits for any of the compounds, the analyst must evaluate the system and calibration. If no problems are found, corrective action must be taken.

12.4.3. A matrix spike/duplicate matrix spike (MS/DMS) must be extracted and analyzed with every batch of 20 or fewer samples. The MS is prepared by spiking a sample

## STANDARD OPERATING PROCEDURE

ALS | Environmental - Kelso

Chlorinated Herbicides

SOC-8151, Rev. 19.0

Effective 12/2/2020

SOP Review: 2/12/2021

Page 12 of 18

aliquot with the matrix spike solution, and going through the entire extraction and analysis. Calculate percent recovery (%R) as follows:

$$\%R = \frac{X - X1}{TV} \times 100$$

Where X = Concentration of the analyte recovered  
X1 = Concentration of unspiked analyte  
TV = True value of amount spiked

Calculate Relative Percent Difference (RPD) as:

$$\%RPD = \frac{R1 - R2}{(R1 + R2)/2} \times 100$$

Where R1 = Recovery of the high result  
R2 = Recovery of the lower result

Evaluate the recovery and RPD using the acceptance criteria in the current ALS-Kelso DQO spreadsheets. If the MS/DMS recovery is out of acceptance limits for reasons other than matrix effects, corrective action must be taken.

12.4.4. Calculate and evaluate the surrogate recovery using the acceptance criteria in the current ALS-Kelso DQO spreadsheets. If surrogate recovery is outside acceptance criteria, the sample data must be closely evaluated for possible matrix interferences. If none are present, then corrective action must be identified.

12.5. Additional QA/QC measures include control charting of QC sample results.

## 13. Data Reduction and Reporting

### 13.1. Calculations

13.1.1. Quantitation of herbicides in sample extracts is performed by comparing total area of residue peaks to total area of peaks from the appropriate reference materials.

13.1.2. The concentration of each analyte in the sample extract (Cex) is computed in µg/mL using the calibration factor or calibration curve. The concentration of analytes in the original samples is computed using the following equations:

#### Aqueous Samples:

$$\text{Concentration } (\mu\text{g} / \text{L}) = \frac{(Cex) (Vf) (D)}{(Vs)}$$

Where Cex = Concentration in extract in µg/mL  
Vf = Final volume of extract in mL  
D = Dilution factor  
Vs = Volume of sample extracted, liters

## STANDARD OPERATING PROCEDURE

ALS | Environmental - Kelso

Chlorinated Herbicides

SOC-8151, Rev. 19.0

Effective 12/2/2020

SOP Review: 2/12/2021

Page 13 of 18

### Non-aqueous Samples:

$$\text{Concentration (mg)/ Kg} = \frac{(C_{ex}) (V_f) (D) \times 1,000}{(W) \times 1,000}$$

Where C<sub>ex</sub> = Concentration in extract in µg/mL  
V<sub>f</sub> = Final volume of extract in mL  
D = Dilution factor  
W = Weight of sample extracted. The wet or dry weight may be used, depending upon the specific client requirements.

#### 13.2. Data Review

13.2.1. Following primary data interpretation and calculations, a secondary analyst reviews all data. Following generation of the report, the report is also reviewed. Refer to the SOP for Laboratory Data Review Process for details.

#### 13.3. Reporting

13.3.1. Reports are generated using the STEALTH Data Reporting System which compiles the SMO login information. This compilation is then transferred to a file, which STEALTH uses to generate a report. The forms generated may be ALS standard reports, DOD, or client-specific reports. The compiled data from LIMS is also used to create EDDs.

13.3.2. Sample concentrations are reported when all QC criteria for the analysis has been met or the results are qualified with an appropriate footnote.

### 14. Contingencies for Handling Out-of-Control or Unacceptable Data

14.1. Refer to the SOP for *Nonconformity and Corrective Action* for corrective action procedures.

14.2. Personnel at all levels and positions in the laboratory are to be alert to identifying problems and nonconformities when errors, deficiencies, or out-of-control situations are detected.

### 15. Method Performance

15.1. This method was validated through single laboratory studies of accuracy and precision. Refer to the reference method for additional method performance data available.

15.2. The method detection limit (MDL) is established using the procedure described in the SOP *Performing and Documenting Method Detection Limit Studies and Establishing Limits of Detection and Quantification*. Method Reporting Limits are established for this method based on MDL studies and as specified in the ALS Quality Assurance Manual.

### 16. Pollution Prevention and Waste Management

16.1. The laboratory will comply with all Federal, State, and local regulations governing waste management, particularly the hazardous waste identification rules and land disposal

## Butyltins

DOCUMENT ID: SOC-BUTYL, REV 16.0

Approved By:   
Organics Manager, Jonathon Walter

Date: 12/2/2020

Approved By:   
Quality Assurance Manager, Kurt Clarkson

Date: 12/2/2020

Approved By:   
Laboratory Director, Charles (Pat) Byrne

Date: 12/2/20

## 1. Scope and Application

- 1.1. This Standard Operating Procedure (SOP) describes the procedure used for the analysis of butyltins by GC-FPD. Concentrations of Tributyltin chloride ( $\text{Bu}_3\text{SnCl}$ ) as well as butyltin trichloride ( $\text{BuSnCl}_3$ ), dibutyltin dichloride ( $\text{Bu}_2\text{SnCl}_2$ ), and tetrabutyltin ( $\text{Bu}_4\text{Sn}$ ) in water, sediment and tissue can be determined by this method. The butyltin chloride salts of tributyltin, dibutyltin and monobutyltin are reported as butyltin cations.
- 1.2. The current Method Reporting Limit (MRL) and MDLs for each of these analytes are listed in the laboratory DQO tables. The Method Detection Limit (MDL) that has been obtained is subject to change as studies are repeated.
- 1.3. In cases where there is a project-specific quality assurance plan (QAPP), the project manager identifies and communicates the QAPP-specific requirements to the laboratory. In general, project specific QAPP's supersede method specified requirements. An example of this are projects falling under DoD ELAP. QC requirements defined in the SOP *Department of Defense Projects - Laboratory Practices and Project Management* (ADM-DOD5) may supersede the requirements defined in this SOP.

## 2. Summary of Procedure

- 2.1. This procedure is based on techniques described in various papers (Unger, et. al; Krone, et.al.) for performing the extraction, derivitization, and analysis of mono-, di-, tri-, and tetrabutyltin chloride, with use of certain modifications. This procedure involves a 0.1% tropolone in methylene chloride extraction of the analytes of interest from an acidified sample, followed by a Grignard reaction of the hexane extract with Hexylmagnesium bromide ( $\text{HxMgBr}$ ). The extract is then eluted through silica and alumina cartridge columns for cleanup of soil extracts, or Florisil columns for cleanup of tissue and water extracts.
- 2.2. Extracts are then analyzed by GC/FPD with a 610nm bandwidth filter. The extraction procedure used is outlined in the ALS SOP EXT-OSWT.

## 3. Definitions

- 3.1. For laboratory definitions applicable to most analyses, refer to the SOP for *Sample Batches*.

## 4. Responsibilities

- 4.1. It is the responsibility of the analyst to perform the analysis according to this SOP and to complete all documentation required for data review. Analysis and interpretation of the results are performed by personnel in the laboratory who have demonstrated the ability to generate acceptable results utilizing this SOP. This demonstration is in accordance with the training program of the laboratory. Final review and sign-off of the data is performed by the department supervisor/manager or designee.
- 4.2. It is the responsibility of the department supervisor/manager to document method proficiency and analyst training.

## 5. Interferences

- 5.1. Solvents, reagents, glassware, and other sample processing hardware may yield discrete artifacts and/or elevated baselines, causing misinterpretation of the chromatograms. All of these materials must be demonstrated to be free from interferences, under the conditions of the analysis, by running method blanks.
- 5.2. Since this procedure is often applied to trace level analyses, particular attention should be paid to ensuring that standards are of acceptable quality and purity.

## 6. Safety

- 6.1. Chemicals, reagents and standards must be handled as described in the ALS safety policies, approved methods and in SDSs where available. Refer to the ALS-Kelso Chemical Hygiene Plan and the appropriate SDS prior to beginning this method.

## 7. Sample Collection, Containers, Preservation, and Storage

- 7.1. Containers used to collect samples should be purchased pre-cleaned containers. The sample containers should be of glass or polycarbonate and have screw-top covers with Teflon liners. Where Teflon is not available, solvent-rinsed aluminum foil may be used as a liner. Highly acidic or basic samples may react with the aluminum foil, causing eventual contamination of the sample. Plastic containers or lids may not be used for the storage of samples due to the possibility of sample contamination from the phthalate esters and other hydrocarbons within the plastic.
- 7.2. Water and soil samples must be iced or refrigerated at  $<6^{\circ}\text{C}$  and protected from light from time of collection until extraction. Water samples should be extracted within 7 days and soil/sediment samples should be extracted within 14 days of collection. Tissue samples should be extracted within 1 year when stored frozen ( $<-10^{\circ}\text{C}$ ) until extraction. Studies have not been done to determine sample or extract stability, however extracts should be analyzed within 40 days after extraction.

## 8. Standards, Reagents, and Consumable Materials

- 8.1. Stock standard solutions may be purchased from a number of vendors. All reference standards, where possible, must be traceable to SI units or NIST certified reference materials. The preparation for all laboratory prepared reagents and solutions must be documented in a laboratory logbook. Refer to the SOP *Reagent/Standards Login and Tracking* (ADM-RTL) for the complete procedure and documentation requirements.

### 8.2. Stock Solutions - 2000 $\mu\text{g}/\text{mL}$

- 8.2.1. A certified butyltins stock solution containing Tetrabutyltin, Tributyltin, Dibutyltin, and Monobutyltin chloride salts is purchased from Restek or equivalent at 2000 ppm in methylene chloride.
- 8.2.2. Alternatively, a stock solution may be prepared from neat materials. Neat standards may be purchased from an approved vendor such as Aldrich, Alfa, or Acros. Prepare by weighing out the following amounts of the neat standards and diluting to 10 mL in DCM. Replace stock solutions yearly, or sooner if there are signs of degradation.

Tetrabutyltin	20.0 mg
Tributyltin chloride	22.4 mg
Dibutyltin dichloride	26.1 mg
Butyltin trichloride	32.1 mg

- 8.2.3. The surrogate stock solution, tripropyltin chloride, is purchased as certified stock solution at 2000 ppm (Restek or equivalent). Alternatively, the solution may be prepared by weighing 20 mg of the neat standard and diluting to 10 mL in DCM. The solution is good for 1 year, or as specified by the manufacturer. Tripropyltin chloride and tricyclohexyltin chloride may be used as alternate surrogates.
  - 8.2.4. An ICV stock standard is purchased from a source different from the calibration standards (Accustandard or equivalent), and prepared at 2000 ppm in DCM.
- ### 8.3. Spiking Standards
- 8.3.1. Butyltin Spike Standard - Prepare a 5  $\mu\text{g}/\text{mL}$  solution by diluting the stock butyltin standard in acetone ( $2000 \mu\text{g}/\text{mL} \times 125 \mu\text{L}/50 \text{ mL}$ ). Replace every 2 months.
  - 8.3.2. Butyltin Surrogate Spike - Prepare a 5  $\mu\text{g}/\text{mL}$  solution by diluting the stock butyltin standard in acetone ( $2000 \mu\text{g}/\text{mL} \times 125 \mu\text{L}/50 \text{ mL}$ ). Replace every 2 months.

#### 8.4. Calibration Standards

- 8.4.1. A 5 ppm intermediate calibration standard mix is prepared by diluting 125 µL of the 2000 ppm butyltins stock solution and 125 µL of 2000 ppm surrogate stock solution into 1 mL hexane and derivitizing with Grignard reagent. The standard is brought to 50 mL final volume following alumina and silica gel cleanups. This standard can be prepared at the same time that a sample set is derivitized. Replace every 12 months.
- 8.4.2. Calibration standards are prepared by diluting the calibration intermediate mix into hexane at appropriate levels. A minimum of five concentrations are used to calibrate the instrument. Recommended concentrations are: 2, 5, 20, 50, 200, 500, and 1000 µg/L as cations. Replace every 6 months. To convert the butyltin chloride salt concentration to the corresponding cation concentration, multiply the chloride salt conc. by the following correction factors:

Tributyltin	=	0.8910
Dibutyltin	=	0.7665
Monobutyltin	=	0.6230

- 8.5. ICV Standard Solution - Using the ICV stock standard, prepare the same as for the calibration intermediate standard (8.3.1). Replace every 12 months. From that solution, make an appropriate dilution to give an ICV concentration that is mid-range in the calibration.
- 8.6. Store all standards in a refrigerator or freezer (<4°C).

### 9. Apparatus and Equipment

- 9.1. Gas Chromatograph (GC) equipped with a flame photometric detector (FPD) and autosampler, HP 6890 with Enviroquant. A 610nm center wavelength, 10nm bandwidth filter for the FPD is required (purchased from Oriel, Stratford, Conn., Part No. 53295). The recommended GC columns and operating conditions are as follows:

#### 9.1.1. Columns:

- Restek RTX-1, 30 m x 0.32 mm I.D., 1.0 µm film thickness, or equivalent.  
Restek RTX-35, 30 m x 0.32 mm I.D., 1.0 µm film thickness, or equivalent.

#### 9.1.2. GC conditions:

Carrier flow (column)	2-5 mL/min.
Carrier + Makeup flow	25 ml/min.
Hydrogen flow (detector)	175 ml/min.
Air flow (detector)	100 ml/min.
Temperature program (both columns):	
Injector Temp	30°C, hold for .6 min., 250°C/min. to 325°C
Detector Temp	250°C
Oven Temp	120°C, hold for 1 minute, 20°C/minute to 280°C, hold for 3 minutes

- 9.2. Data system - A computer system must be interfaced to the GC. The system must allow the continuous acquisition and storage on machine-readable media of all chromatographic data obtained throughout the duration of the chromatographic program. The computer must have software that can search any GC data file and plot such response versus time. The data system must be capable of performing calibrations and quantitation calculations. HP Enviroquant is the current software in use.
- 9.3. Analytical balance (0.0001 g).
- 9.4. Volumetric flasks, syringes, vials, and bottles for standards preparation.

### 10. Preventative Maintenance

- 10.1. All maintenance activities are recorded in a maintenance logbook kept for each instrument. Pertinent information (serial numbers, instrument I.D., etc.) must be in the logbook. This includes the routine maintenance. The entry in the log must include: date of event, the initials of who performed the work, and a reference to analytical control.
- 10.2. Carrier gas - Inline purifiers or scrubbers should be in place for all sources of carrier gas. These are selected to remove water, oxygen, and hydrocarbons. Purifiers should be changed as recommended by the supplier.
- 10.3. Gas Chromatograph
  - 10.3.1. Whenever GC maintenance is performed, care should be taken to minimize the introduction of air or oxygen into the column. Injection port maintenance includes changing the injection port liner, seal, washer, o-ring, septum, column ferrule, and autosampler syringe as needed. Liners and seals should be changed when recent sample analyses predict a problem with chromatographic performance. In some cases liners and seals may be cleaned and re-used.
  - 10.3.2. Clipping off a small portion of the head of the column often improves chromatographic performance. When cutting off any portion of the column, make sure the cut is straight and clean (uniform, without fragmentation) by using the proper column cutting tool.
  - 10.3.3. Over time, the column will exhibit poorer overall performance, as contaminated sample matrices are analyzed. The length of time for this to occur will depend on the samples analyzed. When a noticeable decrease in column performance is evident and other maintenance options do not result in improvement, the column should be replaced. This is especially true when evident in conjunction with calibration difficulties.
- 10.4. The autosampler should be cleaned periodically. This includes turret cleaning and cleaning or replacing the syringe. Refer to manufacturer's instructions for autosampler restarting.
- 10.5. The detector should be cleaned and serviced as specified by the manufacturer.

## 11. Procedure

- 11.1. Refer to the SOP *Sample Batches* (ADM-BATCH) for guidance on analytical calibration and sample batches.

**Note:** Refer to the SOP for *Calibration of Instruments for Organics Chromatographic Analyses* (SOC-CAL), where calibration procedures and policies are described. The calibration procedure(s) and options chosen must follow the SOP SOC-CAL. Any criteria described in the following sections takes precedence over the SOP SOC-CAL.
- 11.2. Initial Calibration
  - 11.2.1. Calibrate the GC immediately prior to conducting any analyses, using the external standard technique. Starting with the standard of lowest concentration, analyze each calibration standard and tabulate response (peak area) versus the concentration in the standard. The ratio of the response to the amount injected, defined as the calibration factor (CF), is calculated for each analyte at each standard concentration.
  - 11.2.2. If the percent relative standard deviation (%RSD) of the calibration factor is less than or equal to 25% over the working range, linearity through the origin can be assumed, and the average calibration factor may be used in place of a calibration curve. Other options for establishing the calibration are given in the SOP for *Calibration of Instruments for Organics Chromatographic Analyses* (SOC-CAL).
- 11.3. Prior to sample analysis; verify the calibration by analyzing the ICV standard immediately after the initial calibration. The acceptance criteria for the ICV are 75-125% of the true value. Values exceeding  $\pm 20\%D$  should be scrutinized for possible error.

#### 11.4. Calibration Verification

11.4.1. The start of any sequence must include a CCV checked against the Initial Calibration (curve or average calibration factors). For any analyte to pass, the response (calculated concentration or calibration factor) must be within  $\pm 25\%D$  of the expected response. For this specific passing analyte, this CCV is valid for 12 hours and is considered an opening CCV. An opening CCV must be run prior to (within 8 hours of the commencement of) any analytical sequence.

11.4.2. CCV standards must be analyzed at the start of each analytical sequence (except when the sequence is initiated with an ICAL and ICV).

11.4.3. CCV standards are analyzed at the following frequency:

11.4.3.1. CCVs must be analyzed at the start of each sequence and after each set of 10 field samples (including MS/DMS) or every 12 hours, whichever is more frequent.

11.4.3.2. Samples with confirmed detections must be bracketed by acceptable CCV standards.

11.4.3.3. When a closing CCV standard is not acceptable, corrective action must be taken. A new CCV standard may be prepared and analyzed to demonstrate degradation of the standard as the cause of a CCV outlier. In this case, instrument stability will be verified and samples analyzed prior to this CCV can be reported. CCV standards that are reinjected after minor instrument maintenance (e.g., injection port maintenance, column bake-out, installation of a new trap, etc.) do not verify instrument stability. Samples analyzed prior to this CCV must be reanalyzed.

11.4.4. Any samples following a failing CCV must be rerun.

#### 11.5. Retention Time Windows

11.5.1. The width of the retention time window used to make identifications should be based upon measurements of actual retention time variations of standards over the course of 72 hours. Three times the standard deviation of a retention time is used to calculate a suggested window size for a compound. However, the experience of the analyst should weigh heavily in the interpretation of chromatograms.

11.5.2. Use the mid-level standards (CCVs) interspersed throughout the analysis sequence to evaluate the qualitative performance of the GC system. If any standard falls outside of their daily retention time window, evaluate the chromatogram for possible causes such as carryover from a highly contaminated sample. If a problem related to GC system has been determined to be the cause of retention time shift, perform whatever maintenance is necessary before reinjecting a CCV or recalibrating and proceeding with sample analysis.

#### 11.6. Sample Analysis

11.6.1. Following calibration analyses, analyze samples in a set referred to as an analytical sequence. The sequence includes field samples and QC samples bracketed by CCVs. Using the data system, setup the data acquisition to acquire data for each analysis into a distinct folder. Refer to the SOP *Sample Batches* (ADM-BATCH) for guidance on setting up an analytical sequence.

##### 11.6.2. Identification of Analytes

11.6.2.1. Identify a sample component by comparison of its retention time to the retention time of the daily standard chromatogram.

11.6.2.2. Tentative identification of an analyte occurs when a peak from a sample extract falls within the daily retention time window. A tentatively identified

compound is confirmed when the retention time for the compound on the confirmatory detector is within the retention time window on that system. Confirmation is routinely done using secondary column and/or GCMS techniques.

## 12. QA/QC Requirements

12.1. The ability of each analyst/instrument to generate acceptable accuracy and precision must be documented prior to sample analysis (IPR study). This must be validated before analysis of samples, or whenever significant changes to the procedures have been made. To do this, four reagent water samples are spiked with each target analyte, extracted, and analyzed. Calculate the average percent recovery and standard deviation. Since no specific criteria are defined for this analysis, the section supervisor/manager should review this data for reasonableness.

### 12.2. Method Detection Limits

12.2.1. A method detection limit (MDL) study must be undertaken before analysis of samples can begin. To establish detection limits that are precise and accurate, the analyst must perform the following procedure. Spike a minimum of seven blank replicates with a MDL spiking solution (at a level below the MRL) for each target analyte, extract, and analyze. The MDL studies should be done for each matrix, prep method, and instrument. Refer to *Performing and Documenting Method Detection Limit Studies and Establishing Limits of Detection and Quantification* (CE-QA011/ADM-MDL).

12.2.2. Calculate the average concentration found (x) in the sample concentration, and the standard deviation of the concentrations for each analyte. Calculate the MDL for each analyte using the correct T value for the number of replicates. The MDL must be verified annually (LOD) for each sample matrix or the MDL study repeated.

### 12.3. Limit of Quantitation (LOQ)

12.3.1. The LOQ must be verified annually for each quality system matrix. Any established LOQ must be above the LOD. Alternatively, the annual LOQ verification is not required if the LOD successfully meets the laboratory established acceptance limits.

12.4. Ongoing QC Samples required are described in the ALS-Kelso Quality Assurance Manual and in the SOP for *Sample Batches* (ADM-BATCH). Routinely, these include:

12.4.1. Method blank - A method blank is extracted and analyzed with every batch of 20 or fewer samples to demonstrate that there are no method interferences. The method blank must demonstrate that interferences from the analytical and preparation steps minimized. No target analytes should be detected above the MRL in the method blank.

**Note:** For DoD projects, no target analytes should be detected in the Method Blank above ½ the MRL. If this criterion is exceeded, the source of the contamination is investigated and steps are taken to correct, minimize, or eliminate the problem. The laboratory shall evaluate whether reprocessing of the samples is necessary.

12.4.2. A lab control sample (LCS) must be extracted and analyzed with every batch of 20 or fewer samples. The LCS is prepared by spiking a blank with the matrix spike solution, and going through the entire extraction and analysis. Calculate percent recovery (%R) as follows:

$$\%R = X/TV \times 100$$

Where X = Concentration of the analyte recovered  
TV = True value of amount spiked

Compare recovery to the current acceptance limits. If the lab control sample (LCS) fails acceptance limits for any of the compounds, the analyst must evaluate the system and calibration. If no problems are found, corrective action must be taken.

- 12.4.3. A matrix spike/duplicate matrix spike (MS/DMS) must be extracted and analyzed with every batch of 20 or fewer samples. The MS is prepared by spiking a sample aliquot with the matrix spike solution, and going through the entire extraction and analysis. Calculate percent recovery (%R) as follows:

$$\%R = \frac{X - X1}{TV} \times 100$$

Where X = Concentration of the analyte recovered  
X1 = Concentration of unspiked analyte  
TV = True value of amount spiked

Calculate Relative Percent Difference (RPD) as:

$$RPD = \frac{R1 - R2}{(R1 + R2) / 2} \times 100$$

Where R1 = % recovery of the MS  
R2 = % recovery of the DMS

Compare recovery and RPD to the current acceptance limits. If the MS/DMS recovery is out of acceptance limits for reasons other than matrix effects, corrective action must be taken.

- 12.4.4. Compare recovery for surrogates to the current acceptance limits. If surrogate recovery is outside acceptance criteria, the sample data must be closely evaluated for possible matrix interferences. If none are present, then corrective action must be identified.
- 12.5. Current acceptance criteria for matrix spikes, LCSs and surrogates are listed in the ALS-Kelso DQO spreadsheets. The acceptance criteria listed are current criteria, but are subject to change as control limits are updated.
- 12.6. Additional QA/QC measures include control charting of QC sample results.

### 13. Data Reduction and Reporting

#### 13.1. Calculations

Sample results are calculated by the external standard method. If there are no interferences, results may also be calculated by the internal standard method, using  $Pe_3SnCl$  as the internal standard, if the associated internal calibration is established. For external standard, use the following equations, for internal standard, use techniques described in EPA Method 8000B for quantification.

Aqueous Samples:

$$Concentration (\mu g / L) = \frac{(C_{ex}) (vf) (D)}{V_s} \times C$$

Where C<sub>ex</sub> = Concentration in extract in  $\mu g/ml$   
VF = Final volume of extract in ml  
D = Dilution factor

- Vs = Volume of sample extracted, liters  
C = Appropriate chloride-to-cation correction factor (Table 2)

Non aqueous Samples:

$$\text{Concentration (mg / Kg)} = \frac{(C_{ex}) (V_f) (D) \times 1000}{(W) \times 1000} \times C$$

- C<sub>ex</sub> = Concentration in extract in µg/ml  
V<sub>F</sub> = Final volume of extract in ml  
D = Dilution factor  
W = Weight of sample extracted. The wet or dry weight may be used, depending upon the specific client requirements.  
C = Appropriate chloride-to-cation correction factor (Table 2)

### 13.2. Data Review

Following primary data interpretation and calculations, all data is reviewed by a secondary analyst. Following generation of the report, the report is also reviewed. Refer to the SOP for *Laboratory Data Review Process* (ADM-DREV) for details.

### 13.3. Reporting

13.3.1. Reports are generated in the ALS LIMS by compiling the SMO login, sample prep database, instrument, date, and client-specified report requirements (when specified). The forms generated may be ALS standard reports, DOD, or client-specific reports. The compiled data from LIMS is also used to create EDDs..

13.3.2. Sample concentrations are reported when all QC criteria for the analysis has been met or the results are qualified with an appropriate footnote.

## 14. Contingencies for Handling Out-of-Control or Unacceptable Data

14.1. Refer to the SOP for *Non Conformance and Corrective Action* (CE-QA008/ADM-NCAR) for procedures for corrective action. Personnel at all levels and positions in the laboratory are to be alert to identifying problems and nonconformities when errors, deficiencies, or out-of-control situations are detected.

## 15. Method Performance

15.1. Available method performance data is given in the reference method. In addition, this procedure was validated through single laboratory studies of accuracy and precision as specified in Section 12.1. The method detection limit(s) and method reporting limit(s) were established for this method as specified in Section 12.2.

## 16. Pollution Prevention and Waste Management

16.1. The laboratory will comply with all Federal, State and local regulations governing waste management, particularly the hazardous waste identification rules and land disposal restrictions as specified in the ALS-Kelso Lab Waste Management Plan.

16.2. This method uses non-halogenated solvents and any waste generated from this solvent must be placed in the collection cans in the lab. The solvent will then be added to the hazardous waste storage area and disposed of in accordance with Federal and State regulations.

## 17. Training

17.1. Training is documented following the SOP ALS-Kelso Training Procedure (ADM-TRAIN).

## 18. Method Modifications

- 18.1. This procedure is based upon procedures published in literature referenced in section 19.
- 18.2. Krone uses GC/MS for analysis, this procedure uses GC/FPD as described in the Unger reference.
- 18.3. The procedure in Krone addressed tissue and sediment matrices. This procedure applies to all matrices.

## 20. Changes Since the Last Revision

Revision Number	Effective Date	Document Editor	Description of Changes
16.0	12/2/2020	T. Caron K. Clarkson	Updated Signatories Grammatical, typographical, and formatting corrections. Section 7.1 & 7.2 Updated sample collection and preservation requirements. Section 13.3.1 updated report generation procedures Section 17.1 updated training documentation guidance

## 21. Attachments, Tables, and Appendices

- 21.1. Table 1 - Conversion Factors.
- 21.2. Table 2 - Summary of Corrective Actions.

**Table 1**  
**Conversion Factors**

Compound	Salt - Cation	Cation - Sn
Tetrabutyltin	1	0.3419
Tributyltin	0.8911	0.4092
Dibutyltin	0.7666	0.5095
Monobutyltin	0.6230	0.6751

**Table 2**

**Summary of Corrective Actions**

Method Reference	Control	Specification and Frequency	Acceptance Criteria	Corrective Action
SOC-Butyl	ICAL	Prior to sample analysis	% RSD $\leq$ 25% or see SOC-CAL	Correct problem then repeat ICAL
SOC-Butyl	ICV	After ICAL	$\pm$ 25%	Correct problem and verify second source standard; rerun second source verification. If fails, correct problem and repeat initial calibration.
SOC-Butyl	Method Blank	Include with each analysis batch (up to 20 samples)	<MRL	If target < 20x MB re-extract and re-analyze.
SOC-Butyl	Matrix Spike	Include with each analysis batch (up to 20 samples)	See DQO Table	Evaluate data to determine if there is a matrix effect or analytical error
SOC-Butyl	Lab Control Sample	Include with each analysis batch (up to 20 samples)	See DQO Table	Re-extract and re-analyze.

## ALS-Kelso SOP Annual Review Statement

**SOP Code: PET-SVF**

Revision: 16

An annual review of the SOP listed was completed on (date): 12/2/2020

The SOP reflects current practices and requires no procedural changes.

Supervisor:            Date:

Revision of the SOP is needed to reflect current practices. Draft revisions are listed below.

SOP Section Number	Description of Revision Needed	Date Procedure Change Implemented	Supervisor Initials Indicating Approval of Revision
11.2.1.7	Stopper and shake or tumble the funnel for 1-2 minutes with periodic venting. Allow the solvent layers to separate.	12/11/2020	JW
11.2.1.12	Carefully remove the collector from the KD and further concentrate the extract, using a gentle N <sub>2</sub> stream and < 40°C water bath (N-Evap) or TurboVap or micro-snyder, to 1 mL in DCM (if the sample volume was approximately 500 mL; 2 mL if sample volume was approximately 1L). Again, do not allow the extract to evaporate to dryness. If the extract is particularly dark, viscous and/or obnoxious smelling, it may be advisable to take the extract to a higher final volume. A graduated, disposable pipet or syringe may be used to measure the final volume	12/11/2020	JW
11.2.2.4	Add approximately 30 g muffled, granular Na <sub>2</sub> SO <sub>4</sub> to the sample in the beaker, stir the mixture thoroughly with a scoopula until the mixture is dry and free flowing, and no material adheres to the beaker or scoopula. After initial mixing, it will be necessary to allow the mixture to sit at room temperature for at least 15 minutes (often longer), followed by further mixing, in order to ensure that the Na <sub>2</sub> SO <sub>4</sub> has been allowed to dry the sample as effectively as possible.	12/11/2020	JW
11.3.7.6	In order to report the associated sample results, all LCS recoveries must be within acceptance criteria. If the LCS recovery is outside the criteria due to chromatographic problems (injection problem, etc.) take the necessary corrective action and reanalyze. If reanalysis does not correct the problem or if the LCS recovery is outside the	12/11/2020	JW

		Effective :1/17/2020
		SOP Review: 1/22/2021
		Page 2 of 9

## 1) Scope & Applicability

- 1.1 This procedure determines percent dry solids in soil, sediment, and solid samples using Standard Methods 2540G, modified EPA Method 160.3 (160.3M) and modified PSEP. These methods are suitable for the determination of solid and semisolid materials produced during water and wastewater treatment.
- 1.2 This procedure is used to determine volatile solids in soil, sediment and sludge using SM 2540G and modified EPA Method 160.4 (160.4M). This determination is useful because it offers a rough approximation of the amount of organic matter present in the solid fraction of wastewater, activated sludge and industrial wastes.
- 1.3 In cases where there is a project-specific quality assurance plan (QAPP), the project manager identifies and communicates the QAPP-specific requirements to the laboratory. In general, project specific QAPP's supersede method specified requirements. An example of this are projects falling under DOD ELAP. QC requirements defined in the SOP *Department of Defense Projects - Laboratory Practices and Project Management* (ADM-DOD5), may supersede the requirements defined in this SOP.

## 2) Summary of Procedure

- 2.1 EPA 160.3M, PSEP, and 2540G - A well-mixed sample is quantitatively transferred to a pre-weighed, metal pan or porcelain crucible and evaporated to dryness at 103-105°C. The pan is weighed and the weight of the residue calculated.
- 2.2 EPA 160.4M and SM 2540G - The residue from EPA 160.3M, PSEP, or 2540G is ignited to a constant weight at 550°C. The weight loss upon ignition is the volatile solids.

## 3) Definitions

- 3.1 Total solids - the residue left in the pan or vessel after evaporation of a sample and its subsequent drying in an oven at a defined temperature.
- 3.2 Total volatile solids, also known as volatile residue, is defined as the total residue obtained from the residue ignited at 550°C in a muffle furnace
- 3.3 Fixed solids/Volatile Solids - is the term applied to the residue of total, suspended, or dissolved solids after ignition for a specified time at a specified temperature. The weight loss on ignition is called volatile solids.
- 3.4 Batch - A batch of samples is a group of environmental samples that are prepared and/or analyzed together as a unit with the same process and personnel using the same lot(s) of reagents. It is the basic unit for analytical quality control.
  - 3.4.1 Preparation Batch - A preparation batch is composed of one to twenty field samples, all of the same matrix, all of the same matrix, processed on the same date.
- 3.5 Sample
  - 3.5.1 Field Sample - An environmental sample collected and delivered to the laboratory for analysis; a.k.a., client's sample.
  - 3.5.2 Laboratory Sample - A representative portion, aliquot, or subsample of a field sample upon which laboratory analyses are made and results generated.

	STANDARD OPERATING PROCEDURE	Total, Fixed, and Volatile Solids in Solid Samples
	ALS   Environmental - Kelso	SOIL-SOLIDS, Rev 2.0
		Effective :1/17/2020
		SOP Review: 1/22/2021
		Page 3 of 9

- 3.6 Quality System Matrix - The matrix of an environmental sample is distinguished by its physical and/or chemical state and by the program for which the results are intended. The following sections describe the matrix distinctions. These matrices shall be used for purpose of batch and quality control requirements.
- 3.7 Solids - Any solid sample such as soil, sediment, sludge, and other materials with >15% settleable solids.
- 3.8 Laboratory Duplicates (DUP) - Duplicates are additional replicates of samples that are subjected to the same preparation and analytical scheme as the original sample. The relative percent difference (RPD) between the sample and its duplicate is calculated and used to assess analytical precision.

#### 4) Responsibilities

- 4.1 It is the responsibility of the analyst to perform the analysis according to this SOP and to complete all documentation required for data review. Analysis and interpretation of the results are performed by personnel in the laboratory who have demonstrated the ability to generate acceptable results utilizing this SOP. This demonstration is in accordance with the training program of the laboratory. The department supervisor/manager or designee performs final review and sign-off of the data.
- 4.2 It is the responsibility of the department supervisor/manager to document analyst training and method proficiency, as described in the *ALS-Kelso Training Procedure* (ADM-TRAIN).

#### 5) Interferences

- 5.1 Sampling and subsampling may introduce serious errors. Homogenize samples thoroughly prior to, and during transfer. Use special handling to insure sample integrity when subsampling.
- 5.2 The temperature at which the residue is dried has an important bearing on sample results, because weight losses due to the volatilization of organic matter and gases from heat-induced chemical decomposition depend on temperature and time of heating.
- 5.3 Each sample requires close attention to desiccation after drying. Minimize opening the desiccator to reduce the entry of moist air.

#### 6) Safety

- 6.1 Samples must be handled as described in the ALS safety policies and approved methods. Refer to the ALS Chemical Hygiene Plan prior to beginning this method.

#### 7) Sample Collection, Containers, Preservation, and Storage

- 7.1 Soil samples may be collected in glass jars, sleeves, or other suitable container.
- 7.2 For soil samples, a minimum of 10 g is required. Collecting 8 oz jars of soil improves subsampling homogeneity.
- 7.3 Samples should be stored at 4°C.
- 7.4 Samples must be analyzed within 7 days of collection.

	STANDARD OPERATING PROCEDURE	Total, Fixed, and Volatile Solids in Solid Samples
	ALS   Environmental - Kelso	SOIL-SOLIDS, Rev 2.0
		Effective :1/17/2020
		SOP Review: 1/22/2021
		Page 4 of 9

## 8) Standards, Reagents, and Consumable Materials

- 8.1 All equipment cleaning, working solutions and dilutions should be prepared using deionized water (DI) conforming to ASTM Type I or ASTM Type II reagent water. For more information on reagent water generation, refer to the related SOP, Operation and Maintenance of Laboratory Reagent Water Systems.

## 9) Apparatus and Equipment

- 9.1 Evaporating dishes: dishes of 100 mL capacity made of porcelain.
- 9.2 Evaporating pans, aluminum
- 9.3 Desiccators, containing desiccant.
- 9.4 Drying oven, for operation at 103-105°C.
- 9.4.1 Ovens housing an internal temperature recorder/display as part of its operational system are calibrated twice per year by an external, accredited calibration service.
- 9.4.2 Oven temperature may be monitored by using a thermometer immersed in sand, or other suitable solid material, in a vessel in the oven. The liquid in glass thermometer is verified annually using a reference traceable to NIST.
- 9.5 Analytical balance capable of weighing to 0.1 mg.
- 9.6 Balance calibration verification weights, ASTM Class 1.
- 9.7 Muffle furnace for operation at 550°C.
- 9.8 Porcelain Dishes (for 2540G only).

## 10) Preventative Maintenance

- 10.1 All maintenance activities are recorded in a maintenance logbook kept for each instrument. Pertinent information (serial numbers, instrument I.D., etc.) must be in the logbook. This includes the routine maintenance described herein. The entry in the log must include: date of event, the initials of who performed the work, and a reference to return to analytical control.
- 10.2 The laboratory utilizes an external calibration service that is accredited to perform calibration or re-certification of ovens housing an internal temperature recorder/display as part of its operational system.
- 10.3 A bound logbook is used to record all balance measurements. Format the logbook such that the date, initials, balance I.D., weight set ID, measurements, and specifications for the check weights are listed for each balance. Record each calibration verification measurement in the logbook. Entries into logbooks are to be performed in accordance with the SOP for *Making Entries Onto Analytical Records* (CE-QA007). Desiccant should be changed as needed.

## 11) Procedure

- 11.1 Total Solids - EPA Method 160.3M and PSEP.
- 11.1.1 Pre-dry the aluminum pans prior to use by heating at 103-105°C for one hour. Allow to cool. Label the pans with corresponding sample I.D.s.

STANDARD OPERATING PROCEDURE ALS   Environmental - Kelso	Total, Fixed, and Volatile Solids in Solid Samples
	SOIL-SOLIDS, Rev 2.0
	Effective :1/17/2020
	SOP Review: 1/22/2021
	Page 5 of 9

- 11.1.2 Determine and record the tare (dry pan) weight.
- 11.1.3 Measure 10 g of homogenized sample into the tared weigh pan. Record the pan plus sample weight. If the sample consists of discrete pieces of solid material (dewatered sludge, for example), take cores from each piece with a No. 7 cork borer (or equivalent); as an alternative, pulverize the entire sample coarsely on a clean surface by hand, using rubber gloves.
- 11.1.4 Place in a drying oven overnight at 103-105°C.
  - 11.1.4.1 If solids must be done same day, samples are placed in the oven for four hours. After sample is cooled and weighed, the sample is placed back in oven for an additional 30 minutes, cooled at reweighed for a confirmation weight. Data reported this way must be qualified as estimated.
- 11.1.5 Remove from the oven and cool to room temperature and weigh.
- 11.2 Total Solids -SM 2540G.
  - 11.2.1 Pre-dry the porcelain crucible prior to use by heating at 103-105°C for one hour. Allow to cool. Label the crucibles with corresponding sample I.D.s.
  - 11.2.2 Determine and record the tare (dry crucible) weight.
  - 11.2.3 Measure 25-50 g of homogenized sample into the tared crucible. Record the crucible plus sample weight. If the sample consists of discrete pieces of solid material (dewatered sludge, for example), take cores from each piece with a No. 7 cork borer (or equivalent); as an alternative, pulverize the entire sample coarsely on a clean surface by hand, using rubber gloves.
  - 11.2.4 Place in a drying oven overnight at 103-105°C.
    - 11.2.4.1 If solids must be done same day, samples are placed in the oven for four hours. After sample is cooled and weighed, the sample is placed back in oven for an additional 30 minutes, cooled at reweighed for a confirmation weight. Data reported this way must be qualified as estimated.
  - 11.2.5 Remove from the oven and cool to room temperature and weigh.
- 11.3 Volatile Solids - EPA Method 160.4M and SM 2540G.
  - 11.3.1 Prepare an evaporating dish by igniting a clean evaporating dish at 550°C for 60 minutes in a muffle furnace.
  - 11.3.2 Cool in a desiccator, weigh and store in desiccator until ready for use.
  - 11.3.3 If the sample consists of discrete pieces of solid material (dewatered sludge, for example), take cores from each piece with a No.7 cork borer (or equivalent); as an alternative, pulverize the entire sample coarsely on a clean surface by hand, using rubber gloves.
  - 11.3.4 Measure 25-50 g of homogenized sample into the pre-weighed, evaporating dish/crucible. Record the weight.
  - 11.3.5 Place in a drying oven overnight at 103-105°C.
  - 11.3.6 Remove from the oven and cool to balance temperature in a desiccator and weigh. Place samples back in the 105°C oven for 1 hour to repeat drying,

STANDARD OPERATING PROCEDURE ALS   Environmental - Kelso	Total, Fixed, and Volatile Solids in Solid Samples
	SOIL-SOLIDS, Rev 2.0
	Effective :1/17/2020
	SOP Review: 1/22/2021
	Page 6 of 9

cooling, weighing and desiccating steps until weight change is less than 4% or 50 mg, whichever is less.

11.3.7 Weigh samples and record on the bench sheet. Transfer the dried residue to a cool muffle furnace, heat furnace to 550°C and ignite for one hour.

Note: if the residue contains high amounts of organic matter, refer to SM 2540G for procedure to lessen losses due to reducing conditions.

11.4 Remove from the muffle furnace and cool in a desiccator to balance temperature and weigh. Repeat igniting, cooling, weighing and desiccating steps until weight change is less than 4% or 50 mg, whichever is less.

## 12) QA/QC Requirements

- 12.1 This method shall operate under the formal Quality Assurance Program established at ALS and must maintain records that define the quality of data that is generated. Data shall be compared to established criteria in order to determine if the results of the analyses meet the performance characteristics of the method.
- 12.2 Multi-point balance calibration verifications are required for each day the balance is used and must be performed prior to use. The calibration verification weights must bracket the range of use. For additional information, refer to the SOP *Documenting Laboratory Balance and Temperature Checks* (ADM-BAL).
- 12.3 For gravimetric determination, prior to, and after each analytical batch, balance calibration verification (CCV) is performed using weights bracketing the sample weights and must be  $\pm 0.5\%$  of the true value.
- 12.4 A system of documentation (logbook, benchsheet, etc.) must be established for recording the serial number of the Weight Set used for CCV verification.
- 12.5 Prior to, and after each analytical batch, drying oven temperature check(s) and time(s) shall be recorded.
- 12.6 Ongoing QC Samples required are described in the ALS-Kelso Quality Assurance Manual and in the SOP for *Sample Batches* (ADM-BATCH). Additional QC Samples may be required in project specific quality assurance plans (QAPP). For example projects managed under the DOD ELAP must follow requirements defined in the DoD Quality Systems Manual for Environmental Laboratories. General QA requirements for DoD QSM are defined in the SOP *Department of Defense Projects - Laboratory Practices and Project Management*. General QC requirements are:

$$RPD = \frac{|R1 - R2|}{(R1 + R2) / 2} \times 100$$

Where: R1 = Higher Result

R2 = Lower Result

- 12.7 Sample Duplicates (DUP) - Run one duplicate per batch of ten samples. Calculate Relative Percent Difference (RPD) for duplicates as:
- 12.7.1 Duplicate determinations should agree within 5% of their average weight for SM 2540G and 10% for 160.3M, 160.4M, and PSEP..

STANDARD OPERATING PROCEDURE ALS   Environmental - Kelso	Total, Fixed, and Volatile Solids in Solid Samples
	SOIL-SOLIDS, Rev 2.0
	Effective :1/17/2020
	SOP Review: 1/22/2021
	Page 7 of 9

NOTE: For samples analyzed under PSEP protocol, samples must be analyzed in triplicate.

12.7.2 Duplicate are required for 10% of all samples (one for every ten samples).

12.8 One method blank (MB) per batch of 20 samples for TVS is required.

### 13) Data Reduction and Reporting

13.1 For soils, sediments, and solids, calculate % solids as follows:

$$(\text{tare} + \text{dry weight}) - \text{tare} = \text{dry weight}$$

$$\text{dry weight} \div \text{wet weight} \times 100 = \% \text{ solids}$$

13.2 For Volatile Solids:

$$\% \text{ Total Solids} = \frac{(A - B) \times 100}{C - B}$$

$$\% \text{ Volatile Solids} = \frac{(A - D) \times 100}{A - B}$$

$$\% \text{ Fixed Solids} = \frac{(D - B) \times 100}{A - B}$$

A = weight of dry residue + dish (mg)

B = weight of dish (mg).

C = weight of wet sample + dish (mg)

D = weight of residue = dish after ignition (mg).

13.3 Reporting

13.3.1 Refer to *Data Reporting and Report Generation* (ADM-RG) for reporting guidelines.

13.3.2 Reports are generated in the ALS LIMS by compiling the SMO login, sample prep database, instrument date, and client-specified report requirements (when specified). The forms generated may be ALS standard reports, DOD, or client-specific reports. The compiled data from LIMS is also used to create EDDs.

13.4 Data review and Assessment

13.4.1 Following primary data interpretation and calculations, all data is reviewed by a secondary analyst. Following generation of the report, the report is also reviewed. Refer to the SOP for *Laboratory Data Review Process* (ADM-DREV) for details. The person responsible for final review of the data report and/or data package should assess the overall validity and quality of the results and provide any appropriate comments and information to the Project Manager to inclusion in the report narrative).

	ALS   Environmental - Kelso	SOIL-SOLIDS, Rev 2.0
		Effective :1/17/2020
		SOP Review: 1/22/2021
		Page 8 of 9

#### 14) Method Performance

14.1 Refer to the reference method for additional method performance data available.

#### 15) Pollution Prevention and Waste Management

15.1 The laboratory will comply with all Federal, State and local regulations governing waste management, particularly the hazardous waste identification rules and land disposal restrictions as specified in the ALS Lab Waste Management Plan.

#### 16) Contingencies for Handling Our-of-Control or Unacceptable Data

16.1 Refer to the SOP for *Non Conformance and Corrective Action Procedure* (ADM-NCAR) for procedures for corrective action.

16.2 Personnel at all levels and positions in the laboratory are to be alert to identifying problems and nonconformities when errors, deficiencies, or out-of-control situations are detected.

#### 17) Training

17.1 All analysts performing this analysis are required to read and understand this SOP.

17.2 Training is documented following the *Employee Training and New Employee Orientation* (ADM-TRAIN).

#### 18) Method Modifications

18.1 The EPA 160.3 procedure is modified to determine percent dry solids in soil, sediment, and solids (160.3M). 10 g of samples used instead of 25-50 g for total solids only analysis.

18.2 The EPA 160.4 procedure is modified to determine percent dry solids in soil, sediment, and solids (160.4M). 25-50 g of samples is used for Total Volatile Solids.

18.3 PSEP procedure is modified to determine percent dry solids in soil, sediment, and solids using 10 g of samples used instead of 25 g for total solids only analysis. Pre-dry the aluminum pans are used in place of porcelain crucible.

## Semi-Volatile Organic Compounds by GC/MS Low Level Procedure

DOCUMENT ID: SVM-8270L, REV. 11.0

Approved By:  Date: 12/2/2020  
Inorganics Manager, Jonathon Walter

Approved By:  Date: 12/2/2020  
Quality Assurance Manager, Kurt Clarkson

Approved By:  Date: 12/2/20  
Laboratory Director, Charles (Pat) Byrne

## 1) Scope & Applicability

- 1.1. This procedure is used to determine low level concentrations of Semi-Volatile Organic Compounds in water and soil using EPA Method 8270D. This procedure may also be applicable to various miscellaneous waste samples. Table 1 indicates compounds that may be determined by this method and lists their method reporting limits (MRLs) in water and soil. Equivalent nomenclature for MRL includes Estimated Quantitation Limit (EQL) or Low Level of Quantitation (LLOQ). The reported MRL may be adjusted if required for specific project requirements; however, the capability of achieving other reported MRLs must be demonstrated. The laboratory DQO Table lists Method Detection Limits (MDLs) that have been achieved. MDLs may change as studies are updated or new studies performed, and will vary depending on the preparation method.
- 1.2. This procedure can be used to quantitate most neutral, acidic, and basic organic compounds that are soluble in methylene chloride and capable of being eluted without derivatization as sharp peaks from a gas chromatographic fused-silica capillary column coated with a slightly polar silicone phase. Such compounds include polynuclear aromatic hydrocarbons, chlorinated hydrocarbons and pesticides, phthalate esters, organophosphate esters, nitrosamines, haloethers, aldehydes, ethers, ketones, anilines, pyridines, quinolines, aromatic nitro compounds, and phenols, including nitrophenols. Other compounds than those listed in Tables 4 and 6 may be analyzed. Refer to Section 1 of method 8270D.
- 1.3. In cases where there is a project-specific quality assurance plan (QAPP), the project manager identifies and communicates the QAPP-specific requirements to the laboratory. In general, project specific QAPP's supersede method specified requirements. An example of this are projects falling under DoD ELAP. QC requirements defined in the *SOP Department of Defense Projects – Laboratory Practices and Project Management – QSM 5.X (ADM-DOD5)* may supersede the requirements defined in this SOP.

## 2) Summary of Procedure

- 2.1 This method provides Gas Chromatography/Mass Spectrometry (GC/MS) conditions for the detection of Semi-volatile Organic Compounds. Prior to the use of this method, an appropriate sample preparation method must be used to recover the analytes of interest. A 1  $\mu$ L aliquot of the extract is injected into the gas chromatograph (GC) using a Agilent Multi-Mode Injector (MMI). The compounds are separated on a fused silica capillary column. Compounds of interest are detected by a mass selective detector. Identification of the analytes of interest is performed by comparing the retention times of the analytes with the respective retention times of an authentic standard, and by comparing mass spectra of analytes with mass spectra of reference materials. Quantitative analysis is performed by using the authentic standard to produce a response factor and calibration curve, and using the calibration data to determine the concentration of an analyte in the extract. The concentration in the sample is calculated using the sample weight or volume and the extract volume.
- 2.2 The following compounds may require special treatment when being determined by this method. Hexachlorocyclopentadiene is subject to decomposition in the injection port of the gas chromatograph, to a chemical reaction in acetone, and can undergo photochemical decomposition. N-Nitroso-dimethylamine is difficult to separate from the solvent under the chromatographic conditions described. N-Nitroso-diphenylamine decomposes in the gas chromatographic inlet and cannot be separated from diphenylamine. Benzoic acid, pentachlorophenol, 2,4-dinitrophenol, 2-nitroaniline, 3-

nitroaniline, 4-chloroaniline, and benzyl alcohol are subject to erratic chromatographic behavior, especially if the GC system is contaminated with high boiling material.

### 3) Definitions

- 3.1 For laboratory definitions applicable to most analyses, refer to the SOP for *Sample Batches*.

### 4) Responsibilities

- 4.1 It is the responsibility of the analyst to perform the analysis according to this SOP and to complete all documentation required for data review. Analysis and interpretation of the results are performed by personnel in the laboratory who have demonstrated the ability to generate acceptable results utilizing this SOP. This demonstration is in accordance with the training program of the laboratory. Final review and sign-off of the data is performed by the department supervisor/manager or designee.
- 4.2 It is the responsibility of the department supervisor/manager to document analyst training and method proficiency, as described in: *Employee Training and Orientation* (ADM-TRAIN).

### 5) Interferences

- 5.1 Raw GC/MS data from all blanks, samples, and spikes must be evaluated for interferences. Determine if the source of interference is in the preparation of the samples. Corrective action should be taken to eliminate the interferences.
- 5.2 Accurate determination of phthalate esters can pose difficulties when using this methodology. Common flexible plastics contain varying amounts of phthalates. These phthalates are easily extracted or leached from such materials during laboratory operations. Cross contamination of clean glassware may occur when plastics are handled during extraction steps, especially when solvent-wetted surfaces are handled. Interferences from phthalates can best be minimized by avoiding contact with any plastic materials. Exhaustive cleanup of reagents and glassware may be required to eliminate background phthalate contamination.
- 5.3 Contamination by carryover can occur whenever high-concentration and low-concentration samples are sequentially analyzed. To reduce carryover, the sample syringe must be rinsed out between samples with solvent. Whenever an unusually concentrated sample is encountered, it should be followed by the analysis of a solvent blank to check for cross contamination.

### 6) Safety

- 6.1 Chemicals, reagents and standards must be handled as described in the ALS safety policies, approved methods and in SDSs where available. Refer to the ALS Environmental, Health and Safety Manual and the appropriate SDS prior to beginning this method.
- 6.2 This method uses Dichloromethane, a known human carcinogen. Refer to the methylene chloride policy document, ENV-HSE-NA-EX-006-EN for proper handling.

<G:\SAFETY\TRAINING\Methylene Chloride\Methylene Chloride - NA 031419.pdf>

## 7) Sample Collection, Containers, Preservation, and Storage

- 7.1 Certified clean containers should be purchased for sample collection. The sample containers should be of glass or Teflon and have screw-top covers with Teflon liners. Plastic containers or lids may not be used for the storage of samples due to the possibility of sample contamination from the phthalate esters and other hydrocarbons within the plastic.
- 7.2 Water and soil samples should be iced or refrigerated at  $<6^{\circ}\text{C}$  from time of collection until extraction.
- 7.3 Water samples must be extracted within 7 days and the extracts analyzed within 40 days following extraction. Soil samples must be extracted within 14 days and the extract analyzed within 40 days following extraction. Extracts are stored at  $\leq 10^{\circ}\text{C}$ .

## 8) Standards, Reagents, and Consumable Materials

- 8.1 Solvents: Acetone, methylene chloride, methanol, and other appropriate solvents.
- 8.2 Stock Standard Solutions (See Table 2)
  - 8.2.1 Commercially prepared stock standards are typically used when available at a concentration of  $1000\ \mu\text{g}/\text{mL}$  or more. They must be obtained from an A2LA or ISO9000 certified vendor. Standard concentrations can be verified by comparison versus an independently prepared standard. Alternatively, prepare stock standard solutions at a concentration of  $1000\ \mu\text{g}/\text{mL}$  by dissolving  $0.0100\ \text{g}$  of reference material in methylene chloride or other suitable solvent and diluting to volume in a  $10\ \text{mL}$  volumetric flask. Larger volumes can be used at the convenience of the analyst. When compound purity is assayed to be 96% or greater, the weight can be used without correction to calculate the concentration of the stock standard. Store according to vendors recommendations.
  - 8.2.2 Transfer the stock standard solutions into Teflon-sealed screw-cap bottles. Store at  $\leq 10^{\circ}\text{C}$  and protect from light. Stock standards should be checked frequently for signs of degradation or evaporation, especially just prior to preparing calibration standards from them.
  - 8.2.3 Stock standard solutions must be replaced after one year, or sooner, if comparison with check standards or samples indicates a problem.
- 8.3 Internal Standard Solutions (See Table 4) - The internal standards are 1,4-dichlorobenzene- $\text{d}_4$ , naphthalene- $\text{d}_8$ , acenaphthene- $\text{d}_{10}$ , phenanthrene- $\text{d}_{10}$ , chrysene- $\text{d}_{12}$ , and perylene- $\text{d}_{12}$  (See Table 4 for corresponding compounds). The nominal concentration of the standard is  $100\ \text{ng}/\mu\text{L}$ . Each  $1\ \text{mL}$  of sample extract undergoing analysis should be spiked with  $10\ \mu\text{L}$  of the internal standard solution, resulting in a concentration of  $1.0\ \text{ng}/\mu\text{L}$  of each internal standard. Store at  $-10^{\circ}\text{C}$  or less when not being used. When using premixed certified solutions, store according to the vendors recommendations.
- 8.4 GC/MS Tuning Standard - For a  $20\ \mu\text{L}$  injection, use a methylene chloride solution containing  $2.5\ \text{ng}/\mu\text{L}$  of decafluorotriphenylphosphine (DFTPP). This will result in  $50\ \text{ng}$  on column injection of DFTPP. The standard should also contain  $2.5\ \text{ng}/\mu\text{L}$  of benzidine, DDT, and pentachlorophenol, to verify injection port inertness and GC column performance. Store at  $-10^{\circ}\text{C}$  or less when not being used, or store according to the manufacturer's recommendations. For smaller injection volumes, use a DFTPP standard with a concentration that will result in a  $10\text{-}50\ \text{ng}$  on column injection.

## 8.5 Calibration Standards (See Table 2)

- 8.5.1 A minimum of five initial calibration standards should be prepared from stock solutions. One of the calibration standards should be at a concentration at or below the method reporting limit; the others should correspond to the range of concentrations found in real samples, but should not exceed the working range of the GC/MS system. At least one calibration standard must be at a concentration corresponding to a sample concentration meeting project-specific data quality objectives. Each standard should contain each analyte for detection by this method. Each 1 ml aliquot of calibration standards should be spiked with 10  $\mu\text{L}$  of the internal standard solution prior to analysis. All calibration standards should be stored at  $-10^{\circ}\text{C}$  or less and should be freshly prepared once a year, or sooner if check standards indicate a problem.
- 8.5.2 The daily calibration standard (CCV) is prepared from stock solutions at a concentration at the midpoint of the calibration curve (typically 2-4  $\text{ng}/\mu\text{L}$ ). The CCV is prepared weekly and can be stored at  $4 \pm 2^{\circ}\text{C}$ , or as recommended by the manufacturer. The DFTPP standard may be combined with this standard (maintaining a 1-50 ng on column injection) providing tuning verification and calibration verification can be done without interferences.

## 8.6 QC Standards (See Table 3)

- 8.6.1 Surrogates: Prepare a working solution in methanol containing 2-fluorophenol, phenol- $\text{d}_6$ , and 2,4,6-tribromophenol at 150  $\text{ng}/\mu\text{L}$  and nitrobenzene- $\text{d}_5$ , 2-fluorobiphenyl, and terphenyl- $\text{d}_{14}$  at 100  $\text{ng}/\mu\text{L}$ . Aliquots of the solution are spiked into all extracted samples, blanks, and QC samples according to the extraction SOP used.
- 8.6.2 Matrix Spike Standards: Prepare a working solution in methanol containing all analytes of interest (full list spike) at 100  $\text{ng}/\mu\text{L}$  (Pyridine is at 200  $\text{ng}/\mu\text{L}$ ). Aliquots of the solution are spiked into the selected QC aliquots according to the extraction SOP used.

**Note:** The spiking level of surrogate and spike may need to be adjusted according to project requirements, if dilutions are expected due to high levels of extracted components, or if a lower calibration range is used

## 9) Apparatus and Equipment

### 9.1 Gas Chromatograph/Mass Spectrometer System

- 9.1.1 Gas Chromatograph – HP 5890, Agilent 6890, or Agilent 7890 -An analytical system complete with a temperature-programmable gas chromatograph suitable for large volume injection with cryogenic cooling, or for small volume injection without cryogenic cooling.
- 9.1.1.1 Atas Optic 2 or 3 large volume injector units – This allows for injection of up to 100  $\mu\text{L}$  of solvent for each analysis. After injection into the cold injector, the solvent is vented while the analytes are retained within a specially packed liner. The injector is then flash heated and the analytes are transferred into the GC. The unit also controls gas flow rates.
- 9.1.1.2 Agilent Split/Splitless Injector – The injector is held at a constant temperature allowing for the direct transfer of analytes onto the analytical column. The unit also controls the gas flow rates.

- 9.1.1.3 Agilent MMI injector - This allows for injection of up to 1000  $\mu\text{L}$  of extract. The injector can be temperature programmed and is equipped with cryogenic cooling. The unit also controls gas flow rates.
- 9.1.1.4 Autosampler - HP 7673, Agilent 7683, Agilent 7693, or equivalent with programmable operation.
- 9.1.1.5 All other required accessories, syringes, analytical columns, and gases. The capillary column should be directly coupled to the source.
- 9.1.2 Column: ZB-5MS, 30 m x 0.25 mm ID x 0.25  $\mu\text{m}$  film thickness silicone-coated fused-silica capillary column with 5 m guard column (or equivalent). Recommended part number 7HG-6010-11-GGA.
- 9.1.3 Mass Spectrometer - HP 5972, Agilent 5973, or Agilent 5975 - Capable of scanning from 35 to 500 amu every 1 second or less, using 70 volts (nominal) electron energy in the electron impact ionization mode. The mass spectrometer must be capable of producing a mass spectrum for decafluorotriphenylphosphine (DFTPP) which meets all of the criteria in Table 1A or 1B when a 10-50 ng tune standard is injected onto the GC
- 9.1.4 GC/MS Interface - Any GC-to-MS interface that gives acceptable calibration points for each compound of interest and achieves acceptable tuning performance criteria may be used.
- 9.1.5 Data System - A computer system must be interfaced to the mass spectrometer. The system must allow the continuous acquisition and storage on machine-readable media of all mass spectra obtained throughout the duration of the chromatographic program. The computer must have software that can search any GC/MS data file for ions of a specific mass and that can plot such ion abundances versus time or scan number. This type of plot is defined as an Extracted Ion Current Profile (EICP). Software must also be available that allows integrating the abundances in any EICP between specified time or scan-number limits. NIST98 Mass Spectral Library is used for spectral comparisons.
- 9.2 Appropriate analytical balance (0.0001 g), volumetric flasks, syringes, vials, and bottles for standards preparation.

## 10) Preventative Maintenance

- 10.1 All maintenance activities are recorded in a maintenance logbook kept for each instrument. Pertinent information (serial numbers, instrument I.D., etc.) must be in the logbook. Maintenance entries should include date, symptom of problem, corrective actions, and description of maintenance, date, and name. The log should contain a reference to return to analytical control.
- 10.2 Carrier gas - Inline purifiers or scrubbers should be in place for all sources of carrier gas. These are selected to remove water, oxygen, and hydrocarbons. Purifiers should be changed as recommended by the supplier.
- 10.3 Gas Chromatograph
  - 10.3.1 Whenever GC maintenance is performed, care should be taken to minimize the introduction of air or oxygen into the column. Injection port maintenance includes changing the injection port liner, seal, washer, O-ring, septum, column ferrule, and autosampler syringe as needed. Liners and seals should be changed when recent sample analyses predict a problem with chromatographic performance. In some cases liners and seals may be cleaned and re-used.

10.3.2 Clipping off a small portion of the head of the column often improves chromatographic performance. When cutting off any portion of the column, make sure the cut is straight and "clean" (uniform, without fragmentation) by using the proper column cutting tool. The column head pressure must be adjusted to maintain proper flow rates.

10.3.3 Over time, the column will exhibit poorer overall performance, as indicated by poor peak shape and reduced responses. The length of time for this to occur will depend on the samples analyzed. When a noticeable decrease in performance is evident, more thorough maintenance is necessary. Some steps are to solvent rinse the split vent and septum lines with a mix of 20% methanol in DCM. When these and other maintenance options do not result in improvement, the column should be replaced. This is especially true when evident in conjunction with calibration difficulties.

#### 10.4 Mass Spectrometer

10.4.1 For units under service contract, certain maintenance is performed by instrument service staff, including pump oil changed, vacuuming boards, etc., as recommended by the manufacturer.

10.4.2 MS source cleaning should be performed as needed, depending on the performance of the unit. This may be done by the analyst or by instrument service staff.

10.4.3 Tune the MS as needed to result in consistent and acceptable performance while meeting the required ion abundance criteria.

### 11) Procedure

#### 11.1 Sample Preparation

##### 11.1.1 Water samples

11.1.1.1 Water samples are prepared using continuous liquid-liquid extraction and EPA method 3520C. Refer to EXT-3520 or samples may be prepared using separatory funnel procedures (EPA 3510C). Refer to EXT-3510.

11.1.1.2 Perform the extraction on a 1000mL or less aliquot of sample.

11.1.2 Soil, sediment, and solid samples are prepared using automated soxhlet extraction EXT-3541. The nominal sample size is 20g. Sample amounts may be decreased in the case of high-concentration waste samples. GPC cleanup may be used (SOP SOC-3640A).

11.1.3 Extracts should be screened by GC/FID (SOC-SCR).

11.1.4 Following sample preparation, sample extracts are then transferred to the extract cold storage unit. Extracts must be analyzed within 40 days of extraction.

11.2 The recommended GC/MS operating conditions are listed below. The GC conditions may be modified to accommodate specific instrument models and configurations.

Mass range:	35-500 amu
Scan Time:	1 sec/scan
Initial temperature:	45°C, hold for 3.5 minutes
Temperature program:	45-100°C at 15°C/min, 100-270°C at 10°C/min, 270-320°C at 6°C/min, hold until 3 minutes after benzo[g,h,i]perylene has eluted.
Detector interface temp:	300°C

Injector: Atas Optic 2, or Optic 3 or equivalent  
Final time: 32.7 min.  
Initialization time: 0.00 min.

Temperature profile: Initial temperature - 5°C

RAMP	RATE	FINAL TEMP	ISOTHERMAL TEMP
1		5°C	2.20 MIN
2	6°C/sec	305°C	30.5 min

Pressure ramps:

RAMP	START PRESS	FINAL TEMP	TARGET PRESS
1	5.00 PSI	0.7 min	5.00 psi
2	10.00 PSI	3.30 min	10.00 psi
3*	*psi	19 min	*psi
4*	*psi	8.0 min	*psi

\* Will vary to give 1.0 ml/min. @ 45°C and the target pressure is set to give 1.5 ml/min @ 320°C.

Split state:

Time	Split State
Initial	Vent
0.75 min	Closed/splitless*
1.90 min	Open/split

\* Splitless time may be adjusted to optimize GC performance.

Vent Flow	85 ml/min. @ 5 psi, 50°C
Split Flow	2-5 ml/min. @ 10 psi, 45°C
Sample Volume	20 µL (5972/5973)
	µL (5975)
Carrier Gas	Helium as 30-45 cm/sec

### 11.3 Initial Calibration

**NOTE** The calibration procedure(s) and options chosen must follow the ALS protocols. Any exceptions to the calibration procedures detailed in SOC-CAL, *Calibration of Instruments for Organics Chromatographic Analyses* are described as follows:

- 11.3.1 Prior to calibration, analyze the GC/MS tuning standard using instrument conditions used for calibration. Obtain the spectrum for evaluation using one of the following options:
- Three scans (the peak apex scan and the scans immediately preceding and following the apex) are acquired and averaged. Background subtraction is required, and must be accomplished using a single scan acquired no more than 20 scans prior to the elution of DFTPP. The background subtraction should be designed only to eliminate column bleed or instrument background ions. Do not subtract part of the DFTPP peak or part of any other closely eluting peak.
  - Use one scan at the apex of the peak. Background subtraction is required, and must be accomplished using a single scan acquired no more than 20 scans prior to the elution of DFTPP. The background subtraction should be designed only to eliminate column bleed or instrument background ions. Do not subtract part of the DFTPP peak or part of any other closely eluting peak.
  - Use one scan either directly preceding or following the apex of the peak. Background subtraction is required, and must be accomplished using a single scan acquired no more than 20 scans prior to the elution of DFTPP. The background subtraction should be designed only to eliminate column bleed or instrument background ions. Do not subtract part of the DFTPP peak or part of any other closely eluting peak.
  - Use the average across the entire peak up to a total of 5 scans. If the peak is wider than 5 scans, the tune will consist of the peak apex scan and the two scans immediately preceding and following the apex. Background subtraction is required, and must be accomplished using a single scan acquired no more than 20 scans prior to the elution of DFTPP. The background subtraction should be designed only to eliminate column bleed or instrument background ions. Do not subtract part of the DFTPP peak or part of any other closely eluting peak.
- 11.3.2 Evaluate the spectrum obtained for DFTPP against the tuning criteria. Criteria are given in Tables 1 and 1A. The GC/MS must meet the DFTPP ion abundance criteria prior to further analyses. To assess column performance and injection port inertness, pentachlorophenol and benzidine should be present at an acceptable level and peak tailing should not exceed a tailing factor of 2. DDT degradation should not exceed 20%. If excessive tailing, poor chromatography, or degradation of >20% is noted, the injection port may require cleaning. It may also be necessary to remove the first 15-30 cm of the GC column. If hardware tuning criteria cannot be met, the source may need cleaning, filaments replaced or other maintenance.
- 11.3.3 The internal standards should permit most of the components of interest in the chromatogram to have retention times of 0.80-1.20 relative to one of the internal standards. Refer to Table 4 for internal standards and corresponding analytes assigned for quantitation. Use the base peak ion from the specific internal standard as the primary ion for quantitation (see Table 1 in EPA method 8270D). If interferences are noted, use the next most intense ion as the quantitation ion (i.e. for 1,4-dichlorobenzene- $d_4$ , use 152 m/z for quantitation).
- 11.3.4 Analyze 20  $\mu$ L of each calibration standard (containing internal standards) and tabulate the area of the primary characteristic ion against concentration for each compound (see Table 1 in EPA method 8270D). Calculate response factors (RFs) for each compound relative to one of the internal standards as follows:

$$RF = (A_x C_{is}) / (A_{is} C_x)$$

Where:

- A<sub>x</sub> = Area of the characteristic ion for compound being measured.
- A<sub>is</sub> = Area of the characteristic ion for specific internal standard.
- C<sub>is</sub> = Concentration of the specific internal standard (ng/μL).
- C<sub>x</sub> = Concentration of the compound being measured (ng/μL).

11.3.5 The percent relative standard deviation (%RSD) should be less than or equal to 20% for each compound. It is also recommended that a minimum response factor for the most common target analytes, as noted in Table 5, be demonstrated as a means to ensure that these compounds are performing as expected.

$$\%RSD = \frac{SD}{\overline{RF}} \times 100$$

where:

- RSD = relative standard deviation.
- $\overline{RF}$  = mean of initial RFs for a compound.
- SD = standard deviation of average RFs for a compound.

$$SD = \sqrt{\frac{\sum_{i=1}^N (RF_i - \overline{RF})^2}{N - 1}}$$

where:

- RF<sub>i</sub> = RF for each of the calibration levels
- N = Number of RF values (e.g., 6)

11.3.6 The relative retention times (RRT) of each compound in each calibration run should agree within 0.06 relative retention time units.

$$RRT = \frac{\text{Retention time of the analyte}}{\text{Retention time of the internal standard}}$$

11.3.7 Linearity - If the % RSD of any compound is 20% or less, then the relative response factor is assumed to be constant over the calibration range, and the average relative response factor may be used for quantitation.

11.3.8 If the %RSD for a compound is >20%, then alternative calibration models should be used. Refer to SOC-CAL, Calibration of Instruments for Organics Chromatographic Analysis for alternative fit guidance.

11.3.9 If more than 10% of the compounds included with the initial calibration exceed the 20% RSD limit and do not meet the minimum correlation coefficient (0.99) for alternate curve fits, then the chromatographic system is considered too reactive

for analysis to begin. Clean or replace the injector liner and/or capillary column, then repeat the calibration procedure.

11.3.10 When calculating the calibration curves using the alternative curve fits, a minimum quantitation check on the viability of the lowest calibration point should be performed by re-fitting the response from the low concentration calibration standard back into the curve (see Method 8000C for additional details). It is not necessary to re-analyze a low concentration standard; rather the data system can recalculate the concentrations as if it were an unknown sample. The recalculated concentration of the low calibration point should be within  $\pm 30\%$  of the standard's true concentration.

11.3.11 Structural isomers that produce very similar mass spectra should be identified as individual isomers if they have sufficiently different GC retention times. Sufficient GC resolution is achieved if the height of the valley between two isomer peaks is less than 50% of the average of the two peak heights. Otherwise, structural isomers are identified as isomeric pairs. The resolution should be verified on the mid-point concentration of the initial calibration as well as the laboratory designated continuing calibration verification level if closely eluting isomers are to be reported

#### 11.4 Independent Calibration Verification

11.4.1 Following initial calibration, analyze an ICV standard. The ICV solution must contain all analytes in the calibration standards at a concentration in the middle of the range of the initial calibration. Calculate the concentration using the typical procedure used for quantitation. Calculate the percent difference (%D) from the ICV true value. The maximum allowed % Difference or % Drift is  $\pm 30\%$ .

11.4.2 If a second source standard is not available or is cost prohibitive (such as certain non-routine analytes), then a second lot number may be used as the ICV and must meet the criteria above.

11.4.3 After the multi-point calibration has passed all of the above criteria, and the Independent Calibration Verification has been performed, samples can be analyzed. The calibration curve mid-point standard may serve as the CCV for the opening set of samples within the same 12-hour window as the initial calibration.

#### 11.5 Continuing Calibration

11.5.1 A calibration standard, or standards, at mid-concentration (See Table 2) containing all semivolatiles, DFTPP, and all required surrogates, must be analyzed every 12 hours during analysis. The DFTPP must result in a mass spectrum which meets the criteria given in Tables 1A or 1B. These criteria must be demonstrated during each 12 hour shift. Obtain the DFTPP spectrum as described.

11.5.2 The internal standard responses and retention times in the calibration check standard must be evaluated immediately after or during data acquisition. If the retention time for any internal standard changes by more than 30 seconds from that in the midpoint standard of the most recent initial calibration sequence, the chromatographic system must be inspected for malfunctions and corrective action identified, as required. If the EICP area for any of the internal standards changes by a factor of two (50% to 200%) from that in the midpoint standard of the most recent initial calibration sequence, the chromatographic system must be inspected for malfunctions and corrective action identified, as appropriate. When corrective action is taken, reanalysis of samples analyzed while the system

was malfunctioning is required. Update the reference spectra and retention times in the quantitation database for the instrument method or ID file. The initial calibration average RF or calibration curve is then used in the quantitation of subsequent analyses.

- 11.5.3 If the percent difference or percent drift for each compound is less than or equal to 20%, the initial calibration is assumed to be valid and the analysis of samples may begin. Calculate the percent drift using:

$$\% \text{ Drift} = \frac{C_i - C_c}{C_i} \times 100$$

where:  $C_i$  = Compound standard concentration.

$C_c$  = Measured concentration using selected quantitation method.

- 11.5.4 Due to the large number of compounds that may be analyzed by this method, some compounds may fail to meet the  $\leq 20\%$  criteria. If no more than 20% of the compounds, included in the initial calibration, differ from their true concentration by 40%, the initial calibration is valid and no corrective action is necessary.
- 11.5.5 In cases where compounds fail, they may still be reported as non-detects if it can be demonstrated that there was adequate sensitivity to detect the compound at the applicable quantitation limit. This is done by analyzing a MRL check standard for the failing compounds, where the resulting peaks for the failing compounds must pass 3:1 signal to noise.
- 11.5.6 Non-detected analytes can be reported from analyses when a CCV exhibit a positive bias (i.e., outside the upper control limit), no further documentation is required.
- 11.5.7 For situations when the CCV fails to meet the criterion in section 11.5.4, and a confirmed detection exceeds the MRL, the sample must be reanalyzed to ensure accurate quantification. If it is not possible to reanalyze the sample, the result must be reported as an estimated value.
- 11.5.8 A blank (method blank, GPC blank, or solvent blank) should be analyzed after the CCV, or at any other time during the analytical shift, to prove the system is free of contaminants. If contaminants are found in a method blank or GPC blank, then a solvent blank should be analyzed to help isolate the source of contamination.
- 11.5.9 Each of the most common target analytes in the calibration verification standard should meet the minimum response factors noted in Table 5.
- 11.5.10 If the minimum response factors are not met, the system should be evaluated, and corrective action should be taken before sample analysis begins. Possible problems include standard mixture degradation, injection port inlet contamination, contamination of the front end of the analytical column, and active sites in the column or chromatographic system.
- 11.6 GCMS Analysis
- 11.6.1 Evaluate FID screen and make proper dilution (See FID screening SOP).

- 11.6.2 Spike the 1 mL extract obtained from sample preparation with 10  $\mu\text{L}$  of the internal standard solution just prior to analysis. Use the same operating conditions as were used for initial calibration.
- 11.6.3 If the response for any quantitation ion exceeds the initial calibration curve range of the GC/MS system, extract dilution must take place. Additional internal standard must be added to the diluted extract to maintain the required 1.0 ng/ $\mu\text{L}$  of each internal standard in the extracted volume. The diluted extract must be reanalyzed.
- 11.6.4 Store the extracts at  $-10^{\circ}\text{C}$  or less, protected from light in vials equipped with unpierced Teflon lined septa. Archive the extract in freezer for 3 months after analysis in the instrument/date specific storage boxes.

## 12) QA/QC Requirements

- 12.1 In addition to instrument criteria for calibration, the ability of each analyst/instrument to generate acceptable accuracy and precision must be documented prior to sample analysis (IPR study). This must be validated before analysis of samples begins, or whenever significant changes to the procedures have been made. To do this, four tap water samples are spiked with each target analyte, extracted, and analyzed.
- 12.2 Method Detection Limits
  - 12.2.1 A method detection limit (MDL) study, or verification of an existing LOD from an equivalent instrument must be completed prior to analysis of samples. To establish detection limits that are precise and accurate, the analyst must perform the following procedure. Spike a minimum of seven blank replicates with a MDL spiking solution (at a level below the MRL) for each target analyte, extract, and analyze. The MDL studies should be done for each matrix, prep method, and instrument. Refer to the SOP Performing Method Detection Limit Studies and Establishing Limits of Detection and Quantification..
  - 12.2.2 Calculate the average concentration found (x) in the sample concentration, and the standard deviation of the concentrations for each analyte. Calculate the MDL for each analyte using the correct T value for the number of replicates. The MDL study must be verified annually.
- 12.3 Limits of Quantification (LOQ)
  - 12.3.1 The laboratory establishes a LOQ for each analyte as the lowest reliable laboratory reporting concentration or in most cases the lowest point in the calibration curve which is less than or equal to the desired regulatory action levels, based on the stated project requirements. Analysis of a standard or extract prepared at the lowest point calibration standard provides confirmation of the established sensitivity of the method. The LOQ recoveries should be within the laboratories LCS acceptance limits to verify the data reporting limit. Refer to the SOP Performing and Documenting Method Detection Limit Studies and Establishing Limits of Detection and Quantification (CE-QA011/ADM-MDL).
- 12.4 The Method Reporting Limits (MRLs) used at ALS are the routinely reported lower limits of quantitation which take into account day-to-day fluctuations in instrument sensitivity as well as other factors. These MRLs are the levels to which ALS routinely reports results in order to minimize false positive or false negative results. The MRL is normally two to ten times the method detection limit.

- 12.5 Ongoing QC Samples required are described in the ALS-Kelso Quality Assurance Manual and in the SOP for Sample Batches. Additional QC Samples may be required in project specific quality assurance plans (QAPP). General QA requirements for DoD QSM are defined in the laboratory SOP, *Department of Defense Projects – Laboratory Practices and Project Management (ADM-DOD5)*. General QC Samples are:

12.5.1 Method blank - A method blank is extracted and analyzed with every batch of 20 or fewer samples to demonstrate that there are no method interferences. The method blank must demonstrate that interferences from the analytical and preparation steps are minimized. No target analytes should be detected above the MRL in the method blank. For some project specific needs, exceptions may be noted and method blank results above the MRL may be reported for common lab contaminants (phthalate esters, etc.).

12.5.2 A lab control sample (LCS) must be extracted and analyzed with every batch of 20 or fewer samples. The LCS is prepared by spiking a blank with the matrix spike solution, and going through the entire extraction and analysis. Calculate percent recovery (%R) as follows:

$$\%R = X/TV \times 100$$

Where X = Concentration of the analyte recovered  
TV = True value of amount spiked

12.5.2.1 Acceptance criteria for lab control samples can be found in the laboratory Data Quality Objectives (DQO) tables. The accuracy of the analysis is controlled on a subset of target analytes. If the project analyte list is fewer than 20 analytes, all are considered control analytes. Analytes which are used for control analytes are listed in Table 6. For DoD projects all project target analytes are considered control analytes. If the LCS recovery for any control analyte fails acceptance limits, the cause is evaluated and corrective action taken as necessary. If instrument corrective action is not applicable or ineffective, re-extraction of the associated samples may be required. If any other analyte fails the advisory acceptance limits, the analyst must evaluate the impact on data quality and take any necessary corrective action, which may include re-extraction of the associated samples. Project-specific requirements may require all compounds to be treated as control analytes, or dictate use of project acceptance criteria.

12.5.3 A matrix spike/duplicate matrix spike (MS/DMS) must be extracted and analyzed with every batch of 20 or fewer samples. The MS is prepared by spiking a sample aliquot with the matrix spike solution, and going through the entire extraction and analysis. Calculate percent recovery (%R) as follows:

$$\%R = \frac{X - X1}{TV} \times 100$$

Where X = Concentration of the analyte recovered  
X1 = Concentration of unspiked analyte  
TV = True value of amount spiked

Calculate Relative Percent Difference (RPD) as:

$$\%RPD = \frac{R1 - R2}{(R1 + R2)/2} \times 100$$

Where R1 = %recovery of the MS  
R2 = %recovery of the DMS

12.5.3.1 The acceptance limits for the MS/DMS recovery can be found in the laboratory Data Quality Objectives (DQO) tables. If the MS/DMS recovery is out of acceptance limits for reasons other than matrix effects, corrective action must be taken. (See Quality Assurance Manual section 11) The RPD acceptance limits are 30% for water and 40% for soils, sediments, and solids. Project-specific requirements may dictate the use of project acceptance criteria.

12.5.4 The acceptance limits for the surrogates can be found in the laboratory Data Quality Objectives (DQO) tables. If any surrogate recovery is outside acceptance criteria, the sample data must be closely evaluated for possible matrix interferences. If none are present, then corrective action must be taken. The sample should be re-analyzed if instrument factors (calibration, injection port) are suspected. If not, re-extraction and re-analysis is required, except in cases of high recovery and no positive hits in the sample for the analyte class represented by the particular surrogate.

12.5.5 The acceptance criteria listed in the laboratory Data Quality Objective (DQO) Tables are current criteria, but are subject to change as control limits are updated.

12.6 Additional QA/QC measures include control charting of QC sample results

### 13) Data Reduction and Reporting

13.1 Qualitative Analysis - The qualitative identification of compounds determined by this procedure is based on retention time, and comparison of the sample mass spectrum, after background correction, with characteristic ions in a reference mass spectrum. The reference mass spectrum must be generated by the laboratory using the instrument and conditions used for the sample analysis. The characteristic ions from the reference mass spectrum are defined to be the three ions of greatest relative intensity, or any ions over 30% relative intensity, if less than three such ions occur in the reference spectrum. Compounds should be identified as present when the criteria below are met.

13.1.1 The intensities of the characteristic ions of a compound maximize in the same scan or within one scan of each other. Selection of a peak by a data system target compound search routine where the search is based on the presence of a target chromatographic peak containing ions specific for the target compound at a compound-specific retention time will be accepted as meeting this criterion.

13.1.2 The RRT of the sample component is within  $\pm 0.06$  RRT units of the RRT of the standard component.

13.1.3 The relative intensities of the characteristic ions agree within 30% of the relative intensities of these ions in the reference spectrum.

13.1.4 Structural isomers that produce very similar mass spectra should be identified as individual isomers if they have sufficiently different GC retention times. Sufficient GC resolution is achieved if the height of the valley between two

isomer peaks is <25% of the sum of the 2 peak heights. Otherwise, structural isomers are identified as isomeric pairs.

13.1.5 Identification is hampered when sample components are not resolved chromatographically and produce mass spectra containing ions contributed by more than one analyte. When gas chromatographic peaks appear to represent more than one sample component (i.e., a broadened peak with shoulder(s) or a valley between two or more maxima), appropriate selection of analyte spectra and background spectra is important. Examination of extracted ion current profiles of appropriate ions can aid in the selection of spectra, and in qualitative identification. When analytes coelute, the identification criteria can be met, but each analyte spectrum will contain extraneous ions contributed by the coeluting compound.

13.2 For samples containing components not associated with the calibration standards, a library search may be made for the purpose of tentative identification. Refer to method 8270D for guidance on tentatively identified compound (TIC) identification and quantification.

13.3 Quantitation and Calculations

13.3.1 The GC/MS data stations, in current use, all use the H-P RTE Integrator to generate the raw data used to calculate the standards  $\overline{RF}_x$  values, the sample amounts, and the spike values. The software does three passes through each data file. The first two identify and integrate each internal standard and surrogate. The third pass uses the time-drift information from the first two passes to search for all method analytes in the proper retention times and with the proper characteristic quantitation ions

When  $\overline{RF}_x$  is used, calculate the extract concentration as follows:

$$C_{ex} = \frac{(Resp_x)(Amt_{ISTD})}{(Resp_{ISTD})(\overline{RF}_x)}$$

Where:

- $C_{ex}$  = the concentration in the sample extract (ppb);
- $Resp_x$  = the peak area of the analytes of interest;
- $Resp_{ISTD}$  = the peak area of the associated internal standard;
- $Amt_{ISTD}$  = the amount, in ppb, of internal standard added
- $\overline{RF}_x$  = the average response from the initial calibration.

13.3.2 The concentration of analytes in the original sample is computed using the following equations:

$$\text{Aqueous Samples: } \text{Concentration } (\mu\text{g} / \text{L}) = \frac{(C_{ex})(V_f)(D)}{(V_s)}$$

- Where  $C_{ex}$  = Concentration in extract in ng/mL
- $V_f$  = Final volume of extract in mL

D = Dilution factor  
Vs = Volume of sample extracted, liters

$$\text{Non-aqueous Samples: Concentration (ug/Kg)} = \frac{(C_{ex}) (V_f) (D)}{(W)}$$

Where C<sub>ex</sub> = Concentration in extract in ng/mL  
V<sub>f</sub> = Final volume of extract in mL  
D = Dilution factor  
W = Weight of sample extracted in grams.

#### 13.4 Data Review and Assessment

13.4.1 Following primary data interpretation and calculations, all data is reviewed by a secondary analyst. Following generation of the report, the report is also reviewed. Refer to the SOP *Laboratory Data Review Process (ADM-DREV)* for details. The person responsible for final review of the data report and/or data package should assess the overall validity and quality of the results and provide any appropriate comments and information to the Project Chemist to inclusion in the report narrative

#### 13.5 Reporting

13.5.1 Refer to the SOP for Data Reporting and Report Generation for reporting guidelines.

13.5.2 Reports are generated in the ALS LIMS by compiling the SMO login, sample prep database, instrument, date, and client-specified report requirements (when specified). This compilation is then transferred to a file which the Stealth reporting system uses to generate a report. The forms generated may be ALS standard reports, DOD, or client-specific reports. The compiled data from LIMS is also used to create EDDs.

### 14) Contingencies for Handling Our-of-Control or Unacceptable Data

14.1 Refer to the SOP for *Nonconformance and Corrective Action Procedures (ADM-NCAR)* for procedures for corrective action. Personnel at all levels and positions in the laboratory are to be alert to identifying problems and nonconformities when errors, deficiencies, or out-of-control situations are detected.

### 15) Method Performance

15.1 This method was validated through single laboratory studies of accuracy and precision. Refer to the reference method for additional method performance data available.

15.2 The method detection limit (MDL) is and related method reporting limit(s) were established using the procedure described in SOP *Performing and Documenting Method Detection Limit Studies and Establishing Limits of Detection and Quantification (Ce-QA011/ADM-MDL)*. Method Reporting Limits are established for this method based on MDL studies and as specified in the ALS Quality Assurance Manual.

### 16) Pollution Prevention and Waste Management

- 16.1 The laboratory will comply with all Federal, State and local regulations governing waste management, particularly the hazardous waste identification rules and land disposal restrictions as specified in the ALS Lab Waste Management Plan.
- 16.2 This method uses Methylene Chloride and any waste generated from this solvent must be placed in the collection cans in the lab. The solvent will then be added to the hazardous waste storage area and recycled off site.
- 16.3 This method uses non-halogenated solvents and any waste generated from this solvent must be placed in the collection cans in the lab. The solvent will then be added to the hazardous waste storage area and disposed of in accordance with Federal and State regulations.

**17) Training**

- 17.1 Training is documented following ADM-TRAIN, ALS-Kelso Training Procedure.

**18) Method Modifications**

- 18.1 Section 11.5.4 - No limit defined in reference method, so lab assigned a limit of 40% based on CLP protocols.
- 18.2 Lower reporting levels are achieved in this procedure through injection of larger volumes and a lower calibration range. Lower limits of quantitation for soils are > 10 µg/Kg for soils and > 0.2 µg/L for waters.
- 18.3 Minimum Response factors listed in Table 5 were determined from representative initial calibrations performed after system maintenance. Recommended minimum response factors listed in Table 4 of EPA 8270D are not applicable due the differences in quantitation levels from the reference method.

**DFTPP Key Ions and Ion Abundance Criteria**

Method 8270D Ion Abundance Criteria		CLP OLM04.2 Ion Abundance Criteria	
Mass	Ion Abundance Criteria	Mass	Ion Abundance Criteria
51	30-60% of mass 198	51	30-80% of mass 198
68	< 2% of mass 69	68	<2% of mass 69
70	< 2% of mass 69	69	Present
127	40-60% of mass 198	70	<2% of mass 69
197	< 1% of mass 198	127	25-75% of mass 198
198	Base peak, 100% relative abundance	197	<1% of mass 198
199	5-9% of mass 198	198	Base peak, 100% relative abundance
275	10-30% of mass 198	199	5-9% of mass 198
365	> 1% of mass 198	275	10-30% of mass 198
441	Present but less than mass 443	365	>0.75% of mass 198
442	> 40% of mass 198	441	Present, but less than mass 443
443	17-23% of mass 442	442	40-110% of mass 198
		443	15-24% of mass 442

**Table 1B**  
**DFTPP Key Ions and Ion Abundance Criteria**  
**FOR 5973 and newer GC/MS SYSTEMS**

Mass	Ion Abundance Criteria
51	10-80% of mass 198
68	0-2% of mass 69
70	0-2% of mass 69
127	10-80% of 198
197	0-2% of 198
198	30-100% of 442 (alternate base)
199	5-9% of 198
275	10-60% of 198
365	1-50% of 442
441	0.01-100% of 443
442	30-100% of 198 (alternate base)
443	15-24% of 442

Alternate tuning criteria (from Method 525.2 or CLP OLM04.2) may be used provided that method performance is not adversely affected and that method performance criterion is met. The criteria used must be the same for all ion abundance criteria checks associated with a given analysis. For example, initial calibration, continuing calibration(s), QC, and sample analyses for a given sample must all use the same criteria.

**Table 2**  
**8270-LL Standards**

**CALIBRATION**

The calibration curve is prepared from the following Supelco stock standards (or equivalent from other vendors\*): 8270 CLP Mix, Equity 8270 Mix 4, Equity Benzidines Mix, Equity N-Nitrosodiphenylamine, 1-Methylnaphthalene, Acetophenone and 8270 Surrogates Mix.

The mix of standards to prepare the ICAL intermediate may be changed to meet project requirements.

Calibration curve is prepared from a 100 ppm intermediate solution and ranges from 50 – 10000ppb depending upon project requirements. Add internal standard when curve is prepared.

Place in amber autosampler vial, cap.

Store at -10°C. Expiration is 1 year from date prepared or expiration of parent standard(s), whichever is earlier.

**ICV**

Recommended: AccuStandard catalog # (or equivalent from other vendors\*):

CLP-HC-BN-R	2000 ppm BN mix
CLP-HC-A-PAK 2000 ppm	Acid composite mix
Z-014E-R3	2000 ppm Composite 3 mix
M-8270-SS-PAK	4000 ppm Surrogates mix
Z-014J	4000 ppm Internal standards mix
M-625C	25000 ppm DFTPP
Z-014F	2000 ppm Benzidines mix

Add 10 µl internal standard for each 1 ml of ICV prepared.

Place in autosampler vial, analyze, recap, and refrigerate.

Expiration is one year after ICV was prepared or the expiration date from the manufacturer, which ever is earlier.

**CCV & TUNE**

Prepare 1 ml 8270\_LL CCV standard that falls near the mid point of the calibration curve. DFTPP is added to the CCV to give a final concentration of 2.5 µg/ml. The CCV is stored in an amber autosampler vial and is good for one week.

**RECAP AND STORE IMMEDIATELY AFTER INJECTING**

\* Vendor must be A2LA and/or ISO9000 certified.

<b>Summary of Corrective Actions</b>				
<b>Method Reference</b>	<b>Control</b>	<b>Specification and Frequency</b>	<b>Acceptance Criteria</b>	<b>Corrective Action</b>
EPA 8000C, EPA 8270D	ICAL	Prior to sample analysis	% RSD $\leq$ 20 COD $\geq$ 0.990	Correct problem then repeat ICAL
EPA 8000C,	ICV	After ICAL	$\pm$ 30% Diff	Correct problem and verify second source standard; rerun second source verification. If fails, correct problem and repeat initial calibration.
EPA 8270D	CCV	Prior to sample analysis	$\pm$ 20% Diff	Correct problem then repeat CCV or repeat ICAL
EPA 8000C,	Method Blank	Include with each analysis batch (up to 20 samples)	<MRL	If target exceeds MRL, reanalyze to determine if instrument was cause. If still noncompliant then:  Re-extract or reanalyze samples containing contaminate, unless samples contain > 20x amount in blank.
EPA 8270D	Laboratory Control Sample	Include with each analysis batch (up to 20 samples)	See DQO Tables	If exceeds limits, re-extract and re-analyze
EPA 8000C,	Matrix Spike	Include with each analysis batch (up to 20 samples)	See DQO Tables	Evaluate data to determine if there is a matrix effect or analytical error
EPA 8270D	Sample Duplicates	Include with each analysis batch (up to 20 samples)	W: RPD $\leq$ 30 S: RPD $\leq$ 40	Re-homogenize and re-analyze if result is > 5 X the MRL

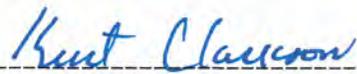

## Semi-Volatile Organic Compounds by GC/MS Selective Ion Monitoring

DOCUMENT ID: SVM-8270S, REV 9.0

Prepared By:   
Organics Manager, Jonathon Walter

Date: 12/2/2020

Prepared By:   
Quality Assurance Manager, Kurt Clarkson

Date: 12/2/2020

Approved By:   
Laboratory Manager, Charles (Pat) Byrne

Date: 12/2/20

## 1) Scope & Applicability

- 1.1. This procedure is used to determine the concentrations of Semi-Volatile Organic Compounds in water, soil, and tissue matrices using EPA Method 8270D and Selected Ion Monitoring (SIM). This procedure may also be applicable to various miscellaneous waste samples. Table 1 lists compounds that may be determined by this method and lists nominal method reporting limits (MRLs) in water, soil, and tissue. Other compounds may be analyzed to meet project requirements. Due to the nature of this analysis and its applications, MRLs may vary due to project specifications. Table 1 lists Method Detection Limits (MDLs) that have been achieved, however, MDLs may change as MDL studies are performed, and may vary depending on the instrument used and preparation method.
- 1.2. The procedure is intended for samples containing trace-level amounts of target compounds. Samples containing high concentrations of target analyte will not be analyzed undiluted. Extracts may be screened using GC/FID to estimate the hydrocarbon content and concentrations of individual polynuclear aromatic hydrocarbons (PAHs). Samples containing PAHs are diluted prior to analysis. All MRLs will be adjusted in accordance with this dilution. Therefore, samples containing high levels of PAHs will not be analyzed to achieve the optimum MRLs for the analysis.
- 1.3. This procedure can be used to quantitate most neutral, acidic, and basic organic compounds that are soluble in methylene chloride and capable of being eluted as sharp peaks from a gas chromatographic fused-silica capillary column coated with a slightly polar silicone phase. Such compounds include polynuclear aromatic hydrocarbons, chlorinated hydrocarbons, phthalate esters, nitrosamines, haloethers, ketones, anilines, aromatic nitro compounds, and phenols, including nitrophenols. Most acidic compounds are derivatized in tissue samples prior to analysis to aid sensitivity and chromatographic resolution.
- 1.4. Other compounds than those listed in Table 1 may be analyzed. However, analytes not summarized in Table 1 may not be validated with a method detection limit study. Therefore, the lab will not use this procedure to analyze for non-routine analytes unless a similar analyte has been validated with a MDL study. As a general rule, the MRL for these compounds will equal the MRL of a similar compound in the routine analyte list. Results will not be reported below this estimated MRL.
- 1.5. In cases where there is a project-specific quality assurance plan (QAPP), the project manager identifies and communicates the QAPP-specific requirements to the laboratory. In general, project specific QAPP's supersede method specified requirements. An example of this are projects falling under DoD ELAP. QC requirements defined in the SOP *Department of Defense Projects – Laboratory Practices and Project Management* (ADM-DOD) may supersede the requirements defined in this SOP.

## 2) Summary of Procedure

- 2.1 This method provides Gas Chromatography/Mass Spectrometry (GC/MS) conditions for the detection of Semi-volatile Organic Compounds. Prior to the use of this method, an appropriate sample preparation method must be used to recover the analytes of interest. Soil, tissue, and colored water extracts may be cleaned using EPA Method 3640 (gel permeation chromatography) prior to analysis.
- 2.2 A 0.5-20  $\mu\text{L}$  aliquot of the extract is injected into the gas chromatograph (GC). The compounds are separated on a fused silica capillary column. Compounds of interest are detected by a mass selective detector in the selective ion mode. Identification of the

analytes of interest is performed by comparing the retention times of the analytes with the respective retention times of an authentic standard, and by comparing mass spectra of analytes with mass spectra of reference materials. Quantitative analysis is performed by using the authentic standard to produce a response factor and calibration curve, and using the calibration data to determine the concentration of an analyte in the extract. The concentration in the sample is calculated using the sample weight or volume and the extract volume. To achieve MRLs listed in Table 1 the initial sample amount, final extract volume, and injection aliquot are specified for each product.

- 2.3 The following compounds may require special treatment when being determined by this method. Benzidine, 3, 3'-Dichlorobenzidine, nitrophenols, Hexachlorocyclopentadiene, Pentachlorophenol, Benzoic Acid and Benzyl Alcohol are subject to poor extraction efficiency or erratic chromatographic behavior, especially if the GC system is contaminated with high boiling material.

### 3) Definitions

- 3.1 For laboratory definitions applicable to most analyses, refer to the SOP for Sample Batches.

### 4) Responsibilities

- 4.1 It is the responsibility of the analyst to perform the analysis according to this SOP and to complete all documentation required for data review. Analysis and interpretation of the results are performed by personnel in the laboratory who have demonstrated the ability to generate acceptable results utilizing this SOP. This demonstration is in accordance with the training program of the laboratory. Final review and sign-off of the data is performed by the department supervisor/manager or designee.
- 4.2 It is the responsibility of the department supervisor/manager to document analyst training and method proficiency, as described in: *Employee Training and Orientation* (ADM-TRAIN).

### 5) Interferences

- 5.1 Raw GC/MS data from all blanks, samples, and spikes must be evaluated for interferences. Determine if the source of interference is in the preparation of the samples. Corrective action should be taken to eliminate the interferences.
- 5.2 Accurate determination of phthalate esters can pose difficulties when using this methodology. Common flexible plastics contain varying amounts of phthalates. These phthalates are easily extracted or leached from such materials during laboratory operations. Cross contamination of clean glassware may occur when plastics are handled during extraction steps, especially when solvent-wetted surfaces are handled. Interferences from phthalates can best be minimized by avoiding contact with any plastic materials. Exhaustive cleanup of reagents and glassware may be required to eliminate background phthalate contamination.
- 5.3 Contamination by carryover can occur whenever high-concentration and low-concentration samples are sequentially analyzed. To reduce carryover, the sample syringe must be rinsed out between samples with solvent. Whenever an unusually concentrated sample is encountered, it should be followed by the analysis of an instrument blank to check for cross contamination.

## 6) Safety

- 6.1 Chemicals, reagents and standards must be handled as described in the ALS safety policies, approved methods and in SDSs where available. Refer to the ALS Chemical Hygiene Plan and the appropriate SDSs prior to beginning this method.
- 6.2 This method uses Dichloromethane, a known human carcinogen. Refer to the methylene chloride policy document, ENV-HSE-NA-EX-006-EN for proper handling.  
<G:\SAFETY\TRAINING\Methylene Chloride\Methylene Chloride - NA 031419.pdf>.

## 7) Sample Collection, Containers, Preservation, and Storage

- 7.1 Certified clean containers should be purchased for sample collection. The sample containers should be of glass or Teflon and have screw-top covers with Teflon liners. Plastic containers or lids may not be used for the storage of samples due to the possibility of sample contamination from the phthalate esters and other hydrocarbons within the plastic.
- 7.2 Water and soil samples should be iced or refrigerated at  $4 \pm 2^{\circ}\text{C}$  from time of collection until extraction. Tissue samples are stored frozen until extraction.
- 7.3 Water and soil samples should be iced or refrigerated at  $<6^{\circ}\text{C}$  from time of collection until extraction. Tissue samples are stored frozen until extraction.

## 8) Standards, Reagents, and Consumable Materials

- 8.1 Reagent grade chemicals shall be used in all tests. Other grades may be used, provided it is first ascertained that the reagent is of sufficiently high purity to permit its use without lowering the accuracy of the determination. The preparation for all laboratory prepared reagents and solutions must be documented in a laboratory logbook. Refer to the SOP *Reagent/Standards Login and Tracking* (ADM-RTL) for the complete procedure and documentation requirements.
- 8.2 BSTFA + TMCS 99:1, Supelco 33154-U: This is used to derivatize the phenols in extracts.
- 8.3 Standards
  - 8.3.1 Stock standard solutions may be purchased from a number of vendors. All reference standards, where possible, must be traceable to SI units or NIST certified reference materials. Commercially prepared stock standards are typically used when available at a concentration of 100  $\mu\text{g}/\text{mL}$  or more. Standard concentrations can be verified by comparison versus an independently prepared standard. Alternatively, prepare stock standard solutions at a concentration of 1000  $\mu\text{g}/\text{mL}$  by dissolving 0.0100 g of reference material in methylene chloride or other suitable solvent and diluting to volume in a 10 mL volumetric flask. Larger volumes can be used at the convenience of the analyst. When compound purity is assayed to be 96% or greater, the weight can be used without correction to calculate the concentration of the stock standard.
  - 8.3.2 Transfer the stock standard solutions into amber Teflon-sealed crimp top autosampler vials at  $-10^{\circ}\text{C}$  and protect from light, or store as

recommended by the manufacturer. Stock standards should be checked frequently for signs of degradation or evaporation, especially just prior to preparing calibration standards from them. The expiration date is 1 year.

- 8.3.3 Unopened stock standards and neat materials have an expiration date equal to the manufacturer's recommendation. Neat material that does not have a manufacturer's recommended expiration date should be replaced after five years. Stock standard solutions received in sealed ampules with manufacture expiration dates in excess of 1 year have an expiration date of 1 year from the date of opening the sealed ampoule.
- 8.4 Internal Standard Solutions - The internal standards are 1,4-dichlorobenzene-d<sub>4</sub>, naphthalene-d<sub>8</sub>, acenaphthene-d<sub>10</sub>, phenanthrene-d<sub>10</sub>, chrysene-d<sub>12</sub>, and perylene-d<sub>12</sub> (See Table 3 for corresponding compounds). The nominal concentration of the standard is 100 ppb. For ultralow-level analyses, use 10 ppb. Each 100 µL of sample extract undergoing analysis should be spiked with 1 µL of the internal standard solution. Store at -10°C or less when not being used. When using premixed certified solutions, store according to the manufacturer's recommendations. The expiration date is 1 year
- 8.5 GC/MS Tuning/Standard, A methylene chloride solution containing decafluorotriphenylphosphine (DFTPP) and pentachlorophenol is prepared. The concentration used (ng injected) will vary depending on the instrument model and/or sensitivity, but generally is 10-50ng. Store at -10°C or less when not being used, or store according to the manufacturer's recommendations. The expiration date is 1 year.
- 8.6 Calibration Standards
  - 8.6.1 A minimum of five initial calibration standards must be prepared from stock solutions (note that a seven point calibration is recommended). One of the calibration standards must be at a concentration at or below the method reporting limit. The others should correspond to the range of concentrations found in samples, but should not exceed the working range of the GC/MS system. Each 1 mL aliquot of calibration standards should be spiked with 10 µL of the internal standard solution prior to analysis. All calibration standards should be stored at -10°C or less and should be freshly prepared from stocks every 1 year, or sooner if check standards indicate a problem.
  - 8.6.2 A calibration range of 10-5000 ng/mL is recommended. Higher concentrations may be prepared for poorer performing analytes. Calibration levels and injection amount may be adjusted to meet project-specific requirements.
  - 8.6.3 The daily calibration standard (CCV) is prepared at a mid-level concentration from stock solutions. The CCV is prepared weekly and can be stored at 4 ± 2°C, or as recommended by the manufacturer.
- 8.7 QC Standards
  - 8.7.1 Surrogates: Prepare a working solution in methanol containing 2-

fluorophenol, phenol-d<sub>6</sub>, and 2,4,6-tribromophenol at 150 ng/μL and nitrobenzene-d<sub>5</sub>, 2-fluorobiphenyl, and terphenyl-d<sub>14</sub> at 100 ng/μL. This solution may be combined with the surrogate solution used to monitor analyses for PAHs only (Fluorene-d<sub>10</sub>, and Fluoranthene-d<sub>10</sub>). Custom project-specific surrogate solutions may also be used. Aliquots of the solution are spiked into all extracted samples, blanks, and QC samples according to the extraction SOP used.

- 8.7.2 Matrix Spike Standards: Prepare a working solution in methanol containing all analytes of interest ("full list spike"). Base-Neutral analytes and acid analytes are prepared at a concentration of 100 ng/μL. Aliquots of the solution are spiked into the selected QC aliquots according to the extraction SOP used

## 9) Apparatus and Equipment

### 9.1 Gas Chromatograph/Mass Spectrometer System

- 9.1.1 Gas Chromatograph - An analytical system complete with a temperature-programmable gas chromatograph suitable for splitless, split, or large-volume injection and all required accessories, including syringes, analytical columns, and gases. The capillary column should be directly coupled to the source.
- 9.1.2 Column: 5% Diphenyl, 95% Dimethyl Polysiloxane - 30 m x 0.25 mm ID x 0.25 μm film thickness silicone-coated fused-silica capillary column or equivalent (recommended: Phenomenex Zebron ZB-5MS, catalog # 7HG-G010-11-GGA.) Some projects may require a similar column, but with a different phase, to achieve improved separation.
- 9.1.3 Mass Spectrometer - Capable of scanning from 35 to 500 amu every 1 second or less, using 70 volts (nominal) electron energy in the electron impact ionization mode, and capable of operating in the SIM mode.
- 9.1.4 GC/MS Interface - Any GC-to-MS interface that gives acceptable calibration points for each compound of interest and achieves acceptable tuning performance criteria may be used.
- 9.1.5 Data System - A computer system must be interfaced to the mass spectrometer. The system must allow the continuous acquisition and storage on machine-readable media of all mass spectra obtained throughout the duration of the chromatographic program. The computer must have software that can search any GC/MS data file for ions of a specific mass and that can plot such ion abundances versus time or scan number. This type of plot is defined as an Extracted Ion Current Profile (EICP). Software must also be available that allows integrating the abundances in any EICP between specified time or scan-number limits.
- 9.1.6 Appropriate analytical balance (0.0001 g), volumetric flasks, syringes, vials, and bottles for standards preparation

## 10) Preventative Maintenance

- 10.1 All maintenance activities are recorded in a maintenance logbook kept for each

instrument. Pertinent information (serial numbers, instrument I.D., etc.) must be in the logbook. Maintenance entries should include date, symptom of problem, corrective actions, and description of maintenance, date, and name. The log should contain a reference to return to analytical control.

- 10.2 Carrier gas - Inline purifiers or scrubbers should be in place for all sources of carrier gas. These are selected to remove water, oxygen, and hydrocarbons. Purifiers should be changed as recommended by the supplier

### 10.3 Gas Chromatograph

10.3.1 Whenever GC maintenance is performed, care should be taken to minimize the introduction of air or oxygen into the column. Injection port maintenance may include swabbing out the port, changing the injection port liner, seal, washer, O-ring, septum, column ferrule, and autosampler syringe as needed. Liners and seals should be changed when recent sample analyses predict a problem with chromatographic performance. In some cases liners and seals may be cleaned and re-used.

10.3.2 Clipping off a small portion of the head of the column often improves chromatographic performance. When cutting off any portion of the column, make sure the cut is straight and "clean" (uniform, without fragmentation) by using the proper column cutting tool.

10.3.3 Over time, the column will exhibit poorer overall performance, as indicated by poor peak shape and reduced responses. The length of time for this to occur will depend on the samples analyzed. When a noticeable decrease in performance is evident, more thorough maintenance is necessary. Some steps are to solvent rinse the split vent and septum lines with a mix of 20% methanol in DCM. When these and other maintenance options do not result in improvement, the column should be replaced. This is especially true when evident in conjunction with calibration difficulties

### 10.4 Mass Spectrometer

10.4.1 For units under service contract, certain maintenance is performed by instrument service staff, including pump oil changed, vacuuming boards, etc., as recommended by the manufacturer.

10.4.2 MS source cleaning should be performed as needed, depending on the performance of the unit. This may be done by the analyst or by instrument service staff.

10.4.3 Tune the MS as needed to result in consistent and acceptable performance while meeting the required ion abundance criteria given in section 11.

## 11) Procedure

### 11.1 Sample Preparation

11.1.1 Water, soil, tissue and waste samples are prepared using the appropriate extraction and cleanup methods (refer to SOPs) and may be screened by GC/FID (see screening SOP). Soil, tissue, waste, and colored water extracts may be cleaned using EPA Method 3640 (GPC).

11.1.2 Tissue extracts and standards that are to be analyzed for phenols are derivatized by the following procedure: 100 µL of BSTFA+TMCS is added to 1.0 mL of the extract or standard in 2 mL autosampler vial. The vial is then sealed with a cap and heated to 60 C for 1.0 hour.

11.1.3 Following sample preparation, sample extracts are then transferred to the extract cold storage unit. Extracts must be analyzed within 40 days of extraction.

11.2 Typical GC/MS operating conditions are listed below, but should be optimized for specific instruments and projects to achieve optimal performance for the application.

Ion dwell time:	10 - 50 msec per ion
Initial temperature:	40°C, hold for 1 minutes
Temperature program:	40-150°C at 10°C/min hold for 2 minutes
Temperature program:	150-270°C at 15°C/min hold for 2 minutes
Final temperature:	270-300°C at 30°/min, hold for 4.33 minutes
Injector temperature:	275°C
Detector interface temp:	300°C
Injector:	Atas Optic, Agilent PTV or equivalent (parameters are method-specific)
Sample volume:	0.5-20 µL
Carrier gas:	helium at 1.3mL/min (constant flow)

### 11.3 Selected Ion Acquisition

11.3.1 Determine the ions to be monitored for the compounds of interest. Refer to Table 2 for characteristic ions. At a minimum, 2 ions (preferably 3 or more) are monitored for each compound, and a minimum of 3 monitored for halogenated compounds and compounds with more complex fragmentation patterns. Set the SIM windows in order to monitor the correct ions at the correct time, based on chromatographic elution of the compounds. This can be setup by analyzing a standard using a full scan analysis and using the GC conditions of the SIM analysis. This analysis will give retention time and spectral information for determining the location of start times for the SIM groups or windows. This is often referred to as a "locator" analysis.

11.3.2 Select the dwell times to be used for each group of ions to be monitored. Dwell times should be selected in order to provide a sufficient number of measurements across the chromatographic peak to accurately define the peak shape. Too few measurements across the peak will result in poor definition of the peak and subsequently result in poor accuracy and precision of results. Too

many measurements across the peak may result in inconsistent detector behavior over the calibration range. Significant differences in dwell times may also affect sensitivity.

#### 11.4 Initial Calibration

**NOTE:** The calibration procedure(s) and options chosen must follow the ALS protocols. Any exceptions to the calibration procedures detailed in the ALS SOP for *Calibration of Instruments for Organics Chromatographic Analyses* (SOC-CAL) are described as follows:

- 11.4.1 Prior to calibration, analyze the GC/MS tuning standard using instrument conditions used for calibration. The DFTPP solution is analyzed to verify GC/MS tuning, injection port inertness, and GC column performance. This injection is acquired in full scan mode and evaluated in accordance with the method specified criteria.
- 11.4.2 Evaluate the spectrum obtained for DFTPP against the tuning criteria in Table 4 and 4A. The GC/MS must meet the DFTPP ion abundance criteria prior to further analyses. Once the instrument is tuned, all subsequent analyses of standards, samples, and QA/QC samples must be analyzed using the identical mass spectrometer operating conditions. If hardware tuning criteria cannot be met, the source may need cleaning, filaments replaced or other maintenance. The following tune verification options can be used.
  - Three scans (the peak apex scan and the scans immediately preceding and following the apex) are acquired and averaged. Background subtraction is required, and must be accomplished using a single scan acquired no more than 20 scans prior to elution of DFTPP. The background subtraction should be designed only to eliminate column bleed or instrument background ions. Do not subtract part of the tune peak or part of any other peak eluting close to the tune peak.
  - Use one scan at the apex of the peak. Background subtraction is required, and must be accomplished using a single scan acquired no more than 20 scans prior to the elution of DFTPP. The background subtraction should be designed only to eliminate column bleed or instrument background ions. Do not subtract part of the tune peak or part of any other peak eluting close to the tune peak.
  - Use one scan either directly preceding or following the apex of the peak. Background subtraction is required, and must be accomplished using a single scan acquired no more than 20 scans prior to the elution of DFTPP. The background subtraction should be designed only to eliminate column bleed or instrument background ions. Do not subtract part of the tune peak or part of any other peak eluting close to the tune peak.
  - Use the average across the entire peak up to a total of 5 scans. Peak integration must be consistent with standard operating procedure. If the peak is wider than 5 scans, the tune will consist of the peak apex scan and the two scans immediately preceding and following the apex.

Background subtraction is required, and must be accomplished using a single scan acquired no more than 20 scans prior to the elution of DFTPP. The background subtraction should be designed only to eliminate column bleed or instrument background ions. Do not subtract part of the tune peak or part of any other peak eluting close to the tune peak.

- 11.4.3 To assess column performance and injection port inertness, pentachlorophenol should be present at an acceptable level and peak tailing should not be excessive. Tailing is evaluated using a tailing factor. The tailing factor is calculated by the processing software as follows (also refer to EPA 8270D, Figure1):

$$\text{Tailing Factor} = \text{PeakBack}/\text{PeakFront}$$

Where:

*PeakBack* is the time from Peak Apex to Peak End measured at 10% of the peak height

*PeakFront* is the time from Peak Start to Peak APEX measured at 10% of the peak height.

The tailing factor should not exceed 2. If excessive tailing or poor chromatography is noted, the injection port may require cleaning. It may also be necessary to remove the first 15-30 cm of the GC column.

- 11.4.4 The internal standards should permit most of the components of interest in the chromatogram to have retention times of 0.80-1.20 relative to one of the internal standards. Refer to Table 3 for internal standards and corresponding analytes assigned for quantitation. Use the base peak ion from the specific internal standard as the primary ion for quantitation (See Table 2). If interferences are noted, use the next most intense ion as the quantitation ion (i.e. for 1,4-dichlorobenzene-d<sub>4</sub>, use 152 m/z for quantitation).
- 11.4.5 Analyze each calibration standard (containing internal standards) and tabulate the area of the primary characteristic ion against concentration for each compound (as indicated in Table 2). Calculate response factors (RFs) for each compound relative to one of the internal standards as follows:

$$\text{RF} = (A_x C_{is}) / (A_{is} C_x)$$

where:

A<sub>x</sub> = Area of the characteristic ion for compound being measured.

A<sub>is</sub> = Area of the characteristic ion for specific internal standard.

C<sub>is</sub> = Concentration of the specific internal standard (ng/μL).

C<sub>x</sub> = Concentration of the compound being measured (ng/μL).

- 11.4.6 The recommended minimum acceptable average RF for target analytes is given in Table 5. If the RF does not meet these recommendations the GC system may require maintenance (see section 9) and recalibration.

11.4.7 The percent relative standard deviation (%RSD) should be less than 20% for each compound. The relative retention times of each compound in each calibration run should agree within 0.06 relative retention time units.

$$\%RSD = \frac{SD}{\overline{RF}} \times 100$$

Where:

RSD = relative standard deviation.

$\overline{RF}$  = mean of 5 initial RFs for a compound.

SD = standard deviation of average RFs for a compound.

$$SD = \sqrt{\frac{\sum_{i=1}^N (RF_i - \overline{RF})^2}{N - 1}}$$

where:

RF<sub>i</sub> = RF for each of the 5 calibration levels

N = Number of RF values (i.e., 5)

11.4.8 Linearity - If the % RSD of any compound is 20% or less, then the relative response factor is assumed to be constant over the calibration range, and the average relative response factor may be used for quantitation.

11.4.9 If the %RSD for a compound is >20%, then alternative calibration models should be used. See the SOP (SOC-CAL) *Calibration of Instruments for Organics Chromatographic Analysis* for further guidance.

#### 11.5 Review of calibration curve

11.5.1 The calibration curve must be reviewed to ensure it represents the calibration data. This is done by re-fitting each calibration level against the true concentration of each calibration standard. See the SOP (SOC-CAL) *Calibration of Instruments for Organics Chromatographic Analysis* for further guidance.

11.5.2 Structural isomers that produce very similar mass spectra should be identified as individual isomers if they have sufficiently different GC retention times. Sufficient GC resolution is achieved if the height of the valley between two isomer peaks is less than 50% of the average of the two peak heights. Otherwise, structural isomers are identified as isomeric pairs. The resolution should be verified on the mid-point concentration of the initial calibration as well as the laboratory designated continuing calibration verification level if closely eluting isomers are to be reported

#### 11.6 Independent Calibration Verification

11.6.1 Following initial calibration, analyze an ICV standard. The ICV solution must contain all analytes in the calibration standards. Calculate the concentration using the typical procedure used for quantitation. Calculate the percent difference (%D) from the ICV true value. For each compound of interest, the calculated value must be  $\pm 30\%$  of the true value for the initial calibration to be valid.

## 11.7 Continuing Calibration

11.7.1 Following an acceptable tune, a calibration standard, or standards, at mid-concentration containing all semivolatile analytes, and all required surrogates, must be analyzed every 12 hours during analysis.

11.7.2 For each compound in the continuing calibration standard, a minimum response factor given in Table 5 should be met. If the minimum response factors are not met, the system should be evaluated, and corrective action taken before sample analysis begins. Some possible problems are standard mixture degradation, injection port inlet contamination, contamination at the front end of the analytical column, and active sites in the column or chromatographic system.

11.7.3 If the percent difference or percent drift for each compound is less than or equal to 20%, the initial calibration is assumed to be valid and the analysis of samples may begin.

Calculate the percent drift using:

$$\% \text{ Drift} = \frac{C_i - C_e}{C_i} \times 100$$

Where:

$C_i$  = Compound standard concentration.

$C_e$  = Measured concentration using selected quantitation method.

11.7.4 If the percent difference or percent drift for a compound is less than or equal to 20%, then the initial calibration for that compound is assumed to be valid. Due to the large number of compounds that may be analyzed by this method, some compounds may fail to meet the  $\leq 20\%$  criteria. If no more than 20% of the compounds, included in the initial calibration, differ from their true concentration by 40%, the initial calibration is valid and no corrective action is necessary.

11.7.5 In cases where compounds fail, they may still be reported as non-detects if it can be demonstrated that there was adequate sensitivity to detect the compound at the applicable quantitation limit.

- 11.7.6 Non-detected analytes can be reported from analyses when a CCV exhibit a positive bias (i.e., outside the upper control limit), no further documentation is required.
- 11.7.7 For situations when the CCV fails to meet the criterion in section 11.7.3, and a confirmed detection exceeds the MRL, the sample must be reanalyzed to ensure accurate quantification. If it is not possible to reanalyze the sample, the result must be reported as an estimated value.
- 11.7.8 The internal standard responses and retention times in the calibration check standard must be evaluated immediately after or during data acquisition. If the retention time for any internal standard changes by more than 30 seconds from that in the midpoint standard of the most recent initial calibration sequence, the chromatographic system must be inspected for malfunctions and corrective action identified, as required. If the EICP area for any of the internal standards changes by a factor of two (50% to 200%) from that in the midpoint standard of the most recent initial calibration sequence, the chromatographic system must be inspected for malfunctions and corrective action identified, as appropriate. When corrective action is taken, reanalysis of samples analyzed while the system was malfunctioning is required. Update the reference spectra and retention times in the quantitation database for the instrument method or ID file. The initial calibration average RF or calibration curve is then used in the quantitation of subsequent analyses.
- 11.7.9 A blank (method blank, GPC blank, or solvent blank) should be analyzed after the CCV, or at any other time during the analytical shift, to prove the system is free of contaminants. If contaminants are found in a method blank or GPC blank, then a solvent blank should be analyzed to help isolate the source of contamination.

## 11.8 GC/MS Analysis

- 11.8.1 Evaluate FID screen, if performed, and make proper dilution (See FID screening SOP).
- 11.8.2 Spike the 1 mL extract obtained from sample preparation with 10  $\mu$ L of the internal standard solution just prior to analysis. Use the same operating conditions as were used for initial calibration.
- 11.8.3 If the response for any quantitation ion exceeds the initial calibration curve range of the GC/MS system, extract dilution must take place. Additional internal standard must be added to the diluted extract to maintain the required concentration of each internal standard in the extracted volume. The diluted extract must be reanalyzed.
- 11.8.4 Store the extracts at  $-10^{\circ}\text{C}$  or less, protected from light in vials equipped with unpierced Teflon lined septa. Extracts are archived in a freezer for 3 months after analysis in the instrument/date specific storage boxes.

## 12) Data Reduction and Reporting

- 12.1 Qualitative Analysis - The qualitative identification of compounds determined by this procedure is based on retention time, and comparison of the sample mass spectrum with characteristic ions in a reference mass spectrum. The reference mass spectrum must be generated by the laboratory using the instrument and conditions used for the sample analysis. The characteristic ions from the reference mass spectrum are defined to be the ions monitored in the SIM mode and typically are the two or three ions of greatest relative intensity. Compounds are identified as present when the criteria below are met.
- 12.2 Qualitative Analysis - The qualitative identification of compounds determined by this procedure is based on retention time, and comparison of the sample mass spectrum with characteristic ions in a reference mass spectrum. The reference mass spectrum must be generated by the laboratory using the instrument and conditions used for the sample analysis. The characteristic ions from the reference mass spectrum are defined to be the ions monitored in the SIM mode and typically are the two or three ions of greatest relative intensity. Compounds are identified as present when the criteria below are met.
- 12.2.1 The intensities of the characteristic ions of a compound maximize in the same scan or within one scan of each other. Selection of a peak by a data system target compound search routine where the search is based on the presence of a target chromatographic peak containing ions specific for the target compound at a compound-specific retention time will be accepted as meeting this criterion.
  - 12.2.2 The RRT of the sample component is within  $\pm 0.06$  RRT units of the RRT of the standard component.
  - 12.2.3 The relative intensities of the characteristic ions agree within 30% of the relative intensities of these ions in the reference spectrum.
  - 12.2.4 Structural isomers that produce very similar mass spectra should be identified as individual isomers if they have sufficiently different GC retention times. Sufficient GC resolution is achieved if the height of the valley between two isomer peaks is  $<25\%$  of the sum of the 2 peak heights. Otherwise, structural isomers are identified as isomeric pairs.
  - 12.2.5 Identification is hampered when sample components are not resolved chromatographically and produce mass spectra containing ions contributed by more than one analyte. When the ion relative intensities do not agree within 30% due to these types of matrix interferences, the analyst uses professional judgement in determining whether the analyte is or is not present. The analyst will take into account other knowledge of the sample, presence of other compounds, and other presumptive evidence available for review. Difficulties will be noted in the case narrative.
  - 12.2.6 Evaluate internal standard areas in each sample. If the area in the sample is less than 50% or greater than 200% the area of in the CCV,

corrective action must be taken. Depending on the analysis, this corrective action may include reinjection or dilution of the extract followed by reinjection.

12.3 Tentatively identified compound (TIC) cannot be reported using this method.

12.4 Quantitation and Calculations

12.4.1 The GC/MS data stations, in current use, all use the H-P RTE Integrator to generate the raw data used to calculate the standards  $\overline{RF}_x$  values, the sample amounts, and the spike values. The software does three passes through each data file. The first two identify and integrate each internal standard and surrogate. The third pass uses the time-drift information from the first two passes to search for all method analytes in the proper retention times and with the proper characteristic quantitation ions. When  $\overline{RF}_x$  is used, calculate the extract concentration as follows:

$$C_{ex} = \frac{(Resp_x)(Amt_{ISTD})}{(Resp_{ISTD})(\overline{RF}_x)}$$

Where:  $C_{ex}$  = the concentration in the sample extract (ppm);  
 $Resp_x$  = the peak area of the analytes of interest;  
 $Resp_{ISTD}$  = the peak area of the associated internal standard;  
 $Amt_{ISTD}$  = the amount, in ppm, of internal standard added  
 $\overline{RF}_x$  = the average response from the initial calibration.

12.4.2 The concentration of analytes in the original sample is computed using the following equations:

Aqueous Samples:  $Concentration (\mu g / L) = \frac{(C_{ex})(V_f)(D)}{(V_s)}$

Where  $C_{ex}$  = Concentration in extract in  $\mu g/mL$   
 $V_f$  = Final volume of extract in mL  
 $D$  = Dilution factor  
 $V_s$  = Volume of sample extracted, liters

Non-aqueous Samples:  $Concentration (mg / Kg) = \frac{(C_{ex})(V_f)(D)}{(W)}$

Where  $C_{ex}$  = Concentration in extract in  $\mu g/mL$   
 $V_f$  = Final volume of extract in mL  
 $D$  = Dilution factor  
 $W$  = Weight of sample extracted in grams.

## 12.5 Data Review

- 12.5.1 Following primary data interpretation and calculations, all data is reviewed by a secondary analyst. Following generation of the report, the report is also reviewed. Refer to the SOP for *Laboratory Data Review Process* (ADM-DREV) for details.

## 12.6 Reporting

- 12.6.1 Reports are generated in the ALS LIMS by compiling the SMO login, sample prep database, instrument, date, and client-specified report requirements (when specified). This compilation is then transferred to a file which the Stealth reporting system uses to generate a report. The forms generated may be ALS standard reports, DOD, or client-specific reports. The compiled data from LIMS is also used to create EDDs.

## 13) Contingencies for Handling Out-of-Control or Unacceptable Data

- 13.1 Refer to the SOP for *Non Conformance and Corrective Action Procedure* (ADM-NCAR) for procedures for corrective action. Personnel at all levels and positions in the laboratory are to be alert to identifying problems and nonconformities when errors, deficiencies, or out-of-control situations are detected.

## 14) Method Performance

- 14.1 This method was validated through single laboratory studies of accuracy and precision. Refer to the reference method for additional method performance data available.
- 14.2 The method detection limit (MDL) is and related method reporting limit(s) were established using the procedure described in SOP *Performing and Documenting Method Detection Limit Studies and Establishing Limits of Detection and Quantification*. Method Reporting Limits are established for this method based on MDL studies and as specified in the ALS Quality Assurance Manual.

## 15) Pollution Prevention and Waste Management

- 15.1 The laboratory will comply with all Federal, State and local regulations governing waste management, particularly the hazardous waste identification rules and land disposal restrictions as specified in the ALS Lab Waste Management Plan.

## 16) Training

- 16.1 All analysts performing this analysis are required to read and understand this SOP.
- 16.2 Training is documented following the *Employee Training and New Employee Orientation* (ADM-TRAIN).

## 17) Method Modifications

- 17.1 There are no known modifications from the reference method.

## 18) References

- 18.1 *Semivolatile Organic Compounds by Gas Chromatography/Mass Spectrometry*, Method

## 19) Changes Since the Last Revision

Summary of Revision Changes			
Rev. #	Effective Date	Document Editor	Description of Changes
9.0	12/2/2020	T CARON	Reformatted SOP to current ALS brand. Minor typographical, grammatical and format changes to improve readability not affecting content. Section 1: Removed obsolete reference to the MDL found in Table 1. Section 6: Added Methylene Chloride exposure control plan. Updated safety references, where applicable throughout the document. Section 11.1: Subsampling and compositing performed by the Soil Prep Department, replacing General Chemistry. Section: 11.2.1.9 Removed obsolete Stealth reference Section 21: Added updated extraction benchsheet associated with SVM-AQ Revision 1.0. Section 7.1 & 7.2 updated collection and storage requirements

## 20) Attachments, Tables, and Appendices

- 20.1 Table 1A –Water and Soil Target Analytes.
- 20.2 Table 1B –Tissue Target Analytes.
- 20.3 Table 2 – Target Compounds and Corresponding Primary and secondary Quantitation Ions.
- 20.4 Table 3- Semi-Volatile Internal Standards with Corresponding Analytes assigned for Quantitation.
- 20.5 Table 4 – DFTPP Key Ions and Ion Abundance Criteria.
- 20.6 Table 4A – DFTPP Key Ions and Ion Abundance Criteria for 5973 and newer GC/MS.

20.7 Table 5 – Target Compounds and Recommended Minimum RT.

**TABLE 4**  
**DFTPP KEY IONS AND ION ABUNDANCE CRITERIA**

<u>Mass</u>	<u>Ion Abundance Criteria</u>
51	30-60% of mass 198
68	< 2% of mass 69
70	< 2% of mass 69
127	40-60% of mass 198
197	< 1% of mass 198
198	Base peak, 100% relative abundance
199	5-9% of mass 198
275	10-30% of mass 198
365	> 1% of mass 198
441	Present but less than mass 443
442	> 40% of mass 198
443	17-23% of mass 442

**TABLE 4A**  
**DFTPP KEY IONS AND ION ABUNDANCE CRITERIA**  
**FOR 5973 and newer GC/MS Systems**

<u>Mass</u>	<u>Ion Abundance Criteria</u>
51	10-80% of mass 198
68	0-2% of mass 69
70	0-2% of mass 69
127	10-80% of 198
197	0-2% of 198
198	30-100% of 442 (alternate base)
199	5-9% of 198
275	10-60% of 198
365	1-50% of 442
441	0.01-100% of 443
442	30-100% of 198 (alternate base)
443	15-24% of 442

Alternate tuning criteria (from Method 525.2 or CLP OLM04.2) may be used provided that method performance is not adversely affected and that method performance criteria is met. The criteria used must be the same for all ion abundance criteria checks associated with a given analysis. For example, initial calibration, continuing calibration(s), QC, and sample analyses for a given sample must all use the same criteria.

	STANDARD OPERATING PROCEDURE	Chlorinated Pest by GC/MS/MS
	ALS   Environmental - Kelso	SVM-PESTMS2, Rev. 7.0
		Effective: 4/22/2021
		SOP Review: 4/16/2021
		Page 2 of 27

## 1) Scope & Applicability

- 1.1. This Standard Operating Procedure (SOP) describes the method used for trace analysis of various chlorinated pesticides by high performance gas chromatography/tandem mass spectrometry (HPGC/MS/MS). This SOP describes both the extraction and chromatographic procedures used to determine the target analytes. Table 1 indicates compounds that may be determined by this method and lists their method reporting limits (MRLs) in water and soil. The reported MRL may be adjusted to meet specific project requirements; however, the capability of achieving other reported MRLs must be demonstrated. Method Detection Limits (MDLs) which have been achieved are also given. The Method Detection Limits (MDLs) will vary depending on the instrument used and preparation method.
- 1.2. This procedure is used to determine the concentrations of chlorinated pesticides in water, soil, and tissue using HPGC/MS/MS. The procedure may be applied to other miscellaneous sample matrices providing that the analyst demonstrates the ability of the procedure to give data of acceptable quality in that matrix.

## 2) Summary of Procedure

- 2.1 This SOP describes HPGC/MS/MS conditions for the detection chlorinated pesticides. Prior to the use of this method, an appropriate sample preparation method must be used to recover the analytes of interest. Stable, isotopically labeled analogs of the analytes of interest are spiked into the samples before they are extracted. They are used to both assess the efficiency of the extraction and to quantitate the analytes of interest.
- 2.2 A 5.0 µL aliquot of the extract is injected into the gas chromatograph (GC). The compounds are separated on a fused silica capillary column. Compounds of interest are detected by a mass selective detector. Identification of the analytes of interest is performed by comparing the retention times of the analytes with the respective retention times of an authentic standard, and by comparing the ratio of the two parent/daughter transitions acquired for each compound with the same ratio in the CCV Standard. Quantitative analysis is performed by using the authentic standard to produce a response factor and calibration curve, and using the calibration data to determine the concentration of an analyte in the extract. The concentration in the sample is calculated using the sample weight or volume and the extract volume.
- 2.3 The following compounds may require special treatment when being determined by this method. DDT and Endrin are subject to thermal decomposition in the inlet of the gas chromatograph. Endosulfan I, Endosulfan II, Dieldrin, Endrin, Endrin aldehyde, and Endrin ketone produce relatively low response areas due to their fragmentation patterns.

## 3) Definitions

- 3.1 For environmental laboratory quality definitions, guidance on analytical calibration and sample batches, refer to the SOP for Sample Batches, ADM-BATCH.

## 4) Responsibilities

- 4.1 It is the responsibility of the analyst to perform the analysis according to this SOP and to complete all documentation required for data review. Analysis and interpretation of the results are performed by personnel in the laboratory who have demonstrated the ability to generate acceptable results utilizing this SOP. This demonstration is in

	STANDARD OPERATING PROCEDURE	Chlorinated Pest by GC/MS/MS
	ALS   Environmental - Kelso	SVM-PESTMS2, Rev. 7.0
		Effective: 4/22/2021
		SOP Review: 4/16/2021
		Page 3 of 27

accordance with the training program of the laboratory. Final review and sign-off of the data is performed by the department supervisor/manager or designee.

- 4.2 It is the responsibility of the department supervisor/manager to document analyst training and method proficiency, as described in: *Employee Training and Orientation* (ADM-TRAIN).

## 5) Interferences

- 5.1 The GC/MS data from all blanks, samples, and spikes must be evaluated for interferences. Determine if the source of interference is in the preparation of the samples. Corrective action should be taken to eliminate the interferences.
- 5.2 Contamination by carryover can occur whenever high-concentration and low-concentration samples are sequentially analyzed. To reduce carryover, the sample syringe must be rinsed out between samples with solvent. Whenever an unusually concentrated sample is encountered, it should be followed by the analysis of solvent to check for cross contamination.
- 5.3 The reporting limits for these analytes are in the low ppb to ppt level. Therefore, low level background contamination is a concern when conducting this method. Solvents, reagents, glassware and other sample processing hardware may yield discrete artifacts and/or elevated baselines, causing misinterpretation of the chromatograms. All of these materials must be demonstrated to be free from interferences.

## 6) Safety

- 6.1 Chemicals, reagents and standards must be handled as described in the ALS safety policies, approved methods and in SDSs where available. Refer to the ALS Chemical Hygiene Plan and the appropriate SDSs prior to beginning this method.
- 6.2 This method uses Methylene Chloride, a known human carcinogen. Viton brand gloves should be used while rinsing, pouring or transferring the solvent.

## 7) Sample Collection, Containers, Preservation, and Storage

- 7.1 Containers used to collect samples should be purchased pre-cleaned containers. Alternatively, containers used to collect samples for the determination of pesticides may be soap and water washed followed by methanol (or isopropanol) rinsing. The sample containers should be of glass or Teflon and have screw-top covers with Teflon liners. In situations where Teflon is not available, solvent-rinsed aluminum foil may be used as a liner. Highly acidic or basic samples may react with the aluminum foil, causing eventual contamination of the sample. Plastic containers or lids may not be used for the storage of samples due to the possibility of sample contamination from the phthalate esters and other hydrocarbons within the plastic.
- 7.2 Sample containers should be filled with care so as to prevent any portion of the collected sample coming in contact with the sampler's gloves, thus causing contamination. Samples should not be collected or stored in the presence of exhaust fumes. If the

sample comes in contact with the sampler (e.g., if an automatic sampler is used), run reagent water through the sampler and use the rinsate as a field blank.

- 7.3 Water and soil samples must be iced or refrigerated at 0-6°C from time of collection until extraction.
- 7.4 Tissue samples should be kept frozen until they are extracted to minimize decomposition.
- 7.5 Water samples must be extracted within 7 days and the extracts analyzed within 40 days following extraction. Solid, mixed-phase, semi-solid, tissue, and oily samples - Extract and analyze within 1 year of collection. If a sample is to be stored for more than 14 days, and results are to be reported in solids units, either hermetically seal the sample container or determine the moisture content upon receipt and immediately prior to analysis. Adjust the final concentration based on the original moisture content. Extracts are stored at <-10°C and analyzed within 40 days of extraction.

## 8) Standards, Reagents, and Consumable Materials

- 8.1 Solvents: Acetone, methylene chloride, methanol, hexane, and other appropriate solvents. Solvents must be of sufficient purity to permit usage without lessening the accuracy of the determination or introducing interferences.
- 8.2 Stock Standard Solutions
  - 8.2.1 Commercially prepared stock standards are typically used, and are available from several vendors. They must be A2LA or ISO9000 certified by the manufacturer. Standard concentrations can be verified by comparison versus an independently prepared standard. Alternatively, prepare stock standard solutions at a concentration of 1000 µg/ml by dissolving 0.0100 g of reference material in hexane, methylene chloride or other suitable solvent and diluting to volume in a 10mL volumetric flask. Larger volumes can be used at the convenience of the analyst. When compound purity is assayed to be 96% or greater, the weight can be used without correction to calculate the concentration of the stock standard.
  - 8.2.2 Transfer the stock standard solutions into Teflon-sealed screw-cap bottles. Store at -10°C and protect from light, or store as recommended by the manufacturer. Stock standards should be checked frequently for signs of degradation or evaporation, especially just prior to preparing calibration standards from them.
  - 8.2.3 Stock standard solutions must be replaced after one year, or sooner, if comparison with check standards or samples indicates a problem.
- 8.3 Instrument Internal Standard - 10 ul of a 10ug/ml Pyrene-d10 solution is added to each 1 ml sample extract undergoing analysis. The resulting concentration of the standard is 100ng/mL. Store at 0-6°C when not being used. When using premixed certified solutions, store according to the manufacturer's recommendations. Other internal standards can be used as long as they do not interfere with the target analytes, and have similar retention times.

STANDARD OPERATING PROCEDURE ALS   Environmental - Kelso	Chlorinated Pest by GC/MS/MS
	SVM-PESTMS2, Rev. 7.0
	Effective: 4/22/2021
	SOP Review: 4/16/2021
	Page 5 of 27

- 8.4 DDT/Endrin calibration standard. A hexane solution containing 20ng/mL of 4,4'-DDT, 4,4'-DDE, 4,4'-DDD, Endrin, Endrin Ketone, Endrin aldehyde, and 100ng/mL of the instrument internal standard.
- 8.5 DDT/ Endrin Standard - A hexane solution containing 20ng/ml of 4,4'-DDT, and Endrin, and 100ng/ml of the instrument internal standard. This is used to verify injection port inertness and GC column performance. Store at 0-6°C when not being used, or store according to the manufacturer's recommendations.
- 8.6 Calibration Standards
- 8.6.1 A minimum of eight initial calibration standards should be prepared from stock solutions. One of the calibration standards should be at a concentration at or below the method reporting limit; the others should correspond to the range of concentrations found in real samples, but should not exceed the working range of the GC/MS system. At least one calibration standard must be at a concentration corresponding to a sample concentration meeting project-specific data quality objectives. Each standard should contain each analyte for detection by this method. Each 1 ml aliquot of calibration standards should be spiked with 10 µL of the internal standard solution prior to analysis. All calibration standards should be stored at 0-6°C or less and should be freshly prepared once a year, or sooner if check standards indicate a problem.
- 8.6.2 The daily calibration standard (CCV) is prepared at a nominal 20 ng/ml concentration from stock solutions. The CCV is prepared weekly and can be stored at 0-6°C, or as recommended by the manufacturer.
- 8.7 QC Standards
- 8.7.1 Labeled internal standards: These are isotopically labeled of the pesticides being analyzed. Prepare a working solution in acetone containing the following: Hexachlorobenzene<sup>13</sup>C<sub>6</sub>, Chlorpyrifos-d<sup>10</sup>, gamma.BHC-d<sub>6</sub>, Aldrin<sup>13</sup>C<sub>12</sub>, Heptachlor<sup>13</sup>C<sub>10</sub>, Endrin<sup>13</sup>C<sub>12</sub>, cis-Heptachlorepoxyde<sup>13</sup>C<sub>10</sub>, Oxychlordane<sup>13</sup>C<sub>10</sub>, Octachlorostyrene<sup>13</sup>C<sub>8</sub>, Isodrin<sup>13</sup>C<sub>12</sub>, Methoxychlor-d<sub>6</sub>, Endrin ketone<sup>13</sup>C<sub>12</sub>, 4,4'-DDD-d<sub>4</sub>, 4,4'-DDT-d<sub>4</sub>, and Mirex<sup>13</sup>C<sub>10</sub> at the concentrations listed in Table 4. Aliquots of the solution are spiked into all extracted samples, blanks, and QC samples according to the extraction SOP used. All labeled internal standards should be stored at 4 ±2°C or less. General expiration guidelines do not apply to labeled isotopes, but standard should be freshly prepared once a year, or sooner if problems are identified. To certify that the labeled internal standards are not degraded or concentrated from storage, and still suitable for use: prepare and analyze a standard containing the labeled standards and the unlabeled target analytes at 100 ng/ml. The ratio of: Labeled Compound Area/ Unlabeled Compound Area should be between 0.5-1.5.
- 8.7.2 Matrix Spike Standards: Prepare a working solution in methanol containing all analytes of interest ("full list spike") from the standard

	STANDARD OPERATING PROCEDURE	Chlorinated Pest by GC/MS/MS

		Effective: 4/22/2021
		SOP Review: 4/16/2021
		Page 6 of 27

analyte list (Table1) at 200ng/mL. Aliquots of the solution are spiked into the selected QC aliquots according to the extraction SOP used.

**Note:** The spiking level of Labeled internal standards and spike may need to be adjusted according to project requirements, if dilutions are expected due to high levels of extracted components, or if a lower calibration range is used.

## 9) Apparatus and Equipment

### 9.1 Gas Chromatograph/Mass Spectrometer System

- 9.1.1 Gas Chromatograph - An analytical system complete with a temperature-programmable gas chromatograph suitable for large volume cool splitless injection and all required accessories, including syringes, analytical columns, and gases. The capillary column should be directly coupled to the source. Agilent 6890N equipped with the Agilent PTV injector recommended.
- 9.1.2 Column: ZB-Multiresidue-1 30 m x 0.25 mm ID x 0.25 µm film thickness silicone-coated fused-silica capillary column or equivalent. Recommended: Phenomenex #7HG-G016-11.
- 9.1.3 MS/MS System – Waters Micromass Quattro Micro GC, tandem mass spectrometer or equivalent.
- 9.1.4 Data System - A computer system must be interfaced to the mass spectrometer. The system must allow the continuous acquisition and storage on machine-readable media of all mass spectra obtained throughout the duration of the chromatographic program. The computer must have software that can search any GC/MS data file for ions of a specific mass and that can plot such ion abundances versus time or scan number. ( Waters MassLynx or equivalent ) This type of plot is defined as an Extracted Ion Current Profile (EICP). Software must also be available that allows integrating the abundances in any EICP between specified time or scan-number limits. The most recent version of the EPA/NIST Mass Spectral Library should also be available.
- 9.1.5 Appropriate analytical balance (0.0001 g), volumetric flasks, syringes, vials, and bottles for standards preparation.

## 10) Preventative Maintenance

- 10.1 All maintenance activities are recorded in a maintenance logbook kept for each instrument.
- 10.2 Carrier gas - Inline purifiers or scrubbers should be in place for all sources of carrier gas. These are selected to remove water, oxygen, and hydrocarbons. Purifiers should be changed as recommended by the supplier.
- 10.3 Gas Chromatograph

STANDARD OPERATING PROCEDURE ALS   Environmental - Kelso	Chlorinated Pest by GC/MS/MS
	SVM-PESTMS2, Rev. 7.0
	Effective: 4/22/2021
	SOP Review: 4/16/2021
	Page 7 of 27

- 10.3.1 Whenever GC maintenance is performed, care should be taken to minimize the introduction of air or oxygen into the column. Injection port maintenance includes changing the injection port liner, seal, washer, O-ring, septum, column ferrule, and autosampler syringe as needed. Liners and seals should be changed when recent sample analyses predict a problem with chromatographic performance. In some cases liners and seals may be cleaned and re-used.
- 10.3.2 Clipping off a small portion of the head of the column often improves chromatographic performance. When cutting off any portion of the column, make sure the cut is straight and "clean" (uniform, without fragmentation) by using the proper column cutting tool.
- 10.3.3 Over time, the column will exhibit poorer overall performance, as contaminated sample matrices are analyzed. The length of time for this to occur will depend on the samples analyzed. When a noticeable decrease in column performance is evident and other maintenance options do not result in improvement, the column should be replaced. This is especially true when evident in conjunction with calibration difficulties.

#### 10.4 Mass Spectrometer

- 10.4.1 For units under service contract, certain maintenance is performed by instrument service staff, including pump oil changed, vacuuming boards, etc., as recommended by the manufacturer.
- 10.4.2 MS source cleaning should be performed as needed, depending on the performance of the unit. This may be done by the analyst or by instrument service staff.

## 11) Procedure

### 11.1 Sample Preparation

#### 11.1.1 Water samples

- 11.1.1.1 Water samples are prepared using solid phase extraction (SPE) and EPA method 3510. Refer to the ALS SOP EXT-3510. Alternative extraction procedures such as EPA 3520 may be used for aqueous samples not suitable for 3510.
- 11.1.1.2 Perform the extraction on a 1000mL aliquot of sample. For heavily contaminated samples use a smaller volume or dilute the sample before extraction.

- 11.1.2 Soil, sediment, and solid samples are prepared using automated soxhlet extraction (SOP EXT-3541). The nominal sample size is 10g. Sample amounts may be decreased in the case of high-concentration waste samples.

STANDARD OPERATING PROCEDURE ALS   Environmental - Kelso	Chlorinated Pest by GC/MS/MS
	SVM-PESTMS2, Rev. 7.0
	Effective: 4/22/2021
	SOP Review: 4/16/2021
	Page 8 of 27

- 11.1.3 Tissue samples are prepared using automated soxhlet extraction (SOP EXT-3541). The nominal sample size is 2.0g.
- 11.1.4 Product samples may not be analyzed by this method.
- 11.1.5 Extracts should be screened by GC/FID (SOP SOC-SCR). Cleanup by GPC, and carbon columns is mandatory for soil and tissue samples, and may be needed for contaminated water samples. All colored extracts must be cleaned with carbon columns. GPC is used to remove lipids from tissue extracts.
- 11.1.6 Extracts are solvent exchanged to hexane before they are taken to final volume. The final volume for all extracts is 1.0ml.
- 11.1.7 Following sample preparation, sample extracts are then transferred to the extract cold storage unit. Extracts must be analyzed within 40 days of extraction.

## 11.2 Analysis

- 11.2.1 The recommended GC/MS operating conditions are listed below. The GC conditions may be modified to accommodate specific instrument models and configurations.

### GC Conditions

Injector	Agilent PTV
Mode	Solvent Vent, Ramped pressure
Injector liner:	Baffled, Restek Siltek Deactivated #21704-214.10
Injection volume:	5uL
Injection speed:	Slow
Post injection dwell:	1.0min
Carrier gas:	Helium @ 0.7 ml/min
Injector temperature:	20 - 320°C, temperature programmed

### GC Temperature program:

Initial temperature	65°C for 2 min
Initial ramp	65 - 240°C @ 20°C per min
Second ramp	240 - 280°C @ 6.1°C per min
Third ramp	280 - 310°C @ 15°C per min
Final Hold	0.7 min or until Mirex or the last analyte elutes

### Mass Spectrometer Conditions

Source temperature	225°C
Detector interface temp:	290°C
Trap Current	200
Collision Gas	Argon @ 2-3 × 10 <sup>-3</sup> torr
Tune file	dtrscan
Photomultiplier	650

- 11.2.2 Analysis sequence - Samples are analyzed in a set referred to as an

STANDARD OPERATING PROCEDURE ALS   Environmental - Kelso	Chlorinated Pest by GC/MS/MS
	SVM-PESTMS2, Rev. 7.0
	Effective: 4/22/2021
	SOP Review: 4/16/2021
	Page 9 of 27

analysis sequence. The sequence begins with injection of a DFTPP Standard, followed by a DDT/Endrin standard and then the initial calibration standards. Once calibrated, a CCV is evaluated and extracts can be run. The sequence ends after 12 hours based on the DFTPP injection time

- 11.2.3 Tune the MS as needed to maximize sensitivity for MS/MS analysis. For the Micromass Quattro micro GC in EI mode the parameters will be similar to these:

Electron Energy	70
Trap	200
Repeller	0.5
Extraction Lens	5.0
Focus lens 1	40
Focus Lens 3	45
LM1 Resolution	10
HM1 Resolution	10
Ion Energy 1	0.9
Entrance	-1
Collision	2
Exit	+1
LM 2 Resolution	12
HM 2 Resolution	12
Ion Energy 2	1.0
Multiplier	650

#### 11.2.4 Daily DFTPP Tune Verification

- 11.2.4.1 5ul of a 1.0ug/ml DFTPP standard is injected and analyzed in MRM mode to verify the MS/MS functioning of the instrument. The 442>198, 443>198, 198>110, 255>186, and the 127>77 transitions are monitored. Acceptance criteria are listed in table 8.

- 11.2.4.2 The analysis time for DFTPP is used to define the start of the 12-hour window in which all analyses must be performed. Once the instrument is tuned, all subsequent analyses of standards, samples, and QA/QC samples within the same 12-hour window must be analyzed using the identical mass spectrometer operating conditions.

#### 11.2.5 Initial Calibration

**NOTE:** The calibration procedure(s) and options chosen must follow the ALS protocols. Any exceptions to the calibration procedures detailed in the ALS SOP for Calibration of Instruments for Organics Chromatographic Analyses are described as follows:

- 11.2.5.1 To assess column performance and injection port inertness; first analyze 5uL of the DDT/Endrin calibration standard by MRM and update

the calibration file. Then analyze the DDT/Endrin standard and quantitate it against the DDT/Endrin calibration.

11.2.5.2 Calculate the DDT/Endrin breakdown as follows:

$$\%DDT = (4,4'\text{-DDE} + 4,4'\text{-DDD}) * 100 / (4,4'\text{-DDE} + 4,4'\text{-DDD} + 4,4'\text{-DDT})$$

$$\%\text{Endrin} = (\text{endrin aldehyde} + \text{endrin ketone}) * 100 / (\text{endrin aldehyde} + \text{endrin ketone} + \text{endrin})$$

11.2.5.3 DDT and Endrin degradation should not exceed 20%. If degradation of >20% is noted, the injection port may require cleaning. It may also be necessary to remove the first 15-30 cm of the GC column

11.2.5.4 The internal standards should permit most of the components of interest in the chromatogram to have retention times of 0.80-1.20 relative to one of the internal standards. Refer to Table 6 for internal standards and corresponding analytes assigned for quantitation.

11.2.5.5 Analyze 5.0  $\mu\text{L}$  of each calibration standard (containing internal standards) and tabulate the area of the primary characteristic ion against concentration for each compound (as indicated in Table 1). Calculate response factors (RFs) for each compound relative to one of the internal standards as follows:

$$RF = (A_x C_{is}) / (A_{is} C_x)$$

where:

$A_x$  = Area of the characteristic ion for compound being measured.

$A_{is}$  = Area of the characteristic ion for specific internal standard.

$C_{is}$  = Concentration of the specific internal standard ( $\text{ng}/\mu\text{L}$ ).

$C_x$  = Concentration of the compound being measured ( $\text{ng}/\mu\text{L}$ ).

11.2.5.6 The minimum RF for analytes and surrogates is 0.01

11.2.5.7 Calculate the %RSD for each analyte and internal standard.

$$\%RSD = \frac{SD}{\overline{RF}} \times 100$$

where:

RSD = relative standard deviation.

$\overline{RF}$  = mean of initial RFs for a compound.

SD = standard deviation of average RFs for a compound.

$$SD = \sqrt{\frac{\sum_{i=1}^N (RF_i - RF)^2}{N - 1}}$$

where:

RF<sub>i</sub> = RF for each of the calibration levels

N = Number of RF values (i.e., 8)

11.2.5.8 The % RSD should be less than 20% for each compound.

11.2.5.9 If the % RSD for any compound is  $\leq 20\%$ , linearity can be assumed over the calibration range, and the relative response factor for each analyte and surrogate is used.

11.2.5.10 If the %RSD for a compound is  $>20\%$ , then alternative calibration models should be used. See the SOP (SOC-CAL) Calibration of Instruments for Organics Chromatographic Analysis for further guidance.

#### 11.2.6 Independent Calibration Verification

11.2.6.1 Following initial calibration, analyze an ICV standard. The ICV solution must contain all analytes in the calibration standards. Calculate the concentration using the typical procedure used for quantitation. Calculate the percent difference (%D) from the ICV true value. The ICV should quantitate within 75–125 % of the target concentration.

### 11.3 Continuing Calibration

11.3.1 First analyze the DDT/Endrin breakdown standard as detailed in 11.3.1 to 11.3.3.

11.3.2 A mid-level calibration verification standard, containing all pesticides, labeled, and recovery internal standards must be analyzed every 12 hours during analysis. Calculate the percent drift using:

$$\% \text{ Drift} = \frac{C_t - C_m}{C_t} \times 100$$

where:

C<sub>t</sub> = Analyte standard concentration.

C<sub>m</sub> = Measured concentration using selected quantitation method.

11.3.3 If the percent drift for each analyte is less than or equal to 25%, the initial calibration is assumed to be valid. If no source of the problem can be determined after corrective action has been taken, a new multipoint calibration must be generated. This criterion must be met

	STANDARD OPERATING PROCEDURE	Chlorinated Pest by GC/MS/MS
	ALS   Environmental - Kelso	SVM-PESTMS2, Rev. 7.0
		Effective: 4/22/2021
		SOP Review: 4/16/2021
		Page 12 of 27

before sample analysis begins. If the % RSD for any analyte exceeds 25%, the analyst must determine if the response is sufficient to attain MRL for that analyte and any hits for that analyte must be rerun for quantitation.

- 11.3.4 The internal standard responses and retention times in the calibration verification standard must be evaluated immediately after or during data acquisition. If the retention time for the instrument internal standard changes by more than 30 seconds from that in the midpoint standard of the most recent initial calibration sequence, the chromatographic system must be inspected for malfunctions and corrective action identified, as required. If the EICP area for the PCB-52 13C12 internal standard changes by a factor of two (50% to 200%) from that in the midpoint standard of the most recent initial calibration sequence, the chromatographic system must be inspected for malfunctions and corrective action identified, as appropriate. When corrective action is taken, reanalysis of samples analyzed while the system was malfunctioning is required. Update retention times and transition ratios in the quantitation database for the instrument method or ID file. The initial calibration average RF or calibration curve is then used in the quantitation of subsequent analyses.
- 11.3.5 A blank (method blank, GPC blank, or solvent blank) should be analyzed after the CCV to prove the system is free of contaminants. If contaminants are found in a method blank or GPC blank, then a solvent blank should be ran to help isolate the source of contamination.

#### 11.4 GC/MS Analysis

- 11.4.1 Evaluate FID screen and make proper dilution (See FID screening SOP).
- 11.4.2 Spike the 1 mL extract obtained from sample preparation with 10 µL of the instrument internal standard solution just prior to analysis. Use the same operating conditions as were used for initial calibration.
- 11.4.3 If the response for any quantitation ion exceeds the initial calibration curve range of the GC/MS system, extract dilution must take place. Additional internal standard must be added to the diluted extract to maintain the required 100ng/ml of the instrument internal standard in the extract volume. The diluted extract must be reanalyzed.
- 11.4.4 If a dilution of more than 10X is required; re-extract the sample using a smaller aliquot or re-fortify the sample for further dilution with internal standard/labeled compounds.
- 11.4.5 Store the extracts at -10°C or less, protected from light in vials equipped with un-pierced Teflon lined septa. Archive the extract in freezer for 3 months after analysis in the instrument/date specific storage boxes.

## 12) QA/QC Requirements

	STANDARD OPERATING PROCEDURE	Chlorinated Pest by GC/MS/MS
	ALS   Environmental - Kelso	SVM-PESTMS2, Rev. 7.0
		Effective: 4/22/2021
		SOP Review: 4/16/2021
		Page 13 of 27

## 12.1 Initial Precision and Recovery Validation

12.1.1 The accuracy and precision of the procedure must be validated before analyses of samples begin, or whenever significant changes to the procedures have been made. To do this, four laboratory generated samples are spiked with the LCS spike solution, then prepared and analyzed. The acceptance criterion is the same as LCS criteria.

## 12.2 Method Detection Limits, Limits of Detection and Limits of Quantitation

12.2.1 Method detection limit (MDL), Limits of Detection (LOD) and Limits of Quantitation (LOQ) must be determined before analysis of samples can begin. Refer to, Performing Method Detection Limit Studies and Establishing Limits of Detection and Quantification.

12.2.2 Calculate the average concentration found (x) in ng/L, and the standard deviation of the concentrations (s) in ng/L for each analyte. Calculate the MDL for each analyte.

## 12.3 Ongoing QC Samples required are described in the ALS-Kelso Quality Assurance Manual and in the SOP for Sample Batches. In general, these include:

12.3.1 Method blank - A method blank is extracted and analyzed with every batch of 20 or fewer samples to demonstrate that there are no method interferences. The method blank must demonstrate that interferences from the analytical and preparation steps minimized. No target analytes should be detected above the MRL in the method blank. For some project specific needs, exceptions may be noted and method blank results above the MRL may be reported.

12.3.2 An LCS or Laboratory Control Sample must be extracted and analyzed with every batch of 20 or fewer samples. The LCS is prepared by spiking a blank with the matrix spike solution, and going through the entire extraction and analysis.

12.3.2.1 Calculate percent recovery (%R) as follows:

$$\%R = X/TV \times 100$$

Where:

X = Concentration of the analyte recovered

TV = True value of amount spiked

12.3.2.2 If the LCS recovery for any control analyte fails acceptance limits, corrective action is required. If instrument corrective action is not applicable or ineffective, re-extraction of the associated samples is required. If any other analyte fails the advisory acceptance limits, the analyst must evaluate the impact on data quality and take any necessary corrective action, which may include re-extraction of the associated

	SVM-PESTMS2, Rev. 7.0
	Effective: 4/22/2021
	SOP Review: 4/16/2021
	Page 14 of 27

samples. Project-specific requirements may require all compounds to be treated as control analytes, or dictate use of project acceptance criteria.

12.3.3 A matrix spike/duplicate matrix spike (MS/DMS) must be extracted and analyzed with every batch of 20 or fewer samples. The MS is prepared by spiking a sample aliquot with the matrix spike solution, and going through the entire extraction and analysis.

12.3.3.1 Calculate percent recovery (%R) as follows:

$$\%R = \frac{X - X1}{TV} \times 100$$

Where:

X = Concentration of the analyte recovered  
X1 = Concentration of unspiked analyte  
TV = True value of amount spiked

12.3.3.2 Calculate Relative Percent Difference (RPD) as:

$$\%RPD = \frac{|R1 - R2|}{(R1 + R2)/2} \times 100$$

Where:

R1 = recovered concentration in the MS  
R2 = recovered concentration in the DMS

12.3.4 If any internal standard recovery is outside acceptance criteria, the sample data must be closely evaluated for possible matrix interferences. If none are present, then corrective action must be taken. The sample should be re-analyzed if instrument factors (calibration, injection port) are suspected. If not, re-extraction and re-analysis is required, except in cases of high recovery and no positive hits in the sample for the analyte class represented by the particular surrogate.

12.4 Additional QA/QC measures include control charting of QC sample results.

### 13) Data Reduction and Reporting

13.1 Qualitative Analysis - The qualitative identification of compounds determined by this procedure is based on retention time, and the ratio of the quantitation transition and the qualifier transition. Compounds should be identified as present when the criteria below are met.

13.1.1 The intensities of the characteristic transitions of a compound maximize in the same scan or within one scan of each other. Selection of a peak

	STANDARD OPERATING PROCEDURE	Chlorinated Pest by GC/MS/MS
	ALS   Environmental - Kelso	SVM-PESTMS2, Rev. 7.0
		Effective: 4/22/2021
		SOP Review: 4/16/2021
		Page 15 of 27

by a data system target compound search routine where the search is based on the presence of a target chromatographic peak containing transitions specific for the target compound at a compound-specific retention time will be accepted as meeting this criterion.

- 13.1.2 The RRT of the sample component is within  $\pm 0.06$  RRT units of the RRT of the standard component.
- 13.1.3 The ratio of the quantitation transition/qualifier transition agrees within 30% of the ratio of these transitions in the reference spectrum.
- 13.1.4 Structural isomers that produce very similar transitions should be identified as individual isomers if they have sufficiently different GC retention times. Sufficient GC resolution is achieved if the height of the valley between two isomer peaks is  $<25\%$  of the sum of the 2 peak heights. Otherwise, structural isomers are identified as isomeric pairs.
- 13.1.5 Identification is hampered when sample components are not resolved chromatographically and produce mass spectra containing transitions contributed by more than one analyte. When gas chromatographic peaks appear to represent more than one sample component (i.e., a broadened peak with shoulder(s) or a valley between two or more maxima), appropriate selection of analyte spectra and background spectra is important. Examination of extracted transition current profiles of appropriate transitions can aid in the selection of spectra, and in qualitative identification. When analytes coelute, the identification criteria can be met, but each analyte spectrum will contain extraneous transitions contributed by the coeluting compound.

## 13.2 Quantitation and Calculations

- 13.2.1 The GC/MS/MS data stations, in current use, use the Waters MassLynx Integrator to generate the raw data used to calculate the standards  $\overline{RF}_x$  values, the sample amounts, and the spike values. The software does three passes through each data file. The first two identify and integrate each internal standard and surrogate. The third pass uses the time-drift information from the first two passes to search for all method analytes in the proper retention times and with the proper characteristic quantitation transitions.

When  $\overline{RF}_x$  is used, calculate the extract concentration as follows:

$$C_{ex} = \frac{(Resp_x)(Amt_{ISTD})}{(Resp_{ISTD})(\overline{RF}_x)}$$

Where:

C<sub>ex</sub> = the concentration in the sample extract (ppm);  
 Respx = the peak area of the analytes of interest;

Resp<sub>ISTD</sub> = the peak area of the associated internal standard;  
Amt<sub>ISTD</sub> = the amount, in ppm, of internal standard added  
= the average response from the initial calibration.

13.2.2 The concentration of analytes in the original sample is computed using the following equations:

Aqueous Samples:

When  $\overline{RF}_x$  is used, calculate the extract concentration as follows:

$$C_{ex} = \frac{(Resp_x)(Amt_{ISTD})}{(Resp_{ISTD})(\overline{RF}_x)}$$

Where:

C<sub>ex</sub> = Concentration in extract in µg/mL

V<sub>f</sub> = Final volume of extract in mL

D = Dilution factor

V<sub>s</sub> = Volume of sample extracted, liters

Non-aqueous Samples:

$$\text{Concentration (mg / Kg)} = \frac{(C_{ex})(V_f)(D)}{(W)}$$

Where C<sub>ex</sub> = Concentration in extract in µg/mL

V<sub>f</sub> = Final volume of extract in mL

D = Dilution factor

W = Weight of sample extracted in grams.

13.2.2.1 If the area of the quantitation transition for any of the pesticides exceeds the calibration range, dilute and reanalyze the extract. Add additional recovery internal standard to maintain its concentration at 100ng/ml.

13.2.2.2 If a dilution greater than 10X is required; re-extract the sample using a smaller aliquot.

13.2.2.3 If the recovery of any of the labeled internal standards is outside of the limits, extract and analyze a smaller aliquot of the sample or refortify if due to dilution. Adjust the MRL/MDL to account for this dilution.

### 13.3 Data Review

13.3.1 Following primary data interpretation and calculations, all data is

	STANDARD OPERATING PROCEDURE	Chlorinated Pest by GC/MS/MS
	ALS   Environmental - Kelso	SVM-PESTMS2, Rev. 7.0
		Effective: 4/22/2021
		SOP Review: 4/16/2021
		Page 17 of 27

reviewed by a secondary analyst. Following generation of the report, the report is also reviewed. Refer to the SOP for Laboratory Data Review Process for details.

#### 13.4 Reporting

13.4.1 Reports are generated using the STEALTH Data Reporting System which compiles the SMO login information and Enviroquant data. This compilation is then transferred to a file, which STEALTH uses to generate a report. The forms generated may be ALS standard reports, DOD, or client-specific reports. The compiled data from LIMS is also used to create EDDs.

13.4.2 As an alternative, reports are generated using [REDACTED] templates located in R:\SVM\forms. The analyst should choose the appropriate form and QC pages to correspond to required tier level and deliverables requirements. The detected analytes, surrogate and matrix spikes are then transferred, by hand or electronically, to the templates.

#### 14) Contingencies for Handling Our-of-Control or Unacceptable Data

14.1 Refer to the SOP for *Nonconformance and Corrective Action Procedures* (ADM-NCAR) for procedures for corrective action.

14.2 Personnel at all levels and positions in the laboratory are to be alert to identifying problems and nonconformities when errors, deficiencies, or out-of-control situations are detected.

#### 15) Method Performance

15.1 This method was validated through single laboratory studies of accuracy and precision. Refer to the reference method for additional method performance data available.

15.2 The method detection limit (MDL) is and related method reporting limit(s) were established using the procedure described in *SOP Performing and Documenting Method Detection Limit Studies and Establishing Limits of Detection and Quantification*. Method Reporting Limits are established for this method based on MDL studies and as specified in the ALS Quality Assurance Manual.

#### 16) Pollution Prevention and Waste Management

16.1 The laboratory will comply with all Federal, State and local regulations governing waste restrictions as specified in the ALS Lab Waste Management Plan.

#### 17) Training

17.1 All analysts performing this analysis are required to read and understand this SOP.

17.2 Training is documented following the Employee Training and New Employee Orientation (ADM-TRAIN).

#### 18) Method Modifications

18.1 N/A.

**LABELED PESTICIDE STANDARDS**

Isotopically labeled pesticide and PCB standards are obtained from Cambridge Isotope Laboratories, C/D/N Isotopes, and Dr Erhenstorfer Laboratories.

**CALIBRATION**

The multipoint calibration is prepared from: AccuStandard catalog # M-8081-SC, M-8080-OP, P-297S, P-184S, P-331S-H, P-066S, P-094S, P-471S, APP-9-112 (or equivalent from other vendors\*)

**ICV**

The ICV standard is prepared from the following: Ultra Scientific catalog # PPM-808C-1, PPM-828-1, PST-480C100A01, PST-590C100A01, PST-120C100A01, PST-3185C100A01, PP-430-1, PST-2705M100A01, PST-1200C100A01, PST-720C100A01

**CCV**

Use the same solutions that were used for the calibration curve  
Prepare 1 ml of 20 ng/ml CCV standard, place in autosampler vial and cap. Expiration date is 1 week after CCV was prepared.

**RECAP AND STORE IMMEDIATELY AFTER INJECTING**

Store remaining stock solutions in 1 ml amber vial. Expiration date is one year after ampule is opened or the manufacturers expiration date which ever is first Order when down to one unopened ampule.

\* Vendor must be A2LA and/or ISO9000 certified.

## Volatile Organic Compounds by GC/MS

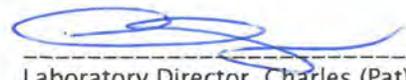

DOCUMENT ID: VOC-8260, REVISION 21.0

Prepared By:   
Organics Manager, Jonathon Walter

Date: 9/24/2020

Prepared By:   
Quality Assurance Manager, Kurt Clarkson

Date: 10/2/2020

Approved By:   
Laboratory Director, Charles (Pat) Byrne

Date: 10-2-2020

## 1) Scope & Applicability

- 1.1 This procedure is used to determine the concentration of volatile organic compounds in water and soil using USEPA Method 8260C. This method is also applicable to TCLP ZHE leachates and may also be applicable to various types of aqueous and non-aqueous waste samples.
- 1.2 The analyte reporting list and current Method Reporting Limits (MRL), Method Detection Limits (MDL)/Lower Limits of Quantitation (LLOQ), Limits of Quantitation (LOQ), and Limits of Detection (LOD) can be found in the ALS-Kelso Data Quality Objective (DQO) Tables.
- 1.3 The nominal quantitation range for water samples is 0.5 - 80 µg/L. The nominal quantitation range for low concentration soils is 5-200 µg/kg. The nominal quantitation range for high concentration soils is 50-8000 µg/kg.

## 2) Summary of Procedure

- 2.1 This procedure gives gas chromatographic/mass spectrometric (GC/MS) conditions for the detection of parts per billion (ppb) levels of volatile organic compounds. A sample aliquot is injected into the gas chromatograph (GC) by either the purge and trap method or by direct injection. The compounds are separated on a fused silica capillary GC column. The compounds are detected by a mass selective detector (MSD), which gives both qualitative as well as quantitative information.
- 2.2 In the purge and trap process an inert gas, helium, is bubbled through the sample aliquot, at room temperature. This gas stream sweeps the volatile organic compounds out of the aqueous phase and into the gas stream - it purges the compounds out of the sample. The gas stream then passes through a sorbent column which selectively adsorbs, (traps) these compounds out of the helium. The preparation and analysis of soil samples uses procedures described in USEPA Method 5030B or 5035/5035A. After the purging sequence is done, the sorbent column (the trap) is heated and desorbed onto the GC column. The GC column separates the compounds and passes then onto the MSD for identification and quantification.
- 2.3 The sensitivity of this method depends on the level of background contamination (i.e. interferences) rather than on instrumental limitations. Highly contaminated waste samples will require a methanol extraction prior to analysis. This will elevate the reporting levels and may mask low levels of compounds of interest.

## 3) Definitions

- 3.1 For laboratory definitions applicable to most analyses, refer to the SOP for [Sample Batches](#).

## 4) Responsibilities

- 4.1 It is the responsibility of the analyst to perform the analysis according to this SOP and to complete all documentation required for data review. Analysis and interpretation of the results are performed by personnel in the laboratory who have demonstrated the ability to generate acceptable results utilizing this SOP. This demonstration is in accordance with the training program of the laboratory. Final review and sign-off of the data is performed by the department supervisor/manager or designee.

- 4.2 It is the responsibility of the department supervisor/manager to document analyst training and method proficiency, as described in the *Employee Training and New Employee Orientation*. (ADM-TRAIN).

## 5) Interferences

- 5.1 Interferences by common laboratory extraction solvents, such as Methylene Chloride, Acetone, and Freon 113 can cause problems. The area where volatile organic analyses are performed is isolated from areas of the laboratory that perform extraction activities. Laboratory experience has shown that when Methylene Chloride is a problem it is due to maintenance activities or air handling equipment failures. In the rare event this happens, ultra-pure water can be used for all samples and calibration standards for that analytical batch.
- 5.2 Other interferences include but are not limited to impurities in the inert purge gas, dirty plumbing/purge vessels, cross contamination by highly contaminated samples to clean ones in transport and storage, and carry over from one analysis to subsequent ones.

## 6) Safety

- 6.1 Chemicals, reagents and standards must be handled as described in the ALS safety policies, approved methods and in SDSs where available. Refer to the ALS Chemical Hygiene Plan and the appropriate SDSs prior to beginning this method.

## 7) Sample Collection, Containers, Preservation, and Storage

- 7.1 Refer to procedures for methods 5030 and 5035 for sample container and collection procedures. Pre-cleaned sample containers are purchased from a lab equipment supplier. All containers should be of glass or amber glass and equipped with a screw top cap and PTFE (Teflon) lined septa.
- 7.2 Samples collected using EPA Method 5035 should be shipped in Encore sample tubes or collected in VOA vials containing sodium bisulfate (low concentration) and/or methanol (high concentration).
- 7.3 Collect all samples in duplicate, triplicate when possible. Prepare the proper number of sample bottles/containers prior to the sampling event with preservatives to adjust the samples pH to <2 with 1:1 HCl (water samples).
- 7.4 Slowly fill sample bottles to just overflowing taking care not to flush out the preservative or to entrain air bubbles in the samples. Seal the bottles with PTFE lined septa toward the sample and invert to check for entrained air bubbles.
- 7.5 Experimental evidence has shown refrigeration at 4°C alone will not stop biological degradation of some aromatic volatile organics. Adjusting the pH of the replicate samples to less than two (pH <2) with 1:1 HCl (@ 2-3 drops per 40 mL) preserves samples for 14 days after collection. Residual chlorine can also degrade some organic compounds, generating trihalomethanes (THMs).
- 7.6 All samples must be stored at 0-6°C and must be analyzed within 14 days of collection. See SOP VOC-5035 for additional holding time information. Any free product samples to be tested do not have any set holding times but should be analyzed as soon as possible.
- 7.7 The analysis of 2-CEVE in water by method 8260 requires the collection of an unpreserved sample. 2-Chloroethyl Vinyl Ether is highly reactive and preservation

may accelerate loss by polymerization or other rapid chemical reaction. Therefore, the accuracy of results from a preserved sample cannot be guaranteed. If a client requests 2-CEVE they must collect three preserved and three unpreserved vials and the sample must be logged in for a separate 2-CEVE analysis.

## 8) Apparatus and Equipment

### 8.1 Gas Chromatograph/Mass Spectrometer System

8.1.1 Each GC/MS system is set up with a GC capable of cooling the GC oven/column, injection onto a capillary column, and a transfer line interfaced with the MSD. Each MSD is a 5973, 5975, or 5977 that is controlled by the HP-MSDOS ChemStation software.

<u>Instrument ID</u>	<u>Configuration</u>	<u>Column</u>
MS13, MS18, MS19, MS23, MS24, MS27, MS46, MS30	Split/splitless capillary direct	- RTX-624, 20m, 0.18mm, 1um

8.1.2 Instrument systems and associated test methods are listed below.

<u>Instrument ID</u>	<u>Description</u>	<u>Tests Performed</u>
MS13	6890/5973	8260W, 8260S
MS18	6890/5973	8260W, 8260S, 8260 SIM
MS19	6890/5973	Screening
MS23	6890/5973	624
MS24/MS27	7890/5975	8260W, 8260S
MS46	7890/5977	8260W, 8260S
MS30	7890/5977	8260SIM

8.2 Purge and Trap with Autosampler - Each volatile GC/MS analytical system uses a purge and trap to introduce the sample onto the GC column. Each purge and trap has an autosampler (A/S) attached to run multiple samples, one at a time, and run unattended for extended periods of time. Teledyne Tekmar or EST Analytical autosamplers and Purge and Traps are preferred for extended unattended automated analyses.

### 8.3 GC Columns

8.3.1 Restek RTX-624 (or equivalent) 20 M x 0.18 mm id fused silica column 1.0 µm film thickness

8.4 Each volatile GC/MS data processing station uses the most recent version of the EPA/NIST Mass Spectral Library. The current version is the NIST98k library.

8.5 Analytical balance - Capable of accurately weighing to 0.001 g, Mettler PE160 or equivalent.

8.6 Syringes, Hamilton Gas-Tight in 10 µL, 25 µL, 100 µL, 500 µL, and 1000 µL sizes.

8.7 Standard storage vials, screw thread with Mini-inert caps.

## 9) Standards, Reagents, and Consumable Materials

9.1 Reagent grade chemicals shall be used in all tests. Other grades may be used, provided it is first ascertained that the reagent is of sufficiently high purity to permit its use without lowering the accuracy of the determination. The preparation for all laboratory prepared reagents and solutions must be documented in a laboratory logbook. Refer to the SOP *Reagent/Standards Login and Tracking* (ADM-RLT) for the complete procedure and documentation requirements.

9.2 Methanol, purge and trap grade or equivalent.

9.3 Reagent water, prepared from deionized water, by charcoal filtration and then purging with high purity helium or nitrogen that is set at 4-5 psi for approximately 2 hours prior to use.

9.4 Blank soil matrix - Ottawa sand, AccuStandard specialty sands.

9.5 Helium, compressed high purity grade.

9.6 BFB Tuning Verification Stock Standard - A 25,000 ppm stock standard is purchased (AccuStandard). This stock solution is diluted in methanol to give a working standard of 50 ppm.

9.7 Stock Standard Solutions

9.7.1 Commercially prepared and certified stock standards are used routinely for all the method specified analytes. All such mixtures are also routinely checked against an independent source for both analyte identification and analyte concentration. All such stock standard mixtures have expiration dates given by the manufacturer and must be replaced if the comparison with the independent check standards indicates a problem. Alternatively, stock standards may be prepared from neat chemicals. Store according to manufacturer's instructions. If no storage instructions are provided, store with minimal headspace, at -10° to -20°C and protect from light.

9.7.2 When preparing stock standards from neat chemicals accurately weigh approximately 0.1 g of material and dilute with methanol to 10 mL in a volumetric flask. If the purity of the neat chemical is <96%, adjust the calculated concentration accordingly.

9.8 Working Standards - Prepare these standards from stock solutions. Prepare at concentrations which facilitate ease of preparation of instrument-level standards (calibration standards, etc.). Refer to Table 1 for Standard Expiration Date Guidelines. Store standards with minimal headspace in appropriately sized standard storage vials with mini-inert caps. Solutions should be checked for degradation or evaporation prior to use.

9.9 Calibration Standards

9.9.1 A minimum of five different concentration levels for all the analytes are prepared by diluting working standards into reagent water. The lowest concentration level must be at the method reporting level, or a level corresponding to a sample concentration meeting project-specific data quality objectives, with the remaining four levels defining the working linear range of the analytical system. **The permanent gas stock**

**standards used to prepare calibration standards must not be more than one week old.**

- 9.9.2 The suggested levels are 0.5, 2, 10, 20 and 40 ppb for waters; and 5, 20, 50, 100, and 200 ppb for soils. All calibration solutions are made up daily.
- 9.9.3 The continuing calibration verification (CCV) solution is prepared by adding 10  $\mu$ L of a 50 ppm working standard to 50 mL of prepared reagent water, resulting in a 10 ppb (nominal concentration) standard. The CCV solution is prepared daily.
- 9.10 ICV Standard
- 9.10.1 The independent calibration verification (ICV) solution is prepared by adding 10  $\mu$ L of a 50 ppm intermediate to 50 mL of prepared reagent water, resulting in a 10 ppb (nominal concentration) standard. Acrolein is added at 50  $\mu$ L directly from a 100 ppm stock into the 50 mL of prepared reagent water yield a final concentration of 100 ppb in. The ICV solution is prepared with each initial calibration.
- 9.11 Internal Standards and Surrogates
- 9.11.1 The surrogates recommended are Dibromofluoromethane, Toluene- $d_8$  and 4-Bromofluorobenzene. The internal standards recommended are: Fluorobenzene, 1,4-Dichlorobenzene- $d_4$  and Chlorobenzene- $d_5$ . Other internal standards and surrogates may be used, depending on the analysis requirements. All internal standards are added to every calibration standard. The spike level for samples, blanks, and matrix spikes is 10  $\mu$ g/L for waters and 50  $\mu$ g/L for soils.
- 9.12 Spiking Solutions
- 9.12.1 Waters are typically spiked at 10 ppb and soils are typically spiked at 50 ppb.
- 9.12.2 Matrix spike and laboratory control spike solutions should contain the full list of analytes of interest. However, a subset may be reported.
- Note:** Refer to Table 1 for Standard Expiration Date Guidelines.

## 10) Preventative Maintenance

- 10.1 All maintenance activities are recorded in a maintenance logbook kept for each instrument. Pertinent information (serial numbers, instrument I.D., etc.) must be in the logbook. This includes the routine maintenance described in section 9. The entry in the log must include: date of event, the initials of who performed the work, and a reference to analytical control.
- 10.2 Carrier gas - Inline purifiers or scrubbers should be in place for all sources of carrier gas. These are selected to remove water, oxygen, and hydrocarbons. Purifiers should be changed as recommended by the supplier.
- 10.3 Purge and Trap /Autosamplers
- 10.3.1 The purge/trap system should be baked out and back-flushed daily as needed, generally prior to use on a daily basis. An instrument primer is run that serves to bake out the system and at the same time will prime the

column. This is especially useful if the instrument has been idle for an extended period of time.

10.3.2 Replace the trap monthly or sooner if performance deteriorates.

#### 10.4 Gas Chromatograph

10.4.1 Clipping off a small portion of the head of the column may improve chromatographic performance. This is typically done at the same time the MS source is cleaned or if unusually dirty samples are analyzed. When cutting off any portion of the column, make sure the cut is straight and “clean” (uniform, without fragmentation) by using the proper column cutting tool.

10.4.2 Over time, the column will exhibit poorer overall performance, as contaminated sample matrices are analyzed. Analytes at the front end of the run will show an increase in tailing and will start to behave in a non-linear manner. The length of time for this to occur will depend on the samples analyzed. When a noticeable decrease in column performance is evident and other maintenance options do not result in improvement, the column should be replaced. This is especially true when evident in conjunction with calibration difficulties.

#### 10.5 Mass Spectrometer

10.5.1 Tune the MS as needed to result in consistent and acceptable performance (see section 11).

10.5.2 For units under service contract, certain maintenance is performed by instrument service staff, including pump oil changed, vacuuming boards, etc., as recommended by the manufacturer.

10.5.3 MS source cleaning should be performed as needed, depending on the performance of the unit. This may be done by the analyst or by instrument service staff.

## 11) Procedure

### 11.1 Sample Preparation

#### 11.1.1 Water Samples

11.1.1.1 No preparation is generally required, other than dilution with reagent water to bring analytes into the upper half of the calibration range. Thus, a 10 mL sample volume is run straight from the sample vial. See the SOP for *Purge and Trap for Aqueous Samples* (VOC-5030) for details.

11.1.1.2 All water samples must be checked to have a  $\text{pH} \leq 2$  after sample analysis has taken place. Narrow range pH paper is used and the results are recorded on the injection log.

11.1.1.3 TCLP ZHE leachates are diluted 1:400 in reagent water prior to analysis. The TCLP samples and method blanks are diluted from the acidified ZHE extract; and the TCLP MS and LCS are diluted from a non-acidified extract, spiked, and poured into an HCL preserved VOA vial.

11.1.2 Soil samples are analyzed as either low concentration (direct purge) or high concentration (methanol preservation/extraction). Refer to the SOP for

*Purge and Trap/Extraction for Volatile Organics in Soil and Waste Samples, Close System (VOC-5035) for details.*

11.1.2.1 For low concentration analyses, one of the sampling options given in method 5035 is to be used. Depending on the option used, follow the instructions given in the method. Typically, 1-5 g is weighed out into the sample vial and 5 mL of reagent water is added. QC spikes and internal standards are then added, and the sample is purged at a temperature of 40°C ± 1°. Calibration standards, LCS, and method blanks require 5 g Ottawa sand as the matrix.

11.1.2.2 In the event that low concentration analyses are specified but samples were not taken using a EPA Method 5035 procedure, a portion of the sample is analyzed via direct heated purge of soil and EPA Method 5030A is cited. The analytical report should also be narrated with a statement indicating that 5030A has been deleted from SW-846. The low concentration analyses require a calibration specific to direct soil analysis.

11.1.2.3 The mid-level type is a methanol extraction method. In general, a 5 g wet weight of soil is extracted with 5 mL of purge-and-trap methanol in a scintillation vial. Place 5 mL of purge-and-trap methanol into vial, tare, and add 5 g of sample, and record the weight. Quickly cap and vortex until the sample is thoroughly mixed. A 1:100 dilution (500 µL to 50 mL) of this extract is then prepared in reagent water and analyzed using the water calibration. The extract weight, volume used, and methanol lot number are recorded on the injection log (or a bench sheet).

**NOTE:** For soil/solid samples requiring VOA and non-VOA analyses and only one container was submitted to the lab, sample receiving will label the sample container as "VOA Analysis First" and/or attach a "VOA FIRST" tag. The VOA department will remove a sample aliquot first for their analyses. The sample should be handled as if it were a Rush analysis, so that the other non-VOA analyses will not be unduly delayed. The VOA analyst who opens the container will either break the custody seal and will initial and date it when the container was opened or sign and date the "VOA FIRST" tag. A VOA Analysis First note will also be included on the SR.

11.2 The recommended typical operating conditions are listed below. Minor modification may be necessary based off the various instrument combinations which may be used.

Purge & Trap	Purge flow rate: 40 mL/min, "K" (Vocarb 3000) or "9" Trap; Purge 11 min, desorb 2 min at 240°C, bake 20 min at 260°C (Tekmar 3000)
Injection Port Temperature	200°C
Initial Temperature	35°C for 1.0 min
Temperature Program	15°C/min to 140°C; hold 0 min
Final Temperature	20°C/min to 200°C; hold 2.5 min
Detector Temperature	200°C
MS Scanning	~3.0 scans/second

Scan Range 35 - 270  
Carrier Gas He, 22.7 psig head pressure

### 11.3 Initial Calibration

**NOTE:** The calibration procedure(s) and options chosen must follow the ALS protocols. Any exceptions to the calibration procedures detailed in the SOP for *Calibration of Instruments for Organics Chromatographic Analyses (SOC-CAL)* are described as follows:

#### 11.3.1 BFB Tuning

11.3.1.1 Prior to calibration and sample analyses, analyze a 25 ng or 50 ng injection of Bromofluorobenzene (BFB). Each volatile GC/MS analytical system set up to run 8260C must meet the criteria listed in Table 2 for the injection of BFB. The analysis time for BFB is used to define the start of the 12-hour window in which all analyses must be performed. Once the instrument is tuned, all subsequent analyses of standards, samples, and QA/QC samples within the same 12-hour window must be analyzed using the identical mass spectrometer operating conditions.

11.3.1.2 Obtain the spectrum for evaluation using one of the following options:

- Three scans (the peak apex scan and the scans immediately preceding and following the apex) are acquired and averaged. Background subtraction is required, and must be accomplished using a single scan acquired no more than 20 scans prior to the elution of BFB. The background subtraction should be designed only to eliminate column bleed or instrument background ions. Do not subtract part of the BFB peak or part of any other closely eluting peak.
- Use one scan at the apex of the peak. Background subtraction is required, and must be accomplished using a single scan acquired no more than 20 scans prior to the elution of BFB. The background subtraction should be designed only to eliminate column bleed or instrument background ions. Do not subtract part of the BFB peak or part of any other closely eluting peak.
- Use the average across the entire peak up to a total of 5 scans. Peak integration must be consistent with standard operating procedure. If the peak is wider than 5 scans, the tune will consist of the peak apex scan and the two scans immediately preceding and following the apex. Background subtraction is required, and must be accomplished using a single scan acquired no more than 20 scans prior to the elution of BFB. The background subtraction should be designed only to eliminate column bleed or instrument background ions. Do not subtract part of the BFB peak or part of any other closely eluting peak.
- Use the average across the entire peak. Peak integration must be consistent with standard operating procedure. Background subtraction is required, and must be accomplished using a single scan acquired no more than 20 scans prior to the elution of BFB. The background subtraction should be designed only to eliminate column

bleed or instrument background ions. Do not subtract part of the BFB peak or part of any other closely eluting peak.

- 11.3.1.3 Evaluate the spectrum against the criteria specified in Table 2. The criteria used must be the same for all ion abundance criteria checks associated with a given analysis. For example, initial calibration, continuing calibration(s), QC, and sample analyses for a given sample must all use the same criteria.

### 11.3.2 GC/MS Analytical System Initial Calibrations

- 11.3.2.1 Prior to conducting any sample analyses, a multi-point (5 point minimum) calibration must be run. Recommended calibration levels are 0.5 - 70 ppb for waters, and 5 - 300 ppb for soils. Analyze each calibration standard and tabulate the area response of the characteristic quantitation ions (Table 3) versus concentration for each compound, internal standard and surrogate. Calculate the response factors (RF) for each compound relative to the specified internal standard by:

$$RF_x = \frac{(A_x)(C_{ISTD})}{(A_{ISTD})(C_x)}$$

Where:

$A_x$  = Area of the characteristic ion for compound being measured.

$A_{ISTD}$  = Area of the characteristic ion for specific internal standard.

$C_{ISTD}$  = Concentration of the specific internal standard (ng/ $\mu$ L).

$C_x$  = Concentration of the compound being measured (ng/ $\mu$ L).

**Note:** For DoD projects, a multi-point calibration is performed for the surrogates.

- 11.3.2.2 Calculate the mean response factor ( $\overline{RF_x}$ ) for each analyte from the five calibration levels. Calculate standard deviation (SD) and the percent relative standard deviations (%RSD) for each analyte from the mean with:

$$\%RSD = \frac{SD}{RF} \times 100$$

Where:

RSD = relative standard deviation.

$\overline{RF}$  = mean of 5 initial RFs for a compound.

SD = standard deviation of average RFs for a compound.

$$SD = \sqrt{\frac{\sum_{i=1}^N (RF_i - \overline{RF})^2}{N - 1}}$$

Where:

$RF_i$  = RF for each of the 5 calibration levels

$N$  = Number of RF values (i.e., 5)

- 11.3.2.3 The %RSD should be less than 20% for each compound.
- 11.3.2.4 If the % RSD for any compound is  $\leq 20\%$ , linearity can be assumed over the calibration range, and the relative response factor for each analyte and surrogate is used.
- 11.3.2.5 If the %RSD for a compound is  $>20\%$ , then alternative calibration models should be used. See the SOP *Calibration of Instruments for Organics Chromatographic (SOC-CAL) Analysis* for further guidance.
- 11.3.2.6 The mean response factor for each target analyte should meet the minimum response factors listed in Table 5. Meeting the minimum response factor criteria for the lowest calibration standard is critical in establishing and demonstrating the desired sensitivity. Due to the large number of compounds that may be analyzed by this method, some compounds will fail to meet this criterion. For these occasions, the analyte is qualified as not meeting the method recommended response factor criterion.
- 11.3.2.7 When instrument response does not follow a linear model, a non-linear calibration model may be used. Refer to the SOP for *Calibration of Instruments for Organics Chromatographic Analysis (SOC-CAL)* for alternative curve fit guidance.
- 11.3.2.8 If more than 10% of the compounds included with the initial calibration exceed the 20% RSD limit and do not meet the minimum correlation coefficient (0.99) for alternate curve fits, then the chromatographic system is considered too imprecise for analysis to begin and corrective action is necessary. Further preventative maintenance may be required or the system may not be adequately *primed* for initial calibration.
- 11.3.3 Review of calibration curve
- 11.3.3.1 The calibration curve must be reviewed to ensure it represents the calibration data. This is done by re-fitting each calibration level against the true concentration of each calibration standard. The % difference between the calculated concentration versus the true concentration should be  $\leq 30\%$  for each calibration level and may not exceed 50% for any level.
- 11.3.3.2 Due to the large number of compounds that may be analyzed, one or more analytes may exceed 20% RSD or 0.99 COD. The initial calibration may still be acceptable if the following conditions are met:
- The % difference between the calculated concentrations versus the true concentration for each level of the initial calibration curve meets the criteria specified in section 11.2.3.1.
  - In order to report non-detects, it must be demonstrated that there is adequate sensitivity to detect the failed compounds

at the applicable lower quantitation limit. This is done by re-evaluating the concentrations of the calibrations standards against the calculated concentrations.

**NOTE:** Certain project plans that fall under the (DoD QSM) contain additional initial calibration acceptance criteria. In these cases, the analyst must refer to the project plan to know if the criteria listed in the DoD QSM or QAPP-specified criteria or EPA method calibration criteria are to be used.

**NOTE:** The “80/20” criteria allowed under section 11.3.3.2 only applies when the full target compound list is being reported. Individual compounds that are a subset of the entire target analyte list and have  $\leq 20\%D$  may still be reported, e.g. dilutions, reruns, abbreviated reporting lists.

#### 11.3.4 Independent Calibration Verification

11.3.4.1 Following initial calibration, analyze an ICV standard. The ICV solution must be obtained for all analytes that are analyzed and reported. Calculate the percent difference (%D) or % Drift from the ICV true value. The acceptance limits for the ICV are  $\pm 30\%$  of true value.

11.3.4.2 If a second source standard is not available from a second vendor, a second lot number from the same vendor may be used. It is recommended that the lab obtain a written warranty that the lot numbers are prepared from different source materials.

11.3.4.3 After the multi-point calibration has passed all of the above criteria, and the Independent Calibration Verification has been performed, samples can be analyzed. The calibration curve mid-point standard may serve as the CCV for the opening set of samples within the same 12-hour window as the initial calibration.

#### 11.4 Continuing Calibration

11.4.1 The start of a 12-hour analysis window requires a check of the instrument tune via an injection of 25ng or 50 ng of BFB. Refer to section 11.2.1.2 for the procedure. If the criteria found in Table 2 are met, then a check of the initial calibration curve is done. If the first analysis of the BFB fails, inspect the instrument for malfunction and perform maintenance as necessary. A second BFB tune verification may then be performed. If the second run fails, it may be necessary to retune the system.

11.4.2 After the tuning criteria have been verified, the initial calibration must be checked and verified by analyzing a midrange calibration standard. The 10 ppb level for waters and 50 ppb level for soils is recommended. For water, CCVs are prepared by adding 10 $\mu$ l of the 50 ppm 8260 working standard and 5 $\mu$ l of the 2000 ppm ketone mix into 50 mL reagent water and a 10 mL aliquot is purged. For soil, CCVs are prepared by adding 25 $\mu$ l of the 100ppm (nominal) working standard into 50 mL reagent water, and a 5 mL aliquot is purged.

11.4.3 The CCV result is evaluated for each target compound using the following

criteria:

11.4.3.1 If the percent difference or percent drift for a compound is less than or equal to 20%, then the initial calibration for that compound is assumed to be valid.

11.4.3.2 Due to the large number of compounds that may be analyzed by this method, some compounds may fail to meet the  $\leq 20\%$  criteria. If no more than 20% of the compounds, included in the initial calibration, differ from their true concentration by 40%, the initial calibration is valid and no corrective action is necessary.

**NOTE:** The "80/20" criteria allowed under section 11.3.3.2 only applies when the full target compound list is being reported. Individual compounds that are a subset of the entire target analyte list and have  $\leq 20\%$  may still be reported (e.g. dilutions, reruns, abbreviated reporting list).

11.4.4 In cases where compounds fail, they may still be reported as non-detects if it can be demonstrated that there was adequate sensitivity to detect the compound at the applicable quantitation limit.

11.4.5 Non-detected analytes can be reported from analyses when a CCV exhibit a positive bias (i.e., outside the upper control limit), no further documentation is required.

11.4.6 For situations when the CCV fails to meet the criterion in section 11.3.3, and a confirmed detection exceed the MRL, the sample must be reanalyzed to ensure accurate quantification. If it is not possible to reanalyze the sample, the result must be reported as an estimated value.

11.4.7 If the tune criteria and the continuing calibration criteria are met, then the retention times of all compounds, surrogates, and internal standards are checked against the initial calibration. If the retention time for any internal standard changes by more than 10 seconds from the retention time from the mid-point standard of the most recent initial calibration, the system must be inspected for malfunctions and corrections must be made, as required.

11.4.8 If the area for any of the internal standards changes by a factor of 2 (-50% to +100%) from the area from the mid-point standard of the most recent initial calibration, corrections must be made to the system.

11.4.9 Quantitation of all compounds will be based on the initial calibration.

## 11.5 GC/MS Analysis

11.5.1 Perform GC/MS screening analysis.

11.5.1.1 Samples are typically diluted 50X for liquid matrices and 500X for solid matrices.

11.5.1.2 Quantify chromatographs from the screening analysis and evaluate based on peaks of interest and the high point of the associated analytical instrument calibration.

11.5.1.3 If required, dilutions are typically performed with the intent to bring the high range analytes of interest into the mid-range of

the instrument calibration as well as a base run that dilutes the highest peak to approximately three times the highest point of the instrument calibration.

- 11.5.1.4 Note the requirement of a dilution in the comment section of the analytical instrument injection log.
- 11.5.2 Prepare samples as described in section 11. Use the same operating conditions as were used for initial calibration.
- 11.5.3 If the response for any quantitation ion exceeds the initial calibration curve range of the GC/MS system, extract dilution must take place.
- 11.6 Identification of Analytes
  - 11.6.1 The MSD data system software identifies a sample component by first finding and identifying the surrogate and internal standards. After they have been integrated, the extracted ion chromatogram is searched for all calibrated analytes.
  - 11.6.2 The qualitative identification of each compound determined by this method is based on retention time, and on comparison of the sample mass spectrum, after background correction, with characteristic ions in a reference mass spectrum. The reference mass spectrum is generated from analysis of a calibration standard and is updated with each initial calibration.
  - 11.6.3 The characteristic ions from the reference mass spectrum are defined to be the three ions of greatest relative intensity, or any ions over 30% relative intensity if less than three such ions occur in the reference spectrum. Compounds are identified as present when the following criteria are met.
    - 11.6.3.1 The intensities of the characteristic ions of a compound maximize in the same scan or within one scan of each other. Selection of a peak by a data system target compound search routine where the search is based on the presence of a target chromatographic peak containing ions specific for the target compound at a compound-specific retention time will be accepted as meeting this criterion.
    - 11.6.3.2 The relative retention time (RRT) of the sample component is within  $\pm 0.06$  RRT units of the RRT of the standard component.
    - 11.6.3.3 The relative intensities of the characteristic ions agree within 30% of the relative intensities of these ions in the reference spectrum.
  - 11.6.4 Table 3 lists characteristic ions as given in Method 8260C. If there is no peak found for an analyte in the expected retention time window and the mass spectrum does not match according to the method criteria, then the analyte is "not found". Print out spectra for all confirmed hits.
- 11.7 The analyst reviews all analyses to confirm (or correct) all data system qualitative interpretations.
- 11.8 If results are to be reported on a dry weight basis, determine the dry weight of a separate aliquot of the sample, using the SOP for Total Solids.

## 12) QA/QC Requirements

### 12.1 Initial Precision and Recovery Validation

12.1.1 The accuracy and precision of the procedure must be validated before analysis of samples begins, or whenever significant changes to the procedures have been made or when an analyst is new to the procedure. To do this, analyze four water sample spikes, calculate the average recovery and standard deviation, and evaluate as described in EPA SW-846. The concentration of the analytes to be spiked should be in the working calibration range. Initial Demonstration of Capability studies must be performed as part of analyst training. Copies of the studies are maintained in the lab and in the analyst's training file.

### 12.2 Method Detection Limits/Lower Limit of Quantitation/LOD/LOQ

12.2.1 For projects that require reporting to the method detection limit (MDL), a method detection limit (MDL) study must be undertaken before analysis of samples can begin. To establish detection limits that are precise and accurate, the analyst must perform the procedure specified in the corporate QA SOP *Performing Method Detection Limit Studies and Establishing Limits of Detection and Quantification*. The MDL studies should be done for each matrix and include data from all instruments on which the test is analyzed.

12.2.2 Calculate the average concentration found ( $\bar{x}$ ) in the sample concentration, and the standard deviation of the concentrations for each analyte. Calculate the MDL for each analyte using the correct T value for the number of replicates. The MDL study must be verified as specified in CE-QA011.

12.2.3 The Limits of Detection (LOD) and Limits of Quantitation (LOQ) must be established and verified following the procedure in the SOP *Performing Method Detection Limit Studies and Establishing Limits of Detection and Quantification*.

12.2.4 The Method Reporting Limits (MRLs) used at ALS are the routinely reported Lower Limits of Quantitation (LLOQ) which take into account day-to-day fluctuations in instrument sensitivity as well as other factors. These MRLs are the levels to which ALS routinely reports results in order to minimize false positive or false negative results. The MRL is normally two to ten times the method detection limit.

12.3 Ongoing QC Samples required are described in the ALS-Kelso Quality Assurance Manual and in the SOP for *Sample Batches* (ADM-BATCH). In general, these include:

12.3.1 Method blank - A method blank is extracted and analyzed with every batch of 20 or fewer samples to demonstrate that there are no method interferences. The method blank must demonstrate that interferences from the analytical and preparation steps minimized. No target analytes should be detected above the MRL in the method blank. For some project specific needs, additional requirements or exceptions may be given.

Note: For DoD projects - The Method Blank will be considered contaminated if:

- The concentration of any target analyte in the blank exceeds  $\frac{1}{2}$  the reporting limit and is greater than  $\frac{1}{10}$  the amount measured in any sample or  $\frac{1}{10}$  the regulatory limit (whichever is greater).
- The concentration of any common laboratory contaminant in the blank exceeds the reporting limit and is greater than  $\frac{1}{10}$  the amount measured in any sample or  $\frac{1}{10}$  the regulatory limit (whichever is greater).
- The blank result otherwise affects the samples results as per the test method requirements or the project-specific objectives.

12.3.2 A lab control sample (LCS) must be prepared and analyzed with every batch, not to exceed 20 samples. The LCS is prepared by spiking a blank with the matrix spike solution, and going through the entire preparation and analysis. Calculate percent recovery (%R) as follows:

$$\%R = X/TV \times 100$$

Where:

X = Concentration of the analyte recovered

TV = True value of amount spiked

Compare the %R to LCS acceptance criteria, located in the current ALS-Kelso LIMS tables. The accuracy of the analysis is controlled on a subset of target analytes. If the project analyte list is fewer than 20 analytes, all are considered control analytes. For DoD projects all project target analytes are considered control analytes. Analytes which are used for control analytes are listed in Table 4. Project-specific acceptance limits may supersede those listed in this SOP. If the lab control sample (LCS) fails acceptance limits for any of the control compounds, any associated sample data is rejected and corrective action must be taken. This may include evaluation of the sample preparation, analytical system, and calibration; and may require re-extraction, re-analysis, and/or recalibration and re-analysis.

12.3.3 A matrix spike/duplicate matrix spike (MS/DMS) must be prepared and analyzed with every batch of 20 or fewer samples if adequate sample volume is received (4 or more vials are needed). If insufficient sample is received, an LCS/DLCS pair will be analyzed to establish batch precision. In the event a dilution analysis is necessary on a sample chosen for MS/DMS, the sample will be spiked at the base level. The MS is prepared by spiking a sample aliquot with the matrix spike solution, and going through the entire preparation and analysis. Calculate percent recovery (%R) as follows:

The MS is prepared by spiking a sample aliquot with the matrix spike solution, and going through the entire preparation and analysis. Calculate percent recovery (%R) as follows:

$$\%R = \frac{X - X1}{TV} \times 100$$

Where:

X = Measured concentration of the spiked sample aliquot

X1 = Measured concentration of unspiked sample aliquot

TV = True value (theoretical concentration) of amount spiked

Calculate Relative Percent Difference (RPD) as:

$$RPD = \frac{|R1 - R2|}{(R1 + R2)/2} \times 100$$

Where:

R1 = measured concentration of the higher concentration

R2 = measured concentration of the lower concentration

Compare the %R and RPD to MS/DMS acceptance criteria located in the ALS-Kelso LIMS tables. If the MS/DMS recovery is out of acceptance limits for reasons other than matrix effects, corrective action must be taken.

**Note:** For DoD projects, recovery limits for the MS are the same as the LCS limits specified in the QSM.

12.3.4 The acceptance limits for the surrogates are given in the ALS-Kelso DQO tables. If any surrogate recovery is outside acceptance criteria, the sample data must be closely evaluated for possible matrix interferences. If none are present, then corrective action must be taken. The sample should be re-analyzed if instrument factors (calibration, poor purge, etc.) are suspected.

12.4 Acceptance criteria and corrective action requirements have been outlined above in the Procedure section and in Table 6.

12.5 Additional QA/QC measures include trend analysis by means of control charts or other means.

### 13) Data Reduction and Reporting

13.1 Structural isomers that produce very similar mass spectra should be identified as individual isomers if they have sufficiently different GC retention times. Sufficient GC resolution is achieved if the height of the valley between two isomer peaks is less than 50% of the average of the two peak heights. Otherwise, structural isomers are identified as isomeric pairs. The resolution should be verified on the midpoint concentration of the initial calibration as well as the laboratory designated continuing calibration verification level if closely eluting isomers are to be reported.

#### 13.2 Calculations

13.2.1 The GC/MS data stations, in current use, all use the H-P RTE Integrator to generate the raw data used to calculate the standards  $\overline{RF}_x$  values, the sample amounts, and the spike values. The software does three passes through each data file. The first two identify and integrate each internal standard and surrogate. The third pass uses the time-drift information from the first two passes to search for all method analytes in the proper retention times and with the proper characteristic quantitation ions. The results for a water sample are calculated as follows when  $\overline{RF}_x$  is used:

$$A_x = \frac{(Resp_x)(Amt_{ISTD})}{(Resp_{ISTD})(\overline{RF}_x)}$$

Where:  $A_x$  = the amount, in ppb, of the analytes in the sample;  
 $Resp_x$  = the peak area of the analytes of interest;  
 $Resp_{ISTD}$  = the peak area of the associated internal standard;  
 $Amt_{ISTD}$  = the amount, in ppb, of internal standard added  
 $RF_x$  = the average response from the five-point for the analytes of interest.

- 13.2.2 The results for low concentration soil work are calculated by taking the normal print out, in ppb, (see the water results outlined above) and correcting for the total, dry soil sample actually purged:

$$(A_x) = \frac{(5 \text{ grams})}{(ASW_t \text{ gr})(\% \text{ Solids})} = A_x \text{ Low - Level Soil}$$

Where:  $A_x$  = the amount, in ppb, from the data system  
 5 g = Nominal amount of soil that is heated and purged  
 $ASW_t$  = the actual soil wet weight, in grams, that is purged; and  
 % Solids the correction factor for dry weight.

- 13.2.3 Results for a high concentration soil samples (methanol extracts) are calculated as follows:

$$(A_x) = \frac{(Dilution)(V_{EXTR})}{(ASW_t)(\% \text{ Solids})} = A_x \text{ High - Level Soil Amt.}$$

Where:  $AX$  = Amount reported from the data station, in ppb  
 Dilution = Dilution factor of the extract  
 % Solids = Correction factor for dry weight  
 $V_{EXTR}$  = Methanol extract volume (mL)\*

\* The water contained in the native sample is accounted for when determining the final extract volume. The final volume of the methanol extract is the total volume of the methanol/water mixture. Calculate the final volume as follows:

$$FinalVolume \text{ Methanol/Water} = mL \text{ of solvent} + \left( \frac{\% \text{ Moisture} \times Sample \text{ Wt.}(g)}{100} \right)$$

### 13.3 Data Review

- 13.3.1 Following primary data interpretation and calculations, all data is reviewed by a secondary analyst. Following generation of the report, the report is also reviewed. Refer to the SOP *Laboratory Data Review Process* (ADM-DREV) for details.

### 13.4 Reporting

- 13.4.1 Reports are generated in the ALS LIMS which compiles the SMO login, sample prep database, instrument, date, and client-specified report requirements (when specified). This compilation is then transferred to a file which the reporting system uses to generate a report. The forms generated may be ALS standard reports, DOD, or client-specific reports. The compiled data from LIMS is also used to create EDDs.

#### 14) Method Performance

- 14.1 This method was validated through single laboratory studies of accuracy and precision. Refer to the reference method for additional method performance data available.
- 14.2 The method detection limit (MDL) is established using the procedure described in the SOP *Performing and Documenting Method Detection Limit Studies and Establishing Limits of Detection and Limits of Quantitation*. Method Reporting Limits are established for this method based on MDL studies

#### 15) Pollution Prevention and Waste Management

- 15.1 It is the laboratory's practice to minimize the amount of solvents, acids and reagent used to perform this method wherever feasible. Standards are prepared in volumes consistent with methodology and only the amount needed for routine laboratory use is kept on site. The threat to the environment from solvent and reagents used in this method can be minimized when recycled or disposed of properly.
- 15.2 The laboratory will comply with all Federal, State and local regulations governing waste management, particularly the hazardous waste identification rules and land disposal restrictions as specified in the ALS Lab Waste Management Plan.
- 15.3 This method uses non-halogenated solvents and any waste generated from this solvent must be placed in the collection cans in the lab. The solvent will then be added to the hazardous waste storage area and disposed of in accordance with Federal and State regulations.

#### 16) Contingencies for Handling Out-of-Control or Unacceptable Data

- 16.1 Refer to the SOP for *Non Conformance and Corrective Action Procedure* (ADM-NCAR) for procedures for corrective action. Personnel at all levels and positions in the laboratory are to be alert to identifying problems and nonconformities when errors, deficiencies, or out-of-control situations are detected.

#### 17) Training

- 17.1 All analysts performing this analysis are required to read and understand this SOP.
- 17.2 Training is documented following the *Employee Training and New Employee Orientation* (ADM-TRAIN).

#### 18) Method Modifications

- 18.1 For water samples, a purge volume of 10mL is used, whereas the method (section 7.5.5) states 5mL or 25mL. The use of a 10mL volume ensures sensitivity for "5mL" type analyses *and*, on the analytical systems in use, meets the sensitivity goals of a 25mL purge volume analysis. Also, the use of 10mL rather than 25mL decreases the negative effects of water being introduced into the P/T-GC-MS system.
- 18.2 Reference method recommends recalculation of low point only and that should be  $\pm 30\%$ . This SOP states each point is refit and each point should be with  $\pm 30\%$  but may not exceed  $\pm 50\%$ .
- 18.3 No limit defined in reference method, so lab assigned a limit of 40% based on CLP protocols.

**20) Changes Since the Last Revision**

Revision Number	Effective Date	Document Editor	Description of Changes
21.0	10/05/2020	T.Caron	Updated SOP format to ALS branding template. Change in SOP signatories. Minor grammatical and typographical changes not affecting content. Section 12: Numerous edits - references to the ALS LIMS Tables. Updated standard paragraphs to current practices.

**21) Tables, Appendices, and Attachments, Standard Expiration Date Guidelines**

- 21.1 Table 2 - 4-Bromofluorobenzene Characteristic Ion Abundance Criteria
- 21.2 Table 3 - Characteristic Masses (m/z) for Purgeable Organic Compounds
- 21.3 Table 4 - Control Analytes for Non-DoD Projects
- 21.4 Table 5 - Recommended Minimum Relative Response Factor Criteria for Initial and Continuing Calibration Verification
- 21.5 Table 6 - Summary of Corrective Actions.

**TABLE 1**  
**Standard Expiration Date Guidelines**

<b>Standard</b>	<b>Expiration time</b>
<b>Neat Chemicals</b> from supplier's	Expiration date 5 years date opened, or assigned date.
<b>Stock Standards (unopened ampules, commercially prepared or lab prepared)</b> or 1 preparation if no expiration date provided.	Supplier's assigned date, year from
<b>Opened ampules and working standards</b> <ul style="list-style-type: none"><li>• concentration <math>\geq</math> 5000 ppm</li><li>• concentration 1000 - &lt;5000 ppm</li><li>• concentration 200 - &lt;1000 ppm</li><li>• concentration &lt; 200 ppm</li></ul>	6 month expiration date. 2 month expiration date. 1 month expiration date. 7 day expiration date.
<b>Internal Standard Solutions</b> date.	One month expiration

**Note:** The analyst performing specific analytical procedures should use judgment and take into consideration the solution reactivity, volatility, and concentration when using standards to prepare calibration curves. Certain standards, depending on use and storage, may have shorter usable life than described in these guidelines.

**TABLE 6**

**Summary of Corrective Actions**

<b>Method Reference</b>	<b>Control</b>	<b>Specification and Frequency</b>	<b>Acceptance Criteria</b>	<b>Corrective Action</b>
EPA 8000C EPA 8260C	ICAL	Prior to sample analysis	% RSD ≤ 20 R2 ≥ 0.995 COD ≥ 0.990	Correct problem then repeat ICAL
EPA 8260C	ICV	After ICAL	± 30% Diff	Correct problem and verify second source standard; rerun second source verification. If fails, correct problem and repeat initial calibration.
EPA 8260C	CCV	Prior to sample analysis	See Sec. 11.3.3	Correct problem then repeat CCV or repeat ICAL
EPA 8260C	Method Blank	Include with each analysis batch (up to 20 samples)	< MRL DOD < 1/2 MRL	If target exceeds MRL, reanalyze to determine if instrument was cause. If still noncompliant then: Re-extract or reanalyze samples containing contaminant, unless samples contain > 20x amount in blank.
EPA 8260C	Laboratory Control Sample	Include with each analysis batch (up to 20 samples)	See DQO Tables	If exceeds limits on control compounds, perform corrective actions, re-extract and re-analyze
EPA 8260C	Matrix Spike	Include with each analysis batch (up to 20 samples)	See DQO Tables	Evaluate data to determine if there is a matrix effect or analytical error
EPA 8260C	Matrix Spike Duplicates	Include with each analysis batch (up to 20 samples)	Water: RPD ≤ 30 Soil, L: RPD ≤ 40 Soil, M: RPD ≤ 40	Re-analyze if result is > 5 X the MRL

		Page 4 of 81

## 1. Scope

This Quality Assurance Manual (QAM) describes the policies, procedures and accountabilities established by the Laboratory of ALS Environmental (ALS) to ensure that the test results reported from analysis of air, water, soil, waste, and other matrices are reliable and of known and documented quality. This document describes the quality assurance and quality control procedures followed to generate reliable analytical data.

This QAM is designed to be an overview of ALS operations. Detailed methodologies and practices are written in ALS Standard Operating Procedures (SOPs). Where appropriate, ALS SOPs are referenced in this document to direct the reader to more complete information.

ALS maintains certifications pertaining to various commercial and government entities. Each certification requires that the laboratory continue to perform at levels specified by the programs issuing certification. Program requirements can be rigorous; they include performance evaluations as well as annual audits of the laboratory to verify compliance.

### Quality Assurance Policy

ALS is committed to producing legally defensible analytical data of known and documented quality acceptable for its intended use and in compliance with applicable regulatory programs. This QAM is designed to satisfy the applicable requirements of the Various States, United States Environmental Protection Agency (USEPA), TNI Volume 1 2009/2016 and ISO 17025: 2017.

ALS corporate management has committed its full support to provide the personnel, facilities, equipment, and procedures required by this QAM and other client and project related requirements.

ALS management reviews its operations on an ongoing basis and seeks input from staff and clients to make improvements.

It is the policy of ALS that all employees be familiar with all quality documentation.

### Quality System

This QAM and SOPs referenced in this document comprise the ALS management system. This management system includes all quality assurance policies and quality control procedures.

Although verbal communication with employees is essential, written and visual communication through email and computer systems is the cornerstone of effective communication at ALS. Computer workstations throughout the lab provide access to LIMS, Procedures and email systems. All information essential for effective and consistent communication of analytical requirements and details affecting quality is available through these computerized systems.

### Ethics and Data Integrity

It is the policy of ALS to perform work for clients in the most efficient manner possible, avoiding waste of resources. It is the role of both ALS management and employees to ensure that work for clients is performed most efficiently and effectively by properly utilizing ALS purchased materials, equipment, and the time and ability of personnel.

ALS policy on waste, fraud, and abuse is described in ALS SOP *Laboratory Ethics and Data Integrity* (CE-GEN-001). It is the policy of ALS to generate accurate and reliable data in accordance with contractual and regulatory requirements. As stated in the ALS policies manual, any undue pressure applied to employees in the performance of their duties must be reported as per procedures for reporting listed in ALS SOP CE-GEN-001. It is against ALS policy to improperly manipulate or falsify data or to engage in any other

	STANDARD OPERATING PROCEDURE	Quality Assurance Manual
	ALS   Environmental - Kelso	ALKLS-QAM, Rev. 28.0
		Effective: 10/21/2020
		Page 5 of 81

unethical conduct as defined in ALS Corporate SOP CE-GEN-001. ALS provides mandatory initial and annual refresher training for all employees on SOP CE-GEN-001.

Data integrity training is provided as a formal part of new employee orientation and a refresher is given annually for all employees as detailed in the Ethics and Data Integrity corporate SOP CE-GEN-001. Key topics covered are the organizational objective and its relationship to the critical need for honesty and full disclosure in all analytical reporting, record keeping, and reporting data integrity issues. Training includes discussion regarding all data integrity procedures, data integrity training documentation, in-depth data monitoring and data integrity procedures. Training topics also cover examples of improper actions, legal and liability implications (company and personal), causes, prevention, awareness, and reporting options. Computer security is also included, covering ALS computing security awareness, passwords and access, and related topics. Employees are required to understand that any infractions of the laboratory data integrity procedures shall result in a detailed investigation that could lead to very serious consequences including immediate termination, or civil/criminal prosecution. Evidence of training is maintained by the QA Department. See Appendix C for a copy of the ALS Ethics and Integrity Agreement.

In order to maintain compliance with the requirement to conduct and document ethics and data integrity training annually for all employees, data integrity training will be assigned on the first work day of the calendar year through the ALStar program. This will allow for completion of the training and the proper documentation within the assigned 60 day period. Any employee that does not complete the required data integrity training by the end of the 60 day assigned completion period will be removed from normal laboratory operations until the requirement is met to complete the required annual training by the end of the calendar year.

The pertinent ALS Project Manager must approve deviations from contractual requirements. The Project Manager obtains approval for any such deviations, either in writing or by phone (documented in a phone log) from pertinent contract authorities. In addition, ALS requires that deviations from contractual requirements that might affect data quality be reported to clients. Any employee who knowingly manipulates and/or falsifies data or documents or engages in any unethical conduct is subject to immediate release from employment.

ALS employees who are aware of, or reasonably suspicious of, any case of data manipulation, falsification of data, waste of resources, or other unethical practice or misconduct shall notify any manager. Under the direction of the laboratory director, every allegation of unethical conduct will be fully investigated.

## 2. Normative References

ALS relies primarily upon the most current EPA approved revisions of the references listed below for methodologies used in the laboratory. Procedures contained in these references are acceptable for use only after the lab has demonstrated and documented adequate performance with the method such as method detection limit studies, precision and accuracy studies, proficiency sample analysis, and linear calibration range studies. These studies are then routinely verified as long as the methods are in use in the laboratory.

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

### 3. Terms and Definitions

- Impartiality - presence of objectivity.
- Complaint - expression of dissatisfaction by any person or organization to a laboratory (3.6), relating to the activities or results of that laboratory, where a response is expected.
- Inter-laboratory comparison - organization, performance and evaluation of measurements or tests on the same or similar items by two or more laboratories in accordance with predetermined conditions.
- Intra-laboratory comparison - organization, performance and evaluation of measurements or tests on the same or similar items within the same laboratory in accordance with predetermined conditions.
- Proficiency testing - evaluation of participant performance against pre-established criteria by means of inter-laboratory comparisons.
- Laboratory - body that performs one or more of the following activities:
  - testing;

	STANDARD OPERATING PROCEDURE	Quality Assurance Manual
	ALS   Environmental - Kelso	ALKLS-QAM, Rev. 28.0
		Effective: 10/21/2020
		Page 7 of 81

- calibration;
- sampling, associated with subsequent testing or calibration
- Decision rule - rule that describes how measurement uncertainty is accounted for when stating conformity with a specified requirement.
- Verification - provision of objective evidence that a given item fulfills specified requirements.
- Validation - verification, where the specified requirements are adequate for an intended use.

## 4. General Requirements

### 4.1 Impartiality

All employees are required to enter into the following agreements:

- **Code of Conduct Agreement**

Provides a framework for decisions and actions in relation to conduct in employment. The agreement covers a wide range of topics including personal and professional behavior, conflicts of interest, gifts, confidentiality, legal compliance, security of information, among others. The code of conduct agreement is administered by the USA Human Resources department. This agreement is provided to the employee during the hiring and induction process and the agreement is reviewed and signed.

- **Confidentiality Agreement**

Describes policies for identifying and protecting information owned by ALS and its customers, and for keeping this information in confidence. The confidentiality agreement is administered by the USA Human Resources department. This agreement is provided to the employee during the hiring and induction process and the agreement is reviewed and signed.

- **Ethics and Data Integrity Agreement**

Provided to the employee as part of the hiring and induction process, and reviewed during periodic ethics refresher training. This is coordinated between the Human Resources and Quality Assurance (QA) departments. This agreement is provided to the employee during the hiring and induction process and the agreement is reviewed and signed. All employees are required to take annual ethics and data integrity refresher training.

In addition to the agreements, project managers act as a firewall to insulate the analysts from clients so that the lab personnel have no contact with clients. Lab IDs are assigned to samples and used throughout preparation and analysis to make the samples ambiguous to lab personnel. Together these agreements and procedures ensure freedom from undue internal and external commercial, financial, and other pressures or influences that could adversely affect the quality of work. They protect customers' confidential information and ALS' proprietary rights. They ensure avoidance of activities that could diminish confidence in the competence, impartiality, judgment or integrity of any ALS laboratory and staff.

It is the responsibility of all staff to comply with all procedures, be familiar with current management systems and policies, and to record all data as established by management. This and the peer review of all data will ensure that all testing is objective and conflicts of interest do not exist. As a commercial laboratory, the decision making using test results, opinions and interpretation of data is outside the scope of the laboratory activities.

### 4.2 Confidentiality

	STANDARD OPERATING PROCEDURE	Quality Assurance Manual
	ALS   Environmental - Kelso	ALKLS-QAM, Rev. 28.0
		Effective: 10/21/2020
		Page 8 of 81

All employees signed confidentiality statement upon employment. These are maintained by Human Resources (HR).

Documents provided to the laboratory are held in strict confidence by project management staff. Documents pertaining to quality assurance and analytical requirements are reviewed with appropriate managers and staff through the project specific meetings and LIMS. Project related information provided by clients is securely archived using procedures described in the SOP *Data Archiving* (ADM-ARCH).

The transmittal of final results is specified by clients and follows those requirements unless specific changes are made by the ALS Project Manager assigned to the client/project. Client communication procedures and documentation requirements are listed in SOP *Project Management* (ADM-PCM).

## 5. Structural Requirements

5.1 The laboratory, a legal entity, is part of ALS USA Corp and the Laboratory Director reports to the General Managers, Life Sciences, USA. There are other support functions such as human resources, accounting, safety oversight and computer systems that are provided to the laboratory by corporate entities but none of which is responsible for managing laboratory activities. The support functions of this laboratory involved with testing and services are under the direction of the laboratory director.

### 5.1.1 Limitation of Liability

Notwithstanding any other provision herein, ALS's liability and Client's exclusive remedy for any cause of action arising hereunder, whether based on contract, negligence, or any other cause of action, shall be limited to the compensation received by ALS from the Customer for the services rendered therewith. All claims, including negligence or any other cause whatsoever shall be deemed waived unless made in writing and received by ALS within ninety (90) days after ALS's completion of the services provided.

### 5.1.2 Transfer of Ownership

In the event of a transfer of ownership of the laboratory, the new owner will agree in writing, which shall be either stipulated in a purchase agreement or as a separate record retention document, that the current records shall be maintained for a period of not less than ten (10) years.

### 5.1.3 Laboratory Closure

In the event of a laboratory closure, the current owner/management will notify in writing all Customers for whom the laboratory performed sample analysis within the last ten (10) years that the laboratory will be closing. This letter will instruct the Customers to contact the laboratory to provide instructions on how previous records are to be transferred to the Customer's care.

5.2 The responsibility for this laboratory under the direction of the laboratory director. Key employees in the management systems are identified in section 5.5.

5.3 This laboratory performs a full range of inorganic and organic analyses using EPA SW-846 methods, EPA drinking water methods per 40CFR141, EPA Clean Water Methods per 40CFR136, AWWA Standard Methods current approved methods, and Accreditation agency or State Approved Methodologies;. This QAM is designed to be an overview of ALS operations. Detailed methodologies and practices are written in ALS Standard Operating Procedures (SOPs). Where appropriate, ALS SOPs are referenced in this document to direct the reader to more complete information.

	STANDARD OPERATING PROCEDURE	Quality Assurance Manual
	ALS   Environmental - Kelso	ALKLS-QAM, Rev. 28.0
		Effective: 10/21/2020
		Page 9 of 81

5.4 ALS is committed to producing legally defensible analytical data of known and documented quality acceptable for its intended use and in compliance with applicable regulatory programs. This QAM is designed to satisfy the applicable requirements of various states, United States Environmental Protection Agency (USEPA), TNI Volume 1 2009 or 2016 and ISO 17025: 2017.

5.5 **Org Chart and Key personnel** - see Appendix B.

5.5.1 **ALS Laboratory Director**, The Laboratory Director is responsible to ensure:

- Implementation of quality policy and applicable standards.
- Employees have sufficient experience and training to perform QAM related duties and procedures.
- That the necessary facilities and equipment are available to meet the commitments of the laboratory.
- Sample handling, instrument calibration, sample analysis, and related activities are conducted and documented as described in this QAM, its related Standard Operating Procedures (SOPs), and its referenced methods.
- That routine QC samples are prepared, analyzed, and reviewed as required by this QAM.
- That at regular intervals audits are conducted and documented to assess compliance with this QAM.
- That corrective action is initiated and completed to remedy discrepancies or problems identified in any laboratory process.
- Management review of all processes and procedures associated with the management system.
- In the absence of the Laboratory Director, either the Metals Technical Director or Client Service Manager will assume the above responsibilities. This will require assistance from corporate leadership.

5.5.2 **Quality Assurance Manager**, The Quality Assurance Manager reports directly to the laboratory Director and is responsible to:

- Ensure implementation of quality policy and applicable standards.
- Understand, monitor and evaluate the quality assurance (QA) and quality control (QC) activities described in this QAM and its references, reporting deficiencies and identifying resource requirements to the Laboratory Director.
- Conduct and document an annual internal audit of laboratory procedures to ensure compliance with this QAM and its references.
- Conduct an annual update of this QAM and review or update laboratory Standard Operating Procedures (SOPs).
- Arrange for the analysis of Proficiency Testing (PT) samples and maintains training records of demonstration of competency (DOC).
- Maintain a record of ongoing personnel training for QAM related activities, reporting training deficiencies to the Laboratory Director.
- Maintain the laboratory documentation of nonconformance, corrective action, preventive action, and improvement programs.

	STANDARD OPERATING PROCEDURE	Quality Assurance Manual
	ALS   Environmental - Kelso	ALKLS-QAM, Rev. 28.0
		Effective: 10/21/2020
		Page 10 of 81

- In the absence of the QA Manager, the Laboratory Director shall assume the above responsibilities. This may require assistance from the corporate Quality Improvement Manager, especially in the event of a prolonged absence.

5.5.3 **Technical Managers (Organic & Inorganic)**, The managers of these operations report directly to the Laboratory Director and are responsible to:

- Ensure implementation of quality policy and applicable standards.
- Read, understand and follow this QAM with its references.
- Ensure that method development projects meet the requirements specified in this QAM.
- Ensure that each set of reported results meets the requirements specified in this QAM and meets the client's requirements as defined in the applicable project requirements.
- Ensure that personnel are trained, authorized and utilized effectively.
- Ensure that facilities and equipment are maintained and utilized effectively.
- Ensure that supplies are available and utilized effectively.
- Immediately report technical and quality problems to the Laboratory Director or Quality Assurance Manager.
- In the event of a prolonged absence of the Organic or Inorganic manager, Supervisors within the department that possess the required qualifications and experience will assume the above responsibilities.

5.5.4 **Project Managers**, Project Managers report directly to the Client Services Manager. Project Managers are responsible to:

- Ensure implementation of quality policy and applicable standards.
- Complete and distribute project related information for each project before the laboratory starts work on the project.
- Immediately communicate to the laboratory changes made to projects in progress and document these changes as appropriate.
- Respond to client requests for information and coordinate responses to client audits.
- Ensure StarLIMS work orders are reviewed and meet client project requirements before release to the laboratory.
- Perform an initial review of results for large projects to verify that data reports submitted to the client meet all project requirements.
- Operate as approved signatories for laboratory reports.

5.5.5 **Support Management** (Computers, Client Services, Health and Safety) are responsible to:

- Ensure implementation of quality policy and applicable standards.
- Read, understand and follow this QAM with its references.
- Ensure that procedures are followed and meets the client's requirements as defined in the applicable project requirements.

	STANDARD OPERATING PROCEDURE	Quality Assurance Manual
	ALS   Environmental - Kelso	ALKLS-QAM, Rev. 28.0
		Effective: 10/21/2020
		Page 11 of 81

- Ensure that personnel are trained, authorized and utilized effectively.
- Ensure that facilities and equipment are maintained and utilized effectively.
- Ensure that supplies are available and utilized effectively.
- Immediately report technical and quality problems to the Laboratory Director or Quality Assurance Manager.
- Training staff to comply with all processes.

5.6 It is the responsibility of all technical and support staff to comply with all procedures and be familiar with current quality systems and policies as established by management. At ALS, improvement of the quality systems and preventive action is effected through an ongoing systems review by management using input from all staff. ALS actively seeks employee and client input for improvements through surveys and questionnaires. Internally ALS maintains a process improvement website for employees to provide suggestions for improvements. For clients, ALS surveys and gains feedback on services provided. This input to management is provided from the corporate level. To comply with these requirements all staff are responsible but not limited to the following:

- Follow project requirements as delineated by project managers to ensure analyses and commitments, including TAT, are performed as requested.
- Develop knowledge and understanding of the QAM requirements under which samples are handled and tested.
- Notify managers and Quality Assurance personnel when QA problems arise.
- Follow Quality Assurance requirements as outlined in the QAM and SOPs.
- Follow appropriate channels regarding modification of existing SOPs.
- Maintain accurate electronic and written records.
- Ensure that applicable data are included in each process in accordance with applicable SOPs.
- Record all nonconformance.
- Follow appropriate protocols when the handling and testing does not meet acceptance criteria.
- Apply integrity and professional judgment when dealing with analytical processes and laboratory operations.

5.7 Although verbal communication with employees is essential, written and visual communication through email and computer systems is the cornerstone of effective communication at ALS. Computer workstations throughout the lab provide access to LIMS, ALS Portals, Instruments used for testing, Policies and Procedures, and Email. All information essential for effective and consistent communication of analytical requirements, client requirements and details affecting quality are available through these computerized systems.

ALS management is committed to improvements of the management systems through compliance with its own policies and procedures. ALS management ensures improvements are made to the management systems and also ensures data integrity is maintained.

## 6. Resources Requirements

### 6.1 General

	STANDARD OPERATING PROCEDURE	Quality Assurance Manual
	ALS   Environmental - Kelso	ALKLS-QAM, Rev. 28.0
		Effective: 10/21/2020
		Page 12 of 81

6.1.1 ALS management has committed its full support to provide the personnel, facilities, equipment, and procedures required by this QAM.

## 6.2 Personnel

6.2.1 It is the responsibility of all staff to comply with all procedures, be familiar with current management systems and policies, and to record all data as established by management. This will ensure that all testing is objective and conflicts of interest do not exist. As a commercial laboratory, the decision making using test results is outside the scope of the laboratory activities. The ALS laboratory employs sufficient personnel to complete required chemical and radiochemical analyses and support activities.

6.2.2 The ALS training program specified in the SOP *Employee Training and Orientation* (ADM-TRAIN) includes quality training, technical training, safety training, and other training as described in this QAM. ALS managers are responsible to ensure that all staff training is initiated, completed, verified, and documented.

The specific training and experience of laboratory personnel is documented in individual training files maintained in accordance with ADM-TRAIN and includes records of analytical proficiency through the analysis of QC and PT samples.

Job Descriptions include requirements for education, qualification, training, technical knowledge, skills and experience. Job descriptions are maintained by the corporate Human Resource Department.

6.2.3 All ALS staff assigned to perform tasks affecting or relating to testing receives training relative to pertinent areas of responsibility, both prior to performing work on client samples and on an ongoing basis. Such training comes from internal and external sources.

6.2.4 Laboratory personnel resources needed to carry out their duties. See 5.6.

6.2.5 The laboratory procedure *Employee Training and Orientation* (ADM-TRAIN), includes the following and records are retained for:

- Determining the competence requirements.
- Selection of personnel.
- Training of personnel.
- Supervision of personnel.
- Authorization of personnel.
- Monitoring competence of personnel.

6.2.6 It is the responsibility of Technical and Support Management to authorize staff to perform specific laboratory activities. These tasks include testing methods, peer review and authorization to report results. Records are retained for the pertinent authorizations by the Quality Assurance department.

## 6.3 Facilities and Environmental conditions

6.3.1 ALS management has committed its full support to provide the personnel, facilities, equipment, and procedures required by this QAM.

6.3.2 Records are maintained for the requirements and conditions necessary for method and regulatory compliance in the facility.

6.3.3 Records are retained with analytical data for monitoring and control of environmental conditions to relevant method and regulatory specifications.

	STANDARD OPERATING PROCEDURE	Quality Assurance Manual
	ALS   Environmental - Kelso	ALKLS-QAM, Rev. 28.0
		Effective: 10/21/2020
		Page 13 of 81

6.3.4 See Appendix D for floor plan.

To maintain facility security and thus sample security, entrance to the ALS facility can be attained only through security access, except at the main business entrance and sample receiving entrance; these are open only during normal business hours and monitored by the receptionist at the business entrance and Sample Receipt Technicians at the sample receiving entrance. All non-employees are required to sign in with the receptionist at the main entrance.

Laboratory areas are segregated by HVAC systems to contain contamination and to eliminate potential contamination from specific laboratory areas that require low ambient chemical background levels for successful analysis.

Each area in the laboratory has adequate lighting, conditions and bench space for instrumentation and for the processes assigned to that area.

Laboratory reagent water is prepared and maintained using any combination of deionization, reverse osmosis, purging and UV radiation. See SOP *Operation and Maintenance of Laboratory reagent Water Systems* (FAC-WATER).

Fume hoods have visual indicators to ensure flow is maintained during use and are performance tested semi-annually.

All safety inspection records are kept on file for a minimum of five years.

6.3.5 Laboratory activities outside the facility are limited to sample pick-up and sample collection. Field service activities are not included in our laboratory scopes of accreditation/certification.

**6.4 Equipment**

6.4.1 A comprehensive list of instrumentation and support equipment utilized at ALS is included in Appendix E. Redundant instruments are maintained for particular analyses.

6.4.2 Laboratory equipment items such as analytical balances, pipettes, and thermometers are verified against reference standards. Laboratory reference weights and thermometers are certified by ISO accredited vendors against ISO or National Metrology Institute (NMI) traceable standards. Support equipment is maintained in proper working order and verified daily or prior to use. Support equipment is calibrated or verified as described by the SOPs *Documenting Laboratory Balance and Check Weight Verification* (ADM-BAL) and *Checking Volumetric Labware* (ADM-VOLWARE).

In the event that equipment is sent outside of the laboratory, such as a NIST thermometer, for calibration, the device shall be inspected by the laboratory prior to being put into use. If found to be of the appropriate quality per the SOP and functioning properly, the Certificate of Calibration will be maintained on file.

6.4.3 Routine maintenance is performed on laboratory instruments and equipment according to manufacturer recommendations. Maintenance is provided under warranty, through service contracts, and by ALS in-house personnel. The ALS approach to preventive maintenance is described in each analytical SOP. Records of routine maintenance and emergency maintenance are kept with the instruments or on the ALS server in hardcopy or electronic maintenance logbooks.

a) Maintenance logs contain general information about the instrument, such as the name of the manufacturer, instrument model, serial number, date of purchase, date placed into service, current instrument

	STANDARD OPERATING PROCEDURE	Quality Assurance Manual
	ALS   Environmental - Kelso	ALKLS-QAM, Rev. 28.0
		Effective: 10/21/2020
		Page 14 of 81

location, condition when received (e.g., new, used, reconditioned), and information concerning any service contracts maintained. They also contain information concerning any routine maintenance done by ALS personnel. Information concerning maintenance should include a brief description of the maintenance performed, the frequency required, the date performed, and the initials of personnel performing the maintenance and any comments concerning the procedure. Also to be entered in or to be stored with the log is information concerning repairs done by ALS personnel or instrument manufacturers. This information should include the date of servicing, the initials of personnel performing the service, record of why it was done and the results of the servicing relative to instrument performance. The individual logbooks are located on the server or in the laboratory with the instruments to which they pertain along with copies of manufacturer's instructions, where available. Records shall be retrievable for review and archived according to required procedures. See *Records Management Policy*, (ADM-RCRDS).

- b) It is the responsibility of the technical managers to determine the effect, if any, of an instrument defect on previous results. If an effect has been determined to have impacted the validity of any sample results, the corrective action procedure is followed. See Nonconformance and Corrective Action Procedures (ADM-NCAR).

6.4.4 All instruments are calibrated or verified before use, using reference materials with traceability established. Specific calibration requirements are detailed in the method or analytical SOP.

- a) Initial calibrations are verified for accuracy by analysis of a second source standard. This is a check standard prepared from a reference material procured from a different source than that used for the calibration. When a different source is not available or cost prohibitive, a second lot of material from the same vendor is acceptable as long as the original source used to prepare the standards is not the same.
- b) All initial calibrations are verified by analysis of continuing calibration standards and/or QC check samples. These are method or SOP specified calibration standards that are analyzed at specific frequencies as established by the method. The amount of analyte recovered is compared to the acceptance criteria of the method. Acceptable recoveries verify the stability of the calibration and lack of instrument drift throughout the analysis. Analysts perform trend analysis by monitoring instrument response and QC each day of analysis. If the acceptance criteria are not met, or sensitivity is determined to be changing, method specific corrective action must be taken. (See analytical SOPs).

6.4.5 The instrument manuals are provided in electronic format usually in the software programs, CDs, and available on network drives. Software is controlled through licensing and is the responsibility of computer support to maintain licenses required.

6.4.6 Testing instruments are calibrated as per method, regulatory and verification procedures listed in SOPs. Support equipment has verification and calibration frequencies specified in SOPs.

6.4.7 Calibration program. See 6.4.4

	STANDARD OPERATING PROCEDURE	Quality Assurance Manual
	ALS   Environmental - Kelso	ALKLS-QAM, Rev. 28.0
		Effective: 10/21/2020
		Page 15 of 81

- 6.4.8 Calibration and verification period are designated in support equipment and analytical method SOPs. This equipment is labeled with calibration or verification dates.
- 6.4.9 Equipment that has been subjected to overloading or mishandling, gives questionable results, or has been shown to be defective or outside specified requirements, is taken out of service. It shall be recalibrated and not returned to service until it has been verified to perform correctly. The laboratory shall examine the effect of the defect or deviation from specified requirements and shall initiate the nonconformance process as outlined in *Nonconformance and Corrective Action Procedures* (ADM-NCAR).
- 6.4.10 Support equipment is verified on the day of use and calibration verification is required on analytical instruments as per method, program and SOP requirements.
- 6.4.11 All reference materials ordered by ALS have available documentation of purity, traceability and uncertainty.
- 6.4.12 Passing verification criteria ensures that unintended adjustment of equipment is identified.
- 6.4.13 Records of instruments are retained and include specifications, manufacturer, serial numbers, identification, software version, location, status and the date of purchase. The majority of firmware has no impact on laboratory activities. There are some instruments in which the firmware is the software and can affect the laboratory operations. These instruments are usually small like pH meters, conductivity meters and auto-titrators. If an instrument does not have typical software to load and firmware is used to generate results, then the firmware version must be entered in the instruments record log and any updates to the firmware will be noted in the instrument maintenance log.
- 6.4.14 Records of calibration, maintenance, reference materials used, calibration checks or verifications are kept with analytical data.

## 6.5 Metrological Traceability

6.5.1 All measurements made by the laboratory required an unbroken chain to NMI, Reference Standards or Reference Materials.

6.5.2 Reference Standards and Reference Materials

a) Reference Standards

Reference standards used by the laboratory are calibrated at determined intervals by outside vendors for the following equipment. These reference standards are maintained under the control of QA personnel and are used for verifying intermediate materials used by the laboratory. Quality Assurance is responsible for maintaining records and schedules of calibration.

Intermediate checks are used in the laboratory to verify performance of support equipment and are verified to traceable reference standards. Records of such verifications are retained by Quality Assurance. See SOP *Documenting Laboratory Balance and Check Weight Verification*. (ADM-BAL).

b) Reference Materials

Reference materials used at ALS must be of the grade or quality specified by the pertinent analytical procedure or methodology.

	STANDARD OPERATING PROCEDURE	Quality Assurance Manual
	ALS   Environmental - Kelso	ALKLS-QAM, Rev. 28.0
		Effective: 10/21/2020
		Page 16 of 81

Purchased reference materials must be traceable to a National Metrology Institute (NMI) or equivalent national or international standards where possible.

#### 6.5.3 Reference Standards are calibrated by vendors certified to ISO 17025: 2017.

Reference Materials are purchased, whenever possible. ALS uses reference materials from Guide 34 or ISO 17034 accredited vendors.

Second source reference materials are purchased and used in the testing process as an independent verification of primary reference materials. The secondary reference material does not require accredited vendors.

- a) The reference standards used are those specified in the reagent sections of the respective analytical SOP.
- b) If reference materials from Guide 34 or ISO 17034 accredited vendors are not available, reference standards of the best purity and quality from a reputable supplier may be used. Determination is made by the laboratory with careful study and consideration of the chemically pure substances available.
- c) All purchased reference standards are received and verified for accuracy against the invoice. They are transferred to the appropriate department where they are entered into the standards logbooks which may be either hardcopy or electronic.
- d) Certificates of Analysis are either maintained by the ordering department. The CoA may be archived either in hardcopy, or preferably electronically.
- e) All purchased reference standards are received and verified for accuracy against what was ordered. The standards are entered into the inventory control system. The certificate of Analysis is saved by the department in either electronic or hardcopy format.
- f) Any standard reference material which is past its expiration date is removed from analytical use. Expired standards may be used for research purposes only and must be kept separate from standards used for the routine analysis of samples.

#### 6.5.4 Reagents

The quality level of reagents and materials (grade, traceability, etc.) required is specified in analytical SOPs. Department supervisors ensure that the proper materials are purchased. Inspection and verification of material ordered is performed at the time of receipt by receiving personnel. The receiving staff labels the material with the date received. Expiration dates are assigned as appropriate for the material. Storage conditions and expiration dates are specified in the analytical SOP. *Quality of Reagents and Standards* (ADM-REAG) and *Reagent and Standards Login and Tracking* (ADM-RLT) provides default expiration requirements. Supplies and services that are critical in maintaining the quality of laboratory testing are procured from pre-approved vendors. The policy and procedure for purchasing and procurement are described in *SOP Procurement and Control of Laboratory Services and Supplies* (ADM-PROC).

Receipt procedures include technical review of the purchase order/request to verify that what was received is identical to the item ordered. Verification that the chemical or reagent purchased is of the correct purity and traceability is performed by comparison of the acquired reagent to reagent listed in the *SOP Reagent and Standards Login and Tracking* (ADM-RLT).

	STANDARD OPERATING PROCEDURE	Quality Assurance Manual
	ALS   Environmental - Kelso	ALKLS-QAM, Rev. 28.0
		Effective: 10/21/2020
		Page 17 of 81

Each lot of chemical or reagent used is monitored and controlled for any unusual contaminants that interfere with analysis as evident in results of prescreens and/or method and reagent blanks. If a working reagent is found to be suspect, it is removed from use and traced back to the original lot number, which is then investigated. If the stock reagent is found to be the source of the problem, it is completely removed from use. Any samples contained in batches in which the suspect reagent was used for analysis will be reanalyzed if sufficient remaining sample and holding time allows, or clients will be contacted and results appropriately qualified with a sample or analyte level comment on the final report. See SOP *Reagent and Standards Login and Tracking* (ADM-RLT) for procedure to verify targeted critical reagents.

## 6.6 Externally Provided Products and Services

6.6.1 Analytical services are subcontracted when the laboratory needs to balance workload or when the requested analyses are not performed by the laboratory. Subcontracting is only done with the knowledge and approval of the client and to qualified laboratories. Subcontracting to another ALS Environmental Group laboratory is preferred over external-laboratory subcontracting. Further, subcontracting is done using capable and qualified laboratories. Established procedures are used to qualify external subcontract laboratories. These procedures are described in SOP *Qualification of Subcontract Laboratories and Internal Subcontracting Protocol* (ADM-SUBCONT).

- a) ALS advises its customers in each proposal of its intention to subcontract any portion of the testing to a third party, or non-ALS laboratory. If it is necessary to subcontract work to a non-ALS laboratory as a result of unforeseen circumstances, customers will be contacted by their project manager to gain their permission. This approval is documented by the Project Manager.
- b) Any subcontracted analysis is noted as such on ALS's final report with an identification of the appropriate subcontractor. The original subcontractor analysis report, or a true duplicate thereof, is also attached to the associated ALS laboratory report.

*Procurement and Control of Laboratory Services and Supplies* (ADM-PROC) outlines the process, evaluation, criteria and records maintained from the evaluation and reevaluation of supplies and services. Corporate personnel are responsible for vendor approval and evaluation. Records are maintained by the corporate purchasing office.

Processes are designed to ensure that materials and services purchased meet the quality specifications of ALS. Procurement and receiving services are provided at ALS by administrative personnel. Procurement and receiving quality requirements established by ALS are followed. All requisitions for purchase are approved by ALS operations management and specify 1) the level of service required or 2) the quality/specifications of material required. The receipt of materials not meeting specification in the purchase requisition require investigation.

## 7. Process Requirements

### Review of Requests Tenders and Contracts

Project Managers are responsible for maintaining, archiving, and retrieving all contracts, project requirements and QAPPs provided to ALS by clients and related to projects completed by ALS. They are also responsible for the destruction of

	STANDARD OPERATING PROCEDURE	Quality Assurance Manual
	ALS   Environmental - Kelso	ALKLS-QAM, Rev. 28.0
		Effective: 10/21/2020
		Page 18 of 81

materials provided on unsuccessful proposals and bidding opportunities. Specific procedures for client communication and required documentation are listed in the SOP *Project Management* (ADM-PCM).

### Selection, Verification, and Validation of Methods

Reference methods for environmental samples are drawn primarily from the current version of Test Methods for Evaluating Solid Waste Physical/Chemical Methods (SW-846), Third Edition. Reference methods for water analysis are taken from Methods for Chemical Analysis of Water and Wastes, EPA-600/4-79-020, March, 1983 with its updates, and from 40 CFR, Part 136. Methods referenced in ALS SOPs also come from ASTM guides, and from Standard Methods for the Examination of Water and Waste Water.

Reference Methods for microbiology are from Standard Methods for the Examination of Water and Wastewater.

SOPs are written for all environmental testing methods, any modified reference methods for industrial hygiene testing and any in-house developed methods. SOPs may be copies of reference methods that are not modified. All SOPs are reviewed using document control procedure. See SOP *Establishing Standard Operating Procedures* (ADM-SOP).

All analytical methods and preparatory method combinations are routinely tracked and ALS maintains statistical control limits and reporting limits. The laboratory can perform using limits provided by clients or from referenced sources in the absence of historical data. The SOP *Trending, Control Charts, and Uncertainty* (ADM-TREND) describes how control limits are established and updated.

ALS policy is that all SOPs be compliant with the reference method. In the event that several methods are referenced in an SOP, all procedures must be compliant with all referenced methods. All SOPs include a section describing changes and clarifications from the reference method. In the event that an analytical method is modified, the SOP documentation must include a description of the modification, any justification of the method modification which includes, but is not limited to, method performance and recovery data, any other supporting data, and approval from the Technical Managers, Quality Assurance Manager, and Laboratory Director. In the event that an analytical method must be modified or is modified to perform on specific sample matrices, the modification and reason must be stated in the case narrative. All modified methods will be identified on the analytical report.

The policy of ALS is to apply analytical methods that have been approved, validated, and published by government agencies, professional societies and organizations, respected private entities, and other recognized authorities. These methods have been validated for their intended use and ALS uses the demonstration of competency procedures, calibration of instruments and LOD/LOQ procedures to verify laboratory capability.

Published methods may be modified as a result of the request of the client or operational conditions prevailing in the laboratory. Operational conditions might relate to, for example, the availability of equipment or the performance of the method as determined by calibration processes, detection limits, or the results obtained for quality control samples.

Validation procedures describe three different classifications of validations for method modification. New methods, permanent modifications to a published method which will be used in subsequent laboratory determinations, and temporary

	STANDARD OPERATING PROCEDURE	Quality Assurance Manual
	ALS   Environmental - Kelso	ALKLS-QAM, Rev. 28.0
		Effective: 10/21/2020
		Page 19 of 81

modifications applied only to immediate analytical projects. These methods are used with approval from the clients.

The essential quality control elements for modification and validation include:

Calibration - The number of levels and acceptance criteria must meet or exceed requirements of ALS analytical SOPs. Additional criteria for organic chromatography methods are included in *Calibration of Instruments for Organic Chromatographic analyses* (SOC-CAL).

QC Samples - QC samples prepared in the specific matrix, are assessed. If possible the recoveries are compared to method or historical control limits used for the reference method.

Sensitivity - Method Detection and Reporting Limit, Method Detection Limit is the lowest analyte concentration that produces a response detectable above the noise level of the system and Reporting Limit is the lowest level at which the analyte can be accurately and precisely measured. Method Detection Limits, if required, are generated. A reporting limit verification is accomplished using SOP *Performing and Documenting Method Detection Limit Studies and Establishing Limits of Detection and Quantitation* (ADM-MDL/CE-QA011).

If validation reports are required to validate methods, these reports must address the following elements and follow established testing industry protocols:

Calibration - a demonstration of a concentration range where the analyte response is proportional to concentration.

Sensitivity - Method Detection Limit is the lowest analyte concentration that produces a response detectable above the noise level of the system and Reporting Limit is the lowest level at which the analyte can be accurately and precisely measured.

Selectivity - the ability of the method to accurately measure the analyte response in the presence of all potential sample components.

Precision and Bias - Precision - the type of variability that can be expected among test results. Bias - systematic error that contributes to the difference between the mean of a large number of test results and an accepted reference value.

Robustness - the ability of the procedure to remain unaffected by small changes in parameters or matrix.

## 7.1 Sampling

In order to produce meaningful analytical data, ALS must have samples that are representative of the system from which they were taken. If the representation and integrity of the samples received in the laboratory cannot be verified due to inadequate sampling procedures, the usefulness of the analytical data produced for these samples is limited. The laboratory cannot accept responsibility for improper sampling of client-procured samples and will document the condition of the samples and analyze them as received. If an incorrect sampling procedure is suspected, the client will be notified as soon as possible by the Project Manager. ALS will postpone testing, if the holding time will not be exceeded, pending client response. Sampling instructions and acceptance criteria are made available to clients.

Where sampling, as in obtaining sample aliquots from a submitted sample, is carried out as part of the test method, the laboratory uses documented procedures as outlined in SOP *Subsampling and Compositing of Samples* (SOILPREP-ALIQUOT) to obtain a representative sub sample.

	STANDARD OPERATING PROCEDURE	Quality Assurance Manual
	ALS   Environmental - Kelso	ALKLS-QAM, Rev. 28.0
		Effective: 10/21/2020
		Page 20 of 81

## 7.2 Handling of Test or Calibration Items

Procedures for receiving, processing, and storing samples and for ensuring continuity of the chain-of-custody are detailed in the following SOPs: *Sample Receiving* (SMO-GEN) and *Sample Tracking and Internal Chain of Custody* (SMO-SCOC).

The ALS Sample Receiving area is isolated from areas of the laboratory where analyses are performed. The area is equipped with ventilation hoods and adequate bench space to ensure that the sample receiving process is safe, efficient, and not a source of cross-contamination in the laboratory.

### Sample Tracking

Sample handling in the laboratory is tracked using a computer-based Laboratory Information Management System or through the signatures on the hand-carried chain of custody documents. After samples are received by the laboratory, as described above, sample receiving personnel enter the sample information into the LIMS. See *Sample Receiving* (SMO-GEN) and *Sample Tracking and Internal Chain of custody* (SMO-SCOC).

When multiple analyses require splitting a sample, the custody documents are copied such that each split can be independently traced to its origin and appropriate entries can be entered into LIMS.

### Sample Storage and Security

Following receipt, samples are stored in accordance with analytical method requirements for storage and preservation. Water samples for organic and inorganic analysis are stored in trays and placed in refrigerators in the designated analysis laboratory. Soil samples will be forwarded to the SoilPrep group for Aliquoting. Samples to be analyzed for volatile testing are stored separately from all other samples in a refrigerator. See *Sample Receiving* (SMO-GEN) and *Sample Tracking and Internal Chain of custody* (SMO-SCOC).

To maintain facility security and thus sample security, entrance to the ALS facility can be attained only through security access, except at the main business entrance and sample receiving entrance; these are open only during normal business hours and monitored by administrative personnel at the business entrance and Sample Receipt Technicians at the sample receiving entrance. All non-employees, other than those delivering samples, are required to sign in at the main entrance.

### Chain-of-Custody

In order to ensure that legally defensible data are produced at ALS, chain-of-custody procedures are established and are described in SOP *Sample Tracking and Internal Chain of Custody* (SMO-SCOC).

## 7.3 Technical Records

ALS maintains records on the most part electronically and in accordance with SOP *Records Management* (ADM-RCRDS). ALS personnel are responsible for the retention, retrieval, and disposition of final records of laboratory data and activities. This includes: data packages, analyst laboratory notebooks, instrument maintenance logs, and training records, as established by procedure.

Data Packages - All documentation which pertains to the analysis of a sample or group of samples that are being reported together must be compiled as a data package. The SOP *Report Generation* (ADM-RG) address the preparation and control of data packages.

	STANDARD OPERATING PROCEDURE	Quality Assurance Manual
	ALS   Environmental - Kelso	ALKLS-QAM, Rev. 28.0
		Effective: 10/21/2020
		Page 21 of 81

Electronic records or scans of records that relate to the analysis of field samples are compiled into folders on network drives for storage. These data packages are generally stored electronically as per SOP *Records Management* (ADM-RCRDS). Unless specified by contract, applicable statute, or program, data packages are retained for ten years.

Laboratory Notebooks and Logbooks - Laboratory notebooks and logbooks are retained by ALS for ten years and are not released to clients. Laboratory notebooks are assigned to specific analysts or areas. If corrections are made it requires a single-line cross-out, initials and date are entered. In some instances the reason for the change should be documented.

Quality Assurance Records - Quality control sample results data are retained in LIMS. Records of internal audits, nonconformance reports, and corrective action reports are retained and stored electronically for an indefinite period on networked drives.

The Quality Assurance Manager is responsible for maintaining and retrieving all records of audits, proficiency testing results, demonstration of competency, nonconformance and corrective action records and reports. Some of these records can be internally accessed by employees on network drives.

Client-Related Information - Project Managers are responsible for maintaining, archiving, and retrieving all contracts, project requirements and QAPPs provided to ALS by clients and related to projects completed by ALS. They are also responsible for the destruction of materials provided on unsuccessful proposals and bidding opportunities. Specific procedures for client communication and required documentation are listed in the SOP *Project Management* (ADM-PCM).

ALS ensures that amendments to technical records are tracked to previous versions or to original observations. Both the original and amended data and files are retained, including the date of alteration, an indication of the altered aspects and the personnel responsible for the alterations.

#### 7.4 Evaluation of Measurement Uncertainty

Uncertainty is associated with most of the results obtained in the laboratory testing conducted by ALS. It is meaningful to estimate the extent of the uncertainty associated with each result generated by the laboratory. It is also useful to recognize that this measurement of uncertainty is likely to be much less than that associated with sample collection activities.

In practice, the uncertainty of a result may arise from many possible sources. ALS has considered the relative contribution of major sources of error. The approach to estimating uncertainty adopted by the laboratory resulted in the conclusion that many sources of error are insignificant compared to the processes of sample preparation, calibration, and instrumental measurement. The uncertainty associated with the processes can be estimated from quality control data. Accordingly, ALS estimates uncertainty from data derived from quality control samples carried through the entire analytical process. A description of the uncertainty calculation is presented in SOP *Trending, Control Charts, and Uncertainty* (ADM-TREND). The estimation of uncertainty applied by ALS relates only to measurements conducted in the laboratory. Uncertainty associated with processes conducted external to the laboratory (e.g., sampling activities) are not considered.

Calculation of uncertainty may use the precision measurement values for duplicate samples when LCS or QC samples are not used in testing.

The calculation of uncertainty is not required for qualitative tests. The process is assessed for contributors to uncertainty but the calculation of uncertainty has limited value when empirical values are not available.

		Page 22 of 81

## 7.5 Ensuring the Validity of Results

Before samples are analyzed, the analytical system must be in a controlled, reproducible state from which results of known and acceptable quality can be obtained. That state is verified through the use of Quality Control (QC) procedures intended to ensure accuracy, precision, selectivity, sensitivity, freedom from interference, and freedom from contamination. The QC procedures performed at ALS include: calibration and calibration verification; analysis and comparison of resultant data to predetermined control limits for method blanks, laboratory control samples, spiked matrix samples, duplicate matrix samples, and surrogates added to samples; analysis of performance evaluation samples; determination of Reporting Limits; and the tracking and evaluation of precision and accuracy. For specific analytical methods, other QC procedures are implemented as required by the method.

These QC procedures are performed and evaluated on a batch basis. A preparation batch must not exceed 20 field samples that are of a similar matrix type without additional method QC in the batch, unless specified differently in an SOP or reference method. The samples in a batch are processed together, through each step of the preparation and analysis, to ensure that all samples receive consistent and equal treatment. Consequently, results from the batch QC samples, not including field sample QC, are used to evaluate the results for all samples in the batch.

In general terms, instrument calibration, method quality control, and data evaluation is described in analytical SOPs.

All QC parameters set by the applicable ALS SOP or method reference shall not be exceeded without initiation of a NCAR. See *SOP Nonconformance and Corrective Action Procedures* (ADM-NCAR).

The hierarchy of quality control requirements begins with:

- Client Requirements (if specified and documented).
- Method and/or SOP requirements.
- Guidance from QAM and other general SOPs.

### Calibration and Calibration Verification

Instrument calibration is a QC measure taken to verify selectivity and sensitivity. Calibration of instruments at ALS is accomplished through the use of reference materials of the highest quality obtainable. ISO or National Metrology Institute (NMI) traceable reference materials are procured and used if they are available. When ISO or National Metrology Institute (NMI) traceable reference materials are not available, certified reference materials from government agencies or reliable vendors are used. In all cases, written records are maintained that allow all analytical results to be traced unambiguously to the reference materials used for calibration.

In general, analytical instruments are initially calibrated with standard solutions made from the reference materials at levels appropriate for the analysis. This is called the initial calibration (IC). This calibration is verified with a standard solution independently prepared from a different lot of the reference material, preferably from a different vendor. This step is called initial calibration verification or ICV. At specified intervals throughout the analytical sequence, the calibration is re-verified again through the analysis of a calibration check solution, usually the mid-point standard solution. This process is called the continuing calibration verification or CCV. If the IC, the ICV, or any CCV fails criteria in the analytical method, the system is recalibrated or the results are narrated. It is ALS' intention to only report results generated under

	STANDARD OPERATING PROCEDURE	Quality Assurance Manual
	ALS   Environmental - Kelso	ALKLS-QAM, Rev. 28.0
		Effective: 10/21/2020
		Page 23 of 81

acceptable calibration conditions. Specific calibration procedures are found in the SOPs associated with each method of analysis.

Alternative calibration sequences or procedures will be discussed with clients.

Calibration parameters set by the applicable SOP or method reference shall not be exceeded without initiation of a NCAR.

### Analysis of Method Blanks

The method blank (or preparation blank) contains no sample material; it is treated as a sample in every other way. It is analyzed to monitor any contamination to which the analytical batch might have been exposed during preparation and analysis. A method blank is analyzed with every analytical batch. Criteria set by the applicable ALS SOP or method reference shall not be exceeded without initiation of a NCAR.

### Analysis of Laboratory Control Samples and QC Samples

A control sample (LCS or QC) contains the analyte(s) of interest in known concentration(s) in a laboratory matrix; it is used to monitor accuracy. It measures the success of the analysis in recovering the analyte(s) of interest from a QC matrix. Soil samples and other solid matrices are analyzed with an LCS made of clean sand or appropriate substrate spiked with the analyte(s) of interest. Water samples and other liquid matrices are analyzed with a method blank spiked with the analyte(s) of interest.

The results of the LCS are reported as percent recovery:

$$\% \text{ Recovery} = \frac{X}{K} \times 100$$

Where: X = Measured value

K = Expected value

LCS/QC criteria set by the applicable ALS SOP or method reference shall not be exceeded without initiation of a NCAR.

### Analysis of Spiked Matrix Samples

Matrix QC samples are generally used to determine acceptability of methods chosen on a field sample and are therefore not used to determine batch acceptability. If the analysis of matrix spike is not possible, as with industrial hygiene, dietary supplements or other samples of limited matrix amount, a duplicate LCS or QC should be analyzed in the batch.

A known concentration of the analyte(s) of interest is added to a second representative portion of a field sample to prepare a matrix spike. The matrix spike is used to determine acceptability of the method chosen on a specific field matrix. It measures the success of the analysis in recovering the analyte(s) of interest from the type of field sample matrix in the batch. A matrix spike is analyzed with every analytical batch of environmental samples. The results are reported as percent recovery.

$$\% \text{ Recovery} = \frac{(X_S - X_U)}{K} \times 100$$

Where: X<sub>s</sub> = Measured value in the spiked sample

X<sub>u</sub> = Measured value in the unspiked sample

K = Expected value

STANDARD OPERATING PROCEDURE ALS   Environmental - Kelso	Quality Assurance Manual
	ALKLS-QAM, Rev. 28.0
	Effective: 10/21/2020
	Page 24 of 81

Laboratory criteria will be used in the absence of client-specified criteria. Failure to meet these criteria will be noted as per client instructions.

### Analysis of Duplicate Matrix Samples

Matrix QC samples are generally used to determine acceptability of methods chosen on a field sample and are therefore not used to determine batch acceptability. If the analysis of matrix spike is not possible, as with industrial hygiene, dietary supplements or other samples of limited sample amount, a duplicate LCS or QC should be analyzed in the batch.

A duplicate matrix spike sample or duplicate matrix sample is used to monitor the precision (repeatability) of the method chosen on a field sample. If a sufficient amount of the analyte(s) of interest is present in the field sample, a matrix duplicate sample is analyzed directly. If the analyte(s) of interest are not present in a sufficient amount, two additional portions of field sample are spiked with the analyte(s) of interest to ensure that meaningful results are obtained. A pair of duplicate samples (matrix/matrix duplicate or matrix spike/matrix spike duplicate) is analyzed with every analytical batch of environmental samples. The results of the analysis of duplicate samples are reported as relative percent difference (RPD).

$$RPD = \frac{|X_1 - X_2|}{[(X_1 + X_2)/2]} \times 100$$

Where:  $|X_1 - X_2|$  = The absolute value of the difference between the two sample values  
 $[(X_1 + X_2)/2]$  = The average of the two sample values

Laboratory criteria will be used in the absence of client-specified criteria. Failure to meet these criteria will be noted as per the analytical SOP instructions, or as per client instructions for project specific requirements.

### Analysis of Surrogates Added to Samples

Surrogates are compounds similar to the analyte(s) of interest but that are known not to be present in the environment. Examples are fluorinated or deuterated homologues of the organic analyte(s) of interest. When appropriate compounds are available, their use is specified in the analytical method SOP. When surrogates are used, they are added to the calibration solutions and to each field and QC sample in the batch. Surrogate recovery is a measure of the accuracy and selectivity of the method in the sample matrix. Surrogate results are reported as percent recovery.

$$\% \text{ Recovery} = \frac{X}{K} \times 100$$

Where: X = Measured value  
K = Expected value

Surrogate criteria set by the applicable SOP or method reference on method QC samples shall not be exceeded without initiation of a NCAR.

The same criteria will be used for field samples although failure to meet these criteria will be noted in report, narrative comments, or as per client requirements.

### Reporting Limit Verification Sample(s) (RLVS)

	STANDARD OPERATING PROCEDURE	Quality Assurance Manual
	ALS   Environmental - Kelso	ALKLS-QAM, Rev. 28.0
		Effective: 10/21/2020
		Page 25 of 81

An RLVS is a control sample that contains the analyte(s) of interest at or below the stated reporting limit(s) in an applicable QC matrix; it is used to monitor sensitivity and assess uncertainty at the reporting limit. These samples are not used for batch acceptance and should be recovered at  $\geq \frac{1}{2}$  the stated reporting limit. The analyst shall raise the reporting limit if systematic failures are apparent.

- An RLVS is required for every sample batch for environmental and industrial hygiene testing.
- Reporting limits must be at or above the lowest calibration standard.

### Analysis of Performance Evaluation Samples (PT)

Proficiency testing (PT) samples are prepared by an authorized independent organization outside the laboratory. They are received and analyzed at regular intervals to monitor laboratory accuracy. ALS Laboratories sends the PT sample results to the independent organization, where they are evaluated and then forwarded directly from that organization to accreditation bodies as needed. PT samples are introduced into the regular sample stream of the laboratory and analyzed as routine samples by analysts who regularly perform the method. Laboratory personnel follow all instructions provided by the PT provider.

The Laboratory Director, Technical Managers or the Quality Assurance Manager can institute the analysis of additional PT samples or modify the performance evaluation program as appropriate.

The following guidelines are followed by ALS:

- Averaging results is prohibited.
- Only qualified ALS laboratory employees analyze PT samples.
- Results are not discussed with outside entities or other ALS laboratories prior to the deadline for receipt of the results.
- ALS does not subcontract to other laboratories or receive from other laboratories any PT samples.

When a PT sample result is scored as “Not Acceptable”, an NCAR is issued by the QA Manager, as per ADM-NCAR, to initiate corrective action to determine and correct any problem(s) leading to the unacceptable result.

Participation in Proficiency Testing programs provides the laboratory with evidence of correlation of results with other laboratories and national standards. A four year proficiency testing schedule is maintained by the QA Manager as required by the DoD QSM.

When no commercial Proficiency Testing (PT) sample is available for an analyte that is routinely reported by ALS to a client, the QA Department will use demonstration of capabilities (DOCs) to monitor and evaluate the precision and accuracy of the analytical procedure against defined acceptance criteria documented in the Standard Operating Procedure.

### Tracking and Evaluation of Accuracy and Precision

When evaluating batch QC the analyst makes a sequence of decisions before reporting sample results regarding calibration, the method blank, LCS, surrogate recovery, matrix spike, and matrix spike duplicate recovery results.

Assessment of the accuracy of an analytical measurement is based upon the analysis of samples of known composition. ALS relies upon the analysis of LCS/QC samples to

	STANDARD OPERATING PROCEDURE	Quality Assurance Manual
	ALS   Environmental - Kelso	ALKLS-QAM, Rev. 28.0
		Effective: 10/21/2020
		Page 26 of 81

track accuracy. The percent recovery relative to the expected value is calculated and can be plotted.

Assessment of the precision (repeatability) of an analytical measurement is based upon repeated analysis of equivalent samples of known or unknown composition. ALS relies upon the analysis of pairs of LCS/QC samples, duplicate samples, or spiked matrix samples (MS/MSD) to assess precision. The range of the pair is expressed as a relative percent difference (RPD).

Control limits for the accuracy and precision of each method are included in the analytical SOPs, and are based on set limits as indicated by the client (project specific), in the reference method or program, or as calculated using in-house data. Control limits for accuracy and precision charts are calculated assuming a normal (Gaussian) distribution of results. Historical data points are used to calculate mean values, two-standard deviation warning limits, and three-standard deviation control limits. The establishment and updating of control limits is described in *SOP Trending, Control Charts, and Uncertainty (ADM-TREND)*.

### Trending

In addition to evaluating individual batch QC results against control limits, QC results from successive batches are also evaluated for possible trends. While a trend is not necessarily an out-of-control situation in itself, it can provide an early warning of a condition that can cause the system to go out of control. *SOP Trending, Control Charts, and Uncertainty (ADM-TREND)* describes in detail the assessment of QC data in the laboratory. The following conditions are trends that may initiate action and/or monitoring.

- A series of successive points on the same side of the mean.
- A series of successive points going in the same direction.
- Two successive points between warning limits and control limits.

ALS relies on analytical staff to identify trends in analytical systems. Quality Assurance can produce control charts as needed to assess trends but this activity by QA is not preventive and is only used to verify trends exist. The occurrence of a trend does not invalidate data that are otherwise in control. However, trends do require attention to determine whether a cause can be assigned to the trend so that appropriate preventive action can be undertaken.

Long term trends in control limits are evaluated quarterly and annually by quality assurance and technical operations. See *SOP Trending, Control Charts, and Uncertainty (ADM-TREND)*.

## 7.6 Reporting of Results

ALS relies upon a system of peer review to ensure the quality of analytical reports. Peer review procedures are specified in the *SOP Laboratory Data Review Process (ADM-DREV)*. An analyst, familiar with the analytical method used to produce the results (peer reviewer), reviews each report. The peer reviewer verifies that the calibration standards, type of calibration, and sample set with associated QC samples were selected correctly. The peer reviewer also verifies any manual transcriptions and calculations. The applicable Technical Manager can perform additional technical review.

Project Managers perform an initial review of results for large projects to verify that data reports submitted to the client meet all project and client requirements.

	STANDARD OPERATING PROCEDURE	Quality Assurance Manual
	ALS   Environmental - Kelso	ALKLS-QAM, Rev. 28.0
		Effective: 10/21/2020
		Page 27 of 81

When the peer review has been completed, a final report is generated. In most situations the report is produced from LIMS. In some cases part or all of the report can be produced from the data system of the analytical instrument. The reports produced by ALS meet the following requirements:

- The report identifies the method used. If the method is modified, it is noted as “modified” in the report.
- Any abnormal sample conditions, deviation from hold time, irregularities in preservation or other situations that might affect the analytical results are noted in the report and associated with the analytical results.

The contents of the report include:

- The report title with the name, address, and telephone number of the laboratory.
- The name of the client or project and the client identification number.
- Sample description and laboratory identification number.
- The dates of sample collection, sample receipt, sample preparation, and analysis.
- The time of sample preparation and/or analysis if the required hold time for either activity is 48 hours or less.
- A method identifier for each method, including methods for preparation steps.
- The MDL or minimum reporting limit for the analytical results.
- The analytical results with qualifiers as required.
- A description of any quality control failures and deviations from the accepted method.
- The name (electronic signature) and title of the individual(s) who accept responsibility for the content of the report.
- The date the report is issued.
- Clear identification of any results generated by a subcontract laboratory.
- Page numbers and total number of pages.
- Electronic Data Deliverables (EDDs) can be developed and generated per client or agency specific specifications, and may contain a subset of components included on the final report. See SOP Report Generation (ADM-RG).

ALS does not evaluate or interpret results.

ALS does not perform calibration services.

Sampling activities are not performed by ALS.

The laboratory reports results based on the sample provided by the customer. If ALS reports to a specification it is only for the sample results and not involved with decision rules applied to the sampling site.

ALS does not make any statements concerning opinions and interpretation of results.

	STANDARD OPERATING PROCEDURE	Quality Assurance Manual
	ALS   Environmental - Kelso	ALKLS-QAM, Rev. 28.0
		Effective: 10/21/2020
		Page 28 of 81

Amended reports of analytical results are issued to correct errors. Amended reports require the following items:

Amendments to analytical reports will only be made in supplemental documents and shall contain identification similar to “Amended”.

Include the date amended or released to the client.

Amended reports shall meet all reporting and client requirements.

Amended Reports are stored with the original report, are uniquely identified, and make reference to original reports.

A peer review process is used to ensure amended results are accurate.

Any information changed in the report must have the reason for the change documented in the report.

### 7.7 Complaints

ALS has a documented process for how complaints are received and evaluated. Nonconformance or corrective actions are generated to ensure decisions and outcomes are monitored and communicated. These outcomes are reviewed by the Quality Assurance department. The SOP on handling complaints is *SOP Handling Customer Feedback* (ADM-FDBK).

### 7.8 Nonconforming Work

The ALS SOP for handling nonconformance is *SOP Nonconformance and Corrective Action Procedures* (ADM-NCAR).

This laboratory procedure shall be implemented when any aspect of its laboratory activities or results of this work do not conform to its own procedures or the agreed requirements of the customer. The procedure ensures that:

- The responsibilities and authorities for the management of nonconforming work are defined;
- Actions (including halting or repeating of work and withholding of reports, as necessary) are based upon the risk levels established by the laboratory.
- Any employee may stop work when a task cannot be performed safely or the quality of data is determined to be or could be negatively affected. Metrics utilized for work stoppage may include but are not limited to exceeding instrument or sample control limits, QC trending, instrument problems, etc. The appropriate manager shall be consulted for any work stoppage;
- An evaluation is made of the significance of the nonconforming work, including an impact analysis on previous results;
- A decision is taken on the acceptability of the nonconforming work;
- Where necessary, the customer is notified and work is recalled;
- The responsibility for authorizing the resumption of work is defined.

The laboratory retains records on all nonconformance.

Quality Assurance Manager or designee reviews all nonconformance for completeness and adds comments as necessary on the acceptance. If this evaluation determines the problem has or can reoccur or it is against the laboratories own policies or procedures the event requires a corrective action as described in section 8.7.

	STANDARD OPERATING PROCEDURE	Quality Assurance Manual
	ALS   Environmental - Kelso	ALKLS-QAM, Rev. 28.0
		Effective: 10/21/2020
		Page 29 of 81

## 7.9 Control of Data and Information Management

The laboratory has access to all data and information through the internet, intranet, network locations and hard copy.

7.9.1 All of the software used for data reduction, verification, and reporting is documented and validated by the ALS computer support staff or by the vendor from whom it is purchased. ALS software is controlled and secured according to SOP *Software Quality Assurance and Data Security* (ADM-SWQADATA). A continuing effort is made at ALS to increase the use of automated data handling, improve efficiency, and minimize human error.

Software errors are treated as a nonconformance under section 7.10 or as a corrective action under 8.7.

7.9.2 Access to ALS networks are controlled through passwords and windows security. Network drives are backed up and disaster planning is evident.

7.9.3 ALS uses offsite locations from the laboratory but internal to ALS for data storage and is managed in accordance with these procedures.

7.9.4 Access to network locations is managed with windows security and roles throughout the system.

7.9.5 Calculations and data transfers are checked using the peer review process and through documentation of computer programs by the IT staff.

## 8. Management System Requirements

### 8.1 Options

8.1.1 The laboratory has implemented **Option A** from the ISO/IEC 17025:2017 standard as a management system. The following sections 8.2 through 8.9 address the required elements of Option A. This manual addresses management systems and demonstrates compliance with this document.

### 8.2 Management System Documentation

8.2.1 This manual describes the policies and objectives of the ALS management system. The laboratory procedures describe the details on how objectives are accomplished.

8.2.2 Policies and objectives of the management system address how competence is demonstrated and assessed, how testing is objectively reviewed and how consistent operations are accomplished. These are addressed in various procedures that define the processes used.

8.2.3 Evidence of commitment is the review of the manual annually and the records of reading by all employees. Additionally, employees are assigned pertinent procedures as needed to ensure objectivity and consistency.

8.2.4 The policies are supported in this management system with references to the procedures as appropriate.

8.2.5 All employees have access to the Quality Assurance Manual and the supporting procedures.

### 8.3 Control of Management System Documents

8.3.1 SOPs and the QAM are maintained under document control procedures described in SOP *Document Control* (ADM-DOC\_CTRL). External documents, such as reference methods, accreditation policies and requirements, and reference

manuals are maintained under document control policies through the use of hardcopy and network drives. Additionally, quality assurance program documents, project plan documents, and contractual Statement of Work documents generated by a client can be designated as controlled documents at the discretion of the ALS Project Manager, Quality Assurance Manager, or the Laboratory Director.

- 8.3.2 Revisions are made to uniquely identified internal documents in accordance with SOP *Document Control* (ADM-DOC\_CTRL) and the following table. Assignments are made to the responsible ALS manager or designee to review and update SOPs applicable to the area of responsibility. At times it is also necessary to obtain approval by specific clients before written SOPs can be modified. After revision, the appropriate Manager, Quality Assurance Manager, and Laboratory Director must approve the updated SOP. Updated SOPs are then distributed on-line by the Kelso network. All obsolete copies are removed from access and stored for historical purposes.

SOP Type	Review Cycle
Environmental Testing SOPs (DoD)	12 Months
Environmental Testing SOPs (TNI ONLY)	24 Months
Management Systems SOPs	36 Months
All other SOPs	24 Months

#### 8.4 Control of Records

- 8.4.1 ALS maintains records on the most part electronically and in accordance with SOP *Records Management* (ADM-RCRDS). ALS personnel are responsible for retention, retrieval, and disposition of final records of laboratory data and activities. This includes: data packages, laboratory notebooks, instrument maintenance logs, and training records.

#### 8.5 Data Packages

- 8.5.1 All documentation which pertains to the analysis of a sample or group of samples that are being reported together must be compiled as a data package.
- 8.5.2 Electronic records or scans of records that relate to the analysis of field samples are compiled into folders on network drives for storage. These data packages are stored electronically as per SOP *Records Management* (ADM-RCRDS). Unless specified by contract, applicable statute, or program, data packages are retained for ten years.
- 8.5.3 Laboratory Notebooks and Logbooks
- Laboratory notebooks and logbooks are retained by ALS for twelve years and are not released to clients. Laboratory notebooks are assigned to specific analysts, who are responsible for their maintenance. If corrections are required, a single-line cross-out, initials and date are entered.

#### 8.6 Quality Assurance Records

	STANDARD OPERATING PROCEDURE	Quality Assurance Manual
	ALS   Environmental - Kelso	ALKLS-QAM, Rev. 28.0
		Effective: 10/21/2020
		Page 31 of 81

8.6.1 Quality control sample results data are retained in LIMS. Records of internal audits, nonconformance reports, and corrective action reports are retained and stored electronically for an indefinite period on networked drives.

8.6.2 The Quality Assurance Manager is responsible for maintaining and retrieving all records of audits, proficiency testing results, demonstration of competency, nonconformance and corrective action records and reports.

Client-Related Information

8.6.3 Project Managers are responsible for maintaining, archiving, and retrieving all contracts, project requirements and QAPPs provided to ALS by clients and related to projects completed by ALS. They are also responsible for the destruction of materials provided on unsuccessful proposals and bidding opportunities. Specific procedures for client communication and required documentation are listed in the SOP *Project Management* (ADM-PCM).

**8.7 Actions to Address Risks and Opportunities**

8.7.1 ALS views risk management as a key component of its corporate governance responsibilities and an essential process in achieving and mandating a viable organization. ALS is committed to enterprise wide risk management to ensure its corporate governance responsibilities are met and its strategic goals are realized.

8.7.2 Refer to ALS Limited Risk Management Policy and Framework CAR-GL-GRP-POL-007 and Risk Appetite and Tolerance Statement CAR-GL-POL-011 for details.

8.7.3 Risk is defined at ALS as the effect of uncertainty on objectives. Objectives for the organization have different attributes and aspects, such as financial, service, quality, health & safety, environmental stewardship, and are considered at different levels, such as enterprise-wide, operational, and project levels. ALS interprets risk as anything that could impact meeting its corporate strategic objectives, and believes risks can provide positive opportunities as well as having negative impacts.

8.7.4 Tools for evaluating and managing risk include routine procedures such as employee evaluations, control limits trending, RLVS data evaluation, corrective action reports, nonconforming events, SOP review, internal and external audits, and PT results.

8.7.5 Risk reporting mechanisms vary from routine reporting mechanisms and immediate action for lower risk situations to immediate notification of the ALS CEO in extreme cases.

8.7.6 Regardless of the mechanism used, the policies and tools provide a framework for categorizing, assessing, analyzing, and addressing risk, as well as monitoring and reviewing actions taken. Roles and responsibilities are defined in the relevant procedures.

8.7.7 Risk severity is evaluated during the decision making process. For each risk there is an opportunity.

8.8 Risks to our business and how we address them include:

**Chemical Exposure**

8.8.1 Failure to practice procedures as trained, issues with the facility, and poor engineering controls can result in injury to employees, lost time, med/hospital situation, contamination, and can close the site.

	STANDARD OPERATING PROCEDURE	Quality Assurance Manual
	ALS   Environmental - Kelso	ALKLS-QAM, Rev. 28.0
		Effective: 10/21/2020
		Page 32 of 81

8.8.2 We have policies, chemical exposure training, and readily available SDS sheets. Employees are expected to offer suggestions for improvement and formally report any conditions where concern for safety is recognized.

### 8.9 Explosion/Chemical Fire

8.9.1 Improper chemical storage and usage along with lack of equipment and facility upkeep can result in loss of life, loss of property, and laboratory down time.

8.9.2 We perform inspections and training, keep an inventory of chemicals, establish storage locations, and maintain minimal quantities of chemicals.

### 8.10 Supply Disruption

8.10.1 Natural disaster and vendors unable to provide needed supplies can disrupt the business, increase expenses, and result in lost production and lost clients.

8.10.2 We maintain multiple sources for supplies, develop relationships with our vendors, and emphasize communication between analysts, managers, purchasing and vendors.

### 8.11 Loss of Key Employees

8.11.1 Resignation, leave for personal reasons or for other employment can negatively impact the business.

8.11.2 Communication, cross-training, designated backups, and having a pool of potential replacements minimizes this risk. We provide a positive atmosphere for employees and provide small perks to reward dedication.

### 8.12 Computer and Instrument Issues

8.12.1 Computer, instrument, or other IT failures can result in loss of revenue, loss of service, and loss of data.

8.12.2 We provide necessary IT resources for instruments and computers including replacing older computers, keeping related systems in good repair, and replacing when necessary. We continue to build robust data systems and make provisions for stellar back-up storage for all data.

### 8.13 Reputation

8.13.1 Falsifying test results can result in loss of credibility, loss of clients, loss of revenue, and suspension.

8.13.2 All new employees must sign an ethics agreement and have initial ethics and data integrity training. Annually, all employees must take ethics and data integrity refresher training. All data undergoes a proper peer review. We maintain a strong quality system.

### 8.14 Legal Ramifications

8.14.1 Not following workplace and environmental laws and failure to practice procedures as trained can result in license revocation, fines, and disruption of the business.

8.14.2 Targeted and ongoing training, inspections, and having established procedures minimizes this risk. We continue to follow all laws and regulations.

### 8.15 Loss Time Injury

8.15.1 Failure to practice procedures as trained and not having proper safeguards in place can result in injury to employees, lost time, med/hospital situation, contamination, and can close the site.

	STANDARD OPERATING PROCEDURE	Quality Assurance Manual
	ALS   Environmental - Kelso	ALKLS-QAM, Rev. 28.0
		Effective: 10/21/2020
		Page 33 of 81

8.15.2 Policies, specific task related training, targeted and ongoing training, inspections, workplace safeguards, cross training, and designated backups, minimize this risk. We continue to grow the safety program and culture.

#### 8.16 Loss of Revenue

8.16.1 Can be caused by various audit fines and contract penalties for late data resulting in loss of revenue and disruption in business.

8.16.2 Policies, specific quality training, targeted and ongoing training, inspections, workplace safeguards, and internal audits minimize this risk. We continue to perform lab operations at the highest level.

#### 8.17 Improvement

8.17.1 ALS management is committed to continually improving the effectiveness of the management and quality systems by implementing the requirements of this quality manual. ALS is also committed to improvements of the management systems through compliance with its own policies and procedures. ALS management is also committed to compliance with requirements related to current EPA CLP SOWs, DoD/DOE QSM, and other client and project related requirements. Internally ALS maintains a process improvement website for employees to provide suggestions for improvements.

8.17.2 ALS surveys clients and gains feedback on services provided. This input to management is managed at a corporate level and is reviewed monthly and during the management review processes.

#### 8.18 Corrective Actions

8.18.1 ALS Laboratory operations are governed by documented procedures, requirements, quality assurance plans, project plans, and contracts. When any operation, for any reason, does not conform to the requirements of the governing documents, the aberrant event, item, or situation must be properly documented and evaluated. In addition, appropriate corrective action must be initiated. Procedures for the documentation and resolution of corrective action are detailed in the SOP *Nonconformance and Corrective Action Procedures* (ADM-NCAR). It is the policy of ALS that any corrective action which impacts results of testing must include notification to clients.

#### 8.19 Internal Audits

8.19.1 Internal audits are conducted in accordance with SOP *Internal Audits* (ADM-AUDIT). When internal and external audits or data assessments reveal a cause for concern with the quality of the data an investigation is initiated by quality assurance personnel to determine the extent of the problem. Internal audits include examination of laboratory practice, the use of data handling systems, documentation and document control, personnel qualification and training records, procurement activities, and other systems that support and augment the laboratory analytical function. All audit findings and any event that casts doubt on the validity of the testing results requires corrective action and client notification within two weeks.

#### 8.20 Management Review

8.20.1 Review of the Management System is completed on an ongoing basis in accordance with SOP *Lab Management Review* (ADM-LABMGMT).

8.20.2 Inputs to management reviews may be kept in agenda notes and include but are not limited to:

- a) Changes in internal and external issues that are relevant to the laboratory;
- b) Fulfilment of objectives;
- c) Suitability of policies and procedures;
- d) Status of actions from previous management reviews;
- e) Outcome of recent internal audits;
- f) Corrective actions;
- g) Assessments by external bodies;
- h) Changes in the volume and type of the work or in the range of laboratory activities;
- i) Customer and personnel feedback;
- j) Complaints;
- k) Effectiveness of any implemented improvements;
- l) Adequacy of resources;
- m) Results of risk and opportunity identification;
- n) Outcome of the assurance of the validity of results; and
- o) Other relevant factors, such as monitoring activities and training.

8.20.3 The outputs from the management review shall record all decisions and actions related to at least:

- a) The effectiveness of the management system and its processes;
- b) Improvement of the laboratory activities related to the fulfilment of the requirements of this document;
- c) Provision of required resources;
- d) Any need for change.

A summary of these outputs is generated annually.

## 9. Change History

Revision Number	Effective Date	Document Editor	Description of Changes
28.0	10/21/2020	T.Caron K. Clarkson	Updated QAM signatories, Organizational Charts and Key Personnel. Minor typographical, grammatical, and formatting changes. Updated master list of controlled documents, laboratory accreditations and Cooler Receipt documentation.

## 10. Appendices

The documents listed in this section are dynamic; accordingly they can change without notice or revision to this QAM. Appendices are current as of the effective date of this SOP. Please contact the laboratory for the most current documents.

## Appendix A

### Data Quality Objectives and Definitions

#### Data Quality Objectives

The data quality objectives discussed below ensure that data will be gathered and presented in accordance with procedures appropriate for its intended uses, and that the data will be of known and documented quality able to withstand scientific and legal scrutiny. The quality of the measurement data can be defined in terms of completeness, accuracy, precision and traceability.

**Completeness** - Completeness is defined as the percentage of measurements that are judged to be valid measurements. Factors negatively affecting completeness include the following: sample leakage or breakage in transit or during handling, missed method prescribed holding times, lost sample during laboratory analysis through accident or improper handling, improper documentation such that traceability is compromised, or rejection of sample results due to failure to conform to QC criteria specifications.

**Accuracy** - Accuracy is the measure of agreement between an analytical result and its “true” or accepted value. Deviations from a standard value represent a change in the measurement system. Potential sources of deviations include (but are not limited to) the sampling process, sample preservation, sample handling, matrix effects, sample analysis and data reduction. Sampling accuracy is typically assessed by collecting and analyzing field and trip blanks for the parameters of interest. Analytical laboratory accuracy is determined by comparing results from the analysis of laboratory control samples or check standards to their known values. Accuracy results are generally expressed as percent recovery.

**Precision** - Precision is the determination of the reproducibility of measurements under a given set of conditions, or a quantitative measure of the variability of a group of measurements compared to their average value. Precision is typically measured by analyzing field duplicates and laboratory duplicates (sample duplicate, matrix spike duplicate, check standard duplicate and/or laboratory duplicate). Precision is most frequently expressed as standard deviation, percent relative standard deviation or relative percent difference.

**Traceability** - Traceability is the extent to which reported analytical results can be substantiated by supporting documentation. Traceability documentation exists in two essential forms: those which link the quantitation process to authoritative standards and those which explicitly describe the history of each sample from collection to analysis and disposal.

#### Laboratory Quality Control Definitions

Technical personnel are responsible for complying with all quality assurance/quality control requirements that pertain to their technical functions. ALS uses the following internal quality controls to verify that the data produced by the laboratory has the required degree of accuracy and precision and is free from contamination due to laboratory processes. All samples are normally processed in preparation and analytical batches of no more than 20 samples per batch. The following quality control checks defined below are appropriate for the various methods performed in the laboratory. Individual SOPs will further define the specific checks to be analyzed with each method. Additionally, a Customer’s individual Quality Assurance Project Manual may require the laboratory to include additional checks for analysis depending on the *site* requirements.

**Method Blank** - A method blank is an analytical control consisting of all reagents, internal standards, and surrogate standards that is carried through the entire analytical procedure. The method blank is used to define the level of laboratory background and reagent contamination contributed from the preparation or processing of the sample.

**Reagent Blank** - A reagent blank is an analyte-free sample that contains all the reagents used in a particular method. It is prepared and analyzed to determine if contamination is present at detectable levels that can be attributed to the reagents used in the process.

	STANDARD OPERATING PROCEDURE	Quality Assurance Manual
	ALS   Environmental - Kelso	ALKLS-QAM, Rev. 28.0
		Effective: 10/21/2020
		Page 37 of 81

**Field Blank** - A field blank consists of reagent water that is transported to the sampling site, transferred from one vessel to another at the site, and preserved with the appropriate reagents. This serves as a check on reagent and environmental contamination.

**Trip Blank** - A trip blank consists of reagent water that is transported to the sampling site and returned to the laboratory without being opened. This serves as a check on sample contamination originating from sample transport, shipping, and from the site conditions. The holding time for the trip blank begins when received by the laboratory, unless otherwise specified by the client, such as the time when field samples were collected.

**Refrigerator / Storage Blank** - Refrigerator/storage blanks are placed in VOA refrigerators on a weekly basis and analyzed by GC/MS for the full Volatile Organic Analytes/Target Compound List (VOA-TCL). These blanks are used to monitor the volatile storage refrigerators for the presence of sample cross-contamination. In order to maintain continuous measurement within each refrigerator these blanks are prepared and logged into the Laboratory Information Management System (LIMS) by the Sample Custodian for specific turnaround times. This ensures that at least one blank is present in each volatile refrigerator at all times. If contamination is found the analyst is required to take corrective action to prevent the problem from affecting other stored samples. All samples associated with a positive blank will then be qualified on the analytical report. The QC Department reviews these results and maintains these files for review by regulatory agencies for a period of 10 years.

**Quality Control Reference Sample or Calibration Verification Standard (Second Source Standard)** - A QC reference sample is a sample prepared from a source other than that used for calibration at a concentration within the calibration range. It is used to verify that the calibration standards were prepared accurately. It is analyzed after every initial calibration performed in the laboratory.

**Laboratory Control Sample (LCS/LFB)** - A Laboratory Control Sample (aka Laboratory Fortified Blank) is a laboratory blank fortified at a known concentration. Aqueous and solid LCSs are analyzed using the same sample preparation, reagents, and analytical methods employed for the samples. An LCS is analyzed with each preparative or analytical batch as required by the method. It provides a measure of the accuracy of the analytical system in the absence of matrix effects.

**Surrogate Standards** - Surrogates are organic compounds which are similar to analytes of interest in chemical composition, extraction, and chromatography, but which are not normally found in environmental samples. These compounds are spiked into all blanks, calibration and check standards, samples (including duplicates and QC reference samples), and spiked samples prior to an organic analysis. Percent recoveries are calculated for each surrogate to detect problems in the sample preparation process and monitor the efficiency of the process.

**Duplicate** - A duplicate is a second aliquot of a sample that is prepared and analyzed in the same manner as the original sample in order to determine the precision of the method. Samples selected for duplicate analysis are rotated among Customer samples so that various matrix problems may be noted and/or addressed. Poor precision in a sample duplicate may indicate a problem with the sample composition and shall be reported to the Customer whose sample was used for the duplicate analysis.

**Matrix Spike/Matrix Spike Duplicate** - A matrix spike/matrix spike duplicate is the addition of a known amount of a target analyte to a sample that is subjected to the entire analytical procedure. Samples selected for matrix spiking are rotated among Customer samples so that various matrix problems may be noted and/or addressed. Poor performance in a matrix spike may indicate a problem with the sample composition and shall be reported to the Customer whose sample was used for the spike.

**Method Detection Limit (MDL)** - The method detection limit (MDL) is defined as the minimum concentration of a substance that can be measured and reported with 99% confidence that the analyte concentration is greater than zero and is determined from analysis of a sample in a given matrix containing the analyte.

**Reportable Detection Limit (RDL)** - The reportable detection limit on the laboratory report is a concentration at which the laboratory routinely reports results. The RDL may also be the method

	STANDARD OPERATING PROCEDURE	Quality Assurance Manual
	ALS   Environmental - Kelso	ALKLS-QAM, Rev. 28.0
		Effective: 10/21/2020
		Page 38 of 81

detection limit and is based on whether the Customer requires the result reported down to the MDL. It is laboratory policy to indicate on the laboratory report when the method detection limit is used as the RDL.

**Common Laboratory Contaminants** - Some common laboratory contaminants include: methylene chloride, acetone, 2-Butanone, hexane, phthalates, aluminum, and zinc. These analytes are sometimes seen in laboratory blanks due to their use in the processing of samples. When blank contamination occurs it is required that samples associated with these blanks be reprocessed. However, if reprocessing cannot occur due to lack of sample, holding time issues, or Customer turnaround time a comment will be placed on the analytical report defining the problem.

**Internal Standard (IS)** - A known amount of standard added to a test portion of a sample as a reference for evaluating and controlling the precision and bias of the applied analytical method (NELAP).

**Minimum Reporting Level (MRL)** - Minimum Reporting Levels represent an estimate of the lowest concentration of a compound that can be quantitatively measured by a group of experienced drinking water laboratories.

**Detection Limit (DL) for DoD** - The smallest analyte concentration that can be demonstrated to be different from zero or a blank concentration at the 99% level of confidence. At the DL, the false positive rate (Type I error) is 1%.

**Limit of Detection (LOD) for DoD** - The smallest amount or concentration of a substance that must be present in a sample in order to be detected at a high level of confidence (99%). At the LOD, the false negative rate (Type II error) is 1%.

**Limit of Quantitation (LOQ) for DoD** - The lowest concentration that produces a quantitative result within specified limits of precision and bias. For DoD projects, the LOQ shall be set at or above the concentration of the lowest initial calibration standard.

**Holding Times** - Samples are prepared and analyzed within method prescribed holding times per SOP 19-Sample Preservation Protocol and the appropriate method SOP. Holding time is the time from sampling until the start of analysis unless otherwise specified by a project QAPP. The date and time of sampling documented on the chain of custody establishes the time zero. If the holding time is specified to be measured in hours, then each hour is measured from the minute the sample was collected in 60-minute intervals. When the maximum allowable holding time is expressed in days, the holding time is based on calendar day measured from time zero, the date the sample was collected. The first day of holding time is not passed until midnight of the day after the sample was collected. Holding times for analysis include any necessary re-analysis due to instrument failure or analyst error that does not yield useful data. If sample re-analysis is necessary due to sample matrix, such as a dilution or matrix spike failure due to matrix interference, the holding time still applies. A comment is added to the final report stating that further analysis was required past hold time. The sampling time must be documented on the chain of custody form by the Customer.

**Turn Around Time** - Turnaround time is the time from receipt of samples to the transmittal of analytical data by mail, electronically or facsimile. The day the chain-of-custody is signed by the sample custodian is day zero in the turnaround time. Samples results will be due by the close of business on the last day of the turnaround time unless alternate arrangements have been made with the laboratory. The turnaround time is based on working business days, excluding weekends and holidays.

# Charles Patrick Byrne

Laboratory Director 03-20 to Present  
Kelso Washington

Implementation of quality policy and applicable standards. Ensure that Employees have sufficient experience and training to perform QAM related duties and procedures. Ensure that the necessary facilities and equipment are available to meet the commitments of the laboratory. Ensure that sample handling, instrument calibration, sample analysis, and related activities are conducted and documented as described in this QAM, its related Standard Operating Procedures (SOPs), and its referenced methods. Ensure that routine QC samples are prepared, analyzed, and reviewed as required by this QAM. That at regular intervals audits are conducted and documented to assess compliance with this QAM. That corrective action is initiated and completed to remedy discrepancies or problems identified in any laboratory process. Management review of all processes and procedures associated with the management system. In the absence of the Inorganic Manager, Organics Manager, Technical Director will assume the above responsibilities.

CEO Principal  
Various Companies  
Baton Rouge Louisiana 2010-2019

Acted as consultant to various laboratories in the area of process improvement. Owner Operator of several owned business entities including: Residential Property restoration and management, Commercial property management, Retail sales organization with sales in excess of 6m annually, manufacturing company with sales in excess of 4m.

CEO Principal Owner  
Gulf Coast Analytical Laboratories  
Baton Rouge Louisiana 1997-2012

Organized the purchase of the Baton Rouge facility of Inhcpe Testing Services. Led the organization through a period of substantial growth from 4-13m. Set industry record productivity metrics in the environmental laboratory sector. Ultimately negotiated the sale of the organization to Private Equity Partners. Remained to transition the business and led the merger and acquisition efforts of the company resulting in the successful acquisition of additional facilities.

1992 and 1994

	STANDARD OPERATING PROCEDURE	Quality Assurance Manual
	ALS   Environmental - Kelso	ALKLS-QAM, Rev. 28.0
		Effective: 10/21/2020
		Page 42 of 81

Led the company through key projects such as:  
Benzene Barge- Multi-Million dollar emergency response effort on the Mississippi River involving an overturned Barge in downtown Baton Rouge. Sloe provider of analytical data with 48 Hour results and 30 day Level IV Packages.

Katrina Emergency Response-Provided analytical support under the EPA START contract.

Murphy Oil Release-Analysis of samples for Client and split samples for EPA in support of the release following the Katrina. Project scope included the analysis of over 45,000 samples.

### Laboratory Manager-General Manager Division Inchcape Testing Services

Baton Rouge Louisiana 1997-2012

Supervise division managers to ensure client expectations are met. Led the installation of LIMS system and follow-up customization that produced significant process improvement and productivity gains in the laboratory. Implemented reporting module that provided automated Level IV reporting. Personally designed the EDD generator that automated the production of complex Multi file EDD deliverables such as EQUIS, ADR, ERPIMS and Terra-base. Conducted daily production meetings to ensure on-time delivery to clients. Supervise multi-state sales force to ensure controlled growth and expansion of petrochemical clients.

### Organics Manager Inchcape Testing Services

Baton Rouge Louisiana 1991-1992

Supervise organics section consisting of Sample Preparation, Pesticide, PCB, Volatile GC and GCMS, Semi-volatile GC and GCMS. Direct report to Lab Manager. Responsible for data quality and Turnaround time compliance with client objectives. Perform method validation and development. Troubleshoot analytical equipment. Supervise approximately 20 staff members.

### Volatile GCMS Supervisor ETC Toxicon

Baton Rouge Louisiana 1990-1991

Analysis of organic components under the EPA CLP Program. Experience with Pesticide, PCBs, Volatile and Semi-volatile contaminants using Gas Chromatography and Mass Spectrometry. Preparation of CLP Data Packages using Form-master.

# Kurt Clarkson

QA Manager 2020 - Present  
ALS-Kelso

Responsible for maintaining the quality systems and ensuring data integrity standards are implemented for the Kelso Laboratory. This includes upholding the requirements of analytical certifications, maintaining QA documents (QA Manual, SOPs, and QA records), coordinating PE/PT testing, conducting internal audits, and acting as a primary point of contact for external audits.

Additional current responsibilities: Safety Committee member, 2017-Present

## Previous Experience

Senior Project Manager, 2017-2020  
ALS Environmental, Kelso  
Kelso, WA

Responsible for technical project management, ensuring overall data quality and compliance with customer requirements. Provide technical support to clients regarding laboratory application to projects including regulatory interpretation assistance, as well as project organization of work.

Additional positions held at ALS-Kelso:  
Client Services Manager, 2016-2017  
Project Manager 2, 2015-2016

## Positions held prior to ALS Environmental, Kelso:

Client Services Manager, 2013-2015  
Western Environmental Testing Laboratory  
Sparks, Nevada

Client Services Manager, 2012-2013  
STAT Analysis  
Chicago, IL

Project Manager/Chemist Analyst, 2008-2011  
SGS  
Anchorage, AK

# JEFF CORONADO

**Manager - Specialty Laboratory Area, Metals Department Manager, 1992 - Present, General Chemistry Department Manager, 2017 - Present, Kelso Laboratory**

Management of the Kelso General Chemistry and Metals Departments with a staff of 28 and annual revenues in excess of \$5 million. Responsible for data quality and timeliness, revenues, expenses, workload coordination, method development efforts, and resource allocation. Participation in multiple LIMS development teams responsible for defining the ALS product.

## PREVIOUS EXPERIENCE

**Supervisor, GFAA Laboratory, 1989-1992**  
Columbia Analytical Services, Inc.  
Kelso, WA

Responsibilities included supervision of metals analysis by graphite furnace atomic absorption following SW 846 and EPA CLP methodologies. Duties include workload scheduling, data review, instrument maintenance, personnel training and evaluation.

## Jonathon Walter

**Organics Manager**  
ALS Environmental, Kelso Laboratory  
Mar 2020 - Present

Responsible for directing the organic sample preparation teams and organic instrumentation teams. Responsible for ensuring that ALS quality systems and data integrity standards are followed. Manage workflow for departments ensuring client needs are met and working with PCs on special projects. Responsible for development of employees, method development efforts, quality and timeliness of data to clients.

### PREVIOUS EXPERIENCE

**Sample Preparation Manager**  
ALS Environmental, Kelso Laboratory  
June 2018 - Mar 2020

Responsible for directing the sample preparation teams, organic extractions and soil prep. Responsible for ensuring that ALS quality systems and data integrity standards are followed. Manage workflow for departments ensuring client needs are met and working with PCs on special projects. Responsible for development of employees, method development efforts, quality and timeliness of samples to labs.

**Laboratory Manager**  
Analytical Resources, Inc.  
Feb 2018 - Jun 2018

Plan and implement the overall laboratory policies, procedures, and services for each division. Ensure efficient and effective departmental operations, as well that departments follow industry standards and safety regulations. Provide input to strategic decisions for the company. Train supervisors in leading their respective sections, including coaching and mentoring supervisors to become better leaders.

**Organic Extraction Laboratory Supervisor**  
Analytical Resources, Inc.  
Oct 2016 - Feb 2018

Oversee the preparation of samples for semi-volatile, polynuclear aromatic hydrocarbons, chlorinated pesticides, chlorinated phenols, PCBs, PCB congeners, and extractable petroleum hydrocarbons. Responsible for ensuring deadlines are met, all extraction methods and daily QA/QC practices are upheld, scheduling and training employees, along with maintaining the budget and supplies for the lab section.

**GC/GC-MS Analyst/HRGCMS Analyst**  
Analytical Resources, Inc.  
Aug 2012 - Nov 2016

Analyzed TPHG, TPHD, SVOA, VOA, Dioxin by GC, GCMS, HRGCMS. Processed, reported and peer reviewed data for all analysis and performed maintenance as needed on instruments.

**Dioxin Laboratory Supervisor and Tech**  
Analytical Resources, Inc.  
Supervisor Aug 2012 - Feb 2018  
Tech July 2010-Aug 2012

Oversee workload, interpretation of data, development of new extraction techniques and cleanups. Always ensuring all regulatory requirements are met. Responsible for the extraction and cleanup of solids, tissues and waters for Dioxin and Furan analysis by 1613, 8290, and EPA methods.

### EDUCATION

Washington State University

# TODD POYFAIR

**Client Services Manager, 2020 - Present**  
Kelso Laboratory

Management of the Client Services Departments: Project Management, Electronic Data Deliverables & Report Production, Sample Management, Sample Control, Bottle Preparation, General Lab Receiving & Shipping, and Courier Services. Responsible for employee supervision, workload coordination, and adherence to all departmental standard operating procedures including the Client Service Guidelines.

## PREVIOUS EXPERIENCE

**Organics Manager, 2017 - 2020**

Kelso Laboratory

Oversee the operation of the Volatiles, Semi-volatiles, and OLC laboratories. Responsibilities included organizing and prioritizing workload, training and development of staff, working with PMs on client-specific project requirements, workload coordination, method development efforts and resource allocation.

**Technical Scientific and Business Development Representative, 2012-2017**

ALS Group USA, Corp.  
Kelso, WA

Worked with clients to define project requirements and expectations. Responsible for project development and technical project management, ensuring overall data quality and compliance with client requirements. Serve as liaison to clients and regulatory agencies functioning as a technical consultant to clients, coordinating technical proposals and sales for ALS Kelso.

**Corporate IT Director / Vice President 2010-2012**

Kelso, WA  
Columbia Analytical Services  
Phoenix, AZ

**Laboratory Director / Vice President 2008-2010**

Columbia Analytical Services  
Phoenix, AZ

Responsible for all phases of laboratory operations at the Phoenix and Tucson Laboratories, including project planning, budgeting and quality assurance. Primary duties include the direct management and operational oversight of the Kelso laboratory and all department managers.

**Department Manager 1993-2009**

Columbia Analytical Services  
Kelso, WA

# SCOTT CHAPPELLE

Site Safety Representative - 2017 - present  
Soil Prep Supervisor - 2016 - present

Responsibilities include development, support and implementation of Environmental, Health and Safety policies for the Kelso laboratory, including policies for respiratory protection and hazardous waste generation. Also responsible for incident reporting and investigation, maintenance of all safety related equipment, review of monthly safety audits, and completion of all Federal and State mandated EH&S reports.

As soil prep supervisor my responsibilities include supporting the staff and ensuring that all sample aliquots are delivered correctly and in as timely a manner as possible. Training of staff and keeping all records current. Resolving any issues that arise with samples or procedures.

## PREVIOUS EXPERIENCE

**Chemist I Volatile Organics Laboratory, 2014-2016**  
ALS Group USA, Corp.  
Kelso, WA

Performing various analyses on both GC and GC/MS instruments. Prepping soil samples for analysis for both gases and volatiles analyses. Reviewing and reporting of data from the analyses I would run.

**Analyst General Chemistry, 2010-2014**  
Columbia Analytical Services, Inc.  
Kelso, WA

Running various analyses from Grainsize to Oil and grease. Operating the IC instrument as well as the discrete analyzer. Performing prep on samples and assisting in analyses. Data reporting and peer review.

## ADDITIONAL TRAINING

DOT Hazardous Materials Transportation, 2017  
DOT Emergency Response Operations Level, 2019  
WA Dangerous Waste Course, 2019

**ETHICS AND DATA INTEGRITY AGREEMENT**  
ALS Environmental - USA

I state that I understand the high standards of integrity required of me with regard to the duties I perform and the data I report in connection with my employment at ALS.

I agree that in the performance of my duties at ALS:

1. I shall not intentionally report data values that are not the actual values obtained;
2. I shall not intentionally report the dates, times and method citations of data analyses that are not the actual dates, times and method citations of analyses;
3. I shall not intentionally represent another individual's work as my own;
4. I shall not intentionally report data values that do not meet established quality control criteria as set forth in the Method and/or Standard Operating Procedures, or as defined by company policy.
5. I agree to inform ALS of any accidental or intentional reporting of non-authentic data by other employees.
6. I have read this ethics and data integrity agreement and understand that failure to comply with the conditions stated above will result in disciplinary action, up to and including termination.
7. I agree to adhere to the following protocols and principals of ethical conduct in my work at ALS. All work assigned to me will be performed using ALS approved methods and procedures and in compliance with the quality assurance protocols defined in the ALS Quality System.
8. I will not intentionally falsify nor improperly manipulate any sample or QC data in any manner. Furthermore, I will not modify data values unless the modification can be technically justified through a measurable analytical process or method acceptable to ALS. All such modifications and their justification will be clearly and thoroughly documented in the raw data and appropriate laboratory record, and will include my initials or signature and the date.
9. I will not make false statements to, or seek to otherwise deceive ALS staff, managers or clients. I will not knowingly, through acts of commission, omission, erasure or destruction, improperly report any test results or conclusions, be they for client samples, QC samples, or standards.
10. I will not condone any accidental or intentional reporting of unauthentic data by other ALS staff and will immediately report such occurrences to my Supervisor, Lab Director, Quality Assurance Manager, or Human Resources. I understand that failure to report such occurrences may subject me to immediate discipline, including termination.

	STANDARD OPERATING PROCEDURE	Quality Assurance Manual
	ALS   Environmental - Kelso	ALKLS-QAM, Rev. 28.0
		Effective: 10/21/2020
		Page 50 of 81

11. If a supervisor, manager, director or other member of the ALS leadership group requests me to engage in or perform an activity that I feel is compromising data validity or defensibility, I have the right to not comply with the request. I also have the right to appeal this action through an ALS local Quality Staff, Corporate Quality Assurance or Human Resources.
12. I understand that if my job includes supervisory responsibilities, I will not instruct, request or direct any subordinate to perform any unethical or non-defensible laboratory practice. Nor will I discourage, intimidate or inhibit a staff member who may choose to appropriately appeal my supervisory instruction, request or directive that may be perceived to be improper, nor retaliate against those who do so.
13. I understand that employees who report violations of this policy will be kept free from intimidation and recrimination arising from such reporting.

I have read, and understand the above policy and realize that failure to adhere to it may result in disciplinary action, up to and including termination. Compliance with this policy will be strictly enforced with all personnel employed by the company.

**Analytical and Support Equipment**

GENERAL CHEMISTRY/WATER CHEMISTRY LABORATORY			
Equipment Description	Year Acquired	Manufacturer or Laboratory Maintained (MM/LM)	# of Trained Operators
Analytical Balances (10): Sartorius, Mettler, Ohaus, Fisher scientific	1990-2011	LM	13
Autoclave - Market Forge Sterilmatic	1988	LM	5
Autoclave – Tutnauer	2010	LM	3
Autotitrator – Thermo Orion 500	2007	LM	3
Calorimeters (2): Parr 1241 EA Adiabatic	1987	LM	2
Parr 6300 Isoparabolic	2005	LM	2
Centrifuge – Beckman Coulter	2019	LM	13
Colony Counter - Quebec Darkfield	1988	LM	5
Conductivity Meter (1): YSI Model 3200	2004	LM	3
Digestion Systems (4): COD (2)	1989	LM	3
Kjeldahl, Lachat 46-place (1)	1999	LM	2
Skalar Micro Digester, 120 place (1)	2016	LM	2
Dissolved Oxygen Meter (2) - YSI Model 5000 & 5100	1988, 1991	LM	4
Distillation apparatus - Easy Still (2), Simple Dist (1)	2000	LM	3
Drying Ovens (6): Shel-Lab and VWR models	1990-2010	LM	13
Flash Point Tester (1): Petroleum Systems Services	2005	LM	2
Flow-Injection Analyzers (2): Bran-Leubbe	2002	LM	3
Lachat 8500	2007	LM	3
Ion Chromatographs (3) Thermo/Dionex ICS-2000	2006	LM	3
Thermo/Dionex ICS-1600	2009	LM	3
Thermo/Dionex ICS-1600	2015	LM	3
Meters (ISE and pH) (5) Orion Star A211	2019	LM	3
Orion Star A214	2016	LM	13
Orion Dual Star	2016	LM	13
VWR Symphony (2)	2004, 2013		
Microscope - Olympus	1988	LM	1
Muffle Furnace- Sybron Thermolyne Model F-A1730	1991	LM	13
Total Organic Carbon (TOC) Analyzers (4)			

Coulemetrics Model 5012	1997	LM	3
Teledyne Tekmar Fusion 1	2009	LM	2
Analytik Jena 2500	2013	LM	3
Total Organic Halogen (TOX) Analyzers (3):			
Mitsubishi TOX-100 (2)	2001	LM	3
Mitsubishi AOX-200	2015	LM	3
Turbidimeter - Hach Model 2100N	1996	LM	5
UV-Visible Spectrophotometers (1):			
Perkin Elmer Lambda 25	2008	LM	6
Vacuum Pumps (3):			
Welch Duo-Seal Model 1376	1990	LM	13
Busch R-5 Series Single Stage	1991	LM	13
Chem Star 1402N-01	2011	LM	13
Water Baths/Incubators (9):			
Various Fisher Scientific and VWR Models	1986 - 2009	LM	13
Drill Press – Craftsman	2012	-	4
<b>SOIL PREP</b>			
<b>Equipment Description</b>	<b>Year Acquired</b>	<b>Manufacturer or Laboratory Maintained (MM/LM)</b>	<b># of Trained Operators</b>
Analytical Balance (12)			
Mettler AE200	1999-2015	MM	5
Sartorius Quintix, Practum	2016-2019	MM	5
Shatter Box (2):			
GP 1000	1989	LM	5
SPEX 8530	2011	LM	5
Sieve Shakers (1):			
WS Tyler - RX 86	1991	LM	5
Thomas-Wiley Laboratory Mill, Model 4	1989	LM	5
Milkshaker (1)			
Hamilton Beach	2010	LM	4
Blender (1)			
Warin Laboratory	2013	LM	5
<b>METALS LABORATORY</b>			
<b>Equipment Description</b>	<b>Year Acquired</b>	<b>Manufacturer or Laboratory Maintained (MM/LM)</b>	<b># of Trained Operators</b>
Analytical Balance (9)			
Mettler AE 200 analytical balance	1988-2018	MM	12
Various Mettler, Sartorius, and Ohaus models			
Atomic Absorption Spectrophotometers (3):			
CETAC Mercury Analyzer M-6100	2010	LM	3
Buck AA Spectrophotometer Model 205 (2)	2008/2015	LM	3
Atomic Fluorescence Spectrophotometer (2)			
Brooks-Rand Model III	2005	LM	3

Brooks-Rand Merx	2014	LM	3
Centrifuge - IEC Model Clinical Centrifuge	1990	LM	12
Drying Oven - VWR Model 1370F	1990	LM	12
Freeze Dryers (1) - Labconco	2010	LM	5
Inductively Coupled Plasma Atomic Emission Spectrometer (ICP-AES) (2)			
Thermo Scientific Model iCAP 6500	2007	MM	3
Thermo Scientific Model iCAP 6500	2012	MM	3
Inductively Coupled Plasma Mass Spectrometers (ICP-MS) (4):			
Agilent 7700	2014	MM	2
Agilent 7800	2016	MM	2
Nexion Model 300D	2011	MM	2
Muffle Furnace (2) - Thermolyne Furnatrol - 53600	1991, 2005	LM	5
Shaker - Burrell Wrist Action Model 75	1990	LM	12
TCLP Extractors (3)	1989, 2002	LM	5

**SEMIVOLATILE ORGANICS SAMPLE PREPARATION LABORATORY**

Equipment Description	Year Acquired	Manufacturer or Laboratory Maintained (MM/LM)	# of Trained Operators
Analytical Balance (3)			
Mettler PM480, AG204, AE240	1999 - 2015	MM	12
Ohaus Explorer Pro	2016	MM	12
Centrifuge – Beckman Coulter Avanti J-15R	2019	LM	7
Drying Ovens (2)			
Fisher Model 655G	1991	LM	8
VWR Model 1305U	1999	LM	8
Evaporators/concentrators			
Organomation N-Evap (7)	1990-2010	LM	6
Organomation S-Evap (10)	1990-2010	LM	7
Biotage Turbovap (2)	2013 - 2016	LM	6
Extractor Heaters: Lab-Line Multi-Unit for Soxhlet and Continuous Liquid-Liquid Extractions (78)	1987-2007	LM	7
Solids Extractors:			
Sonic Bath VWR	1994	LM	5
Sonic Horn (4)	1994	LM	4
Soxtherm	2000	LM	3
Gerhardt (4)	2008	LM	3
OI Analytical (5)			
Extractors, TCLP (8):			
Millipore TCLP Zero Headspace Extractors (10)	1992-2011	LM	4
TCLP 12 position Extractor/Tumbler (2)	1989-2011	LM	4

Gel Permeation Chromatography (GPC) (4) J2 Scientific AccuPrep (3) Gilson (1)	2005, 2010 2013	LM LM	4 4
Muffle Furnace (2)	2006, 2009	LM	2
Solid Phase Extractors (8) – Horizon SPE-Dex 4790	2003-2008	LM	3
Microwave Extractor – Mars 6 (2)	2014, 2019	LM	4
Edmund Buhler 3-Storey top frame VKS 'Shaker table' (1)	2016	LM	5

**GC SEMIVOLATILE ORGANICS INSTRUMENT LABORATORY**

Equipment Description	Year Acquired	Manufacturer or Laboratory Maintained (MM/LM)	# of Trained Operators
Gas Chromatographs (16): Agilent 6890 GC with Agilent 7683 Autosampler and Dual ECD Detectors (6)	2001, 2005, 2007, 2011	LM	5
Agilent 6890 GC with Agilent 7683 Autosampler and Dual FPD Detectors (1)	2003	LM	4
Agilent 7890A Dual ECD Detectors Agilent 7683B autosampler (4)	2010 - 2014	LM	5
Hewlett-Packard 5890 GC with HP 7673 Autosampler and FID Detector (1)	1995	LM	4
Agilent 6890 with Dual FID Detectors and Agilent 7873 Autosampler (4)	2001, 2005	LM	4
Agilent 7890A Dual NPD Detectors and Agilent 7683B autosampler (1)	2012	LM	1

**GC/MS SEMIVOLATILE ORGANICS INSTRUMENT LABORATORY**

Equipment Description	Year Acquired	Manufacturer or Laboratory Maintained (MM/LM)	# of Trained Operators
Analytical Balance - Mettler AB 104-S	2000	MM	6
Semivolatile GC/MS Systems (10): Agilent 6890/5973 with ATAS Optic2 LVI and HP 7673 Autosampler (2)	1997, 2001	LM	5

**AUTOMATED DATA PROCESSING EQUIPMENT**

Equipment Description	Year Acquired	Manufacturer or Laboratory Maintained (MM/LM)	# of Trained Operators
1 - WAN: LIMS Sample Manager using Oracle 11gR2 Enterprise RDBMS running on Red Hat Enterprise Linux Advanced Server v.6.6 platform connected via DMVPN circuits (100 Mbps)	2013	LM	NA
1 - Network Server for reporting and data acquisition running Windows Server 2008 R2 with a 1.4 TB capacity, 1 - Application server running Windows Server 2008 R2	2012	LM	NA
Approximately 90+ HP (3015, 4000, 4014, 4050, 4200, 4250, 4300), Dell 1720dn, and Lexmark M5155 printers.	2010 - 2015	LM	NA
Approximately 220+ Dell/HP PC workstations running Windows XP/Windows 7 on LAN connected via 100BT/1GigE network	2010 - 2015	LM	NA
Microsoft Office 2013 Professional as the base office application suite for all PC workstations. Some systems using Microsoft Office 2003/2007/2010	1996 - 2014	LM	NA
E-mail via Office365.com with webmail via Outlook Web Access. Microsoft Outlook 2013 is standard email client, with some using Outlook 2010	2011 - 2014	LM	NA
Facsimile Machines - Brother 4750e, Brother 2920, and Brother 1860	2005 - 2008	LM	NA
Copier/Scanners - BizHub 283, BizHub 600, BizHub 601 (2), BizHub 654, BizHUB754e (2), BizHub 951, BizHub 1050.	2005 - 2015	LM	NA

	STANDARD OPERATING PROCEDURE	Quality Assurance Manual
	ALS   Environmental - Kelso	ALKLS-QAM, Rev. 28.0
		Effective: 10/21/2020
		Page 58 of 81

Thru-Put, MARRS, Stealth, Harold, Blackbird, EDDGE, CASLIMS, & LabCoat reporting software systems.	1998 - 2014	LM	NA
Data processing terminals (79) - EnviroQuant, Target, Saturn, MassHunter, Chromeleon, MassLynx, Insight.	1996 - 2016	LM	NA

**Appendix F**  
**Sample Preservation, Containers, and Hold Times**

DETERMINATION <sup>a</sup>	MATRIX <sup>b</sup>	CONTAINER <sup>c</sup>	PRESERVATION	HOLDING TIME
<b>Bacterial Tests</b>				
Coliform, Colilert (SM 9223)	W, DW	P, Bottle or Bag	Cool, 4°C, 0.008% Na <sub>2</sub> S <sub>2</sub> O <sub>3</sub> <sup>d</sup>	6-24 hours <sup>e</sup>
Coliform, Fecal and Total (SM 9221, 9222D)	W, S, DW	P,G	Cool, 4°C, 0.008% Na <sub>2</sub> S <sub>2</sub> O <sub>3</sub> <sup>d</sup>	6-24 hours <sup>e</sup>
Enterococci (Enterolert)	W	P	Cool, 4°C, 0.008% Na <sub>2</sub> S <sub>2</sub> O <sub>3</sub> <sup>d</sup>	8 hours
<b>Inorganic Tests</b>				
Acidity (SM 2310B)	W	P,G	Cool, 4°C	14 days <sup>EPA</sup>
Alkalinity (SM 2320B)	W, DW	P,G	Cool, 4°C	14 days <sup>EPA</sup>
Ammonia (SM 4500 NH <sub>3</sub> )	W, DW	P,G	Cool, 4°C, H <sub>2</sub> SO <sub>4</sub> to pH<2	28 days
Biochemical Oxygen Demand(SM 5210B)	W	P,G	Cool, 4°C	48 hours
Chemical Oxygen Demand (SM 5220C)	W	P,G	Cool, 4°C, H <sub>2</sub> SO <sub>4</sub> to pH<2	28 days
Chloride (EPA 300.0)	W, DW	P,G	Cool, 4°C	28 days
Chloride (EPA 9056)	W, S	P,G	Cool, 4°C	28 days
Chlorine, Total Residual (SM 4500 Cl F)	W, S	P,G	Cool, 4°C	24 hours
Chlorophyll-A (SM 11200H)	W	G Amber	Cool, 4°C	48 hours
Chromium VI (EPA 7196A)	W	P,G	Cool, 4°C	24 hours
Color (SM 2120B)	W, DW	P,G	Cool, 4°C	48 hours
Cyanide, Total and Amenable to Chlorination (EPA 335.4, 9010, 9012, Kelada-01) (SM 4500 CN E,G)	W, S, DW	P,G	Cool, 4°C, NaOH to pH>12, plus 0.6 g Ascorbic Acid	14 days
Cyanide, Weak Acid Dissociable (SM 4500 CN I)	W, S	P,G	Cool, 4°C, NaOH to pH >12	14 days
Ferrous Iron (ALS SOP)	W, D	G Amber	Cool, 4°C	24 hours
Fluoride (EPA 300.0, 9056, SM 4500 F-C)	W, S	P,G	Cool, 4°C	28 days
Formaldehyde (ASTM D6303)	W	G Amber	Cool, 4°C	48 hours

DETERMINATION <sup>a</sup>	MATRIX <sup>b</sup>	CONTAINER <sup>c</sup>	PRESERVATION	HOLDING TIME
Hardness (SM 2340 C)	W, DW	P,G	HNO <sub>3</sub> to pH<2	6 months
Hydrogen Ion (pH) (SM 4500 H <sup>+</sup> B)	W, DW	P,G	Cool, 4°C	Analyze immediately
Kjeldahl and Organic Nitrogen (ASTM D3590-89)	W	P,G	Cool, 4°C, H <sub>2</sub> SO <sub>4</sub> to pH<2	28 days
Nitrate (EPA 300.0)	W, DW	P,G	Cool, 4°C	48 hours
Nitrate (EPA 9056)	W, S	P,G	Cool, 4°C	48 hours
Nitrate-Nitrite (EPA 353.2)	W, DW	P,G	Cool, 4°C, H <sub>2</sub> SO <sub>4</sub> to pH<2	28 days
Nitrite (EPA 300.0)	W, DW	P,G	Cool, 4°C	48 hours
Nitrite (EPA 353.2)	W, S	P,G	Cool, 4°C, H <sub>2</sub> SO <sub>4</sub> to pH<2	48 hours
Nitrite (EPA 9056)	W, S	P,G	Cool, 4°C	48 hours
Nitrocellulose	S	G	Cool, 4°C	28 days
Oil and Grease, Hexane Extractable Material (EPA 1664)	W	G, Teflon Lined Cap	Cool, 4°C, H <sub>2</sub> SO <sub>4</sub> or HCL to pH<2	28 days
Organic Carbon, Total (9060 & SM 5310 C)	W	P,G	Cool, 4°C, H <sub>2</sub> SO <sub>4</sub> to pH<2	28 days
Organic Carbon, Total (ASTM-D4129)	S	P,G	Cool, 4°C	28 days
Organic Halogens, Adsorbable (EPA 1650B)	W	G, Teflon Lined Cap	Cool, 4°C, HNO <sub>3</sub> to pH<2	6 months
Organic Halogens, Total (EPA 9020)	W	G, Teflon Lined Cap	Cool, 4°C, H <sub>2</sub> SO <sub>4</sub> to pH<2, No headspace	28 days
Orthophosphate (SM 4500 P- E)	W, DW	P,G	Cool, 4°C	48 hours
Oxygen, Dissolved (Probe) (SM 4500 O G)	W, DW	G, Bottle and Top	None Required	24 hours
Oxygen, Dissolved (Winkler)	W, DW	G, Bottle and Top	Fix on Site and Store in Dark	8 hours
Phenolics, Total (EPA 420.1, 9056)	W, S	G Amber	Cool, 4°C, H <sub>2</sub> SO <sub>4</sub> to pH<4	28 days
Phosphorus, Total (EPA 365.3)	W	P,G	Cool, 4°C, H <sub>2</sub> SO <sub>4</sub> to pH<2	28 days
Residue, Filterable (TDS) (SM 2540 C)	W	P,G	Cool, 4°C	7 days
Residue, Nonfilterable (TSS) (SM 2540 D)	W	P,G	Cool, 4°C	7 days
Residue, Settleable (SM 2540 F)	W	P,G	Cool, 4°C	48 hours

DETERMINATION <sup>a</sup>	MATRIX <sup>b</sup>	CONTAINER <sup>c</sup>	PRESERVATION	HOLDING TIME
Residue, Total (SM 2540 B)	W	P,G	Cool, 4°C	7 days
Residue, Volatile (EPA 160.4)	W	P,G	Cool, 4°C	7 days
Silica (SM 4500 SiO <sub>2</sub> C)	W	P Only	Cool, 4°C	28 days
Specific Conductance (SM 2510 B)	W, DW	P,G	Cool, 4°C	28 days
Sulfate (EPA 300.0)	W, DW	P,G	Cool, 4°C	28 days
Sulfate (EPA 9056)	W, S	P,G	Cool, 4°C	28 days
Sulfide (9030/934)	W, S	P,G	Cool, 4°C, Add Zinc Acetate, plus Sodium Hydroxide to pH>9	7 days
Sulfide (SM 4500 S <sub>2</sub> D)	W	P,G	Cool, 4°C, Add Zinc Acetate, plus Sodium Hydroxide to pH>9	7 days
Sulfide (SM 4500 S <sub>2</sub> F)	W	P,G	Cool, 4°C, Add Zinc Acetate, plus Sodium Hydroxide to pH>9	7 days
Sulfite (SM 4500 SO <sub>3</sub> B)	W	P,G	Cool, 4°C	24 hours
Sulfides, Acid Volatile	S	G	Cool, 4°C	14 days
Surfactants (MBAS) (SM 5540 C)	W	P,G	Cool, 4°C	48 hours
Tannin and Lignin (SM 5550 B)	W	P,G	Cool, 4°C	28 days
Turbidity (EPA 180.1)	W, DW	P,G	Cool, 4°C	48 hours
<b>Metals</b>				
Arsenic Species 1632	W	G	HCL to pH<2, Cool < 4°C	28 days
Mercury (1631E)	W	F	Cool, 4°C, HCl or H <sub>2</sub> SO <sub>4</sub> to pH<2	90 days
Mercury (1631E)	S	F	Freeze < -15°C	1 year
Mercury (7471)	S	P,G	Cool, 4°C	28 days
Mercury (EPA 245.1, 7470, 7471)	W, DW	P,G	HNO <sub>3</sub> to pH<2	28 days
Metals (200.7, 200.8, 6010, 6020)	W, DW	P,G	HNO <sub>3</sub> to pH<2	6 months
Metals (200.7, 200.8, 6010, 6020)	S	G, Teflon Lined cap	Cool, 4°C	6 months

DETERMINATION <sup>a</sup>	MATRIX <sup>b</sup>	CONTAINER <sup>c</sup>	PRESERVATION	HOLDING TIME
Methyl Mercury 1630	W, S, T	F	HCL to pH<2	6 months
<b>Volatile Organics</b>				
Gasoline Range Organics (8015, NWTPH-Gx)	W	G, Teflon-Lined, Septum Cap	Cool, 4°C, HCl to pH<2, No headspace	14 days
Gasoline Range Organics (8015, NWTPH-Gx)	S	G, Teflon- Lined Cap	Cool, 4°C, Minimize Headspace	14 days
Purgeable Halocarbons (624, 8260)	W	G, Teflon-Lined, Septum Cap	No Residual Chlorine Present; HCl to pH<2, Cool, 4°C, No Headspace	14 days
Purgeable Halocarbons (624, 8260)	W	G, Teflon-Lined, Septum Cap	Residual Chlorine Present; 10% Na <sub>2</sub> S <sub>2</sub> O <sub>3</sub> , HCl to pH<2, Cool, 4°C	14 days
Purgeable Halocarbons (8260)	S	G, Teflon- Lined Cap	Cool, 4°C, Minimize Headspace	14 days
Purgeable Halocarbons (8260)	S	Method 5035	Terracore/Encore device, Freeze at -20°C Methanol, Cool, 4°C	48 hr. to prepare from device, 14 days after preparing.
Purgeable Halocarbons (8260)	S	Method 5035	Sodium Bisulfate Cool, 4°C	48 hr. to prepare, 14 days after preparation
Purgeable Aromatic Hydrocarbons (including BTEX and MTBE 624, 8260)	W	G, Teflon-Lined Septum Cap, No Headspace	No Residual Chlorine Present: HCl to pH<2, Cool, 4°C, No Headspace	14 days
Purgeable Aromatic Hydrocarbons (including BTEX and MTBE 624, 8260)	W	G, Teflon-Lined Septum Cap, No Headspace	Residual Chlorine Present: 10% Na <sub>2</sub> S <sub>2</sub> O <sub>3</sub> , HCl to pH<2, Cool, 4°C	14 days
Purgeable Aromatic Hydrocarbons (including BTEX and MTBE 624, 8260)	S	G, Teflon- Lined Cap	Cool, 4°C, Minimize Headspace	14 days
Purgeable Aromatic Hydrocarbons (including BTEX and MTBE 624, 8260)	S	Method 5035	Encore, Freeze at -20°C Methanol, Cool, 4°C	48 hr. to prepare from Encore, 14 days after preparation.
Purgeable Aromatic Hydrocarbons (including BTEX and MTBE 624, 8260)	S	Method 5035	Sodium Bisulfate, Cool, 4°C	48 hr. to prepare from Encore, 14 days after preparation

DETERMINATION <sup>a</sup>	MATRIX <sup>b</sup>	CONTAINER <sup>c</sup>	PRESERVATION	HOLDING TIME
Acrolein, Acrylonitrile, Acetonitrile (624, 8260)	W	G, Teflon - Lined Septum Cap	Adjust pH to 4-5, Cool, 4°C, No headspace	14 days
2-chloroethyl vinyl ether (8260)	W	G, Teflon - Lined Septum Cap	Cool, 4°C, Minimize Headspace	7 days
<b>Semivolatile Organics</b>				
Nonylphenols	W	G, Teflon-Lined Cap	H <sub>2</sub> SO <sub>4</sub> to pH<2, Cool, 4°C	28 days until extraction; 40 days after extraction
Organotins (ALS SOP)	W, S	G, Teflon-Lined Cap	Cool, 4°C	7 <sup>f</sup> days until extraction; 40 days after extraction
Otto Fuel	W, S	G, Teflon-Lined Cap	Cool, 4°C	7 <sup>f</sup> days until extraction; 40 days after extraction
Methanol in Process Liquid NCASI 94.03	L	G, Teflon-Lined Cap	Cool, 4°C	30 days
HAPS - Condensates NCASI 99.01		G, Teflon-Lined Cap	Cool, 4°C	14/30 days
HAPS - Impinger/Canisters NCASI 99.02			Cool, 4°C	21 days
Acrylamide by HPLC/MS/MS (ALS SOP LCP-ACRYL)	W, S	G, P	Cool, 4°C	14 days until extraction; 40 days after extraction
Carbamate Pesticides by HPLC/MS/MS (EPA 8321B)	W, S	Amber G, Teflon-Lined Cap	1.2 mL ChlorAC Buffer Cool, 4°C	7 <sup>f</sup> days until extraction; 40 days after extraction
Per- and Polyfluoroalkyl Substances (PFAS) by HPLC/MS/MS (ALS SOP LCP-PFC)	W, S	HDPE, Polypropylene	Cool, 4°C	14 days until extraction; 40 days after extraction
PBDE/PBB - ROHS GC/MS	W, S, T	G	Cool, 4°C	40 days after extraction
Pharmaceuticals & Personal Care Products (PPCP) by HPLC/MS/MS (EPA 1694)	W, S	Amber G, Teflon-Lined Cap	50 mg ascorbic acid if residual chlorine present, Cool, < 6°C	7 days until extraction; 30 days after extraction

DETERMINATION <sup>a</sup>	MATRIX <sup>b</sup>	CONTAINER <sup>c</sup>	PRESERVATION	HOLDING TIME
Petroleum Hydrocarbons, Extractable (Diesel-Range Organics) (EPA 8015)	W, S	G, Teflon-Lined Cap	Cool, 4°C	7 <sup>f</sup> days until extraction, 40 days after extraction
Alcohols and Glycols (EPA 8015)	W, S	G, Teflon-Lined Cap	Cool, 4°C <sup>g</sup>	7 <sup>f</sup> days until extraction; 40 days after extraction
Acid Extractable Semivolatile Organics (EPA 625, 8270)	W	G, Teflon-Lined Cap	Cool, 4°C <sup>g</sup>	7 <sup>f</sup> days until extraction; 40 days after extraction
Base/Neutral Extractable Semivolatile Organics (EPA 625, 8270)	W	G, Teflon-Lined Cap	Cool, 4°C <sup>g</sup>	7 <sup>f</sup> days until extraction; 40 days after extraction
Acid Extractable Semivolatile Organics (EPA 8270)	S	G, Teflon-Lined Cap	Cool, 4°C <sup>g</sup>	14 days until extraction; 40 days after extraction
Base/Neutral Extractable Semivolatile Organics (EPA 8270)	S	G, Teflon-Lined Cap	Cool, 4°C <sup>g</sup>	14 days until extraction; 40 days after extraction
Chlorinated Herbicides (EPA 8151)	W, S	G, Teflon-Lined Cap	Cool, 4°C <sup>g</sup>	7 <sup>f</sup> days until extraction; 40 days after extraction
Chlorinated Phenolics (EPA 1653)	W	G, Teflon-Lined Cap	H <sub>2</sub> SO <sub>4</sub> to pH<2, Cool, 4°C <sup>g</sup>	30 days until extraction; 30 days after extraction
Polynuclear Aromatic Hydrocarbons (EPA 625, 8270)	W, S	G, Teflon-Lined Cap	Cool, 4°C, Store in Dark <sup>g</sup>	7 <sup>f</sup> days until extraction; 40 days after extraction
Organochlorine Pesticides and PCBs (EPA 608, 8081, 8082, GC/MS/MS)	W, S	G, Teflon-Lined Cap	Cool, 4°C	7 <sup>f</sup> days until extraction; 40 days after extraction
Organophosphorus Pesticides (GC/MS/MS)	W, S	G, Teflon-Lined Cap	Cool, 4°C, Store in Dark <sup>g</sup>	7 <sup>f</sup> days until extraction; 40 days after extraction
<b>Drinking Water Organics</b>				
EDB, DBCP, and TCP (EPA 504.1)	W	G, Teflon-Lined Cap	Cool, 4°C, 3 mg Na <sub>2</sub> S <sub>2</sub> O <sub>3</sub> , No Headspace	14 days

DETERMINATION <sup>a</sup>	MATRIX <sup>b</sup>	CONTAINER <sup>c</sup>	PRESERVATION	HOLDING TIME
Purgeable Organics (EPA 524.2)	DW	G, Teflon-Lined, Septum cap	Ascorbic Acid, HCl to pH <sub>≤</sub> 2, Cool, 4°C, No Headspace	14 days
Per- and Polyfluoroalkyl Substances (PFAS) by HPLC/MS/MS (EPA 537 ver1.1)	DW, W	Polypropylene	1,25 g Trizma, Cool, 10°C shipment, 6°C storage	14 days until extraction; 28 days after extraction
Haloacetic Acids (EPA 552.2)	DW	G, Amber, Teflon-Lined Cap	100 mg/L NH <sub>4</sub> Cl, Cool, 4°C	14 days until extraction; 7 days after extraction
<b>Toxicity Characteristic Leaching Procedure (TCLP)</b>				
Semivolatile Organics (EPA 1311/8270)	HW	G, Teflon - Lined Cap	Sample: Cool, 4°C, Store in dark <sup>g</sup>	14 days until TCLP extraction
			TCLP extract: Cool, 4°C, Store in dark <sup>g</sup>	7 days until extraction; 40 days after extraction
Organochlorine Pesticides (EPA 1311/8081)	HW	G, Teflon Lined Cap	Sample: Cool, 4°C	14 days until TCLP extraction
			TCLP extract: Cool, 4°C	7 days until extraction; 40 days after extraction
Chlorinated Herbicides (EPA 1311/8151)	HW	G, Teflon Lined Cap	Sample: Cool, 4°C	14 days until TCLP extraction
			TCLP extract: Cool, 4°C	7 days until extraction; 40 days after extraction
Mercury (EPA 1311/7470)	HW	P,G	Sample: Cool, 4°C	28 days until extraction
			TCLP extract: HNO <sub>3</sub> to pH<2	28 days after extraction
Metals, except Mercury (EPA 1311/6010)	HW	P,G	Sample: Cool, 4°C	180 days until extraction;
			TCLP extract: HNO <sub>3</sub> to pH<2	14 days until TCLP extraction
Volatile Organics (EPA 1311/8260)	HW	G, Teflon Lined Cap	Sample: Cool, 4°C, Minimize Headspace	14 days until TCLP extraction
			Extract: Cool 4°C, HCL to pH,2, No Headspace	14 days after extraction

		Page 75 of 81

**Appendix H**  
**Data Qualifiers**

#### Inorganic Data Qualifiers

- \* The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- E The result is an estimate amount because the value exceeded the instrument calibration range.
- J The result is an estimated value.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.  
*DOD-QSM definition*: Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.
- H The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

#### Metals Data Qualifiers

- # The control limit criteria is not applicable. See case narrative.
- J The result is an estimated value.
- E The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
- M The duplicate injection precision was not met.
- N The Matrix Spike sample recovery is not within control limits. See case narrative.
- S The reported value was determined by the Method of Standard Additions (MSA).
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.  
*DOD-QSM definition*: Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- W The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
- i The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
- X See case narrative.
- + The correlation coefficient for the MSA is less than 0.995.
- Q See case narrative. One or more quality control criteria was outside the limits.

#### Organic Data Qualifiers

- \* The result is an outlier. See case narrative.
- # The control limit criteria is not applicable. See case narrative.
- A A tentatively identified compound, a suspected aldol-condensation product.
- B The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
- C The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
- D The reported result is from a dilution.
- E The result is an estimated value.
- J The result is an estimated value.
- N The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
- p The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
- U The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL.  
*DOD-QSM definition*: Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
- i The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
- X See case narrative.
- Q See case narrative. One or more quality control criteria was outside the limits.

#### Additional Petroleum Hydrocarbon Specific Qualifiers

- F The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
- L The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
- H The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
- O The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
- Y The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
- Z The chromatographic fingerprint does not resemble a petroleum product.

## **1.0 STANDARD OPERATING PROCEDURE FOR DIOXIN/FURAN/PCB CONGENER SAMPLE PROCESSING**

### **2.0 METHOD OBJECTIVE, PURPOSE, CODES, AND SUMMARY**

- 2.1 This standard operating procedure provides the necessary instructions for the preparation, extraction and cleanup of environmental samples for analysis by high-resolution GC/MS methods listed below, for the determination of polychlorinated dibenzo-dioxins/furans(PCDDs/PCDFs) and polychlorinated biphenyls (PCBs).
- 2.2 Solid and tissue samples are homogenized as needed and extracted by soxhlet/Dean-Stark (SDS) or microwave. Aqueous samples are extracted by continuous liquid-liquid extraction (CLLE). Sample extracts are fractionated and prepared for analysis using a variety of cleanup procedures, including silica gel and florisil column chromatography.
- 2.3 Analytical methods
  - 2.3.1 EPA SW-846 Method 8290A
  - 2.3.2 EPA Method 1613B
  - 2.3.3 EPA Method TO-9a
  - 2.3.4 EPA Method 23
  - 2.3.5 EPA Method 1668A
  - 2.3.6 EPA Method 1668C
- 2.4 Extraction techniques
  - 2.4.1 Method 3520C (CLLE) Continuous Liquid-Liquid Extraction
  - 2.4.2 Method 3540C (SDS/SOX) Soxhlet/Soxhlet Dean-Stark Extraction
  - 2.4.3 Method 3546 (MWV) Microwave Extraction
- 2.5 Cleanup techniques
  - 2.5.1 Method 3620C (Florisil)
  - 2.5.2 Method 3630C (Silica)

### **3.0 APPLICABLE MATRICES**

This SOP is applicable to solid (soil, sediment, sludge), aqueous (groundwater, surface water, leachate, drinking water), air (PUF, XAD-2) and tissue matrices.

### **4.0 METHOD SCOPE, APPLICABILITY, AND DETECTION LIMIT**

- 4.1 Calibration ranges and PQLs may be found in the appropriate analytical SOPs.
- 4.2 Analysts must demonstrate proficiency prior to work under this SOP. Demonstrated proficiency may be in the form of an IDOC or PT study. Records are maintained in the Quality Department.

### **5.0 METHOD VARIATIONS**

- 5.1 Aqueous samples containing >1% solids are filtered prior to extraction. The aqueous portion is extracted by CLLE, and the filter and solids are extracted by SOX. The fractions are re-combined prior to cleanup.
- 5.2 Aqueous samples are adjusted to a pH of  $\leq 7$  using 50:50 sulfuric acid. Samples with an initial pH >10 are re-checked after acidifying to ensure a pH of  $\leq 7$ .
- 5.3 EPA Method 3520C, Continuous Liquid-Liquid Extraction and EPA Method 3540C, Soxhlet Extraction include the use and control of laboratory equipment not in use at

Cape Fear Analytical, LLC. The laboratory SOP correctly reflects the equipment used to perform the preparatory methods of reference.

- 5.4 EPA Method 3546 may be used as an alternative extraction procedure for Method 1613B, Method 8290A, Method 1668A, and Method 1668C in recognition of advances that are occurring in analytical technology that use less solvent and take less time than the Soxhlet procedure.

## 6.0 DEFINITIONS

- 6.1 AlphaLIMS: The Laboratory Information Management System used at CFA, LLC.
- 6.2 Blank: An aliquot of reagent water or other blank matrix that is treated exactly as a sample including exposure to all glassware, equipment, solvents, reagents, and standard additions that are used with other samples. The LMB (Lab Method Blank) is used to determine if method analytes or other interferences are present in the laboratory environment, the reagents, or the apparatus. Contamination may be derived during sampling, transportation, storage or analysis. The blank may be used to establish a background value.
- 6.3 Cleanup Standards: Isotopes added prior to cleanup that are used to measure the efficiency of the fractionation step alone. Method 1613B uses one compound (37Cl4-2378-TCDD) as the Cleanup Standard. Method 1668A/C uses three compounds as cleanup standards. Method 8290A does not address the use of cleanup standards.
- 6.4 Extraction Standards: Isotopes added prior to extraction that serve as internal standards. In addition, to measure the overall extraction and fractionation efficiencies.
- 6.5 Laboratory Control Standard/Duplicate (LCS/LCSD): Aliquots of reagent water or other blank matrix to which known quantities of the method analytes are added in the laboratory. The LCS/LCSD are analyzed exactly like a sample, and their purpose is to determine whether the methodology is in control, and whether the laboratory is capable of making accurate and precise measurements.
- 6.6 Laboratory Duplicate (DUP): Aliquots of a sample taken from the same container and processed in the same manner under identical laboratory conditions. The duplicate aliquot is analyzed independently from the parent sample and the results are compared to measure precision and accuracy.
- 6.7 Matrix Spike and Matrix Spike Duplicate (MS and MSD): Two separate aliquots of an environmental sample to which known quantities of the method analytes are added in the laboratory. The MS and MSD are analyzed exactly like a sample, and their purpose is to determine whether the sample matrix contributes bias to the analytical results. The concentrations of the analytes in the sample matrix must be determined in a separate aliquot and the measured values in the MS/MSD adjusted. Percent recovery is calculated for both aliquots, and RPD is calculated between the two.

## 7.0 INTERFERENCES/LIMITATIONS

- 7.1 Contaminants found in extraction glassware, solvents, and other sample processing hardware may jeopardize the integrity of this method.
- 7.2 Glassware must be scrupulously cleaned as soon as possible after extraction.
- 7.3 Reagents and solvents should be purified and tested before use, or alternatively, they should be purchased pre-cleaned by the manufacturer.

- 7.4 PCB extracts must not be allowed to concentrate to dryness due to the potential for loss of low molecular weight chlorinated biphenyls.

## 8.0 SAFETY PRECAUTIONS AND WARNINGS

### WARNING

METHYLENE CHLORIDE IS A SUSPECTED CARCINOGEN AND A KNOWN SKIN IRRITANT. NO OCCUPATIONAL EXPOSURE LIMIT FOR DIOXIN HAS BEEN ESTABLISHED. IT IS A KNOWN AND PROBABLE HUMAN CARCINOGEN.

PCBs HAVE BEEN TENTATIVELY CLASSIFIED AS KNOWN OR SUSPECTED HUMAN OR MAMMALIAN CARCINOGENS.

CONTACT WITH OXIDIZERS MAY GENERATE EXPLOSIVE MIXTURES.

PREVENT SKIN AND EYE CONTACT BY USING SPECIFIED PERSONAL PROTECTIVE EQUIPMENT WHEN MAKING STOCK REAGENTS.

WORK UNDER A HOOD TO PREVENT INHALATION WHEN MAKING STOCK REAGENTS FROM SOLIDS.

- 8.1 Eye protection should be worn when handling samples, reagents, or standards.  
NOTE: Contact lenses pose a special problem; soft lenses may absorb irritants and all lenses concentrate them. DO NOT wear contact lenses in the laboratory.
- 8.2 Treat all chemicals and samples as potential health hazards and reduce exposure to these chemicals to the lowest level possible. CFA maintains a reference file of Safety Data Sheets (SDS). These documents and individual sample SDS provided by clients are maintained in the laboratory.
- 8.3 Personal Protective Equipment (PPE)
- 8.3.1 Gloves and eye protection should be worn when handling reagents, solvents, standards and samples.
- 8.3.2 Analysts should prepare samples and standards under the hood.
- 8.4 Prior to handling radioactive samples, analysts must have had radiation safety training and must understand their full responsibilities in radioactive sample handling. Some general guidelines follow:
- 8.4.1 Proper PPE should be worn at all times when handling radioactive samples. Gloves, safety glasses, and a lab coat should be worn when handling radioactive samples. In addition, a disposable lab apron may be worn over the lab coat.
- 8.4.2 Protect counter tops with counter paper, or work from radioactive sample handling trays.
- 8.4.3 Post signs indicating radioactive samples are in the area.
- 8.4.4 Swipes of the counter tops should be taken upon completion of work.
- 8.4.5 Segregate radioactive wastes. Radioactive and non-radioactive wastes are segregated in the waste satellite area. Radioactive waste containers are obtained from Waste Management.
- 8.5 All samples, chemicals, extracts, and extraction residues must be transferred, delivered, and disposed of safely according to all related SOPs.
- 8.6 Never leave gas cylinders unchained or untied.
- 8.7 In the event of an accident or medical emergency, call for help immediately. When time and safety permit, management should be notified of all accidents.

8.8 Fire escape routes are posted in the lab, and all personnel should be familiar with them. In addition, fire safety equipment such as fire extinguishers and fire blankets are located in the lab. Training is available on the proper operation of this equipment.

8.9 For further safety instructions, consult the Safety, Health and Chemical Hygiene Plan, CF-LB-N-001.

## 9.0 APPARATUS, EQUIPMENT AND INSTRUMENTATION

9.1 Equipment associated with this SOP includes:

- Soxhlet/Continuous Liquid-Liquid Extraction Rack
- Soxhlet/Dean-Stark (SDS) glassware apparatus
- Continuous Liquid-Liquid (CLLE) glassware apparatus
- Balances
- Fume hoods
- Thermolyne 1400 furnace
- Turbovap
- Dry weight oven
- Buchner funnels
- Vacuum pump
- 2 L vacuum flask
- Microwave Extractor

9.2 Materials and supplies:

- Boiling chips
- Cellulose thimbles
- Spatulas
- Aluminum dry weight pans
- pH strips
- 5 3/4" disposable pipets and rubber pipet bulbs
- Filter paper
- Nitrogen
- 500mL test tubes
- 60 mL vials with PTFE caps
- 60 mL vial racks
- 25 mL drying columns
- 10 mL drying columns
- Glass wool
- 10-100 µL air displacement pipet and disposable tips
- 100-1000 µL air displacement pipet and disposable tips
- 1000 mL graduated cylinder

## 10.0 REAGENTS AND STANDARDS

10.1 Reagents, chemicals, and standards:

- Methylene chloride
- Toluene
- Hexane
- Carbon - Carbopack C or equivalent
- Corn oil – Carbon purified
- Celite
- Tridecane: Plug a 25 mL drying column with glass wool; add 1 g sodium sulfate; add approximately 1-2 g carbon-coated celite. Percolate the tridecane from the supplier's bottle through the carbon column. Collect into a clean and properly labeled container; document preparation in the Supply Prep logbook.
- Nonane
- Deionized water
- Sodium sulfate

- Concentrated sulfuric acid
- 1 N Sodium hydroxide
- High purity potassium hydroxide
- Neutral silica
- Acid-coated silica: 44.0 g concentrated sulfuric acid to 100 g neutral silica. Add 1 to 2 mL acid to the silica and shake vigorously; continue until all acid has been added. Document preparation in the Supply Prep logbook; affix appropriate label to jar. A one year expiration date is assigned.
- NaOH-coated silica: 30.0 g 1 N NaOH to 100 g neutral silica. Add 1 to 2 mL base to the silica and shake vigorously; continue until all base has been added. Document preparation in the Supply Prep logbook; affix appropriate label to jar.
- KOH-coated silica: Dissolve 56 g high purity KOH in 300 mL methanol. Add 100 grams neutral silica; stir on hot plate at 60° to 70°C for 1 to 2 hours. Decant liquid and rinse with two 100 mL aliquots methanol. Rinse once with 100 mL methylene chloride. Spread potassium silicate on foil and dry for 1 to 2 hours in a fume hood. Activate at 200 °C for 18 hours. Stir in 37 g neutral silica (This is a deviation from the methods, intended to reduce the strength of the KOH-coated silica to prevent recovery losses in the samples). Document preparation in the Supply Prep logbook; affix appropriate label to jar. A one year expiration date is assigned.
- Florisil: Fill a 200mL beaker with magnesium silicate and bake at 650°C overnight (1 hour minimum). Store in a glass reagent bottle with ground glass stopper to protect from moisture.
- Sand – White quartz, or other similar solid matrix: Bake at 450°C (842°F) for four hours minimum.
- Salt (sodium sulfate): Bake at 450°C (842°F) for four hours minimum.
- Source Standards: Source Standards are purchased directly from vendors and may be diluted to make stock, intermediate, or working standards. These include extraction standard, matrix spiking standard, cleanup standard, injection standard. Source standards expire per the vendor expiration date or after five years from the date opened, whichever is shorter. Please reference CF-LB-E-007 for further information regarding standards and their preparation.
- Dioxin Injection Standard - A Nonane solution containing two recovery standards, 13C-1,2,3,4-TCDD and 13C-1,2,3,7,8,9-HxCDD (see App. I for spike concentrations). The former is used to determine the percent recoveries of tetra- and pentachlorinated PCDD/PCDF labeled congeners, while the latter is used to determine the percent recoveries of the hexa-, hepta- and octachlorinated PCDD/PCDF labeled congeners. 10 to 50 µl, depending on the matrix, will be spiked into each sample extract during final concentration.
- Dioxin Cleanup Standard – A nonane standard containing 37Cl -2,3,7,8-TCDD in that is added to all method 1613 extracts prior to cleanup to measure the efficiency of the cleanup process.
- Dioxin Extraction Standard – A nonane standard containing 13C labeled dioxin and furans. Method 1613 and 8290 versions of this standard contain different numbers of labeled parameters. The method 1613 version contains all of the

labeled standards for use in method 8290. This standard is spiked into all samples prior to extraction to measure the efficiency of the extraction and cleanup processes together and to quantify native parameters.

- Dioxin Matrix Spike Standard – A nonane solution containing the 17 2378 substituted dioxin/furan parameters. This standard is spiked into certain samples for the purpose of providing positive controls such as the measurement of accuracy and precision.
- PCB Injection Standard - A nonane solution containing labeled CBs 9, 52, 101, 138, and 194. These parameters are used to quantify extraction and cleanup standards added earlier in the sample preparation process. This standard is spiked into all sample extracts during final concentration.
- PCB Cleanup Standard – A nonane solution containing labeled CBs 28, 111, and 178. This standard is added to sample extracts prior to cleanup to measure the efficiency of the cleanup process.
- PCB Extraction Standard – A nonane standard containing 27 13C labeled CBs which include toxic WHO parameters and window defining CBs. This standard is spiked into all samples prior to extraction to measure the efficiency of the extraction and cleanup processes together and to quantify native parameters.
- PCB Matrix Spike Standard – A nonane solution containing the 209 native CBs. This standard is spiked into certain samples for the purpose of providing positive controls such as the measurement of accuracy and precision.

## 11.0 SAMPLE HANDLING AND PRESERVATION

- 11.1 For method 8290A, there are no restrictions on when samples must be extracted after collection. For methods 1613B and 1668A/C, samples must be extracted within 365 days of collection. Sample extracts have no maximum recommended holding time from the date of extraction by method 8290A and a 365 day holding time from the date of extraction by 1613B and 1668A/C. For method TO-9a, cartridges are considered clean for up to 30 days from date of certification when stored in their sealed containers. Extraction must be performed within 7 days of sampling and analysis within 40 days after extraction. For method 23, cartridges are considered clean for up to 14 days (no method requirement) from date of certification when stored in their sealed containers. All samples must be extracted within 30 days of collection and analyzed within 45 days of extraction.
- 11.2 Samples should be collected in amber glass containers with PTFE-lined caps.
- 11.3 Aqueous samples should be checked in the field for the presence of residual chlorine, and if present, preserved with 80 mg sodium thiosulfate. If sample labels do not indicate whether they have been checked/preserved, the samples should be checked at the time of receipt, and preserved if necessary.
- 11.4 Samples should be maintained at  $0 \leq 6$  °C after collection until such time as they may be disposed by the laboratory.
- 11.5 Custody of samples is monitored using the AlphaLIMS sample tracking system. Each analyst should scan the samples planned to extract into their custody.
- 11.6 All samples and sample extracts should be treated with caution as potential health hazards. Refer to Section 8.0 on safety.

## 12.0 SAMPLE PREPARATION

- 12.1 Sample preparation and conditioning

### 12.1.1 Homogenization of tissue

- Vegetation samples can require special procedures to prevent cross contamination from other matrices. Some vegetation can be difficult to reduce in particle size and homogenize. Vegetation sample processing is handled on a case-by-case basis with project management to client communication.
- Tissue samples should be received and maintained at -10 to -20°C. If a sample is received as a whole specimen (fish, rodent, etc.), a project manager should verify with the client which portion of the specimen is to be analyzed.
- If specific portions must be dissected from the whole specimen, the remaining tissue can be refrozen. When the entire sample, usually fish, requires analysis, reduce the sample down to manageable means using a butcher knife.

**NOTE: Great care must be exercised when reducing a frozen fish with a knife. Cut-resistant gloves must be worn to protect the hands as well as to hold the fish in place.**

- When analyzing specific portions, such as a fillet, dissect the required portion under stringent safety guidelines to prevent injury as well as to ensure the integrity of the sample.
- Once reduced in size or dissected to the appropriate portion, process the tissue through a meat grinder, if required, and collect into an amber glass jar.
- To ensure a homogeneous mixture, grind the sample two more times.
- Record any observations on the bench sheet.

### 12.1.2 Compositing

Specific procedures for compositing may be found in SOP CF-LB-E-031.

### 12.1.3 Percent solids determination

Specific procedures for determination of percent solids (moisture content) may be found in SOP CF-OA-E-020.

### 12.1.4 Percent lipids determination

Specific procedures for determination of percent lipids may be found in SOP CF-OA-E-021.

### 12.1.5 Sub-Sampling

Sample matrices and mechanisms of contamination are infinitely variable and require judgments to be made. If the client provides no instructions, it is advisable that experienced analysts decide which sub-sampling techniques are employed. For solid samples, mixing is the preferred process. For liquid samples without obvious layers, the entire container is used and rinsed. Documentation of these two forms of sub-sampling is not required due to the frequency of their use.

All other selected sub-sampling techniques should be documented. If the sample integrity or composition does not match that anticipated by the laboratory, the client must be contacted to confirm or clarify any sub-sampling instructions. An example of a time when client direction is required can be demonstrated with the receipt of a coring sleeve. If upon opening the container, the analyst notices obvious heterogeneous composition of the sample, (clay in one end of the sleeve, and sand at

the other end), appropriate instructions from the client must be obtained prior to beginning analysis.

Anytime the analytical result will obviously be biased, it must be documented, and the client should be notified prior to beginning any sub-sampling technique. An example of a time when this occurs is when interferences or target contamination require the use of a reduced extraction volume for a liquid sample preventing a container rinse.

#### 12.1.6 Air Cartridge/Trap Preparation

TO-9a sampling cartridges are available pre-cleaned and assembled. Method 23 traps that have been through the glassware cleaning procedure are empty and require laboratory personnel to load XAD resin into them and secure the resin with glass wool prior to fortification.

Prior to field deployment, the laboratory adds surrogate compounds (i.e., chemically inert compounds not expected to occur in an environmental sample) to the center bed of the PUF cartridge or XAD trap, using a pipette. The surrogate compounds must be added to each cartridge or trap assembly.

The laboratory will use the recoveries of the surrogate compounds to monitor for unusual matrix effects and gross sampling processing errors.

## 12.2 Sample Extraction

### 12.2.1 Pre-extraction for both Soxhlet and Dean-Stark (SOX and SDS) Extraction

#### 12.2.1.1 Pre-extraction

- Add one scoop of boiling chips to a round-bottom.
- Fill 500 mL round-bottom flask with 350 mL extraction solvent (methylene chloride for all tissues and PCB solids; toluene for dioxin/furan solids).
- Add a soxhlet to the round-bottom flask and clamp the apparatus securely to the extraction rack.
- If pre-extracting for PCB samples, include glass wool.
- Dean-Stark adapters are cleaned as needed and are not required during pre-extraction. Sand and silica are cleaned separately for use later in the process.
- Attach the condenser.
- Pull out emergency stops to energize heater controllers.
- Set the heating mantle controller to '65' for toluene or '50' for methylene chloride, turn power switch to 'on', and allow to reflux for 3 to 4 hours.
- Turn power switch to 'off' and allow apparatus to cool.
- Hit emergency stops to turn off controllers.
- Thimbles are used only for dioxins and are used as received from the manufacturer.
- Disassemble extraction apparatus and transfer the solvent into appropriate waste container.
- Glassware is now prepared for extraction.

### 12.2.2 Soxhlet (SOX) Extraction of PCB Solid Samples

This procedure is used for PCB solids and tissues.

- Refill the round-bottom flask with 350 mL extraction solvent.

- Add one scoop fresh boiling chips.
- Reassemble the glassware apparatus, clamping securely to the extraction rack.
- Weigh a 10 g dry weight equivalent sample aliquot into a clean glass beaker. Record the sample weight. For wet samples, a shallow layer of salt may be used on the bottom of the beaker.
- Re-seal the sample container and prepare it to be returned to cold storage. If this aliquotting depleted the sample's volume then re-seal the container and scan it to warm storage.
- Add the appropriate type and amount of extraction standard to the sample (see Appendix 1). Add the appropriate type and amount of matrix spike to the LCS/LCSD. Using a small amount of acetone, incorporate the standard into the sample matrix.
- Allow the sample at least 1 hour for equilibration.
- Manually mix approximately 10-15g of salt (sodium sulfate) into the sample with a spatula. Carefully breaking up any large clumps of sample. Additional salt may be required to fully dry the sample to free flowing.
- Add the mixed sample into the appropriately labeled soxhlet. If the sample/salt mixture exceeds the capacity of the soxhlet, a second soxhlet will be used.
- Rinse the beaker with extraction solvent and transfer to the soxhlet.
- Attach the condenser.
- Pull out emergency stops.
- Set the heating mantle controller to '50' for methylene chloride to ensure 4 to 6 cycles per hour. Turn power switch to 'on', and allow to reflux for 18 to 24 hours. When the last sample has been turned on, record this as the start time for the extraction.
- At the end of the extraction period, open the stopcock on the soxhlet and allow the solvent to drain to waste. When the first sample has had its stopcock opened, record this as the stop time for the extraction.
- When the solvent level reaches 30 to 40 mL, turn off the heating mantle controller and allow the apparatus to cool.
- Hit emergency stops.
- Remove the condenser and soxhlet from the round-bottom flask, and place the sample and glass wool into the appropriate waste can.
- Quantitatively transfer the extract from the round-bottom flask to an appropriately labeled 60 mL vial.
- Normally, 100% of the extract is delivered to cleanup. If splitting or archiving of the extract is required, perform that step now.
- Concentrate the extract under nitrogen in a Turbovap. PCB extracts should be concentrated to approximately 2 to 3 mL to avoid analyte loss. **DO NOT TAKE PCB EXTRACTS TO DRYNESS.**

- Add the appropriate type and amount of cleanup standard to the extract (see Appendix 1).
- The extract is now ready for cleanup.

### 12.2.3 Soxhlet (SOX) Extraction of Dioxin Solid Samples

This procedure is used for dry dioxin samples such as filters, wipes, etc. This procedure is also used for dioxin tissues. Dioxin soils, which may contain water are extracted by soxhlet also, but with a dean-stark trap. See the next section for use of the dean-stark trap.

- Refill the round-bottom flask with 350 mL extraction solvent.
- Add one scoop fresh boiling chips.
- Add 500 uL tridecane as a keeper solvent. **Please Note: This step is not performed for SC samples.**
- Reassemble the glassware apparatus, clamp securely to the extraction rack.
- For tissue samples, place a thimble into a labeled clean container such as a glass beaker. Weigh a 10 g sample aliquot into the thimble.
- Re-seal the sample container and prepare it to be returned to cold storage. If this aliquotting depleted the sample's volume then re-seal the container and scan it to warm storage.
- For wipes or filters, place the entire sample directly into the soxhlet.
- Add the appropriate type and amount of extraction standard (spike) to the thimble (see Appendix 1). Also add matrix spike mix as appropriate. Mix in the standards (for tissues). A small amount of acetone or methanol, 1-2 mL, is used to aid in mixing in the standards.
- Allow the sample at least 1 hour for equilibration.
- Manually mix approximately 10-15g of salt into the sample with a spatula. Carefully break up any large clumps of sample.
- Place the thimble into the appropriately labeled soxhlet.
- Attach the condenser.
- Pull out emergency stops.
- Set the heating mantle controller to '65' for toluene or '50' for methylene chloride to ensure 4 to 6 cycles per hour. Turn power switch to 'on', and allow to reflux for 18 to 24 hours. (8290 requires at least 16 hours). When the last sample has been turned on, record this as the start time for the extraction.
- At the end of the extraction period, open the stopcock on the soxhlet and allow the solvent to drain to waste. When the first sample has had its stopcock opened, record this as the stop time for the extraction.
- When the solvent level reaches 30 to 40 mL, turn off the heating mantle controller and allow the apparatus to cool.
- Hit emergency stops.
- Remove the condenser from the soxhlet and place it in its holder.

- Remove the soxhlet from the round-bottom flask. Place the cellulose thimble into the appropriate waste can and place the soxhlet in the fume hood.
- Quantitatively transfer the extract from the round-bottom flask to an appropriately labeled 60 mL vial.
- Normally, 100% of the extract is delivered to cleanup. If splitting or archiving of the extract is required, perform that step now.
- Concentrate the extract under nitrogen in a Turbovap. Extracts should be concentrated to 500  $\mu$ L (tridecane) and exchanged with hexane.
- Add the appropriate type and amount of cleanup standard to the extract (see Appendix 1).
- The extract is now ready for cleanup.

#### 12.2.4 Soxhlet Dean-Stark (SDS) Extraction of Dioxin Solid Samples

This procedure is a soxhlet procedure that uses a dean-stark trap. It is employed for dioxin soils/solids that may contain water such as sediments, soils and XAD resin. See the next section for air extraction.

- Refill the round-bottom flask with 350 mL extraction solvent.
- Add one scoop fresh boiling chips.
- Add 500  $\mu$ L tridecane as a keeper solvent. **Please Note: This step is not performed for SC samples.**
- Reassemble the glassware apparatus, clamp securely to the extraction rack.
- Place pre-extracted cellulose thimbles into labeled clean containers such as glass beakers. Weigh a 10 g dry weight equivalent sample aliquot into the thimble. A beaker may be used for this purpose and the sample added to the thimble just prior to placing it in a soxhlet.
- Re-seal the sample container and prepare it to be returned to cold storage. If this aliquoting depleted the samples volume then re-seal the container and scan it to warm storage.
- Add the appropriate type and amount of extraction standard (spike) to the thimble (see Appendix 1). Also add matrix spike mix as appropriate. Mix in the standards. A small amount of acetone (or methanol), 1-2 mL, is used to aid in mixing in the standards.
- Allow the sample at least 1 hour for equilibration.
- Manually mix approximately 10-15g of sand into the sample with a clean spatula. Carefully break up any large clumps of sample. Do not disturb the silica layer during this process. Additional sand may be required to fully disperse the sample. If clumping is suspected, the beaker may be used to further inspect the sample and break up the clumps. If this step is performed in a beaker, add the mixed sample back to the thimble. If the sample/sand mixture exceeds the capacity of the thimble, a second thimble and soxhlet will be used.

- Place the thimble into the appropriately labeled soxhlet.
- Rinse the beaker with extraction solvent and transfer to the soxhlet.
- Add a Dean-Stark adaptor, charge it with solvent, and attach the condenser.
- Pull out emergency stops.
- Set the heating mantle controller to '65' for toluene to ensure 4 to 6 cycles per hour. Turn power switch to 'on', and allow to reflux 18 to 24 hours. (8290 requires at least 16 hours). When the last sample has been turned on, record this as the start time for the extraction.
- Drain the Dean-Stark adapter's water reservoir as needed.
- At the end of the extraction period, open the stopcock on the soxhlet and allow the solvent to drain to waste. When the first sample has had its stopcock opened, record this as the stop time for the extraction.
- When the solvent level reaches 30 to 40 mL, turn off the heating mantle controller and allow the apparatus to cool.
- Hit emergency stops.
- Remove the condenser from the soxhlet and place it in its holder. Using a beaker, drain the traps reservoir. Remove the trap from the soxhlet.
- Remove the soxhlet from the round-bottom flask. Place the cellulose thimble into the appropriate waste can and place the soxhlet in the fume hood.
- Quantitatively transfer the extract from the round-bottom flask to an appropriately labeled 60 mL vial.
- Normally, 100% of the extract is delivered to cleanup. If splitting or archiving of the extract is required, perform that step now.
- Concentrate the extract under nitrogen in a Turbovap. Extracts should be concentrated to 500  $\mu$ L (tridecane) and exchanged with hexane.
- Add the appropriate type and amount of cleanup standard to the extract (see Appendix 1).
- The extract is now ready for cleanup.

#### 12.2.5 Extraction of Air Samples

- Refill the round-bottom flask with 350 mL of toluene.
- Add one scoop fresh boiling chips.
- For dioxin/furan extractions, add 500  $\mu$ L tridecane as a keeper solvent. Do NOT add tridecane for PCB extractions.
- Reassemble the glassware apparatus, clamp securely to the extraction rack.
- For TO-9A place the filter then the PUF directly into thimble holder.
- For M23 transfer XAD into a cellulose thimble

- Add the appropriate type and amount of extraction standard (spike) to the thimble/PUF (see Appendix 1). Also add matrix spike mix as appropriate.
- Allow the sample at least 1 hour for equilibration. The sample may be allowed to equilibrate on the soxhlet.
- Place the thimble into the appropriately labeled soxhlet.
- Attach the condenser.
- Pull out emergency stops.
- Set the heating mantle controller to '65' for toluene to ensure 4 to 6 cycles per hour. Turn power switch to 'on', and allow to reflux for 16 hours. (TO-9a and M23 require 16 hours). When the last sample has been turned on, record this as the start time for the extraction.
- At the end of the extraction period, open the stopcock on the soxhlet and allow the solvent to drain to waste. When the first sample has had its stopcock opened, record this as the stop time for the extraction.
- When the solvent level reaches 30 to 40 mL, turn off the heating mantle controller and allow the apparatus to cool.
- Hit emergency stops.
- Remove the condenser from the soxhlet and place it in its holder. Using a beaker, drain the traps reservoir. Remove the trap from the soxhlet.
- Remove the soxhlet from the round-bottom flask, and place the cellulose thimble/PUF into the appropriate waste can. Place the soxhlet in the fume hood.
- Quantitatively transfer the extract from the round-bottom flask to an appropriately labeled 60 mL vial.
- Archive 50% of the extract.
- Concentrate the extract under nitrogen in a Turbovap. Dioxin/furan extracts should be concentrated to 250  $\mu$ L (tridecane) and exchanged with hexane. PCB extracts should be concentrated to approximately 2 to 3 mL to avoid analyte loss. **DO NOT TAKE PCB EXTRACTS TO DRYNESS.**
- The extract is now ready for cleanup.

#### 12.2.6 Microwave (MWV) Extraction of Dioxin and PCB Solid Samples

This procedure is for extracting dioxins/furans and PCBs from soils, tissues, clays, sediments, sludges, and solid wastes. Microwave energy is used to produce elevated temperature and pressure conditions in a closed vessel containing the sample and organic solvent(s) to achieve analyte recoveries equivalent to those from Soxhlet extraction (method 3540), using less solvent and taking significantly less time than the Soxhlet procedure. This method (3546) was developed and validated on commercially-available solvent extraction systems for solid matrices containing up to 5,000 ng/g of PCBs and 6000 pg/g of PCDDs/PCDFs.

- Locate 500mL test tubes.

- Weigh a 10 g dry weight equivalent sample aliquot into a glass beaker. (QC samples are 10g sand, 10 grams salt)
- Re-seal the sample container and prepare it to be returned to cold storage. If this aliquoting depleted the samples volume then re-seal the container and scan it to warm storage.
- To a spiking vial containing 100-250uL of acetone, add the appropriate type and amount of extraction standard (see Appendix 1). Also add matrix spike mix as appropriate.
- Manually mix approximately 10-15g of salt into the sample with a clean spatula. Carefully break up any large clumps of sample. Additional salt may be required to fully disperse the sample. If clumping is suspected, inspect the sample and break up the clumps. (If the sample/salt mixture exceeds the capacity of the 500 mL test tube, a beaker will be used.)
- Add the prepared spike in acetone to the sample in the tube/beaker, mix, and allow the sample at least 1 hour for equilibration. Complete the spike transfer with rinse of the vial with extraction solvent (1:1 hexane/acetone).
- Add 30mL of extraction solvent to the 500mL tube.
- Load the tube into a microwavable vessel and place in the turntable. Seal the tube with torque gun.
- Load turntable into microwave and seal the door.
- Using the microwaves software, load the sample extraction method and start the extraction. Record start time/date.
- After cooling, remove the turntable.
- Add 500 uL tridecane as a keeper solvent to collection vials. Transfer solvent from 500mL tube to 60mL vial through a salt funnel. Rinse the 500mL tube with 10-20 mL of extraction solvent.
- Normally, 100% of the extract is delivered to cleanup. If splitting or archiving of the extract is required, perform that step now.
- Concentrate the extract under nitrogen in a Turbovap. Extracts should be concentrated to 500  $\mu$ L (tridecane) and exchanged with hexane.
- Add the appropriate type and amount of cleanup standard to the extract (see Appendix 1).
- The extract is now ready for cleanup.

## 12.2.7 Aqueous Extraction

### 12.2.6.1 Continuous Liquid-Liquid Pre-extraction

- Verify water level in circulation tank.
- Turn the two-way valves to 'extract' and turn on the pump switch to 'extract'. Verify water is flowing.
- Turn on the water heater to 160 °F.
- Add 1 to 2 boiling chips to the concentrator, fill the drying adapter halfway with sodium sulfate, and assemble the glassware apparatus.

- Securely attach the apparatus to the CLLE extraction rack. Attach the water hoses to the concentrator.
- Add 200 mL methylene chloride to the extractor body. Then add 1 L deionized water, being careful not to allow any water into the sidearm.
- Attach the condenser to the apparatus.
- Verify chiller temperature and flow.
- Open the water valves to allow hot water to flow through the concentrator.
- Open the sidearm stopcock to allow methylene chloride to flow over to the drying adapter.
- Allow pre-extraction to run for at least 1 hour.
- Close stopcock and allow methylene chloride to concentrate to 15-20 mL.
- Turn off heater, close water valves, turn two-way valves to 'drain', and turn pump switch to 'drain'.
- Once the water has drained, turn the pump switch to 'off'.
- Remove the concentrator and drying adapter and pour remaining methylene chloride into the appropriate waste container, leaving the boiling chips inside.
- Rinse twice more with methylene chloride and dump to waste.
- Re-attach the drying adapter.
- Remove the extractor body and dump the deionized water and methylene chloride in the appropriate waste container.
- Re-attach the entire apparatus to the extraction rack.
- Glassware is now ready for sample extraction.

#### 12.2.6.2 High- solids (>1%) Procedure

- Remove water sample from cold storage and allow to come to room temperature.
- Prepare QC samples by adding 10g of glass beads and DI water into a 1L container.
- Shake the sample to thoroughly homogenize.
- Pour the dry weight equivalent into a secondary 1L container on balance. NOTE: If a second container of sample is to be used (normally in cases of re-extraction), be sure a %solids measurement has been taken on the additional container.
- Add 40uL of nonane as a 'keeper' solvent.
- Spike the sample with the appropriate type and amount of extraction standard (See Appendix 1).
- Allow sample to equilibrate for 1-2 hours.
- Attach a large funnel and filter assembly directly to the liquid extraction vessel.
- Slowly pour in the sample and allow it to filter.
- Rinse the sample bottle with 50mL deionized water and pour into funnel.

- Rinse the sample bottle with 50mL dichloromethane and pour into funnel.
- Allow all fluid to flow through the filter.
- Transfer the filter with the remaining solids into a cellulose thimble.
- Rinse the funnel with dichloromethane.
- Add salt as needed to the filter cake. For dioxins, dean-stark adapters may be used.
- Extract the liquid using the procedure in Section 12.2.6.3 and the solid using procedures in 12.2.2. NOTE: SAMPLE HAS ALREADY BEEN SPIKED. DO NOT RESPIKE.

#### 12.2.6.3 Low-solids (<1%) Extraction by Continuous Liquid-Liquid (CLLE)

- Fill extractor body with 250 mL methylene chloride.
- Remove water sample from the cooler and allow to come to room temperature.
- If the pH is above 7, add 2 mL 50:50 sulfuric acid to the extractor body. If initial pH was >10, re-check pH; if still > 7, continue adding acid to achieve a pH  $\leq 7$ .
- If the sample is decanted, such as to extract a smaller volume than nominal, then re-seal the original sample container and prepare it to be scanned to cold storage. Mark the sample as decanted in LIMS.
- Place sample on balance and record the initial weight.
- Spike the sample with the appropriate type and amount of extraction standard (see Appendix 1). Add 10mL of methylene chloride to the standard vial.
- Shake to thoroughly homogenize the sample and allow 1 hour for equilibration.
- Pour into the appropriately labeled extractor body, being sure the sample does not get into the sidearm.
- Reweigh the sample bottle on the tared scale and record the resulting sample volume on the bench sheet.
- Add approximately 50mL of methylene chloride to the sample bottle, cap and shake to rinse the bottle. Open the bottle carefully to vent any potential solvent pressure. Pour the methylene chloride from the bottle rinse and standard vial rinse into the extractor body.
- Attach the condenser.
- Turn the two-way valves to 'extract' and turn on the pump switch to 'extract'.
- Turn on the water heater.
- Open the water valves.
- Open the stopcock. When the last sample has been opened, record this as the start time for the extraction.
- Allow the sample to extract for 18 to 24 hours at 1 to 2 drops/second.

- Close the stopcock and allow the extract to concentrate down to the nipple of the concentrator. When the first sample has been closed, record this as the stop time for the extraction. If samples are for PCB analysis, only concentrate to 5 to 10 mL to avoid analyte loss.
- Turn heater off, close water valves, switch two-way valves to 'drain' and turn pump to 'drain'.
- When water has drained, turn pump to 'off'.
- Remove concentrator and drying adapter.
- Pour contents of extractor body into the appropriate waste container.
- Remove drying adapter from concentrator and dump sodium sulfate into appropriate waste container.
- Quantitatively transfer the extract to an appropriately labeled 60 mL vial.
- Add the appropriate type and amount of cleanup standard to the vial. For dioxin/furan extracts, add 100  $\mu$ L tridecane to the vial.
- Concentrate the extracts down to the 100  $\mu$ L tridecane in the Turbovap at 45 °C. For PCB extracts, only concentrate down to 2 to 3 mL.
- Remove the vial and cap.
- Extract is now ready for cleanup.

#### 12.2.8 Waste Dilution Procedures

Typically performed on oily wastes, but is useful for samples with high levels of interferences, target parameters, incidental odor, etc.

- Prepare labeled 60mL vials.
- Weigh 1 gram of a solid matrix into the vial. Surrogate matrix is used to prepare QC vials.
- Add 50mL of the appropriate dilution solvent, typically hexane.
- If the sample matrix dissolves in the solvent then one may proceed to aliquot. If the sample matrix does not dissolve, one can try heat and sonication to speed up the process. Please note any discrepancies.
- Prepare a second set of labeled vials.
- Aliquot 1mL of each diluted sample into the second set of vials. Archive the dilution vials.
- Spike the 1mL sample vials with the appropriate type and amount of extraction standard.
- Extract is now ready for cleanup.

#### 12.3 Cleanup Procedures

The preparation guide in the appendix may be used to assist in assembling cleanup columns.

##### 12.3.1 Mini Acid/Base Silica Column (for dioxin/furan samples)

- A smaller version of this column as follows is used for samples with less potential contaminating interferences such as drinking waters. Insert a glass wool plug into a 25 mL drying column and

pack the column from bottom to top as follows: 4g acidic silica gel, 1 g neutral silica gel, 2 g sodium sulfate.

- Rinse the column with 20 mL dichloromethane and catch in a rinsate container.
- Rinse the column with 20 mL hexane and catch in a rinsate container.
- Position a 60 mL vial under the column.
- Quantitatively transfer the 1mL extract onto the column and follow with a 5mL rinse with hexane.
- Elute the sample with 25 mL hexane.
- Remove the 60 mL vial and cap.
- Concentrate the vial in the Turbovap at 45 °C.
- If the extract requires additional cleanup, concentrate to approximately 1 to 2 mL and proceed to another cleanup step.
- If the extract is ready for analysis, concentrate to 0.5 mL.
- Quantitatively transfer the extract to a labeled GC vial and deliver to the GC/MS analyst.

#### 12.3.2 Acid/Base Silica Column (for PCB samples)

- Insert a glass wool plug into a 25 mL drying column and pack the column from bottom to top as follows: 1 g neutral silica gel, 4 g basic silica gel, 1 g neutral silica gel, 8 g acidic silica gel, 2 g neutral silica gel, 4 g sodium sulfate.
- Rinse the column with 100mL of DCM and a 50mL aliquot of hexane and catch in a waste container.
- Position a 60 mL vial under the column.
- Quantitatively transfer the extract onto the column.
- Begin elution the sample with 50mL hexane into a collection vial. Place a second vial in position and elute with another 50mL aliquot of hexane. One may begin to concentrate the first vial as soon as it is full. Continue concentrating the first vial to approximately 5mL so that it can be added to the second.
- If the extract requires additional cleanup, concentrate to approximately 1 to 2 mL in the Turbovap at 45 °C and proceed to another cleanup step.
- If the extract is ready for analysis, concentrate to 0.5 mL. DO NOT let PCB extracts go to dryness.
- Quantitatively transfer the extract to a labeled GC vial containing 18 µL nonane and deliver to the GC/MS analyst.

#### 12.3.3 Anthropogenic Isolation Column (for all tissue samples)

- Insert a glass wool plug into a 25 mL drying column and pack the column as follows: 2 g neutral silica gel, 2 g potassium silicate, 2 g sodium sulfate, 10 g acid silica gel, 2 g sodium sulfate.
- Elute the column with 100 mL hexane and collect to a waste container.
- Quantitatively transfer the extract to the column.

- Elute with 200 mL hexane and collect into an appropriate sample container.
- If the sample requires further cleanup, concentrate the extract to approximately 1 to 2 mL hexane in the Turbovap at 45 °C and proceed with another cleanup.
- If no further cleanup is required, concentrate to 0.5 mL for dioxin/furan samples. For PCB samples, concentrate only to approximately 0.5 mL. DO NOT take PCB samples to dryness.
- Quantitatively transfer the extract to a labeled GC vial and deliver to the GC/MS analyst.

#### 12.3.4 Acid/Base Back-Extraction (for PCB samples)

- Partition the extract against 50 mL potassium hydroxide solution.
- Shake for 2 minutes, venting periodically.
- Remove and discard the aqueous layer.
- Repeat until no color is visible in the aqueous layer, to a maximum of four washings.
- Partition the extract against 50 mL sodium chloride solution.
- Discard the aqueous layer.
- Partition the extract against 50 mL sulfuric acid.
- Discard the aqueous layer.
- Repeat until no color is visible in the aqueous layer, to a maximum of four washings.
- Partition the extract against 50 mL sodium chloride solution.
- Discard the aqueous layer.
- Transfer the extract to a drying column containing 7-10 grams sodium sulfate.
- Concentrate the extract to 1 to 2 mL hexane in the Turbovap at 45°C and proceed with additional cleanup steps.

#### 12.3.5 Acid/Base/Florisil Column Extraction (for Dioxin samples)

- Prepare a silica gel column as follows: Insert a glass wool plug into a 25 mL drying column and pack the column from bottom to top as follows: 1 g neutral silica gel, 4 g basic silica gel, 1 g neutral silica gel, 8 g acidic silica gel, 2 g neutral silica gel, 4 g sodium sulfate.
- Rinse the silica gel column with 30mL of DCM and then 30 mL hexane and catch in a waste container.
- Prepare the florisil column as follows: Insert a glass wool plug into a 10 mL disposable pipet, pack with 1.5 g florisil, and top with 1 g sodium sulfate.
- Rinse the column with 10 mL methylene chloride, 10 mL hexane, and discard to waste.
- Position the columns so that the florisil column receives the silica gel effluent.
- Quantitatively transfer the 3mL extract onto the column followed by two 2mL rinses.

- Elute the sample with 50 mL hexane to waste.
- Elute the sample with 50 mL hexane a second time to waste.
- Remove the silica gel column.
- Elute the florisil column with 20 mL 2% methylene chloride/hexane and discard to waste.
- Position a 60 mL vial under the column.
- Elute with an additional 55 mL DCM.
- Concentrate to approximately 0.5 ml in the Turbovap at 45°C.
- Quantitatively transfer the extract to a labeled GC vial and deliver to the GC/MS analyst.

### **13.0 QUALITY CONTROL SAMPLES AND REQUIREMENTS**

#### **13.1 Method Blank (MB)**

A method blank is extracted with each extraction batch of 20 samples or less. The method blank should be a reagent-free matrix similar to that of the batch, such as deionized water, glass beads, PUF (a polyurethane foam, supplied 1-3 inch cylinders approximately 3 inches long), XAD (a hydrophobic crosslinked polystyrene copolymer resin, supplied as 20-60 mesh size white insoluble beads), or purified corn oil. The method blank is spiked in the same manner as the samples. The method blank is subjected to the same extraction and cleanup procedures as the samples, and is used as a measure of laboratory contamination. Method blank acceptance criteria may be found in the appropriate analytical SOP.

#### **13.2 Laboratory Control Sample/Laboratory Control Sample Duplicate (LCS/LCSD)**

A laboratory control sample is extracted with each extraction batch of 20 samples or less. The LCS should be a reagent-free matrix (as listed above), and is subjected to the same extraction and cleanup procedures. The LCS is spiked with native analytes in addition to the extraction standards added to all samples. The LCS is subjected to the same extraction and cleanup procedures as the samples, and is used as a measure of system performance. A LCSD may also be performed as required by the analytical method. LCS/LCSD acceptance criteria may be found in the appropriate analytical SOP.

#### **13.3 Matrix Spike/Matrix Spike Duplicate (MS/MSD)**

A MS/MSD pair may be performed as required by the analytical method, or as requested by a specific client. A matrix spike is a second aliquot of sample which is spiked with native analytes prior to extraction, and is used as another measure of system performance. MS/MSD acceptance criteria (if available) may be found in the appropriate analytical SOP.

### **14.0 INSTRUMENT CALIBRATION, STANDARDIZATION AND PERFORMANCE**

Samples are analyzed using a Waters Autospec Premier high-resolution GC/MS system. Instrument calibration, standardization and performance information may be found in the appropriate analytical SOP.

### **15.0 PROCEDURE FOR ANALYSIS AND INSTRUMENT OPERATION**

Procedures for analysis and instrument operation may be found in the appropriate analytical SOP.

### **16.0 EQUIPMENT AND INSTRUMENT MAINTENANCE**

16.1 Chiller water levels should be checked monthly.

16.2 Chromalox heater water level should be checked each day of use.

**16.3 Balance**

Procedures for balance calibration and maintenance may be found in SOP CF-LB-E-002 for Balances.

**16.4 Fume Hood**

Fume hood monitoring and maintenance may be found in SOP CF-FC-E-003.

16.5 Dry weight oven temperature should be verified each day of use.

**17.0 DATA RECORDING, CALCULATION AND REDUCTION METHODS**

17.1 Data such as sample weights/volumes, dry weights, pH, spike amounts and lot numbers are input to the LIMS.

17.2 Calculations such as percent moisture and percent lipids are calculated in the LIMS.

**18.0 POLLUTION/CONTAMINATION**

18.1 Work areas should be maintained free of dust and dirt accumulations.

18.2 Whenever possible, work should be performed in a fume hood to reduce the spread of solvent fumes and airborne contaminants.

18.3 Glassware should be washed and prepared in a designated area.

**19.0 DATA REVIEW, APPROVAL AND TRANSMITTAL**

Bench data are input manually to AlphaLIMS. The data recorded in AlphaLIMS are checked by the analyst for accuracy and completeness.

**20.0 CORRECTIVE ACTION FOR OUT-OF-CONTROL OR UNACCEPTABLE DATA**

Corrective action for out-of-control data may require instrument maintenance, re-extraction, the use of a new spike mix, or a more complex set of actions. When troubleshooting measures (Section 21) fail to bring an analytical process or data into control, a nonconformance report (NCR) and/or corrective action should be initiated in accordance with CF-QS-E-004 for the Documentation of Nonconformance Reporting and Dispositioning and Control of Nonconforming Items, and CF-QS-E-002 for Conducting Corrective Action.

**21.0 CONTINGENCIES FOR HANDLING THESE SITUATIONS**

Troubleshooting is used to determine the appropriate action to take when a sample or QC fails to meet defined acceptance criteria. Troubleshooting may involve one or more of the following actions:

21.1 When a method blank fails the defined criteria, the analyst must find and eliminate the source of contamination before proceeding with the analysis. This may involve the further testing of reagents, solvents, equipment or glassware. If the contamination is believed to be from a highly contaminated sample in the batch, the sample may be removed from the batch and the remaining batch re-processed.

21.2 If an extraction standard recovery fails the specified criteria, the sample must be evaluated as to why the failure may have occurred. If matrix interferences are apparent, the extract may need further cleanup steps, or the sample may need to be re-extracted at a reduced weight/volume.

21.3 If any native analyte recoveries in the LCS are outside specified limits, the process should be examined. Corrective action may include repeating the extraction or analysis, utilizing a new spike mix, or more complex actions.

21.4 If normal equipment and software operating procedures do not resolve troubleshooting efforts, the manuals for software, hardware and other equipment discussed in this SOP are available for consultation and resolution. On-line support may be

available from software and instrument manufacturers, as well. Any revisions, repairs or corrective actions required must be documented in accordance with the laboratory's Quality System as described in CF-QS-B-001.

## 22.0 RECORDS MANAGEMENT

- 22.1 Bench data logbooks are stored in the lab in storage boxes as long as there is space available. When space runs out, the boxes are sent to off-site storage.
- 22.2 Records generated as a result of this procedure are maintained as quality documents in accordance with CF-QS-E-008 for Quality Records Management and Disposition.

## 23.0 LABORATORY WASTE HANDLING AND DISPOSAL

Laboratory waste is disposed in accordance with the Laboratory Waste Management Plan, CF-LB-G-001.

## 25.0 HISTORY

- Revision 11. Cleanup solvent volume corrections, pH strip dip allowed in CLLE.
- Revision 12. Radiation safety additions in section 8.
- Revision 13. Addition of Method 8280B. Clarifications to extractions procedures.
- Revision 14. Removed duplicate step in PCB SOX procedure.
- Revision 15. Removed water rinse from CLLE sample prep; Removed 8280B references; refinements to PCB SOX.
- Revision 16. Consolidated cleanup steps; updated spike profile for 1613 CS and 8280.
- Revision 17. Added cleanup column prep guide; changed prep of sand to include baking.
- Revision 18. Added clarification as to what steps mark the extraction start and stop times to be recorded.
- Revision 19. Added details to CLLE section. Added 3546 extraction procedure.
- Revision 20. Added florisol preparation procedure.
- Revision 21. Added details to tridecane preparation.

Revision 22. Update 3546 extraction procedure. Added sodium sulfate preparation procedure.

Revision 23. Added extraction rates.

Revision 24. Updated method variations to include microwave extraction. Updated 3546 extraction procedure. Added reference for percent lipid determination.

Revision 25. Update 8290 holding times.

## Sample Fortification:

- Line up vials to match the rack. Label the vials: With the sample id, or if using a labeled rack, just label, or otherwise indicate, the LCS/LCSD/MS/MSD, or with the rack position number and indicate the LCS/LCSD/MS/MSD.
- Add approximately 100-250  $\mu\text{L}$  of acetone to each vial.
- Print the witness sheet and get a witness.
- Witness: Check the labeling (vial labels, rack labels, glassware labels). Check the standards and pipet settings. Witness the spike of the vials with the required standards. Add the appropriate type and amount of extraction standard to the acetone (see Table 2). Add the appropriate type and amount of matrix spike to the MS/MSD/LCS/LCSD. Note: Witnessing is complete, please initial the witness page.
- Pour each vial into its corresponding rack location (i.e. beaker, extraction vessel, sample container). Add approximately 1 mL of acetone to each vial as a rinse and pour that into the corresponding rack location also. (For solids, do not disturb the silica layer during this process.)

\* Standard is interchangeable between methods 8290, 1613, TO-9a, and M23.

\*\* 50% archive prior to analysis.

Complete compound lists for each standard may be found in the standards logbook.

## Appendix 2: Cleanup Column Preparation Guide

**Standard Mixed Bed Silica Gel:**

		Glass Wool in bottom of pipette
1	1/4 tsp	Neutral silica gel
1	1/2 tsp	Basic silica gel (NaOH; KOH for tissue)
1	1/4 tsp	Neutral silica gel
3	tsp	Acidic silica gel (H <sub>2</sub> SO <sub>4</sub> )
1	1/2 tsp	Neutral silica gel
1	1/4 tsp	Sodium sulfate

**Standard Florisil:**

		Glass Wool in bottom of pipette
2	1/4 tsp	Florisil
1	1/4 tsp	Sodium sulfate

## **1.0 STANDARD OPERATING PROCEDURE FOR THE ANALYSIS OF POLYCHLORINATED DIBENZO-P-DIOXINS AND POLYCHLORINATED DIBENZOFURANS (PCDD/PCDF) BY HIGH-RESOLUTION GAS CHROMATOGRAPHY/HIGH-RESOLUTION MASS SPECTROMETRY (HRGC/HRMS)**

### **2.0 METHOD OBJECTIVE, PURPOSE, CODE, AND SUMMARY**

This standard operating procedure (SOP) covers the analytical determination of PCDD/PCDFs according to the following methods:

- 2.1 SW-846 Method 8290A
- 2.2 EPA Method 1613B
- 2.3 SW-846 Method 0023A
- 2.4 EPA Method TO-9a (Jan 99)

### **3.0 APPLICABLE MATRICES**

Applicable matrices for methods 8290A and 1613B include groundwater, wastewater, surface water, leachate, soil, sediment, sludge, oil, and tissue. The applicable matrix for method 0023A is an air sampling train, which may contain XAD resin (a hydrophobic crosslinked polystyrene copolymer resin, supplied as 20-60 mesh size white insoluble beads), filters, impinger water and solvent rinses. TO-9a is an ambient air sampling train which may contain polyurethane foam (PUF, a polyurethane foam, supplied as 1-3 inch cylinders approximately 3 inches long), XAD resin, filters, and solvent rinses.

### **4.0 METHOD SCOPE, APPLICABILITY, AND DETECTION LIMIT**

- 4.1 Methods 8290A, 1613B and 0023A may be used to quantify PCDD/PCDFs that are soluble in methylene chloride and/or toluene. The compounds are separated using a gas chromatograph (GC) and detected using a high-resolution double focusing mass spectrometer (HRMS). Appendix 1 lists the analytes currently analyzed using these methods and their practical quantitation limits.
- 4.2 The practical quantitation limit (PQL) is the lowest level in the calibration curve. The PQL is the lowest level at which compounds may be accurately quantitated and is compound dependent. The calibration curve typically ranges from 1.0 ng/mL to 1000 ng/mL for methods 8290A, 0023A, and TO-9a, and from 0.5 ng/mL to 2000 ng/mL for method 1613B. These ranges reflect instrument readings, which are in ng/mL (ppb). It should be noted that the calibration range may vary between calibrations and instruments.
- 4.3 Method detection limit studies (MDLs) are performed and/or verified on an annual basis. MDLs are done for aqueous, solid, tissue and XAD matrices. For more information regarding MDLs, refer to The Determination of Method Detection Limits, CF-LB-E-001.
- 4.4 Qualified analysts must demonstrate proficiency initially and annually thereafter with an IDOC, CDOC, or PT study. Acceptability criteria may be found in the applicable analytical method.
  - 4.4.1 To establish the ability to generate acceptable accuracy and precision, the analyst should perform an "analyst validation study" or Initial Demonstration of Capability. Four LCS standards are extracted and analyzed. Calculate the average recovery and the standard deviation of the recovery for each analyte of interest using the four results. Then compare the average and the standard deviation with the corresponding criteria found in Table 6 of method 1613B,

or with the determined limits for methods 8290A and 0023A. If the average and the standard deviation for all analytes of interest meet the acceptance criteria, then the analyst may begin work on actual samples. If the validation study fails for one or more of the compounds, then the study must be repeated for those compounds which failed.

## 5.0 METHOD VARIATIONS

- 5.1 Cape Fear Analytical analyzes a calibration point at 0.25 ng/mL, which is below the method required low point.
- 5.2 Standards and sample extracts are stored at room temperature to avoid analyte loss. Many of the target analytes in these methods form a strong cohesive bond with solids such as glass in cold temperatures; this type of analyte loss is not addressed in the method. (This is a variance from the following method recommendations:  $\leq 6^\circ$  per method 8290A;  $< -10^\circ\text{C}$  per 1613B;  $-10^\circ$  to  $-20^\circ\text{C}$  per DoD QSM.)
- 5.3 Cape Fear Analytical utilizes the DB-5ms GC column (and may use the ultra inert version), which is capable of better resolution of the TCDF isomers. This column exhibits a different elution pattern than the DB-5 column referenced in the analytical methods. Relative retention time limits have been determined for this column for use with method 1613B, and are listed in Table 9.
- 5.4 Method 1613B does not address the reporting of EDL and EMPC. These values are reported for this method only when requested by the client.
- 5.5 See document CF-UD-F-133 for a list of personnel performing this SOP with the preceding method 1613B modifications.

## 6.0 DEFINITIONS

- 6.1 Accuracy: The degree of agreement between an observed value and an accepted reference value.
- 6.2 AlphaLIMS: The Laboratory Information Management System used at CFA, LLC.
- 6.3 Blank: An aliquot of reagent water or other blank matrix that is treated exactly as a sample including exposure to all glassware, equipment, solvents, reagents, and standard additions that are used with other samples. The LMB (Lab Method Blank) is used to determine if method analytes or other interferences are present in the laboratory environment, the reagents, or the apparatus. Contamination may be derived during sampling, transportation, storage or analysis. The blank may be used to establish a background value.
- 6.4 Calibration Standard (CAL): An aliquot of a primary standard solution or stock standard solution. The CAL solutions are used to calibrate the instrument response with respect to analyte concentration.
- 6.5 Calibration Verification Standard (CVS, CCAL, CS3WT): A solution of target analytes with a concentration near the mid-point of the calibration range. It should be obtained from a second source vendor and is used to verify the initial calibration on a basis described in the determinative method. This solution may also contain the window defining analytes and the column performance mix.
- 6.6 Cleanup Standards: Isotopes added prior to cleanup that are used to measure the efficiency of the fractionation step alone. Method 1613B uses one compound (37Cl4-2378-TCDD) as the Cleanup Standard. Method 8290A does not address the use of cleanup standards.

- 6.7 Duplicate Analysis: The analysis or measurement of the variable of interest performed identically on two field subsamples of the same sample. The results from duplicate analyses are used to evaluate analytical or measurement precision of sample, preservation, or storage internal to the laboratory.
- 6.8 Estimated Detection Limit (EDL): A calculation of the concentration of a given analyte required to produce a signal with a peak height of at least 2.5 times the background signal level. The EDL is calculated for each 2378-substituted congener that is not identified.
- 6.9 Estimated Maximum Possible Concentration (EMPC): A calculation for a peak characterized by a response with a signal-to-noise ratio of at least 2.5 for both the quantitation ions, and meeting all identification criteria except ion ratio. EMPC is a worst-case estimate of the concentration.
- 6.10 Extraction Standards: Isotopes added prior to extraction that serve as internal standards for many 2,3,7,8 substituted congeners. In addition, to measure the overall extraction and fractionation efficiencies. Method 8290A names them Internal Standards while Method 1613B uses the Labeled Compounds terminology.
- 6.11 Injection Standards: Isotopes added prior to injection to determine the recoveries of the Extraction and Cleanup Standards. Method 8290A names them Recovery Standards while Method 1613B calls them Internal Standards.
- 6.12 Internal Standard (ISTD): A known amount of standard added to a test portion of a sample as a reference for evaluating the retention time and concentration of dependent analytes and controlling the precision and bias of the applied analytical method.
- 6.13 Laboratory Control Standard (LCS): An aliquot of reagent water or other blank matrix to which known quantities of the method analytes are added in the laboratory. The LCS is analyzed exactly like a sample, and its purpose is to determine whether the methodology is in control, and whether the laboratory is capable of making accurate and precise measurements.
- 6.14 Laboratory Duplicate (DUP): Aliquots of a sample taken from the same container and processed in the same manner under identical laboratory conditions. The aliquot is analyzed independently from the parent sample and the results are compared to measure precision and accuracy.
- 6.15 Matrix Spike and Matrix Spike Duplicate (MS and MSD): Two separate aliquots of an environmental sample to which known quantities of the method analytes are added in the laboratory. The MS and MSD are analyzed exactly like a sample, and their purpose is to determine whether the sample matrix contributes bias to the analytical results. The concentrations of the analytes in the sample matrix must be determined in a separate aliquot and the measured values in the MS/MSD adjusted. Percent recovery is calculated for both aliquots, and RPD is calculated between the two.
- 6.16 Method Detection Limit (MDL): The minimum concentration of an analyte that can be identified, measured and reported with 99% confidence that the analyte concentration is greater than zero.
- 6.17 Precision: The degree to which a set of observations or measurements of the same property, obtained under similar conditions, conform to themselves, a data quality

indicator. Precision is usually expressed as standard deviation, variance or range in either absolute or relative terms.

- 6.18 Quantitation Limits (also PQL, RL): The value at which an instrument can accurately measure an analyte at a specific concentration (i.e., a specific numeric concentration can be quantified). These points are established by the upper and lower limits of the linear calibration range.
- 6.19 Sampling Standards: Isotopes added prior to field sampling for Method 0023A and Method TO-9a that are used to measure the efficiency of the sampling step alone.

## 7.0 INTERFERENCES/LIMITATIONS

- 7.1 Contaminants found in extraction glassware, solvents, and other sample processing hardware may jeopardize the integrity of this method.
- 7.2 Glassware must be scrupulously cleaned as soon as possible after extraction.
- 7.3 Contamination may also occur in the GC/MS system. High boiling materials tend to build up in the injection port and the front end of the column. The analyst should maintain a thorough working knowledge of keeping the injection port free of contamination, including changing out the septum, injection port liner, O-ring, ferrule, and gold seal.
- 7.4 Contamination by carryover can occur whenever high-level and low-level samples are sequentially analyzed. To reduce carryover, the sample syringe must be rinsed with solvent between samples. If carryover is suspected, potentially impacted samples must be re-analyzed after any needed maintenance, solvent replacement, and/or cleaning has been done.
- 7.5 Upon review of a completed sequence, if one is required to perform a 200x or greater dilution because of a sample's target concentrations, that the rinse vials on the instrument that determined this dilution need must have its solvent replaced. This action should be documented in the maintenance log.

## 8.0 SAFETY PRECAUTIONS AND WARNINGS

METHYLENE CHLORIDE IS A SUSPECTED CARCINOGEN AND A KNOWN SKIN IRRITANT. NO OCCUPATIONAL EXPOSURE LIMIT FOR DIOXIN HAS BEEN ESTABLISHED. IT IS A KNOWN AND PROBABLE HUMAN CARCINOGEN.

CONTACT WITH OXIDIZERS MAY GENERATE EXPLOSIVE MIXTURES.

PREVENT SKIN AND EYE CONTACT BY USING SPECIFIED PERSONAL PROTECTIVE EQUIPMENT WHEN MAKING STOCK REAGENTS.

WORK UNDER A HOOD TO PREVENT INHALATION WHEN USING METHYLENE CHLORIDE.

- 8.1 Eye protection should be worn when handling samples, reagents, or standards.  
NOTE: Contact lenses pose a special problem; soft lenses may absorb irritants and all lenses concentrate them. DO NOT wear contact lenses in the laboratory.
- 8.2 Treat all chemicals and samples as potential health hazards and reduce exposure to these chemicals to the lowest level possible. CFA maintains a current reference file of Material Safety Data Sheets (MSDS). These documents and individual sample MSDS provided by clients are maintained in the laboratory.
- 8.3 Personal Protective Equipment (PPE)
- 8.3.1 Gloves and eye protection should be worn when handling reagents, solvents, standards and samples.

- 8.3.2 Analysts should prepare samples and standards under the hood.
- 8.4 All samples, chemicals, extracts, and extraction residues must be transferred, delivered, and disposed of safely according to all related SOPs.
- 8.5 Never leave gas cylinders unchained or untied.
- 8.6 In the event of an accident or medical emergency, call for help immediately. When time and safety permit, management should be notified of all accidents.
- 8.7 Fire escape routes are posted in the lab, and all personnel should be familiar with them. In addition, fire safety equipment such as fire extinguishers and fire blankets are located in the lab. Training is available on the proper operation of this equipment.
- 8.8 The analyst must use care when assembling and operating instrumentation. Check to see that the gas chromatograph equipment is properly assembled and hooked up to the proper gas cylinder and power, referencing the appropriate manual. Analytical equipment must only be operated by qualified personnel.
- 8.9 For further safety instructions, consult the Safety Manual, CF-LB-N-001.
- 9.0 APPARATUS, EQUIPMENT AND INSTRUMENTATION**
- 9.1 Equipment associated with this method includes:
- 9.1.1 Gas tight syringes
  - 9.1.2 2 mL high recovery (conical) autosampler vials and storage racks
  - 9.1.3 Teflon crimp tops
  - 9.1.4 Crimper/De-crimper
  - 9.1.5 GC Columns
    - 9.1.5.1 Agilent DB5-MS or equivalent (i.e. ui); 60 m, 0.25 mm, 0.25 um
    - 9.1.5.2 Agilent DB-225 or equivalent; 30 m, 0.25 mm, 0.25 um
  - 9.1.6 Quartz/Glass injection port liners
  - 9.1.7 Injection port liner O-ring seals
  - 9.1.8 Gold seals
  - 9.1.9 Ferrules
  - 9.1.10 Column cleaving tool
  - 9.1.11 Septa (thermogreen)
  - 9.1.12 10-100 uL adjustable air displacement pipette with disposable tips
- 9.2 Instrumentation
- 9.2.1 Waters Autospec Premier high resolution mass spectrometer
    - 9.2.1.1 The MassLynx workstation software is used for instrument control and data acquisition of the AutoSpec-NT SIOS hardware embedded PC based system running the industry standard VxWorks real-time. The workstation operating system used is Windows XP SP2 or SP3 to support Masslynx v4.1.
    - 9.2.1.2 The TargetLynx Application Manager is used for post-acquisition processing and general data manipulation. The workstation operating system used is Windows XP SP2 or SP3 to support Targetlynx v4.1. Post-acquisition processing and

general data manipulation can be carried out by an additional computer workstation and software installation.

## 9.2.2 Agilent 7890 Gas Chromatograph

### 9.2.2.1 A suggested temperature program for primary analysis follows:

Initial Temp.	140° C
Hold Time	1.0 min.
Rate 1	20° C/min.
Temperature 2	180° C
Time 2	2°/min
Temperature 3	235° C
Rate 3	30° C/min.
Final Temp.	290° C
Hold Time	13 min.
Run Time:	45 minutes (may vary due to column length or flow rate)
Solvent Delay:	18.0 min.
Splitless Valve Time:	1.5 min.
Flow:	1.8 mL/min.
Mass Range:	See descriptor definitions (Table 2)

**NOTE:** These instrument conditions and rates are guidelines which may change.

## 9.2.3 LEAP Technologies GC PAL Autosampler

### 9.2.3.1 Suggested parameters:

Sample volume – 1 µL
Air volume – 0.5 µL
Solvent push volume – 1 µL
Number of sample washes - 0
Solvent washes - 30
Sample viscosity wait – 1 second
Number of sample pumps - 0
Injection mode - Fast

## 10.0 REAGENTS AND STANDARDS

### 10.1 Reagents and standards

#### 10.1.1 Nonane

10.1.2 Source Standards: Source Standards are purchased directly from vendors and may be diluted to make stock, intermediate, or working standards. These may include extraction standard, matrix spiking standard, cleanup standard, injection standard, as well as others. Source standards expire per the vendor expiration date or after five years from the date opened, whichever is shorter. Please reference CF-LB-E-007 and CF-OA-E-002 for further information regarding standards and their preparation.

- 10.1.3 Initial Calibration (ICAL) Standards: Certified calibration standards are purchased from commercial vendors at a minimum of five concentration levels. One of the calibration standards is at a concentration near, but above, the method detection limit; the others should correspond to the expected range of compounds found in samples. Calibration standards expire after a maximum of five years and should be monitored frequently for signs of degradation.
- 10.1.4 Calibration Verification Standards (CVS, CCAL, CS3WT): A certified CVS is purchased from a second source commercial vendor at a concentration that is near to the midpoint of the calibration curve.
- 10.1.5 Window Defining Mix and Column Performance Mix (WDM and CPM): A standard containing the first and last eluters for each homolog group, as well as the dioxin and furan isomers used to demonstrate isomer specificity on the GC column in use. These may be contained in the same standard as the calibration verification (known as CS3WT).

## 11.0 SAMPLE HANDLING AND PRESERVATION

- 11.1 Sample extracts have no maximum recommended holding time from the date of extraction by method 8290A, and a 365 day holding time from the date of extraction by 1613B. Sample extracts have a 45-day holding time from the date of extraction by 0023A. TO-9a cartridges are considered clean for 30 days from preparation; samples must be extracted 7 days from collection and analyzed 40 days from extraction. See Table 13.
- 11.2 Sample extracts are delivered from the prep lab to the instrument lab and are stored in a darkened hood at room temperature. The extracts are usually grouped according to preparation batches and are accompanied by the batch pull sheet and other pertinent paperwork.
- 11.3 Custody of samples is monitored using the AlphaLIMS sample tracking system. Each analyst should scan the samples planned to run into their custody prior to analysis.
- 11.4 All sample extracts should be treated with caution as potential health hazards. Refer to Section 8.0 on safety.

## 12.0 SAMPLE PREPARATION

- 12.1 Before extracts can be analyzed on the instrument, they must first be evaporated to dryness under nitrogen and then spiked with injection standard to set the final volume nominally at 20  $\mu$ L. A determination must also be made as to whether the extract should be diluted. The decision to dilute a sample extract is based on a number of factors: sample screening, historical data about the sample or sample site, the appearance of the extract (color, viscosity, incidental odor, turbidity, etc.), or regulatory considerations. The experience of the analyst is invaluable in making this determination.

**NOTE:** Sample extracts may contain multiple layers or sediment. Samples that contain sediment are returned to cleanup. Multiple layers are treated on a case-by-case basis. If the extract can be homogenized, then a uniform sample is achieved. If the extract remains bi-phasic, the PM and client are contacted for further guidance.

- 12.2 If a sample is to be analyzed without dilution ('neat'), 2 nanograms of injection standard solution is added to the extract using a pipette (20  $\mu$ L of a 0.1 ng/ $\mu$ L = 100

pg/ $\mu$ L extract concentration). A cap is then placed on the vial and secured by crimping before vortexing the sample to ensure complete mixing and vial wall washing.

- 12.3 If samples require dilution, the dilution is made using nonane or appropriate solvent. If not previously added, 2 nanograms of JS is added to the autosampler vial. Dilution prep may involve the addition of supplemental extraction standard (ES) and is documented in the injection prep logbook.
- 12.4 Once samples are prepped, they are ready to be injected onto the instrument. An autosampler is used to inject standards and sample extracts on the instrument.
- 12.5 The need for dilution may also be determined after analysis is performed, and may still be performed as above. Under normal circumstances, a sample would be diluted if any chromatographic peaks saturate the detector.

### 13.0 QUALITY CONTROL REQUIREMENTS

Typically a blank (LMB), laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) are extracted and analyzed with each prep batch. Other client requirements may include a matrix spike (MS) and matrix spike duplicate (MSD) or sample duplicate (DUP).

#### 13.1 Blanks

- 13.1.1 A blank is extracted with each batch of 20 or fewer samples to demonstrate that interferences from glassware, reagents and the analytical system are under control. Blanks are carried through all stages of sample preparation and analysis.
  - 13.1.1.1 For Method 1613B, an acceptable blank must be below the minimum levels listed in Table 2 of the method for all analytes.
  - 13.1.1.2 For Methods 8290A, 0023A, and TO-9a, all analytes must be below the Lower Method Calibration Limits.
  - 13.1.1.3 For DOD work, an acceptable blank must have no analytes detected  $> 1/2$  the laboratory's LOQ or  $> 1/10$ th the amount measured in any sample or  $1/10$ th the regulatory limit, whichever is greater. (see QSM v5.3 table B-6)
- 13.1.2 The percent recovery of each labeled standard (extraction and cleanup) is calculated as shown in Sec. 17.4.5. Recoveries must be within the limits in Table 7 for method 1613B. For methods 8290A and 0023A, extraction standard recoveries must be within 40-135%. Sampling standards for Method 0023A must be within 70-130%. For method TO-9a, extraction standards must be within 50-120% for tetra- through hexa- and within 40-120% for hepta- and OCDD. Sampling standards for Method TO-9a must be within 50-120%.

#### 13.2 Laboratory Control Samples and Matrix Spikes

- 13.2.1 The spiking standard for LCS/LCSDs and MS/MSDs contains all analytes listed in Table 5. For each LCS, LCSD, MS and MSD, the concentration of each analyte and its percent recovery are calculated as shown in Sec. 17.4.1 and 17.4.5. For methods 8290A and 0023A, percent recoveries should be within 70-130%. For method 1613B, recovered concentrations should be within the limits in Table 6.
- 13.2.2 If recovery is not within these limits, the data may need to be re-checked for errors, or the samples and QC may need to be re-analyzed. In addition, the

instrumentation may need to be checked for performance problems. If the LCS fails to meet acceptance criteria due to low recovery, the associated samples may have to be re-extracted and re-analyzed when possible. If one or more recoveries are high in the LCS and these analytes are not detected in the samples, the event should be documented and data may be reported. If the MS and MSD both fail due to matrix interference and/or dilution, data may be reported provided the associated LCS passes acceptance criteria.

**NOTE:** Many clients have contract specific criteria that must be considered when evaluating recovery of the Quality Control samples.

- 13.2.3 The percent recovery of each labeled standard (extraction and cleanup) is calculated as shown in Sec. 17.4.5. Recoveries must be within the limits in Table 6 for method 1613B. For methods 8290A and 0023A, extraction standard recoveries must be within 40-135%. Sampling standards for Method 0023A must be within 70-130%. For method TO-9a, extraction standards must be within 50-120% for tetra- through hexa- and within 40-120% for hepta- and OCDD. Sampling standards for Method TO-9a must be within 50-120%.

### 13.3 Samples

- 13.3.1 The percent recovery of each labeled standard (as listed in SOP CF-OA-E-001) is calculated as shown in Sec. 17.4.5. Recoveries must be within the limits in Table 7 for method 1613B or 40-135% for method 8290A. For method TO-9a, extraction standards must be within 50-120% for tetra- through hexa- and within 40-120% for hepta- and OCDD. Sampling standards for Method TO-9a must be within 50-120%.
- 13.3.2 Calculated EDLs should be below the PQLs in Table 1. Any reported EDLs above the PQLs should be noted in the case narrative.

## 14.0 INSTRUMENT CALIBRATION, STANDARDIZATION, AND PERFORMANCE

### 14.1 Mass spectrometer performance

- 14.1.1 The mass spectrometer is operated in electron ionization mode. A static resolving power of at least 10,000 (10 percent valley definition) must be demonstrated at appropriate masses before any analysis is performed. Static resolving power checks must be performed at the beginning and at the end of each 12-hr period of operation. Corrective action must be implemented whenever the resolving power does not meet the requirement.
- 14.1.1.1 Chromatography time for PCDDs and PCDFs exceeds the long term mass stability of the mass spectrometer. Because the instrument is operated in the high-resolution mode, mass drifts of a few ppm (e.g., 5 ppm in mass) can have serious adverse effects on instrument performance. Therefore, a mass drift correction is mandatory. A lock-mass ion from the reference compound PFK is used for tuning the mass spectrometer. The selection of the lock-mass ion is dependent on the masses of the ions monitored within each descriptor. Lock mass ions may be found in the descriptor table, Table 2. The level of the reference compound (PFK) metered into the ion chamber during HRGC/HRMS analyses should be adjusted so that the amplitude of the most intense selected lock-mass ion signal (regardless of the descriptor number) does not

exceed 10 percent of the full scale deflection for a given set of detector parameters. Under these conditions, sensitivity changes that might occur during the analysis can be more effectively monitored. NOTE: Excessive PFK (or any other reference substance) may cause noise problems and contamination of the ion source resulting in an increase in downtime for source cleaning.

- 14.1.2 Documentation of the instrument resolving power must be accomplished by recording the peak profile of the high-mass reference signal ( $m/z$  380.9760) obtained during the above peak matching experiment by using the low mass PFK ion at  $m/z$  304.9824 as a reference. The minimum resolving power of 10,000 must be demonstrated on the high-mass ion while it is transmitted at a lower accelerating voltage than the low-mass reference ion, which is transmitted at full sensitivity. The format of the peak profile representation (Figure 2) must allow manual determination of the resolution, i.e., the horizontal axis must be a calibrated mass scale (amu or ppm per division). The result of the peak width measurement (performed at 5 percent of the maximum, which corresponds to the 10 percent valley definition) must appear on the hard copy and cannot exceed 100 ppm at  $m/z$  380.9760 (or 0.038 amu at that particular mass).

## 14.2 System Performance

System performance criteria are presented below. The laboratory may use the recommended GC column described in Sec. 9.1. The laboratory must document that all applicable system performance criteria are met before sample analysis begins. Sec. 9.2.2 provides recommended GC conditions that may be used to satisfy the required criteria. Mass spectrometer resolving power checks must be performed at the beginning and the end of each 12-hr period of operation. A GC column performance check is required at the beginning of each 12-hr period during which samples are analyzed. For Method 1613B, a continuing calibration must be performed at the beginning of the sequence, while for Methods 0023A and 8290A, continuing calibrations must be performed at both the beginning and the end of a sequence. An ending continuing calibration may also serve as the beginning check for the next sequence.

### 14.2.1 GC Column performance check

- 14.2.1.1 Inject 1  $\mu$ L of an aliquot of the column performance check solution (Sec. 10.1.5) and acquire selected ion monitoring (SIM) data within a total cycle time of  $\leq 1$  second. The chromatographic separation between 2,3,7,8-TCDD and the peaks representing any other unlabeled TCDD isomers must be resolved with a valley of  $\leq 25$  percent (Figure 1), where:

$$\text{Valley percent} = (x/y) \times 100$$

x = measured as in Figure 1 from the 2,3,7,8-closest TCDD eluting isomer

y = the peak height of 2,3,7,8-TCDD

For 2378-TCDF confirmatory analysis, the chromatographic separation between 2378-TCDF and its closest eluters must be resolved with a valley of  $\leq 25$  percent.

- 14.2.1.2 It is the responsibility of the laboratory to verify the conditions suitable for the appropriate resolution of 2,3,7,8-TCDD from all other TCDD isomers. The GC column performance check solution also contains the known first and last PCDD/PCDF eluters under the conditions described in this SOP. Their retention times are used to determine the five homologue retention time windows that are used for qualitative (Sec. 15.3.1.1) and quantitative purposes. All peaks (including  $^{13}\text{C}_{12}$ -2,3,7,8-TCDD) should be labeled and identified on the chromatograms. All first eluters of a homologous series should be labeled with the letter "F," and all last eluters of a homologous series should be labeled with the letter "L". Any individual selected ion current profile (SICP) or the reconstructed homologue ion current constitutes an acceptable form of data presentation. A SICP for the labeled compounds is also required.
- 14.2.1.3 Particular caution should be exercised for the switching time between the last tetra-chlorinated congener (1,2,8,9-TCDF) and the first penta-chlorinated congener (1,3,4,6,8-PeCDF), as these two compounds elute within 15 sec of each other on the 60m DB-5 column, and overlap on the 60m DB-5ms column. Both congeners must be acquired within one analysis.
- 14.2.1.4 The absolute retention time of  $^{13}\text{C}_{12}$ -1,2,3,4-TCDD must exceed 25.0 minutes on the primary GC column in use, and 15.0 minutes on the confirmatory GC column.
- 14.3 Initial Calibration
- 14.3.1 Prior to running a multi-level calibration, take precautions to ensure that the instrument meets system performance criteria. The analyst must document that all system performance criteria are met before analyzing an initial calibration.
- 14.3.2 Initial calibration is required before any samples are analyzed for PCDDs and PCDFs and must meet the acceptance criteria listed below. Initial calibration is also required if any routine calibration does not meet the required criteria listed in Sec. 15.2, and at a minimum, annually.
- 14.3.3 At a minimum, all five high-resolution concentration calibration solutions listed in Table 5 must be used for the initial calibration.
- 14.3.4 Tune the instrument with PFK to meet the above-specified system performance criteria.
- 14.3.5 Inject the GC column performance check solution and acquire SIM mass spectral data. The total cycle time for each descriptor must be < 1 second. The laboratory must not perform any further analysis until it is demonstrated and documented that the criteria listed in Sec. 15.1.1.1 are met.
- 14.3.6 By using the same conditions (GC and MS) that produced acceptable results with the column performance check solution, analyze each of the five concentration calibration solutions. Each injection must meet the following ion ratio and signal-to-noise (S/N) requirements:
- 14.3.6.1 The ratio of the areas of the integrated ion current for the ions appearing in Table 2 (homologous series quantitation ions) must be

within the indicated control limits (set for each homologous series) in Table 3. These ion ratio requirements must be within the specified control limits simultaneously in one run. It is the analyst's responsibility to take corrective action if the ion abundance ratios are outside the limits.

- 14.3.6.2 For each selected ion current profile (SICP) and for each GC signal corresponding to the elution of a target analyte and of its labeled standards, the S/N ratio must be better than or equal to 10. Manual measurement of S/N is required for any GC peak that has an apparent S/N of less than 15:1. The result of the calculation must appear on the SICP above the GC peak in question.
- 14.3.7 Calculate the 17 relative response factors (RF) for unlabeled target analytes relative to their appropriate internal standards (see Table 10). Also calculate the RFs for the ESs and CSs relative to the appropriate injection standards according to the following formula:

$$RF = \frac{A_x C_{is}}{A_{is} C_x}$$

Where:

A<sub>x</sub> = Sum of the Areas of the two characteristic ions for the compound being measured.

A<sub>is</sub> = Sum of the Areas of the two characteristic ions for the specific internal standard.

C<sub>is</sub> = Concentration of the specific internal standard.

C<sub>x</sub> = Concentration of the compound being measured.

The RF is a dimensionless quantity; the units used to express C<sub>is</sub> and C<sub>x</sub> must be the same.

- 14.3.8 The RF for other isomers within a homolog group shall be determined from the average RF of the 2,3,7,8-substituted isomers. For example, the RF for non-2,3,7,8-substituted HxCDD isomers (totals peaks) is the average of the three 2,3,7,8-substituted isomers. NOTE: If only one 2,3,7,8-substituted isomer is present in the calibration then use that isomer's RF for all isomers within its homolog group.
- 14.3.9 Because more than five calibration levels may be analyzed, the analyst may choose to deactivate one or more levels. The low standard representing the PQL cannot be deactivated. CFA only includes calibration points below the PQL at the request of the client (drinking water states, TMDL, etc.). If warranted, a mid-level standard is deactivated for all analytes (globally) in that calibration mixture. An upper level(s) standard may be deactivated to meet method criteria for single compounds. This practice results in a narrower calibration range. The analyst must get supervisory approval before deactivating any calibration levels within the method calibration range. Following approval, management will document the situation, including reasonable cause for calibration level removal. Calibrations with rejected mid-level points are not used for DOE clients. Please note that this practice

does not represent “cherry picking,” which is acknowledged as an unacceptable laboratory practice.

14.3.10 The average RF must be calculated for each compound as follows:

$$RF_{avg} = \frac{\sum_{i=1}^n X}{n}$$

Where:

$N$  = number of calibration levels

$X_i$ ;  $i=1$  to  $n$ , are the compounds RF values for each calibration point

14.3.11 Criteria for acceptable initial calibration

The criteria listed below for acceptable calibration must be met before sample analyses are performed.

14.3.11.1 Per method 8290A, the percent relative standard deviations for the mean response factors from the 17 unlabeled standards must not exceed  $\pm 20$  percent, and those for the nine labeled reference compounds must not exceed  $\pm 20$  percent. These limits also apply to Method 0023A. Per method 1613B, the percent relative standard deviations for the mean response factors from the 17 unlabeled standards must not exceed  $\pm 20$  percent, and those for the fifteen labeled reference compounds must not exceed  $\pm 35$  percent. See Table 12 for method TO-9a minimum requirements.

$$\%RSD = \frac{SD}{\bar{x}} \times 100$$

Where:

RSD = relative standard deviation

$\bar{x}$  = mean of 5 or more initial RFs for a compound

SD = standard deviation of average RFs for a compound

$$SD = \sqrt{\frac{\sum_{i=1}^n (X - A)^2}{n - 1}}$$

where:

$n$  = number of calibration levels

$X_i$ ;  $i=1$  to  $n$ , are the compounds RF values for each calibration point

$A$  = average of the RFs from above

## 15.0 PROCEDURE FOR ANALYSIS AND INSTRUMENT OPERATION

### 15.1 Resolution check

15.1.1 At the beginning and end of each 12-hour window, mass resolution must be tuned and/or verified. A static resolving power of at least 10,000 must be demonstrated at appropriate masses before analysis is performed.

15.1.2 Using a PFK molecular leak, tune the instrument to the minimum required resolving power of 10,000 at  $m/z$  330.9792 (for day to day operations, the

instrument may be tuned to approximately 11,000). Verify that the exact mass of m/z 380.9760 is within 5 ppm of the required value.

## 15.2 Column Performance/Window Defining/Continuing Calibration Check (CS3WT)

15.2.1 Inject 1 uL of the CS3WT or CPM. This standard is obtained from a different manufacturer or is a different lot from the same manufacturer than the initial calibration standard. Note that for NC drinking waters a different manufacture must be used. Verify that all column performance and window defining criteria in Section 14.2.1 have been met.

15.2.2 The CS3WT also contains the analytes for continuing calibration. The initial calibration curve for each compound of interest must be verified once every 12 hours.

Calculate the percent difference using:

$$\% \text{ Difference} = \frac{|\overline{RF}_i - RF_c|}{\overline{RF}_i} \times 100$$

Where:

$\overline{RF}_i$  = average response factor from initial calibration

$RF_c$  = response factor from current CS3WT

Calculate analyte concentrations using:

$$[PCDD / PCDF] = \frac{(A_{unk}^{ion1} + A_{unk}^{ion2})}{(A_{ES}^{ion1} + A_{ES}^{ion2})} \times \frac{Q_{ES}}{RF}$$

Where:

$A_{unk}$  and  $A_{ES}$  = the integrated area for each ion monitored.

$Q_{ES}$  = the amount of extraction standard in pg/uL

$RF$  = Average RF from the ICAL for the compound

15.2.2.1 For methods 0023A and 8290A, if the percent difference for each native analyte in the CS3WT is  $\leq 20\%$ , and for each labeled analyte is  $\leq 30\%$ , the initial calibration is assumed to be valid. For method 1613B, analyte concentrations must fall within the limits in Table 8. If the criteria are not met, corrective action should be taken. If no source of the problem can be determined after corrective action has been taken, a new calibration may need to be generated. For Method TO-9a See Table 12 for minimum requirements.

15.2.2.2 All ion ratios must be within the limits in Table 3.

15.2.2.3 For methods 0023A and 8290A, if no more than two unrelated compounds in the continuing calibration check performed at the end of a 12-hour period fail by no more than  $\pm 25\%$  for the 17 unlabeled compounds and  $\pm 35\%$  for the 9 labeled compounds, the average RF values from the beginning and ending continuing calibration checks should be used to compute the analyte concentrations, instead of the RF values obtained from the initial calibration. No further sample analyses should be performed until an acceptable calibration is achieved.

## 15.3 Sample Analysis

### 15.3.1 Data Interpretation

#### 15.3.1.1 Qualitative Determination

For a peak to be identified as a PCDD or PCDF, it must meet all of the criteria listed below.

- 15.3.1.1.1 The signals for the two m/z's being monitored must be present and maximize within  $\pm 2$  seconds of each other.
- 15.3.1.1.2 The signal-to-noise ratio between the two m/z's must be  $\geq 2.5$  for native compounds and  $\geq 10$  for labeled compounds.
- 15.3.1.1.3 Ion ratios must be within the limits in Table 3.
- 15.3.1.1.4 Relative Retention Times
  - 15.3.1.1.4.1 For Methods 0023A and 8290A, congeners which have an isotopically labeled compound must fall within -1 to +3 seconds of the labeled compound. Congeners with no labeled compound must be within 0.005 retention time units of the RRT measured in the continuing calibration. (See Table 11.) For method TO-9a, congeners which have an isotopically labeled compound must fall within -3 to +3 seconds of the labeled compound. Congeners with no labeled compound must be within 0.005 retention time units of the RRT measured in the continuing calibration.
  - 15.3.1.1.4.2 For Method 1613B, relative retention times must be within the RRT limits found in Table 9.
  - 15.3.1.1.4.3 For non-2378 peaks, retention times must be within the retention time windows established by the analysis of the window defining mixture (Sec. 14.2.1.2).
- 15.3.1.1.5 For PCDFs, no peak may be present in the associated PCDPE channel at the same retention time. If a PCDPE peak is present, the PCDF peak should be reported with a flag denoting the interference.
- 15.3.1.1.6 Any sample in which 2378-TCDF has been identified at or above the method reporting limit must be confirmed on a second column (DB-225 or equivalent).

#### 15.3.1.2 Calibration Limit Exceedance

- 15.3.1.2.1 If a compound in a sample exceeds the upper calibration limit, all subsequent samples must be checked for carryover contamination.
- 15.3.1.2.2 When a subsequent sample is non-detect for the compound in question, the sequence is again considered acceptable for reporting.
- 15.3.1.2.3 All affected samples between the exceeding sample and the non-detect sample must be re-analyzed.

## 16.0 EQUIPMENT AND INSTRUMENT MAINTENANCE

- 16.1 Preventive maintenance on a HRGC/HRMS system involves the following basic areas:
  - 16.1.1 Vane type vacuum pumps for the inlets, source, and analyzer need a change of oil and scroll type pumps may need tip seals changed about every year or when system performance indicates it is needed.
  - 16.1.2 The GC injection port is cleaned as needed, approximately once a week. It is recommended that the septum and injection port liner be replaced at the time of cleaning. Additionally, the gold plated seal should be cleaned or replaced.
  - 16.1.3 Ion source maintenance is usage dependent. The type and quantity of samples that have been injected determine the frequency of ion source cleaning and filament replacement.
  - 16.1.4 Autosampler maintenance is primarily that of cleanliness. Most autosamplers need their moving parts to be clean and lightly lubricated. The most frequent corrective maintenance is that of changing the syringe, usually about once per month.
  - 16.1.5 Instrument maintenance logs are kept with each instrument and serve as a record of all the maintenance that has been done on the instrument.
- 16.2 Non-Routine Maintenance Procedures (Special, Operational or Failure Mode Maintenance)
  - 16.2.1 Service is provided to the instrument via the analyst, the in-house instrument service engineer, or a technical support specialist from the manufacturer. When instrument failure occurs, different parts of the instrument are isolated to determine the root cause. For example, the injection port may be capped off if a leak is suspected to prove the leak is/is not coming from that source. Instrument maintenance logbooks are kept for each instrument detailing the type of maintenance performed on the instrument and when it was performed. Preventive maintenance visits are scheduled annually for the mass spectrometers.
  - 16.2.2 Analytical GC columns are clipped or replaced when the existing column shows signs of excessive degradation or the inability to properly resolve chromatographic peaks. Excessive peak tailing, poor responses, and baseline disturbances may also indicate that the column needs to be replaced.

## 17.0 DATA RECORDING, CALCULATION AND REDUCTION METHODS

- 17.1 Data are evaluated qualitatively and quantitatively using a software program such as Waters MassLynx, or equivalent data system.

17.2 Data are reviewed, and a hard copy is generated. If manual integrations are made, a hard copy of the manual integration is printed and initialed by the analyst and included with the raw data.

17.3 Additional supporting documentation, such as totals pages generated by the software may be included with the data.

#### 17.4 Quantitative Analysis

17.4.1 The concentration (ng/L for aqueous, ng/g for solids) of each identified compound in the sample is calculated as follows:

$$[PCDD / PCDF] = \frac{(A_{unk}^{ion1} + A_{unk}^{ion2})}{(A_{ES}^{ion1} + A_{ES}^{ion2})} \times \frac{Q_{ES}}{W_{unk} \times D \times \overline{RF}}$$

Where:

$A_{unk}$  and  $A_{ES}$  = the integrated area for each ion monitored.

$Q_{ES}$  = the amount of extraction standard added to the sample in nanograms

$W_{unk}$  = the initial sample aliquot size, in liters for waters and in grams for solids.

$D$  = (% moisture in sample)/100, or 1 for waters

$\overline{RF}$  = Average RF from the ICAL for the compound

17.4.2 The estimated detection limit (EDL) is calculated as follows:

$$[EDL_{ppt}] = 2.5 \times \frac{(H_{unk}^{ion1} + H_{unk}^{ion2})}{(H_{ES}^{ion1} + H_{ES}^{ion2})} \times \frac{Q_{ES}}{W_{unk} \times \overline{RF}}$$

Where:

$H_{unk}$  = the height of the noise present in each ion monitored.

$H_{ES}$  = the height of the extraction standard peak in each ion monitored.

2.5 = signal-to-noise factor for minimum height of peak.

17.4.3 The estimated maximum possible concentration (EMPC) is calculated in the same manner as a concentration (Section 17.4.1).

17.4.4 The concentration of each extraction and cleanup standard is calculated as follows:

$$[ES_{ng}] = \frac{(A_{ES}^{ion1} + A_{ES}^{ion2})}{(A_{JS}^{ion1} + A_{JS}^{ion2})} \times \frac{Q_{JS}}{\overline{RF}}$$

Where:

$A_{ES}$  and  $A_{JS}$  = the integrated area for each ion monitored.

$Q_{JS}$  = the amount of injection standard added to the sample in nanograms

$\overline{RF}$  = Average RF from the ICAL for the compound

The cleanup standard concentration is calculated as above, substituting the area of the individual cleanup standard ions for the extraction standard ions.

17.4.5 Percent recovery is calculated as follows:

$$\%R = \frac{R_{ng}}{S_{ng}} \times 100$$

Where:

$R_{ng}$  = the amount of standard recovered in nanograms.

$S_{ng}$  = the amount of standard spiked in nanograms.

## 18.0 POLLUTION/CONTAMINATION

- 18.1 Work area should be maintained free of dust and dirt accumulations.
- 18.2 Fume hoods are utilized to remove fumes and reduce the risk of airborne contaminants to ensure personnel safety. Hoods are monitored in accordance with CF-FC-E-003 for Fume Hood Face Velocity Performance Checks.
- 18.3 The laboratory area is restricted to authorized personnel.

## 19.0 DATA REVIEW, APPROVAL AND TRANSMITTAL

- 19.1 A review process is used to insure the quality of the data. Raw data are reviewed first by the analyst, then by a second (peer) analyst or a data validator. When the analyst is satisfied that the data have been correctly processed and uploaded to the LIMS, a data report is generated from AlphaLIMS. The AlphaLIMS report along with the raw data and supporting documentation, such as a run log and case narrative, are submitted for review to the data validator or another experienced analyst. The reviewer goes through the raw data as if he/she was working it up for the first time and verifies that they are correct. In addition, he/she must make sure that the data have been correctly entered into AlphaLIMS. AlphaLIMS reports may be self-reviewed. If errors are discovered in either the raw data or the AlphaLIMS report, then the two analysts should discuss the differences and how best to resolve them. In some cases, the peer review process may uncover errors that lead to a sample being re-extracted or re-run. In cases such as these, a nonconformance report (NCR) should be completed and submitted to the Quality department. It is recommended that a copy of the NCR be given to the prep analyst if it involves a re-extraction and that a copy be kept with the original data.
- 19.2 Once the data review has been completed by the reviewer, the batch is returned to the analyst for corrections (if applicable) and the status is updated from REVW to DONE in AlphaLIMS.
- 19.3 Data may be transmitted automatically to AlphaLIMS. This automatic "upload" procedure may be activated prior to data review or after data review is complete. In either case, the data recorded in AlphaLIMS are checked by the analyst for accuracy and completeness.

## 20.0 CORRECTIVE ACTION FOR OUT-OF-CONTROL OR UNACCEPTABLE DATA

Corrective action for out-of-control data may require instrument maintenance, re-analysis, re-extraction, or a more complex set of actions. When troubleshooting measures fail to bring an analytical process or data into control, a nonconformance report and/or corrective action should be initiated in accordance with CF-QS-E-004 for the Documentation of Nonconformance Reporting and Dispositioning and Control of Nonconforming Items, and CF-QS-E-002 for Conducting Corrective Action.

## 21.0 CONTINGENCIES FOR HANDLING THESE SITUATIONS

Troubleshooting is used to determine the appropriate action to take when an initial or continuing calibration, blank and/or laboratory control sample fails to meet the acceptance criteria defined for the method. Troubleshooting may involve one or more of the following actions:

- 21.1 If analytes in a multi-point calibration fail to meet specified criteria, additional standards for the failing compounds may need to be reanalyzed. If they still do not meet specifications, instrument maintenance or new standards may be required before work is continued.

- 21.2 If a continuing calibration fails to meet specified criteria, instrument tuning or inlet maintenance may be required. If routine maintenance procedures fail to produce a second consecutive calibration verification within acceptance criteria, then the laboratory must demonstrate acceptable performance after further corrective action with two consecutive calibration verifications, or a new initial calibration must be analyzed.
- 21.3 If a method blank fails to meet defined criteria, the source of contamination should be found and eliminated before proceeding with analysis.
- 21.4 If normal equipment and software operating procedures do not resolve troubleshooting efforts, the manuals for software, hardware and other equipment discussed in this SOP are available for consultation and resolution. On-line support may be available from software and instrument manufacturers, as well. Any revisions, repairs or corrective actions required must be documented in accordance with the laboratory's Quality System as described in CF-QS-B-001.

## 22.0 RECORDS MANAGEMENT

- 22.1 Run logs are generated for each instrument each day that the instrument is run. These run logs serve as records of what is run on the instrument, including samples, QC, calibrations, tunes, etc. Additional information is provided in the run log, including the analyst's initials, run date and time, and file name.
- 22.2 Raw data are stored in the lab in filing cabinets and/or boxes as long as there is space available. When space runs out, the data are boxed and sent to storage.
- 22.3 All records generated as a result of this procedure are maintained as quality documents in accordance with CF-QS-E-008 for Quality Records Management and Disposition.

## 23.0 LABORATORY WASTE HANDLING AND DISPOSAL

Sample extracts that have been run are temporarily stored in case they have to be reanalyzed. Once space is no longer available to keep them in the lab, they are moved to Waste Disposal where they are handled and disposed in accordance with the Laboratory Waste Management Plan, CF-LB-G-001.

## 25.0 HISTORY

Revision 1: Section 15.3.1.2 added.

Revision 2: Absolute RT information added in 14.2.1.4; Calibration limit exceedance information added in section 15.3.1.2; Table 8 footnote describing RRT window adjustment to column used.

Revision 3: Method 0023A requirements added.

Revision 4: 2378-TCDF confirmation procedure and requirements added.

Revision 5: Injection standard changed from Tridecane to nonane. Discussion of equipment use and operation instructions was added, per DoD ELAP gray box 22.

Revision 6: Added TO-9a support and additional Tables for Method 8290.

Revision 7: Removed references to 8290 cleanup standard. Added TO-9a reference.

Revision 8: RRT limits for 1613 adjusted to method limits, except for three which have methods widths but db-5ms centers.

Revision 9: Added air matrix descriptions.

Revision 10: Table 9 updated. Maintenance rule for highly contaminated samples. TNI reference updated.

Revision 11: Changed EDL signal to noise value to 2.5. Updated Table references.

Revision 12: Added Table 13, Method Holding Times.

Revision 13: Added a NC requirement that a 1613 DW CCAL standard must only be obtained from a different manufacturer.

Revision 14: Adjusted TO-9a SS limits, added DB-5ms ui column use.

Revision 15: Added a document reference for Method 1613.

Revision 16: Updated section 9 to include hardware and software requirements.

Revision 17: Updated 8290 holding times.

Revision 18: Added DoD MB acceptance limits.

Revision 19: Updated 14.3.9 to clarify calibration level deactivation protocol.

Revision 20: Improved 14.3.9.

## **1.0 STANDARD OPERATING PROCEDURE FOR THE ANALYSIS OF POLYCHLORINATED BIPHENYLS (PCB) BY HIGH-RESOLUTION GAS CHROMATOGRAPHY/HIGH-RESOLUTION MASS SPECTROMETRY (HRGC/HRMS)**

### **2.0 METHOD OBJECTIVE, PURPOSE, CODE AND SUMMARY**

This standard operating procedure (SOP) covers the analytical determination of PCBs according to EPA Method 1668, Revisions A & C.

### **3.0 APPLICABLE MATRICES**

Applicable matrices include groundwater, wastewater, surface water, leachate, soil, sediment, sludge, oil, and tissue.

### **4.0 METHOD SCOPE, APPLICABILITY AND DETECTION LIMIT**

4.1 Method 1668 may be used to quantify PCBs that are soluble in methylene chloride and/or toluene. The compounds are separated using a gas chromatograph (GC) and detected using a high-resolution double focusing mass spectrometer (HRMS). Appendix 1 lists the analytes currently analyzed using these methods and their practical quantitation limits.

4.2 The practical quantitation limit (PQL) is the lowest level in the calibration curve. The PQL is the lowest level at which compounds may be accurately quantitated and is compound dependent. The calibration curve typically ranges from 0.5 ng/mL to 2000 ng/mL. These ranges reflect instrument readings, which are in ng/mL (ppb). It should be noted that the calibration range may vary between calibrations and instruments.

4.3 Method detection limit studies (MDLs) are performed and/or verified on an annual basis. MDLs are done for aqueous, solid, and tissue matrices. For more information regarding MDLs, refer to The Determination of Method Detection Limits, CF-LB-E-001.

4.4 Qualified analysts must demonstrate proficiency initially and annually thereafter with an IDOC, CDOC or PT study. Acceptability criteria may be found in the analytical method.

4.4.1 To establish the ability to generate acceptable accuracy and precision, the analyst should perform an "analyst validation study" or Initial Demonstration of Capability. Four LCS standards are extracted and analyzed. Calculate the average recovery and the standard deviation of the recovery for each analyte of interest using the four results. Then compare the average and the standard deviation with the corresponding criteria found in Table 6 of Method 1668A or C as appropriate. If the average and the standard deviation for all analytes of interest meet the acceptance criteria, then the analyst may begin work on actual samples. If the validation study fails for one or more of the compounds, then the study must be repeated for those compounds which failed.

### **5.0 METHOD VARIATIONS**

5.1 Sample extracts are stored at room temperature to avoid analyte loss. Many of the target analytes in these methods form a strong cohesive bond with solids such as glass in cold temperatures; this type of analyte loss is not addressed in the method. (This is a variance from the following method recommendations: -10° to -20° C per DoD QSM.)

5.2 The analytical method does not address the reporting of EDL and EMPC. These values are reported only when requested by the client.

- 5.3 Project specific modifications are allowed to meet the data quality objectives of the Delaware River Basin Commission.

## 6.0 DEFINITIONS

- 6.1 Accuracy: The degree of agreement between an observed value and an accepted reference value.
- 6.2 AlphaLIMS: The Laboratory Information Management System used at CFA, LLC.
- 6.3 Blank: An aliquot of reagent water or other blank matrix that is treated exactly as a sample including exposure to all glassware, equipment, solvents, reagents, and standard additions that are used with other samples. The LMB (Lab Method Blank) is used to determine if method analytes or other interferences are present in the laboratory environment, the reagents, or the apparatus. Contamination may be derived during sampling, transportation, storage or analysis. The blank may be used to establish a background value.
- 6.4 Calibration Standard (CAL): An aliquot of a primary standard solution or stock standard solution. The CAL solutions are used to calibrate the instrument response with respect to analyte concentration.
- 6.5 Calibration Verification Standard (CVS, CCAL): A solution of target analytes with a concentration near the mid-point of the calibration range. It should be obtained from a second source vendor and is used to verify the initial calibration on a basis described in the determinative method.
- 6.6 Cleanup Standards: Isotopes added prior to cleanup that are used to measure the efficiency of the fractionation step alone. Method 1668 uses three compounds as the Cleanup Standards.
- 6.7 Duplicate Analysis: The analysis or measurement of the variable of interest performed identically on two field subsamples of the same sample. The results from duplicate analyses are used to evaluate analytical or measurement precision of sample, preservation, or storage internal to the laboratory.
- 6.8 Estimated Detection Limit (EDL): A calculation of the concentration of a given analyte required to produce a signal with a peak height of at least 2.5 times the background signal level. The EDL is calculated for each congener that is not identified.
- 6.9 Estimated Maximum Possible Concentration (EMPC): A calculation for a peak characterized by a response with a signal-to-noise ratio of at least 2.5 for both the quantitation ions, and meeting all identification criteria except ion ratio. EMPC is a worst-case estimate of the concentration.
- 6.10 Extraction Standards: Isotopes added prior to extraction that serve as internal standards for many PCB congeners. In addition, to measure the overall extraction and fractionation efficiencies. Method 1668 names them Labeled Compounds.
- 6.11 Injection Standards: Isotopes added prior to injection to determine the recoveries of the Extraction and Cleanup Standards. Method 1668 calls them Internal Standards.
- 6.12 Internal Standard (ISTD): A known amount of standard added to a test portion of a sample as a reference for evaluating the retention time and concentration of dependent analytes and controlling the precision and bias of the applied analytical method.
- 6.13 Laboratory Control Standard/Duplicate (LCS/LCSD): Aliquots of reagent water or other blank matrix to which known quantities of the method analytes are added in the

laboratory. The LCS/LCSD are analyzed exactly like a sample, and the purpose is to determine whether the methodology is in control, and whether the laboratory is capable of making accurate and precise measurements.

- 6.14 Laboratory Duplicate (DUP): Aliquots of a sample taken from the same container and processed in the same manner under identical laboratory conditions. The aliquot is analyzed independently from the parent sample and the results are compared to measure precision and accuracy.
- 6.15 Matrix Spike and Matrix Spike Duplicate (MS and MSD): Two separate aliquots of an environmental sample to which known quantities of the method analytes are added in the laboratory. The MS and MSD are analyzed exactly like a sample, and their purpose is to determine whether the sample matrix contributes bias to the analytical results. The concentrations of the analytes in the sample matrix must be determined in a separate aliquot and the measured values in the MS/MSD adjusted. Percent recovery is calculated for both aliquots, and RPD is calculated between the two.
- 6.16 Method Detection Limit (MDL): The minimum concentration of an analyte that can be identified, measured and reported with 99% confidence that the analyte concentration is greater than zero.
- 6.17 Precision: The degree to which a set of observations or measurements of the same property, obtained under similar conditions, conform to themselves, a data quality indicator. Precision is usually expressed as standard deviation, variance or range in either absolute or relative terms.
- 6.18 Quantitation Limits (also PQL, RL): The value at which an instrument can accurately measure an analyte at a specific concentration (i.e., a specific numeric concentration can be quantified). These points are primarily established by the upper and lower limits of the linear calibration range, but may be elevated as needed.

## 7.0 INTERFERENCES/LIMITATIONS

- 7.1 Contaminants found in extraction glassware, solvents, and other sample processing hardware may jeopardize the integrity of this method.
- 7.2 Glassware must be scrupulously cleaned as soon as possible after extraction.
- 7.3 Contamination may also occur in the GC/MS system. High boiling materials tend to build up in the injection port and the front end of the column. The analyst should maintain a thorough working knowledge of keeping the injection port free of contamination, including changing out the septum, injection port liner, O-ring, ferrule, and gold seal.
- 7.4 Contamination by carryover can occur whenever high-level and low-level samples are sequentially analyzed. To reduce carryover, the sample syringe must be rinsed with solvent between samples. If carryover is suspected, potentially impacted samples should be re-analyzed after any needed maintenance, solvent replacement, and/or cleaning has been done.

## 8.0 SAFETY PRECAUTIONS AND WARNINGS

METHYLENE CHLORIDE IS A SUSPECTED CARCINOGEN AND A KNOWN SKIN IRRITANT. PCBs HAVE BEEN TENTATIVELY CLASSIFIED AS KNOWN OR SUSPECTED MAMMALIAN CARCINOGENS.

CONTACT WITH OXIDIZERS MAY GENERATE EXPLOSIVE MIXTURES.

PREVENT SKIN AND EYE CONTACT BY USING SPECIFIED PERSONAL PROTECTIVE EQUIPMENT WHEN MAKING STOCK REAGENTS.

WORK UNDER A HOOD TO PREVENT INHALATION WHEN MAKING STOCK REAGENTS FROM SOLIDS.

- 8.1 Eye protection should be worn when handling samples, reagents, or standards.  
NOTE: Contact lenses pose a special problem; soft lenses may absorb irritants and all lenses concentrate them. DO NOT wear contact lenses in the laboratory.
- 8.2 Treat all chemicals and samples as potential health hazards and reduce exposure to these chemicals to the lowest level possible. CFA maintains a reference file of Material Safety Data Sheets (MSDS) for each chemical and standard. These documents and individual sample MSDS provided by clients are maintained in the laboratory.
- 8.3 Personal Protective Equipment (PPE)
  - 8.3.1 Gloves and eye protection should be worn when handling reagents, solvents, standards and samples.
  - 8.3.2 Analysts should prepare samples and standards under the hood.
- 8.4 All samples, chemicals, extracts, and extraction residues must be transferred, delivered, and disposed of safely according to all related SOPs.
- 8.5 Never leave gas cylinders unchained or untied.
- 8.6 In the event of an accident or medical emergency, call for help immediately. When time and safety permit, management should be notified of all accidents.
- 8.7 Fire escape routes are posted in the lab, and all personnel should be familiar with them. In addition, fire safety equipment such as fire extinguishers and fire blankets are located in the lab. Training is available on the proper operation of this equipment.
- 8.8 The analyst must use care when assembling and operating instrumentation. Check to see that the gas chromatograph equipment is properly assembled and hooked up to the proper gas cylinder and power, referencing the appropriate manual. Analytical equipment must only be operated by qualified personnel.
- 8.9 For further safety instructions, consult the Safety, Health and Chemical Hygiene Plan, CF-LB-N-001.

## 9.0 APPARATUS, EQUIPMENT AND INSTRUMENTATION

- 9.1 Equipment associated with this method includes:
  - 9.1.1 Gas tight syringes
  - 9.1.2 2 mL high recovery (conical) autosampler vials and storage racks
  - 9.1.3 Teflon crimp tops
  - 9.1.4 Crimper/De-crimper
  - 9.1.5 GC Column (SPB-Octyl or equivalent; 30m, 0.25 mm, 0.25 um)
  - 9.1.6 Quartz/Glass injection port liners
  - 9.1.7 Injection port liner O-ring seals
  - 9.1.8 Gold seals
  - 9.1.9 Ferrules
  - 9.1.10 Column cleaving tool
  - 9.1.11 Septa (thermogreen)
  - 9.1.12 0.5-10 uL adjustable air displacement pipette with disposable tips

## 9.2 Instrumentation

### 9.2.1 Waters Autospec Premier high resolution mass spectrometer

9.2.1.1 The MassLynx workstation software is used for instrument control and data acquisition of the AutoSpec-NT SIOS hardware embedded PC based system running the industry standard VxWorks real-time. The workstation operating system used is Windows XP SP2 or SP3 to support Masslynx v4.1.

9.2.1.2 The TargetLynx Application Manager is used for post-acquisition processing and general data manipulation. The workstation operating system used is Windows XP SP2 or SP3 to support Targetlynx v4.1. Post-acquisition processing and general data manipulation can be carried out by an additional computer workstation and software installation.

### 9.2.2 Agilent 7890 Gas Chromatograph

9.2.2.1 A suggested temperature program follows:

Temperature 1	150° C
Time 1	2.0 min.
Rate	5° C/min.
Temperature 2	180° C
Time 2	1.5°/min
Final Temperature	265° C
Run Time:	55 minutes (may vary due to column length or flow rate)
Solvent Delay:	6.0 min.
Splitless Valve Time:	2.0 min.
Flow:	1.0 mL/min.
Mass Range:	See descriptor definitions (Table 2)

**NOTE:** These instrument conditions and rates are guidelines which may change.

### 9.2.3 LEAP Technologies GC PAL Autosampler

9.2.3.1 Suggested parameters:

Sample volume –	1 µL
Air volume –	0.5 µL
Solvent push volume –	1 µL
Number of sample washes -	0
Solvent washes -	30
Sample viscosity wait –	1 second
Number of sample pumps -	0
Injection mode -	Fast

## 10.0 REAGENTS AND STANDARDS

### 10.1 Reagents and standards

#### 10.1.1 Nonane

- 10.1.2 Source Standards: Source Standards are purchased directly from vendors and may be diluted to make stock, intermediate, or working standards. These may include extraction standard, matrix spiking standard, cleanup standard, injection standard, as well as others. Source standards expire per the vendor expiration date or after five years from the date opened, whichever is shorter. Please reference CF-LB-E-007 for further information regarding standards and their preparation.
- 10.1.3 Initial Calibration (ICAL) Standards: Certified calibration standards are purchased from commercial vendors at a minimum of five concentration levels. One of the calibration standards is at a concentration near, but above, the method detection limit; the others should correspond to the expected range of compounds found in samples. Calibration standards expire after a maximum of five years and should be monitored frequently for signs of degradation.
- 10.1.4 Calibration Verification Standards (CVS, CCAL, CS3): A certified CVS is purchased from a second source commercial vendor at a concentration that is near to the midpoint of the calibration curve.
- 10.1.5 Window Defining Mix and Column Performance Mix (WDM and CPM): A standard containing the first and last eluters for each homolog group, as well as the isomers used to demonstrate isomer specificity on the GC column in use. Usually contained in the daily 209 injection mix.

## 11.0 SAMPLE HANDLING AND PRESERVATION

- 11.1 Samples have a one year holding time from the date of collection, and a one year holding time from the date of extraction.
- 11.2 Sample extracts are delivered from the prep lab to the instrument lab and are stored in a darkened hood at room temperature. The extracts are usually grouped according to batches and are accompanied by the batch pull sheet and other pertinent paperwork.
- 11.3 Custody of samples is monitored using the AlphaLIMS sample tracking system. Each analyst should scan the samples planned to run into their custody prior to analysis.
- 11.4 All sample extracts should be treated with caution as potential health hazards. Refer to Section 8.0 on safety.

## 12.0 SAMPLE PREPARATION

- 12.1 Before extracts can be analyzed on the instrument, they must first be evaporated to 18 uL nonane (added after cleanup steps) under nitrogen and then spiked with injection standard to set the final volume nominally at 20  $\mu$ L. A determination must also be made as to whether the extract should be diluted. The decision to dilute a sample extract is based on a number of factors: sample screening, historical data about the sample or sample site, the appearance of the extract (color, viscosity, incidental odor, turbidity, etc.), or regulatory considerations. The experience of the analyst is invaluable in making this determination.

**NOTE:** Sample extracts may contain multiple layers or sediment. Samples that contain sediment are returned to cleanup. Multiple layers are treated on a case-by-case basis. If the extract can be homogenized, then a uniform sample is achieved. If the extract remains bi-phasic, the PM and client are contacted for further guidance.

- 12.2 If a sample is to be analyzed without dilution ('neat'), 2 nanograms of injection standard solution is added to the extract using a pipette (2  $\mu$ L of a 1.0 ng/ $\mu$ L = 100

pg/ $\mu$ L extract concentration). A cap is then placed on the vial and secured by crimping before vortexing the sample to ensure complete mixing and vial wall washing.

- 12.3 If samples require dilution, the dilution is made using nonane or appropriate solvent. If not previously added, 2 nanograms of JS is added to the autosampler vial. Dilution prep may involve the addition of supplemental extraction standard (ES) and is documented in the injection prep logbook.
- 12.4 Once samples are prepped, they are ready to be injected onto the instrument. An autosampler is used to inject standards and sample extracts on the instrument.
- 12.5 The need for dilution may also be determined after analysis is performed, and may still be performed as above. Under normal circumstances, a sample would be diluted if any chromatographic peaks saturate the detector.

### 13.0 QUALITY CONTROL SAMPLES AND REQUIREMENTS

Typically a blank (LMB), laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) are extracted and analyzed with each prep batch. Other client requirements may include a matrix spike (MS) and matrix spike duplicate (MSD) or sample duplicate (DUP).

#### 13.1 Blanks

- 13.1.1 A blank is extracted with each batch of 20 or fewer samples to demonstrate that interferences from glassware, reagents and the analytical system are under control. Blanks are carried through all stages of sample preparation and analysis. An acceptable blank must be below the minimum levels listed in Table 2 of the method for all analytes.
- 13.1.2 The percent recovery of each labeled standard (extraction and cleanup) is calculated as shown in Sec. 19.1.3. Recoveries must be within the limits in Table 5.

#### 13.2 Laboratory Control Samples and Matrix Spikes

- 13.2.1 The spiking standard for LCS/LCSDs and MS/MSDs contains all analytes listed in Table 4. For each LCS, LCSD, MS and MSD, the concentration of each analyte and its percent recovery are calculated as shown in Sec. 19.1.1 and 19.1.3. Recovered concentrations should be within the limits in Table 5.
- 13.2.2 If recovery is not within these limits, the data may need to be re-checked for errors, or the samples and QC may need to be re-analyzed. In addition, the instrumentation may need to be checked for performance problems. If the LCS fails to meet acceptance criteria due to low recovery, the associated samples may have to be re-extracted and re-analyzed when possible. If one or more recoveries are high in the LCS and these analytes are not detected in the samples, the event should be documented and data may be reported. If the MS and MSD both fail due to matrix interference and/or dilution, data may be reported provided the associated LCS passes acceptance criteria.  
**NOTE:** Many clients have contract specific criteria that must be considered when evaluating recovery of the Quality Control samples.
- 13.2.3 The percent recovery of each labeled standard (extraction and cleanup) is calculated as shown in Sec. 19.1.3. Recoveries must be within the limits in Table 5.

#### 13.3 Samples

- 13.3.1 The percent recovery of each labeled standard (as outlined in SOP CF-OA-E-001) is calculated as shown in Sec. 19.1.3. Recoveries must be within the limits in Table 5.
- 13.3.2 Calculated EDLs should be below the PQLs. Any reported EDLs above the PQLs should be noted in the case narrative.

#### 14.0 INSTRUMENT CALIBRATION, STANDARDIZATION AND PERFORMANCE

##### 14.1 Mass spectrometer performance

- 14.1.1 The mass spectrometer is operated in electron ionization mode. A static resolving power of at least 10,000 (10 percent valley definition) must be demonstrated at appropriate masses before any analysis is performed. Static resolving power checks must be performed at the beginning and at the end of each 12-hr period of operation. Corrective action must be implemented whenever the resolving power does not meet the requirement.

14.1.1.1 Chromatography time for PCBs exceeds the long term mass stability of the mass spectrometer. Because the instrument is operated in the high-resolution mode, mass drifts of a few ppm (e.g., 5 ppm in mass) can have serious adverse effects on instrument performance. Therefore, a mass drift correction is mandatory. A lock-mass ion from the reference compound PFK is used for tuning the mass spectrometer. The selection of the lock-mass ion is dependent on the masses of the ions monitored within each descriptor. Lock mass ions may be found in the descriptor table, Table 2. The level of the reference compound (PFK) metered into the ion chamber during HRGC/HRMS analyses should be adjusted so that the amplitude of the most intense selected lock-mass ion signal (regardless of the descriptor number) does not exceed 10 percent of the full scale deflection for a given set of detector parameters. Under these conditions, sensitivity changes that might occur during the analysis can be more effectively monitored. NOTE: Excessive PFK (or any other reference substance) may cause noise problems and contamination of the ion source resulting in an increase in downtime for source cleaning.

- 14.1.2 Documentation of the instrument resolving power must be accomplished by recording the peak profile of the high-mass reference signal ( $m/z$  380.9760) obtained during the above peak matching experiment by using the low mass PFK ion at  $m/z$  304.9824 as a reference. The minimum resolving power of 10,000 must be demonstrated on the high-mass ion while it is transmitted at a lower accelerating voltage than the low-mass reference ion, which is transmitted at full sensitivity. The format of the peak profile representation must allow manual determination of the resolution, i.e., the horizontal axis must be a calibrated mass scale (amu or ppm per division). The result of the peak width measurement (performed at 5 percent of the maximum, which corresponds to the 10 percent valley definition) must appear on the hard copy and cannot exceed 100 ppm at  $m/z$  380.9760 (or 0.038 amu at that particular mass).

##### 14.2 System Performance

System performance criteria are presented below. The laboratory may use the recommended GC column described in Sec. 9.1.5. The laboratory must document that all applicable system performance criteria were met before sample analysis begins. Sec. 9.2.2.1 provides recommended GC conditions that may be used to satisfy the required criteria. A GC column performance check is required at the beginning of each 12-hr period during which samples are analyzed. A continuing calibration must be performed at the beginning of the sequence.

#### 14.2.1 Daily 209 injection mix

- 14.2.1.1 Inject 1 uL of the daily 209 injection mix solution and acquire selected ion monitoring (SIM) data within a total cycle time of  $\leq 1.5$  second. The chromatographic separation between congeners 34-TrCB and 23-TrCB, and between congeners 187-HxCB and 182-HxCB, must be resolved with a valley of  $\leq 40$  percent, where:

$$\text{Valley percent} = (x/y) \times 100$$

x = the height of the valley

y = the peak height of the shorter of the two peaks

Congeners 156-HxCB and 157-HxCB must also co-elute within 2 seconds.

- 14.2.1.2 The daily 209 injection mix contains all 209 PCB congeners, and may thus be used to identify the first and last PCB eluters in each congener group, and in each analytical descriptor. Their retention times are used to determine the seven homologue retention time windows that are used for qualitative (Sec. 15.4.1.1) and quantitative purposes.

### 14.3 Initial Calibration

- 14.3.1 Prior to running a multi-level calibration, take precautions to ensure that the instrument meets system performance criteria. The analyst must document that all system performance criteria are met before analyzing an initial calibration.
- 14.3.2 Initial calibration is required before any samples are analyzed for PCBs and must meet the acceptance criteria in this section. Initial calibration is also required if any routine calibration does not meet the required criteria listed in Sec. 15.3, and at a minimum, annually.
- 14.3.3 At a minimum, all five high-resolution concentration calibration solutions listed in Table 4 must be used for the initial calibration. A lower calibration point of 0.5pg/ul is used for DRBC.
- 14.3.4 Tune the instrument with PFK to meet the above-specified system performance criteria.
- 14.3.5 Inject the daily 209 injection mix solution and acquire SIM mass spectral data. The laboratory must not perform any further analysis until it is demonstrated and documented that the criteria listed in Sec. 14.2.1 are met.
- 14.3.6 By using the same conditions (GC and MS) that produced acceptable results with the 209 injection mix solution, analyze each of the five concentration calibration solutions. Each injection must meet the following ion ratio and signal-to-noise (S/N) requirements:

- 14.3.6.1 The ratio of integrated ion current for the ions appearing in Table 2 (homologous series quantitation ions) must be within the indicated control limits (set for each homologous series) in Table 3. These ion ratio requirements must be within the specified control limits simultaneously in one run. It is the analyst's responsibility to take corrective action if the ion abundance ratios are outside the limits.
- 14.3.6.2 For each selected ion current profile (SICP) and for each GC signal corresponding to the elution of a target analyte and of its labeled standards, the S/N ratio must be better than or equal to 10. Manual measurement of S/N is required for any GC peak that has an apparent S/N of less than 15:1. The result of the measurement must appear on the SICP above the GC peak in question. NOTE: An interference with PFK m/z 223.9872 may preclude meeting this requirement for DiCB congeners. Suspected column bleed interference may preclude meeting this requirement in other congeners groups. These interferences are noted in the low calibration levels, CS1 and below. If interference occurs, 10:1 S/N must be met at the CS2 level. The lower calibration points are still included in the initial calibration.
- 14.3.6.3 Manual integrations, if required, are performed and documented according to SOP CF-LB-E-017.
- 14.3.7 Calculate the relative response factors (RF) for unlabeled target analytes relative to their appropriate internal standards. Also calculate the RFs for the ESs and CSs relative to the appropriate injection standards according to the following formula:

$$RF = \frac{A_x C_{is}}{A_{is} C_x}$$

Where:

A<sub>x</sub> = Sum of the Areas of the two characteristic ions for the compound being measured.

A<sub>is</sub> = Sum of the Areas of the two characteristic ions for the specific internal standard.

C<sub>is</sub> = Concentration of the specific internal standard.

C<sub>x</sub> = Concentration of the compound being measured.

The RF is a dimensionless quantity; the units used to express C<sub>is</sub> and C<sub>x</sub> must be the same.

- 14.3.8 Because more than five calibration levels may be analyzed, the analyst may choose to deactivate one or more levels. The low standard representing the PQL cannot be deactivated. CFA only includes calibration points below the PQL at the request of the client (drinking water states, TMDL, etc.). If warranted, a mid-level standard is deactivated for all analytes (globally) in that calibration mixture. An upper level(s) standard may be deactivated to meet method criteria for single compounds. This practice results in a narrower calibration range. The analyst must get supervisory approval before deactivating any calibration levels within the method calibration range. Following approval, management will document the situation,

including reasonable cause for calibration level removal. Calibrations with rejected mid-level points are not used for DOE clients. Please note that this practice does not represent “cherry picking,” which is acknowledged as an unacceptable laboratory practice.

14.3.9 The average RF must be calculated for each compound as follows:

$$RF_{avg} = \frac{\sum_{i=1}^n X}{n}$$

Where:

$N$  = number of calibration levels

$X_i$ ;  $i=1$  to  $n$ , are the compounds RF values for each calibration point

14.3.10 Criteria for acceptable initial calibration

The criteria listed below for acceptable calibration must be met before sample analyses are performed.

14.3.10.1 The percent relative standard deviations for the mean response factors from the unlabeled standards must not exceed  $\pm 20$  percent.

$$\%RSD = \frac{SD}{\bar{x}} \times 100$$

Where:

RSD = relative standard deviation

$\bar{x}$  = mean of 5 or more initial RFs for a compound

SD = standard deviation of average RFs for a compound

$$SD = \sqrt{\frac{\sum_{i=1}^n (X - A)^2}{n - 1}}$$

where:

$n$  = number of calibration levels

$X_i$ ;  $i=1$  to  $n$ , are the compounds RF values for each calibration point

$A$  = average of the RFs from above

14.3.10.2 The percent relative standard deviations for the mean response factors from the labeled standards must not exceed  $\pm 30$  percent.

## 15.0 PROCEDURE FOR ANALYSIS AND INSTRUMENT OPERATION

### 15.1 Resolution check

15.1.1 At the beginning and end of each 12-hour window, mass resolution must be tuned and/or verified. A static resolving power of at least 10,000 must be demonstrated at appropriate masses before analysis is performed.

15.1.2 Using a PFK molecular leak, tune the instrument to the minimum required resolving power of 10,000 at  $m/z$  330.9792 (for day to day operations, the instrument may be tuned to approximately 11,000). Verify that the exact mass of  $m/z$  380.9760 is within 5 ppm of the required value. Due to the

wide mass ranges required for PCB analysis, resolution may drop to 8000 at either end of the descriptor, but should be >10,000 at the midpoint.

## 15.2 Daily 209 injection mix

Inject 1 uL of the daily 209 mix. Verify that all column performance and window defining criteria in Section 14.2.1 have been met.

## 15.3 Continuing Calibration

15.3.1 The initial calibration curve for each compound of interest must be verified once every 12 hours. Inject 1 uL of the CS3 standard. For 1668C, the Daily 209 injection mix is used to satisfy the calibration verification criteria.

Calculate the percent difference using:

$$\% \text{ Difference} = \frac{|\overline{\text{RF}}_i - \text{RF}_c|}{\overline{\text{RF}}_i} \times 100$$

Where:

$\overline{\text{RF}}_i$  = average response factor from initial calibration

$\text{RF}_c$  = response factor from current CS3

15.3.1.1 For Method 1668A, if the percent difference for each native analyte is  $\leq 30\%$ , and for each labeled analyte is  $\leq 50\%$ , the calibration is assumed to be valid. Method 1668C criteria are listed in Table 7. If the criteria are not met, corrective action should be taken. If no source of the problem can be determined after corrective action has been taken, a new initial calibration may need to be generated.

15.3.1.2 All ion ratios must be within the limits in Table 3.

## 15.4 Sample Analysis

### 15.4.1 Data Interpretation

#### 15.4.1.1 Qualitative Analysis

For a peak to be identified as a PCB, it must meet all of the criteria listed below.

15.4.1.1.1 The signals for the two m/z's being monitored must be present and maximize within the same two scans.

15.4.1.1.2 The signal-to-noise ratio between the two m/z's must be  $\geq 2.5$  for each PCB detected in a sample extract, and  $\geq 10$  for all PCBs in the calibration and verification standards. (DiCBs suffer from PFK interference and are not required to meet 10:1 until the CS2. Other PCBs suffer from suspected column bleed interference and are only required to meet 2.5:1 in calibration points below the CS1.)

15.4.1.1.3 Ion ratios must be within the limits in Table 3.

15.4.1.1.4 The relative retention time of the peak for a PCB must be within the RRT limits calculated as specified in Table 8 based on the RT limits provided.

15.4.1.1.5 Congener overlap, interfering substances, or the loss of chlorine from a higher chlorinated congener may make

it difficult to meet all identification criteria. In these cases, an experienced spectrometrists must determine the presence or absence of the congener.

#### 15.4.1.2 Calibration Limit Exceedance

15.4.1.2.1 If a compound in a sample exceeds the upper calibration limit, all subsequent samples must be checked for carryover contamination.

15.4.1.2.2 When a subsequent sample is non-detect for the compound in question, the sequence is again considered acceptable for reporting.

15.4.1.2.3 All affected samples between the exceeding sample and the non-detect sample must be re-analyzed.

## 16.0 EQUIPMENT AND INSTRUMENT MAINTENANCE

16.1 Preventive maintenance on a HRGC/HRMS system involves the following basic areas:

16.1.1 Vacuum pumps for the inlets, source, and analyzer need a change of oil about every year or when system performance indicates it is needed.

16.1.2 The GC injection port is cleaned as needed, approximately once a week. It is recommended that the septum and injection port liner be replaced at the time of cleaning. Additionally, the gold plated seal should be cleaned or replaced.

16.1.3 Ion source maintenance is usage dependent. The type and quantity of samples that have been injected determine the frequency of ion source cleaning and filament replacement.

16.1.4 Autosampler maintenance is primarily that of cleanliness. Most autosamplers need their moving parts to be clean and lightly lubricated. The most frequent corrective maintenance is that of changing the syringe, usually about once per month.

16.1.5 Instrument maintenance logs are kept with each instrument and serve as a record of all the maintenance that has been done on the instrument.

16.2 Non-Routine Maintenance Procedures (Special, Operational or Failure Mode Maintenance)

16.2.1 Service is provided to the instrument via the analyst, the in-house instrument service engineer, or a technical support specialist from the manufacturer. When instrument failure occurs, different parts of the instrument are isolated to determine the root cause. For example, the injection port may be capped off if a leak is suspected to prove the leak is/is not coming from that source. Instrument maintenance logbooks are kept for each instrument detailing the type of maintenance performed on the instrument and when it was performed. Preventive maintenance visits are scheduled annually for the mass spectrometers.

16.2.2 Analytical GC columns are clipped or replaced when the existing column shows signs of excessive degradation or the inability to properly resolve chromatographic peaks. Excessive peak tailing, poor responses, and baseline disturbances may also indicate that the column needs to be replaced.

**17.0 DATA RECORDING, CALCULATION AND REDUCTION METHODS**

- 17.1 Data are evaluated qualitatively and quantitatively using a software program such as Waters MassLynx, or equivalent data system.
- 17.2 Data are reviewed, and a hard copy is generated. If manual integrations are made, a hard copy of the manual integration is printed and initialed by the analyst and included with the raw data.
- 17.3 Additional supporting documentation, such as totals pages generated by the software may be included with the data.
- 17.4 Quantitative Analysis

- 17.4.1 The concentration (ng/L for aqueous, ng/g for solids) of each identified compound in the sample is calculated as follows:

$$[PCB] = \frac{(A_{unk}^{ion1} + A_{unk}^{ion2})}{(A_{ES}^{ion1} + A_{ES}^{ion2})} \times \frac{Q_{ES}}{W_{unk} \times D \times \overline{RF}}$$

Where:

$A_{unk}$  and  $A_{ES}$  = the integrated area for each ion monitored.

$Q_{ES}$  = the amount of extraction standard added to the sample in nanograms

$W_{unk}$  = the initial sample aliquot size, in liters for waters and in grams for solids.

$D$  = (% moisture in sample)/100, or 1 for waters

$\overline{RF}$  = Average RF from the ICAL for the compound

- 17.4.2 The concentration of each extraction and cleanup standard is calculated as follows:

$$[ES_{ng}] = \frac{(A_{ES}^{ion1} + A_{ES}^{ion2})}{(A_{JS}^{ion1} + A_{JS}^{ion2})} \times \frac{Q_{JS}}{\overline{RF}}$$

Where:

$A_{ES}$  and  $A_{JS}$  = the integrated area for each ion monitored.

$Q_{JS}$  = the amount of injection standard added to the sample in nanograms

$\overline{RF}$  = Average RF from the ICAL for the compound

The cleanup standard concentration is calculated as above, substituting the area of the individual cleanup standard ions for the extraction standard ions.

- 17.4.3 Percent recovery is calculated as follows:

$$\%R = \frac{R_{ng}}{S_{ng}} \times 100$$

Where:

$R_{ng}$  = the amount of standard recovered in nanograms.

$S_{ng}$  = the amount of standard spiked in nanograms.

**18.0 POLLUTION/CONTAMINATION**

- 18.1 Work area should be maintained free of dust and dirt accumulations.
- 18.2 Fume hoods are utilized to remove fumes and reduce the risk of airborne contaminants to ensure personnel safety. Hoods are monitored in accordance with CF-FC-E-003 for Fume Hood Face Velocity Performance Checks.
- 18.3 The laboratory area is restricted to authorized personnel.

**19.0 DATA REVIEW, APPROVAL AND TRANSMITTAL**

- 19.1 A review process is used to insure the quality of the data. Raw data are reviewed first by the analyst, then by a second (peer) analyst or a data validator. When the analyst is satisfied that the data have been correctly processed and uploaded to the LIMS, a data report is generated from AlphaLIMS. The AlphaLIMS report along with the raw data and supporting documentation, such as a run log and case narrative, are submitted for review to the data validator or another experienced analyst. The reviewer goes through the raw data as if he/she was working it up for the first time and verifies that they are correct. In addition, he/she must make sure that the data have been correctly entered into AlphaLIMS. AlphaLIMS reports may be self-reviewed. If errors are discovered in either the raw data or the AlphaLIMS report, then the two analysts should discuss the differences and how best to resolve them. In some cases, the peer review process may uncover errors that lead to a sample being re-extracted or re-run. In cases such as these, a nonconformance report (NCR) should be completed and submitted to the Quality department. It is recommended that a copy of the NCR be given to the prep analyst if it involves a re-extraction and that a copy be kept with the original data.
- 19.2 Once the data review has been completed by the reviewer, the batch is returned to the analyst for corrections (if applicable) and the status is updated from REVW to DONE in AlphaLIMS.
- 19.3 Data may be transmitted automatically to AlphaLIMS. This automatic "upload" procedure may be activated prior to data review or after data review is complete. In either case, the data recorded in AlphaLIMS are checked by the analyst for accuracy and completeness.

**20.0 CORRECTIVE ACTION FOR OUT-OF-CONTROL OR UNACCEPTABLE DATA**

Corrective action for out-of-control data may require instrument maintenance, re-analysis, re-extraction, or a more complex set of actions. When troubleshooting measures fail to bring an analytical process or data into control, a nonconformance report and/or corrective action should be initiated in accordance with CF-QS-E-004 for the Documentation of Nonconformance Reporting and Dispositioning and Control of Nonconforming Items, and CF-QS-E-002 for Conducting Corrective Action.

**21.0 CONTINGENCIES FOR HANDLING THESE SITUATIONS**

Troubleshooting is used to determine the appropriate action to take when an initial or continuing calibration, blank and/or laboratory control sample fails to meet the acceptance criteria defined for the method. Troubleshooting may involve one or more of the following actions:

- 21.1 If analytes in a multi-point calibration fail to meet specified criteria, additional standards for the failing compounds may need to be reanalyzed. If they still do not meet specifications, instrument maintenance or new standards may be required before work is continued.
- 21.2 If a continuing calibration fails to meet specified criteria, instrument tuning or inlet maintenance may be required. If these attempts fail, a new initial calibration must be analyzed.
- 21.3 If a method blank fails to meet defined criteria, the source of contamination should be found and eliminated before proceeding with analysis.
- 21.4 If a LCS fails to meet specified criteria, the process should be reviewed to identify potential areas for failure. Any problem areas should be corrected before re-extraction or re-analysis is performed.

21.5 If a sample fails to meet recovery or detection limit criteria, the data should be reviewed to determine whether matrix interferences are present, and if further cleanup or a smaller volume extraction might improve recoveries.

## **22.0 RECORDS MANAGEMENT**

22.1 Run logs are generated for each instrument each day that the instrument is run. These run logs serve as records of what is run on the instrument, including samples, QC, calibrations, tunes, etc. Additional information is provided in the run log, including the analyst's initials, run date and time, and file name.

22.2 Raw data are stored in the lab in filing cabinets and/or boxes as long as there is space available. When space runs out, the data are boxed and sent to storage.

22.3 All records generated as a result of this procedure are maintained as quality documents in accordance with CF-QS-E-008 for Quality Records Management and Disposition.

## **23.0 LABORATORY WASTE HANDLING AND DISPOSAL**

Sample extracts that have been run are temporarily stored in case they have to be reanalyzed. Once space is no longer available to keep them in the lab, they are moved to Waste Disposal where they are handled and disposed in accordance with the Laboratory Waste Management Plan, CF-LB-G-001.

## **24.0 REFERENCES**

Method 1668, Revision A, "Chlorinated Biphenyl Congeners in Water, Soil, Sediment, Biosolids, and Tissue by HRGC/HRMS" with corrections and changes through August 20, 2003

Method 1668C Chlorinated Biphenyl Congeners in Water, Soil, Sediment, Biosolids, and Tissue by HRGC/HRMS April 2010

DELAWARE RIVER ESTUARY STAGE 2 PCB TMDL Polychlorinated Biphenyls - EPA Method 1668A Project Quality Control Requirements 02/03/05

## **25.0 HISTORY**

Revision 1: Section 15.4.1.2 added.

Revision 2: Calibration upper limit exceedance clarified.

Revision 3: Tables 1, 4, 5, and 6 updated. Table 8 added. 1668A references added. Tridecane use removed. 1668C references and limits added.

Revision 4: Removed references to Version B.

Revision 5: Comments regarding DRBC modifications and references. Additions for DRBC ICAL exceptions.

Revision 6: Added holding time table.

Revision 7: Removing PQLs from and adding CAS numbers to SOP.

Revision 8: Updated section 9 to include hardware and software requirements. Updated 14.3.8 to clarify calibration level deactivation protocol.

Revision 9: Improved 14.3.8.

**TABLE 1: METHOD ANALYTES**

2-Chlorobiphenyl (1)	2051-60-7	2,3,3',4'-Tetrachlorobiphenyl (55)	74338-24-2

**1.0 STANDARD OPERATING PROCEDURE FOR PERCENT MOISTURE****2.0 PURPOSE**

To describe the procedure by which to calculate percent moisture of soil, sludge, and other solid matrices.

**3.0 DISCUSSION**

Determination of percent moisture is necessary when sample results are desired on a dry weight basis. This determination can be made by comparing weights of a known amount of sample before and after drying the sample in an oven at a temperature just above the evaporation temperature of water.

**4.0 METHOD VARIATIONS**

The recommended mass for determining percent moisture is 20 g (when available). When sample is limited, sample mass will be reduced to 5 to 10 g.

**5.0 DEFINITIONS**

- 5.1 Batch: Environmental samples prepared and/or analyzed together with the same process and personnel. A batch consists of 20 or less samples.
- 5.2 Laboratory Duplicate (DUP): Aliquots of a sample taken from the same container under the same laboratory conditions that are processed and analyzed independently.

**6.0 INTERFERENCES/LIMITATIONS**

Not applicable.

**7.0 SAFETY PRECAUTIONS AND WARNINGS**

- 7.1 Personnel performing this analytical procedure are trained in and follow the safe laboratory practices outlined in the Safety, Health, and Chemical Hygiene Plan, CF-LB-N-001.
- 7.2 If there is any question regarding the safety of any laboratory practice, **stop immediately**, and consult qualified senior personnel such as a group or team leader.

**8.0 APPARATUS, EQUIPMENT, AND INSTRUMENTATION**

- 8.1 Drying oven
- 8.2 Balance, with 0.01 g readability
- 8.3 Sample containers
- 8.4 Desiccator cabinet with a hygroscopic desiccant

**9.0 REAGENTS AND STANDARDS**

Not applicable.

**10.0 SAMPLE HANDLING AND PRESERVATION**

Samples should be unpreserved and can be stored in glass or plastic containers. Samples should be stored in airtight containers at a temperature between 3 and 30 °C and in an area that prevents direct contact with sunlight. The percent moisture determination should be done as soon as possible after sampling.

**11.0 PROCEDURES**

- 11.1 Dry Weight Determination for Soils/Solids
- 11.1.1 Turn on oven. Set temperature to 110°C.
- 11.1.2 Write sample number on the drying container.

- 11.1.3 Record weight of sample container (grams),  $W_p$  in AlphaLIMS.
- 11.1.4 Weigh out an appropriate amount of sample and record weight,  $W_i$  in AlphaLIMS. The recommended sample size is approximately 10 g, when sufficient sample is available. (When sample is limited, sample mass will be reduced to 2 to 5 g.)
- 11.1.5 Record temperature of oven. Oven must be stable and within limits to begin a drying cycle ( $110 \pm 5^\circ\text{C}$ ).
- 11.1.6 When the samples are added to the oven, use the LIMS to populate the start time.
- 11.1.7 Leave the samples in the drying oven for minimum of 4 hours (preferably overnight).

**NOTE:** HRSM samples require a minimum of 12 hours of drying time before proceeding to constant weight measurements.

- 11.1.8 Move the samples from the oven to a desiccator. After allowing sample to cool, weigh sample container, and record weight,  $W_f$  in AlphaLIMS. (Enter the extension data link and enter the weigh back time as instance 1.) Replace sample in drying oven for a minimum of 1 hour.
- 11.1.9 Repeat previous step until a constant weight is obtained. (Each weigh back must be associated with an entry in extension data that records the weigh back time. Increment the instance for each weigh back.) A constant weight is defined as a weight difference of less than about 0.1% (i.e. for a 10 g aliquot, the change in weight should be less than 0.01 g). Contact management after 3 unsuccessful tries.

**NOTE:** The time required to obtain constant mass will vary depending on the type of material, size of samples, oven type and capacity, and other factors. The influence of these factors generally can be established by good judgment, experience with the materials being tested, and the apparatus being used.

- 11.1.10 Once no more weigh backs are needed. Place the sample material in the associated dry weigh material container kept in a fume hood.
- 11.1.11 Calculate % moisture:

$W_i$  = weight of sample and container, before drying

$W_f$  = weight of sample and container, after drying

$W_p$  = weight of container

% Moisture =  $((W_i - W_p) - (W_f - W_p)) / (W_i - W_p) \times 100\%$

## 11.2 Wet Weight Determination for Waters/Liquids

- 11.2.1 Turn on oven. Set temperature to  $110^\circ\text{C}$ .
- 11.2.2 Write sample number on the drying container.
- 11.2.3 Record weight of sample container (grams),  $W_p$  in AlphaLIMS.
- 11.2.4 Shake the sample to suspend the solids. Weigh out an appropriate amount of sample and record weight,  $W_i$  in AlphaLIMS. The recommended sample size is approximately 10 g (mL).
- 11.2.5 Ensure that the temperature of the oven is correct and recorded. Oven must be stable and within limits to begin a drying cycle ( $110 \pm 5^\circ\text{C}$ ).

- 11.2.6 When the samples are added to the oven, use the LIMS to populate the start time.
- 11.2.7 Leave the samples in the drying oven for minimum of 4 hours (preferably overnight).
- NOTE:** HRSM samples require a minimum of 12 hours of drying time before proceeding to constant weight measurements.
- 11.2.8 Move the samples from the oven to a desiccator. After allowing sample to cool, weigh sample container, and record weight,  $W_i$  in AlphaLIMS. (Enter the extension data link and enter the weigh back time as instance 1.) Replace sample in drying oven for a minimum of 1 hour.
- 11.2.9 Repeat previous step until a constant weight is obtained. (Each weigh back must be associated with an entry in extension data that records the weigh back time. Increment the instance for each weigh back.) A constant weight is defined as a weight difference of less than about 0.1% (i.e. for a 10 g aliquot, the change in weight should be less than 0.01 g). Contact management after 3 unsuccessful tries.
- NOTE:** The time required to obtain constant mass will vary depending on the type of material, size of samples, oven type and capacity, and other factors. The influence of these factors generally can be established by good judgment, experience with the materials being tested, and the apparatus being used.
- 11.2.10 Once no more weigh backs are needed. Place the sample material in the associated dry weigh material container kept in a fume hood.
- 11.2.11 Calculate % Solids and a 10g equivalent weight:
- $W_i$  = weight of sample and container, before drying  
 $W_f$  = weight of sample and container, after drying  
 $W_p$  = weight of container

$$\% \text{ Solids} = 100 \times \left[ \frac{(W_i - W_p) - (W_f - W_p)}{(W_i - W_p)} \right]$$

$$10 \text{ gram equivalent} = \frac{1000}{\% \text{ Solids}}$$

## 12.0 QUALITY CONTROL SAMPLES AND REQUIREMENTS

A duplicate of a sample shall be run with every batch of 20 or less samples. The relative percent difference (RPD) between the sample and the duplicate (DUP) should be less than 20% if both results are greater than 15% moisture. If either result is less than 15% moisture, the RPD limits do not apply.

## 13.0 CALIBRATION

- 13.1 Balances are calibrated and verified in accordance with CF-LB-E-002.
- 13.2 Temperature monitoring devices are verified in accordance with CF-QS-E-007.

**14.0 RECORDS MANAGEMENT**

All logbooks and data generated as a result of this procedure are maintained as quality records in accordance with CF-QS-E-008 for Quality Records Management and Disposition.

**15.0 LABORATORY WASTE HANDLING AND DISPOSAL**

For the proper disposal of sample and reagent wastes from this procedure, refer to the Laboratory Waste Management Plan, CF-LB-G-001.

**16.0 REFERENCES**

ASTM, Vol. 4.08, D2216-05, "Standard Test Method for Laboratory Determination of Water (Moisture) Content of Soil and Rock by Mass."

**17.0 HISTORY**

Revision 0: New document.

Revision 1: Section 11.5 added to address temperature recording.

Revision 2: Paragraph reference fixed in 11.8.

Revision 3: Added 12 hour drying time for HRSM and clarified the recording of the weigh back times.

Revision 4: Added the use of a desiccator to cool samples.

Revision 5: Added disposition of spent dry weight material in queue for disposal.

Revision 6: Added wet weight procedure.

**SECTION 1  
INTRODUCTION****1. SECTION 1 - INTRODUCTION**

Cape Fear Analytical, LLC (CFA) is a privately owned environmental laboratory dedicated to providing personalized client services of the highest quality. Our mission is to employ innovative thinking and state-of-the-art analyses to solve analytical challenges. Well trained professional personnel and modern reporting tools will be an integral part of the businesses success. Implementation of a quality control and assurance program will provide a focus for productive work and the basis of state and regulating agency certifications.

CFA was established as an analytical testing laboratory in 2009. Our analytical laboratory uses state of the art equipment and methods to provide data of the highest quality and related support services to meet the needs of our clients.

This Quality Assurance Plan (QAP) provides an overview of our quality assurance program for analytical services. Outlined in this plan are the responsibilities, policies, and processes essential to maintaining client satisfaction and our high quality of performance. The Quality Manager is responsible for revising, controlling, and distributing the QAP. It is reviewed and updated at least annually.

Everyone on our staff is expected to understand the policies, objectives, and procedures that are described in this plan and to fully appreciate our commitment to quality and their respective roles and responsibilities with regard to quality. We also expect any analytical subcontractors we employ to perform in accordance with the quality assurance requirements delineated in this plan.

This Quality Assurance Plan has been prepared according to the standards and requirements of the US Environmental Protection Agency (EPA), ANSI/ISO/IEC 17025-2017, the National Environmental Laboratory Accreditation Program (NELAP 2003), and The NELAC Institute Quality Systems Standards effective July 2009 (TNI 2016).

**1.1 QUALITY POLICY**

CFA's quality policy is a demonstrated commitment to excellence in professional practice and to the quality of the data provided to its clients. The laboratory strives to provide high quality, personalized services that enable its clients to meet their analytical testing needs quickly and cost effectively. All CFA employees are required to be familiar with the quality management system and the necessity for documentation and implementation of its policies and procedures in meeting client and regulatory requirements. Continual improvement to effective, ethical implementation of all quality systems measured is expected throughout the laboratory operations.

We define quality as "consistently meeting the needs and exceeding the expectations of our clients in a highly ethical manner." As such, we strive to:

- meet or exceed client and regulatory requirements
- be technically correct and accurate
- be defensible within contract specifications

- provide services in a cost-effective, timely and efficient manner

At CFA, quality is emphasized at every level—from the owners and directors down to the newest of employees. Management’s commitment to good professional practice and to the quality of our testing services for our customers is demonstrated by their dedication of personnel and resources to develop, implement, assess, and continually improve our technical and management operations.

The purpose of CFA’s quality assurance program is to establish policies, procedures, and processes to meet or exceed the expectations of our clients. To achieve this, all personnel that support these services to our clients are introduced to the program and policies during their initial orientation, and annually thereafter during company-wide training sessions.

CFA’s management is committed to compliance with and continual improvement of our quality assurance program. The program is designed to comply with the guidelines and specifications outlined in the following:

- NELAC 2003
- TNI 2016
- ANSI/ISO/IEC 17025-2017
- Department of Defense Quality Systems Manual
- Current U.S. EPA CLP statements of work for organic analyses

### 1.2 Quality Goals

CFA’s primary goals are to:

- Ensure that all measurement data generated are scientifically and legally defensible, of known and acceptable quality per the data quality objectives (DQOs), and thoroughly documented to provide sound support for environmental decisions.
- Ensure compliance with all contractual requirements, environmental standards, and regulations established by local, state and federal authorities.
- Additional goals include:
- A comprehensive quality assurance program to ensure the timely and effective completion of each measurement effort.
- A commitment to excellence and improvement at all levels of the organization.
- Early detection of deficiencies that might adversely affect data quality.
- Adequate document control.
- Effective quality assurance objectives for measurement systems and for quality data in terms of accuracy, precision, completeness, and comparability through the use of proven methods.
- The establishment of procedures that demonstrate that the analytical systems are in a state of statistical control.
- The implementation of corrective actions and improvements to ensure the integrity of data.
- Reduction of data entry errors through automated data handling procedures.
- The development and implementation of good laboratory practices and standard operating procedures (SOPs).
- Ability to customize quality assurance procedures to meet a client’s specific requirements for data quality.
- Good control of instruments, services, and chemical procurement.
- A continuously capable laboratory information management system (AlphaLIMS).
- Validated and documented computer hardware and software.

### 1.3 Key Quality Elements

A sound quality assurance program is essential to our ability to provide data and services that consistently meet our high standards of integrity. The key features of our program are:

- A formal quality policy and QAP.
- Management review.
- Stated data quality objectives.
- A comprehensive employee training program.
- Ethics policy and education program.
- Internal audits and self-evaluations.
- A closed-loop corrective action program.
- State-of-the-art facilities and instruments.
- Adherence to standard operating procedures.
- EPA/NIST traceable reference materials.
- Electronically based document control.
- Chain of custody and electronic sample tracking.
- Inter-laboratory comparison programs.
- Formal laboratory accreditations.
- The evaluation of subcontractor laboratories.
- Statistical controls for analytical precision and accuracy.
- Replicate, method blank, matrix spike, internal standards, and surrogate measurements.
- The preventive maintenance of instrumentation and equipment.
- Independently prepared blind standard reference materials.
- Multi-level review processes.
- Focus on client satisfaction.
- Electronic tracking of client commitments, nonconformances and corrective actions.
- Trend analysis of nonconforming items.

### 1.4 Management Reviews

The effectiveness of the Quality System is reviewed at least annually by Senior Management. These reviews address issues that impact quality, and the results of the reviews are used to develop and implement improvements to the system. Records of the review meetings are maintained as quality documents.

### 1.5 Disposition of Client Records

In the event that the laboratory should change ownership, the responsibility for the maintenance and disposition of client records shall transfer to the new owners. In the unlikely event that the laboratory ceases to conduct business, clients shall be notified and asked to provide instructions as to how their records should be returned or disposed. If a client does not provide instructions, those records will be maintained and disposed in a manner consistent with regulations and good laboratory practices for quality records.

### 1.6 Supporting Documents

Our laboratory operations and the quality of our analytical data comply with the specifications described in the documents listed in Appendix A.

### 1.7 Definitions

Applicable definitions are listed in Appendix B.

## 1.8 Test Methods

1.9 The following test methods are performed at Cape Fear Analytical:

- SW846 Method 8290A
- EPA Method 1613B
- EPA Methods 1668A and 1668C
- EPA TO-9a
- EPA DLM02.2
- EPA CBC01.2
- EPA HRSM01.2
- EPA HRSM02.0
- SW846 3546

**SECTION 2  
ORGANIZATION, MANAGEMENT, AND PERSONNEL****2. SECTION 2 - ORGANIZATION, MANAGEMENT, AND PERSONNEL**

The chart found in Appendix C depicts our organization, chain of command and flow of responsibility. The illustration in this appendix is designed to ensure the overall quality and cost efficiency of our company's analytical products and services. Our relationship to our parent corporation is shown by the dotted lines on the organizational chart in appendix C. We have the use of the parent corporation's Chief of Operations to help with items such as laboratory direction, the evaluation of new work, and management review. CFA accesses the Quality Director of the parent corporation to provide help with annual quality systems review, allocation of additional quality resources to support heavy work loads in order to maintain quality, and vendor and subcontractor audit support. CFA depends upon its parent corporation for IT support, maintenance of AlphaLIMS and electronic deliverables.

Our structure is based on a customer-focused approach that follows a project from the point of initial contact to the final invoicing of work. This approach includes expertise in project management, sample receipt and custody, sample preparation and analysis, data review, and data packaging. Our Quality Manager monitors the adherence of these departments to the Quality Assurance Program.

The general responsibilities associated with the following position levels are discussed in this section:

- Laboratory Director
- Technical Director
- Client Services Manager
- Production Manager
- Laboratory and Technical Staff

An overview of CFA's employee training protocol is also provided at Section 2.7.

**2.1 Laboratory Director**

The Laboratory Director is responsible for the daily operations of the laboratory and client services (see Section 2.4). He/she is also responsible for strategic planning, profitability and growth, personnel management and business development. Other responsibilities include the following:

- Ensuring that the individuals who staff our technical and quality positions have the necessary education, training, and experience to competently perform their jobs.
- Ensuring that all staff members receive ancillary training, as needed, to enhance performance in assigned positions.
- Budgeting, staffing, managing, and equipping the laboratory to meet current and future analytical program requirements.
- Monitoring and meeting profitability and growth objectives of the division.
- Establishing and implementing short and long range objectives and policies that support CFA's goals.

- Overseeing the implementation and overall effectiveness of our Quality Assurance Plan, health and safety initiatives, and environmental programs.
- Authorizes stop-work orders. In the absence of the Quality Manager, authorizes return-to-work orders after a major out-of-control situation.
- Managing production and cost control activities.
- Supervising all personnel employed in the laboratory.
- Ensuring development of capabilities in response to new or revised regulations, instrumentation and procedures, and quality assurance initiatives.
- Ensuring compliance with regulatory standards, including ISO/IEC 17025 and the Department of Defense Quality Systems Manual.
- Representing the company to the public and to clients.
- Ensuring the appropriate delegation of authorities during periods of absence.
- Ensuring that the laboratory has policies to avoid involvement in activities or relationships which might negatively affect confidence in the laboratory's competence, impartiality, judgment or operational integrity.
- Ensuring that management and personnel are free from undue internal and external pressures and influences that may adversely affect their impartiality, affecting the quality of their work, by mitigating pressures.

The Laboratory Director also manages the implementation and ongoing development of our Human Resources. Responsibilities include:

- Administration, orientation, and indoctrination of all new employees.
- Administration and compliance with Federal, State, and Local employment regulations.
- Sourcing candidates for all functional positions to maintain and strengthen the technical services provided by CFA.
- Management of occupational health and safety as it relates to Federal, State, and OSHA regulations.

## 2.2 Technical Director

The Technical Director is ultimately responsible for the technical content and quality of work performed within each department. Other responsibilities include:

- Defining the minimum level of qualification, experience, and skills necessary for positions in each department.
- Establishing and implementing policies and procedures that support our quality standards.
- Ensuring that technical laboratory staff demonstrates initial and continuing proficiency in the activities for which they are responsible.
- Documenting all analytical and operational activities of the laboratory.
- Ensuring that all sample acceptance criteria are verified and that samples are logged into the sample tracking system, properly labeled, and stored.
- Documenting the quality of all data reported by the laboratory.
- Developing internal mechanisms and measurements to improve efficiency.
- Overseeing activities designed to ensure compliance with laboratory health and safety requirements.
- Allocating the resources necessary to support an effective and ongoing quality assurance program.
- Ensuring compliance with regulatory standards, including ISO/IEC 17025 and the Department of Defense Quality Systems Manual.
- Maintaining MDL, PQL, LOD and LOQ studies in the laboratory LIMs

- Due to high volume and the variety of analytical tests performed in the laboratory, the Technical Director has the assistance of a Production Manager (see Section 2.5).
- Ensuring that the laboratory has policies to avoid involvement in activities or relationships which might negatively affect confidence in the laboratory's competence, impartiality, judgment or operational integrity.
- Ensuring that management and personnel are free from undue internal and external pressures and influences that may adversely affect their impartiality, affecting the quality of their work, by mitigating pressures.

The Technical Director also oversees our physical facility, laboratory safety program, and instrumentation. This includes the following responsibilities:

- Planning, evaluating, and making recommendations for facility maintenance.
- Implementation of the Chemical Hygiene program.
- Aiding in the Installation, maintenance, repair, and modification of analytical instrumentation.
- Providing technical expertise and training in instrumentation operation, calibration, and maintenance.
- Monitoring and ensuring regulatory compliance for waste management operations and off-site disposal.

The Technical Director at CFA also manages the implementation and maintenance of our quality systems in a timely, accurate, and consistent manner. These responsibilities may be found in Section 3.

### 2.3 Quality Systems Review

The effectiveness of the Quality System is reviewed on a regular basis during management meetings, which are held as frequently as needed. These meetings address issues that impact quality, and the subsequent discussions are used to design and implement improvements to the system. At least annually, a management assessment of CFA's Quality System is conducted and reported. The Quality Manager maintains records of these assessments.

### 2.4 Client Services Manager

Project Managers (PMs) serve as primary liaisons to our clients. Employees function as PMs, under the guidance of the Client Services Manager, to manage the company's interaction with clients. They are the client's first point of contact and have responsibility for client satisfaction and for communicating project specifications and changes to the appropriate laboratory areas.

In addition to overseeing project management, other responsibilities include:

- Retaining clients and soliciting new work.
- Managing multiple sample delivery orders and preparing quotes.
- Working with clients to define analytical methodologies, quality assurance requirements, reports, deliverables, and pricing.
- Overseeing sample management and informing laboratory staff of the anticipated arrival of samples for analysis.
- Conducting a review of client documents (i.e. quotes, invoices, routine and specialized reports).
- Working with the accounting team on invoicing and collection issues.
- Working with the Laboratory Director and Production Manager to project workloads and determine schedules.

- Ensuring that the laboratory has policies to avoid involvement in activities or relationships which might negatively affect confidence in the laboratory's competence, impartiality, judgment or operational integrity.
- Ensuring that management and personnel are free from undue internal and external pressures and influences that may adversely affect their impartiality, affecting the quality of their work, by mitigating pressures.

### 2.5 Production Manager

The Production Manager is a critical link between project management, lab personnel, and support staff. He/she reports to the Laboratory Director and has the following responsibilities:

- Planning and coordinating the operations of the laboratory to meet client expectations.
- Scheduling sample preparation and analyses according to holding times, quality criteria, and client due dates.
- Ensuring a multi-level review of 100% of data generated by the laboratory.
- Coordinating non-conformances and corrective actions in conjunction with the Quality Manager.
- Serving as a technical resource to the laboratory, including data review.
- Managing special projects, reviewing new work proposals, and overseeing the successful implementation of new methods.
- Monitoring and controlling expenses incurred by the laboratory such as overtime and consumables.
- Providing performance and career development feedback to laboratory staff.
- Ensuring compliance with regulatory standards, including ISO/IEC 17025 and the Department of Defense Quality Systems Manual.
- Ensuring that the laboratory has policies to avoid involvement in activities or relationships which might negatively affect confidence in the laboratory's competence, impartiality, judgment or operational integrity.
- Ensuring that management and personnel are free from undue internal and external pressures and influences that may adversely affect their impartiality, affecting the quality of their work, by mitigating pressures.

### 2.6 Laboratory and Technical Staff - General Requirements

At CFA, every effort is made to ensure that the laboratory is sufficiently staffed with personnel who have the training, education, and skills to perform their assigned jobs competently.

Depending upon the specific position, laboratory personnel are responsible for:

- Complying with quality assurance and quality control requirements that pertain to their group and/or technical function.
- Demonstrating a specific knowledge of their particular function and a general knowledge of laboratory operations.
- Understanding analytical test methods and standard operating procedures that are applicable to their job function.
- Documenting their activities and sample interactions in accordance with analytical methods and standard operating procedures.
- Implementing the quality assurance program as it pertains to their respective job functions.
- Identifying potential sources of error and reporting any observed substandard conditions or practices.
- Identifying and correcting any problems affecting the quality of analytical data.

### 2.7 Employee Training

To ensure that our clients receive the highest quality services possible, we train our employees in the general policies and practices of the company, as well as the specific operating procedures relative to their positions. We conduct and document this training according to CF-HR-E-002 for Employee Training and CF-QS-E-017 for Maintaining Technical Training Records.

New employees participate in a company orientation shortly after they are hired. During orientation they receive information on quality systems, ethics/data integrity, laboratory safety, and employment practices. Each new employee is also provided a manual that reiterates our policies on equal opportunity, benefits, leave, conflicts of interest, employee performance, and disciplinary action. Employees can access standard operating procedures, the Quality Assurance Plan, Safety, Health, and Chemical Hygiene Plan, and the Laboratory Waste Management Plan on CFA's Intranet.

Other training provided on an ongoing basis may include:

- Demonstration of initial proficiency in analytical methods and training to SOPs conducted by a trainer who has been documented as qualified and proficient in the process for which training is being provided.
- Demonstration of continued analyst proficiency is updated annually, usually during the first quarter of each year. Proficiency is demonstrated using the same processes as those used for initial Demonstration of Capability. (Refer to Section 8.3.1.)
- Company-wide, onsite training.
- Courses or workshops on specific equipment and analytical techniques.
- University courses.
- Professional and trade association conferences, seminars, and courses.
- MDL studies are maintained with training records where applicable (Kentucky Certification Manual).

Documentation of employee training is the joint responsibility of the employee and the Quality Manager or Production Manager. If an SOP is revised during the course of the year, training to the revised SOP must be documented.

## 2.8 Ethics and Data Integrity

Employees attend ethics education programs that focus on the high standards of data integrity and ethical behavior mandated by our company and expected by our clients.

The annual ethics training includes:

- Specific examples of unethical behaviors for the industry and for the laboratory.
- Explanation of Internal Auditing for unethical behaviors and practices.
- CFA use of electronic audit functions using instrument and AlphaLIMS software.
- Examples of consequences of inappropriate or unethical behaviors/practices.
- Examples of impartiality from commercial, financial or other pressures, both external and internal.

CFA's policy on confidential reporting of potential integrity issues is presented during the initial and continuing Ethics and Data Integrity training. Potential business or data integrity issues are handled and reviewed in a confidential manner until such time as a follow-up evaluation, full investigation, or other appropriate actions have been completed and issues clarified. All investigations are confidentially processed by CFA's Quality Manager, or other members of CFA's Laboratory Management staff under the direction of the QM. All investigations that

result in finding of inappropriate activity are properly documented and include any disciplinary actions involved, corrective actions taken, and all appropriate notifications of clients. The QM is responsible for updating CFA's Executive Committee on the progress of integrity investigations during regularly scheduled meetings.

All employees sign an Ethics and Data Integrity Agreement that reflects their commitment to always performing their duties with these high standards. (Refer to Appendix F.)

### 2.9 Confidentiality

The laboratory maintains the confidentiality and proprietary rights of information including the type of work performed and results of analysis. Laboratory personnel and staff are informed of this policy and sign a confidentiality agreement.

A confidentiality statement accompanies the electronic transfer of data from CFA via telefacsimile (fax) or electronic mail systems (email). Government affiliated auditing agencies have access to pertinent laboratory records. However, contract, third party, and client auditors have access only to those records that may be applicable to their inspection and shall not be granted access to client records that may be considered in conflict with their interests, unless prior authorization has been given by the submitting client. Confidential information may be purged of references to client identity, project and/or sample identity by the laboratory so that records may be provided to other entities (e.g. auditors) for review.

### 2.10 Impartiality

The laboratory is committed to Impartiality in producing valid results derived under its range of activities or scope of work. Results are provided accurately, objectively, clearly and in a report format which includes all the information necessary for the interpretation of the results. All information required by the method used and agrees with the customer is reported. The laboratory strives to maintain impartiality from commercial, financial or other pressures which might compromise impartiality. In addition to internal management structure mitigating undue pressures on employees, the laboratory reviews requests and tenders for possible risks to impartiality prior to bidding on work.

Our Core Values, along with procedures, plans, and policies outlined in the Quality Assurance Plan, scheduled management meetings, and monitoring of key performance indicators help in the management of risks on an on-going basis.

### 2.11 Appointment of Deputies for Key Managerial Personnel

Deputy personnel are assigned to key management personnel so that the responsibilities associated with the key position will be attended to by the deputy. The laboratory appoints the following deputies for the following positions:

Management - The deputy Laboratory Director shall be the Production Manager.

Technical – The deputy Production Manager shall be the Laboratory Director.

Quality - The deputy Quality Manager shall be Packaging/Technical Support.

Customer Service – The deputy Project Manager shall be the Laboratory Director.

**SECTION 3  
QUALITY SYSTEMS****3. SECTION 3 - QUALITY SYSTEMS**

Our Quality Systems include all quality assurance (QA) policies and quality control (QC) procedures necessary to plan, implement, and assess the work we perform. CFA's QA Program establishes a quality management system (QMS) that governs all of the activities of our organization.

CFA's quality management system is designed to conform to the requirements specified in the standards referenced in Appendix A. Essential elements of our quality management system are described in this section.

**3.1 Quality Manager**

The Quality Manager is responsible for managing CFA's Quality Assurance Program. This person functions independently of the systems he/she monitors.

Following is a summary of the responsibilities of this position:

- Reports to the Laboratory Director
- Demonstrates strict adherence to and support of the company ethics policy
- Serves as management's representative for quality
- Responsible for the implementation and maintenance of the QMS
- Responsible for ensuring communication takes place at all levels within CFA, pertaining to issues included in this section.
- Responsible for evaluating the effectiveness of the quality system through various quality measures such as internal and external assessment, non-conformances and management review
- Initiates and recommends preventive action and solutions to quality problems
- Implements appropriate action to control quality problems until solutions are implemented and verified to be effective
- Verifies that effective solutions are implemented
- Authorizes stop-work and return-to-work orders after a major out-of-control situation
- Demonstrates knowledge of the Quality System as defined by NELAC, TNI, ANSI/ISO/IEC 17025, DoD and DoE.
- Plans, schedules and participates in CFA's client audits, internal audits, and subcontractor audits
- Conducts conformance audits as necessary to verify implementation and closure of audit action items
- Serves as liaison to client and third party auditors
- Coordinates laboratory responses to audit reports and prepares final response
- Monitors progress of corrective actions
- Demonstrates the ability to evaluate data objectively without outside influence
- Has knowledge of analytical methods
- Ensures the monitoring of balances and weights, and temperature regulation of ovens, water baths, and refrigerators
- Writes and reviews quality documents and standard operating procedures
- Provides training in quality systems, ethics, confidentiality and good laboratory practices.

- Evaluates effectiveness of training and makes recommendations when additional training or re-training is required
- Manages laboratory certification and licensing processes. Performs notification of changes at our lab with respect to ownership, technical direction or location.
- Coordinates the receipt and disposition of external and internal performance evaluation samples.
- Developing and evaluating quality assurance policies and procedures pertinent to our laboratory functions, and communicating these with the division directors and managers.
- Ensuring that laboratory activities are in compliance with local, state, and federal environmental laws and regulations.
- Manage performance, evaluation and implementation of MDL, PQL and SPC determinations.
- Reviewing project-specific quality assurance plans.
- Performing independent quality reviews of randomly selected data reports and laboratory practices including facilities and instruments.
- Communicating system deficiencies, recommending corrective action to improve the system, and defining the validity of data generated during out of control situations.
- Administering our document control system.
- Designating quality systems authorities in times of absence to one or more appropriately knowledgeable individuals.
- Submittal of Quarterly Progress Reports (QPR) to the DOE contractor SMO.
- Ensuring that the laboratory has policies to avoid involvement in activities or relationships which might negatively affect confidence in the laboratory's competence, impartiality, judgment or operational integrity.
- Ensuring that management and personnel are free from undue internal and external pressures and influences that may adversely affect their impartiality, affecting the quality of their work, by mitigating pressures.
- Ensuring that employee competence measurements are established and monitored.

### 3.2 Quality Documents

Our Quality Systems policies and procedures are documented in the QA Plan (CF-QS-B-001) and other supporting documents. CFA's management approves all company quality documents. Pre-approval is secured for any departures from such documents that may affect quality. Any departures are documented and provided to the client.

In addition to the QA Plan, Quality Systems allows for QA Project Plans (QAPjP) and includes standard operating procedures and any other quality assurance program requirements defined by individual contracts. The QA Plan describes the quality standards that we apply to our laboratory operations. We use Quality Assurance Project Plans to specify individual project requirements. The QA Plan and supporting documents are verified to be understood and are implemented throughout the laboratory fractions to which they apply.

Finally, our Standard Operating Procedures (SOPs) are used to describe in detail those activities that affect quality. SOPs are prepared, authorized, changed, revised, released, and retired in accordance with CF-ADM-E-001. SOPs are accessible electronically via CFA's Intranet.

### 3.3 Document Control

The control of quality documents is critical to the effective implementation of our Quality Systems. We define and control this process in accordance with CF-DC-E-001 for Document

Control. Responsibilities for document control are divided between the Production Manager and the Quality Manager.

The Production Manager is responsible for:

- Supporting the development and maintenance of controlled documents that apply to their respective departments.
- Ensuring through documentation that the affected employees are aware of revisions to documents or manuals.

The Quality Manager is responsible for:

- Electronic maintenance of all records required for control, re-creation, and maintenance of analytical documentation.
- Maintenance of electronic copies of archived data and the electronic log of how they were determined.
- Demonstrating strict adherence to and support of the company ethics policy as it pertains to Document Control.
- Managing the system for the preparation, authorization, change, revision, release, and retirement of the Quality Manual, QAP, project plans, and standard operating procedures.
- Ensuring that current controlled documents are accessible via CFA's Intranet.
- Managing a system to document current revision numbers and revision dates for all distributed documents and manuals.
- Managing a system to identify the nature of document revisions.
- Maintaining hard or electronic copies of obsolete documents and original copies of controlled documents.

### 3.4 Controlled Document Review

Internally generated controlled documents undergo a multi-level review and approval process before they are issued. These levels include a procedural review, technical and/or quality review and final authorization by the appropriate manager or director. To ensure that new or revised standard operating procedures are not implemented prematurely, SOPs are effective upon the date of the final approval signature.

### 3.5 Review of New Work

Prior to submitting proposals for new work, all available information, including but not limited to, statements of work (SOW), requests for proposal (RFP) and client communications are reviewed. Review is conducted by the Laboratory Director, Project Manager, Quality Manager, and Production Manager. This review is performed in order to ascertain the appropriateness of CFA's resources and facilities.

### 3.6 Quality Records

Quality records provide evidence that specified quality requirements have been met and documented. We generate them in accordance with applicable procedures, programs, and contracts. Quality records include but are not limited to:

- Observations
- Calculations
- Calibration data
- Certificates of analysis
- Certification records

- Chains of custody
- Audit records
- Run logs, instrument data, and analytical logbooks
- Instrument, equipment, and building maintenance logs
- Material requisition forms
- Monitoring logs
- Nonconformance reports and corrective actions
- Method development and start-up procedures including method detection limit studies
- Technical training records
- Waste management records
- Standard logs
- Software validation documentation
- Standard Operating Procedures (SOPs)
- Sample collection and field data

Our quality records are:

- Documented in a legible manner.
- Indexed and filed in a manner conducive to ready retrieval.
- Stored in a manner that protects them from loss, damage, and unauthorized alterations.
- Retained and disposed in the identified time period.

The generation, validation, indexing, storage, retrieval, and disposition of our quality records are detailed in CF-QS-E-008 for Quality Records Management and Disposition. The quality records of subcontracted services are also required to meet the conditions established in this SOP.

### 3.7 Internal and Supplier Quality Audits

We conduct internal audits annually to verify that our operations comply with the requirements of our QA program and those of our clients. We perform supplier audits as necessary to ensure that they too meet the requirements of these programs. Both internal and supplier audits are conducted in accordance with CF-QS-E-001 for the Conduct of Quality Audits.

#### 3.7.1 Audit Frequency

Internal audits are conducted at least annually in accordance with a schedule approved by the Quality Manager. Supplier audits are contingent upon the categorization of the supplier, and may or may not be conducted prior to the use of a supplier or subcontractor (Refer to CF-QS-E-001.) Type I suppliers and subcontractors, regardless of how they were initially qualified, are re-evaluated at least once every three years.

Additional internal and supplier audits may be scheduled if deemed necessary.

#### 3.7.2 Audit Team Responsibilities

Internal and supplier audits are conducted by qualified staff under the direction of the Quality Manager. A qualified audit team member shall have the technical expertise to examine the assigned activities.

We do not allow staff to audit activities for which they are responsible or in which they are directly involved. It is the responsibility of the Quality Manager to ensure that such conflicts of interest are avoided when the audit team is assembled.

Management has a significant role in the internal audit process, including:

- Provision of audit personnel
- Empowerment of the audit team with authority to make the audit effective
- Development and implementation of timely corrective action plans

### 3.7.3 Identification and verification of OFIs

Opportunities for Improvement are identified conditions that may adversely affect the quality of products or services. Several examples of objective evidence are used to support an OFI, which might be classified as a finding, concern, observation, and/or recommendation.

The Quality Manager may initiate a Nonconformance Report (NCR) or Corrective Action Request and Report (CARR) referencing the OFI. The NCR or CARR is then entered into the NCR system per CF-QS-E-012 for NCR Database Operation.

Implementation of a corrective action is later verified by a re-audit of the deficient area, review of new or revised documents, or, if the OFI does not warrant immediate action, the corrective action may be verified during the next scheduled audit. Such long term follow-up will document the implementation and effectiveness of the corrective action.

### 3.8 Managerial and Audit Review

Laboratory management reviews the audit process at least annually. This ensures the effectiveness of the corrective action plan and provides the opportunity to introduce changes and improvements.

We document all review findings and corrective actions. Implementation plans and schedules are monitored by the Quality Manager.

### 3.9 Nonconformances

Processes, materials, and services that do not meet specifications or requirements are defined as nonconforming. Such nonconformances can include items developed in-house or purchased from vendors, samples received from clients, work in progress, and client reports.

At CFA, we have a nonconformance reporting system (NCR) that helps us prevent the entry of defective goods and services into our processes and the release of nonconforming goods and services to our clients. Our NCR system provides a means for documenting the disposition of nonconforming items and for communicating these to the persons involved in the process affected by the adverse condition(s).

Nonconformances are documented according to CF-QS-E-004 for the Documentation of Nonconformance Reporting and Dispositioning and Control of Nonconforming Items. We regularly review SOPs, client complaints, and quality records, including completed NCRs, to promptly identify conditions that might result in situations or services that do not conform to specified quality requirements.

Our Quality Manager processes, categorizes and trends nonconformances. Trending information may be provided to management.

### 3.10 Corrective Action

There are two categories of corrective action at CFA. One is corrective action implemented at the analytical and data review level in accordance with the analytical SOP. The other is formal corrective action documented by the Quality Manager in accordance with CF-QS-E-002.

Formal corrective action is initiated when a nonconformance reoccurs or is so significant that permanent elimination or prevention of the problem is required.

We include quality requirements in most analytical SOPs to ensure that data are reported only if the quality control criteria are met or the quality control measures that did not meet the acceptance criteria are documented.

Formal corrective action is implemented according to CF-QS-E-002 for Conducting Corrective/Preventive Action and Identifying Opportunities for Improvement and documented according to CF-QS-E-012 for NCR Database Operation.

Any employee at CFA can identify and report a nonconformance and request that corrective action be taken. Any CFA employee can participate on a corrective action team as requested by the Quality Manager or Production Manager. The steps for conducting corrective action are detailed in CF-QS-E-002.

In the event that correctness or validity of the laboratory's test results is doubted, the laboratory will take corrective action. If investigations show that the results have been impacted, affected clients will be informed of the issue in writing within 21 calendar days of the discovery.

### 3.11 Performance Audits

In addition to internal and client audits, our laboratory participates in annual performance evaluation studies conducted by independent providers. We routinely participate in the following types of performance audits:

- Proficiency testing and other inter-laboratory comparisons.
- Performance requirements necessary to retain certifications (Appendix D).
- Evaluation of recoveries of certified reference and in-house secondary reference materials using statistical process control (SPC) data.
- Evaluation of relative percent difference between measurements through SPC data.

NOTE: Once PE samples have been prepared in accordance with the instructions provided by the PE vendor, they are managed and analyzed in the same manner as environmental samples from clients. The analytical and reporting processes for PE samples are not handled differently than for authentic samples. SOP CF-QS-E-013 more completely describes the laboratory policies and practices for managing proficiency evaluation samples.

We also participate in a number of proficiency testing programs for federal and state agencies and as required by contracts. It is our policy that no proficiency evaluation samples be analyzed in any special manner.

Our annual performance evaluation participation generally includes a combination of studies that support the following:

- Water Pollution (WP). Biannual program for waste methodologies.
- Water Supply (WS): Biannual program for drinking water methodologies.

At CFA, we also evaluate our analytical performance on a regular basis through statistical process control acceptance criteria. Where feasible, this criterion is applied to both measures of precision and accuracy and is specific to sample matrix.

We establish environmental process control limits for the LCS, MS and MSD at least annually. CFA's current process control limits are maintained in LIMS. The upper and lower control limits (UCL and LCL respectively) for precision are plus or minus three times the standard deviation from the mean of a series of relative percent differences. For DoD QSM projects the

laboratory initially uses the limits provided in the current DoD QSM tables and when unavailable, uses the laboratory derived limits. When the laboratory has enough data points to establish statistical limits, it will derive these limits in accordance with its normal procedures, using DoD QSM project sample results.

CFA's procedure for establishing precision and bias at the LOQ is to collect data from LOQ and LOQV determinations until there are enough points to generate valid statistical limits. These limits are reported with the LOQ results in data packages. Where there is not adequate laboratory data available, the laboratory uses 50 -150% for UCL and LCL, with 45% - 155% ME limits.

CFA also measures precision through the use of matrix duplicates and/or matrix spike duplicates. The upper and lower control limits (UCL and LCL respectively) for precision are the same as those used for the LCS, in accordance with the DoD QSM.

For non-DoD QSM projects, the upper and lower control limits (UCL and LCL respectively) for precision are plus or minus three times the standard deviation from the mean of a series of relative percent differences.

Accuracy is measured through laboratory control samples and/or matrix spikes, as well as surrogates and internal standards. The UCLs and LCLs for accuracy are plus or minus three times the standard deviation from the mean of a series of recoveries. Specific instructions for out-of-control situations are provided in the applicable analytical SOP.

### 3.12 Essential Quality Control Measures

Some quality control measures are method-specific. There are, however, general quality control measures that are essential to our quality system. These quality measures include:

- Monitoring of negative and positive controls
- Defining variability and reproducibility through duplicates
- Ensuring the accuracy of test data including calibration and/or continuing calibrations, use of certified reference materials, proficiency test samples, etc.
- Evaluating test performance using method detection limits and quantitation limits or range of applicability such as linearity
- Selecting the appropriate method of data reduction
- A copy of CFA's Ethics and Integrity Agreement is provided in Appendix F.

### 3.13 Control Charts

Control charts are a graphical representation of data taken from a repetitive measurement or process. Control charts may be developed for various characteristics (e.g. mean, standard deviation, range, etc.) of the data. A control chart has two basic uses, as a tool to judge if a process was in control and as an aid in achieving and maintaining statistical control.

The Quality Manager utilizes the LIMS to automatically generate and evaluate control chart data once a week. Tables of the data are emailed to the Quality Manager for review. This assists with monitoring out of control situations due to laboratory contamination or analyst error. The QA Officer shall be able to stop unsatisfactory work and prevent further loss in quality.

The Quality Manager also may utilize the LIMS and the Computer Services Team (CST) to trend data as control charts for method blank levels, surrogate recoveries, etc. At this time, any out of control conditions will be identified and a corrective action initiated.

Many of the quality control limits are dictated by our clients and the methods employed by CFA. In certain cases where no guidance exists, or at a client's request, in-house limits are generated and used to control data. CFA's Quality Manager or designee shall review such control charts during the period when the LIMS program queries data points for analyses that require in-house limits for quality control parameters. This is performed on a biannual basis. In-house limits for new control parameters are generally developed when more than 20 data points are available for review. Data points may be determined as outliers based on the process knowledge of the procedure being evaluated and the professional opinion of the data reviewer.

**SECTION 4  
FACILITIES****4. SECTION 4 - FACILITIES**

Our laboratory is designed with a full-service approach to handling environmental needs. The layout provides dedicated space for organic extractions and dioxin/PCB analyses.

The laboratory and support offices occupy approximately 5,400 square feet engineered to meet the stringent quality control and utility requirements of the modern environmental laboratory. Records are temporarily stored on-site then warehoused in a secured building off-site. The diagram in Appendix H depicts the layout of the laboratories.

Discussed in this section are:

- Facility security
- Utility services and deionized water
- Prevention of contamination
- Assessment of contamination

**4.1 Facility Security**

Our facility features secured laboratory and storage areas. Restricted entry assures sample integrity and client confidentiality, which satisfies clients' and potential national security interests.

Visitors cannot gain entry without being escorted through the laboratory by authorized personnel. A designated sample custodian and a bar-coded chain-of-custody provide a second level of security.

CFA implements standard security mechanisms to restrict sensitive data and applications to only those who are authorized to view or use it. Security efforts are taken to secure applications, CFA employees, and CFA's computing environment from external intruders.

For GLP/GMP compliant systems, computer screensaver programs with password protection shall be set to control access to the computer if it is left unattended for more than five minutes (or lowest setting if 5 minutes is not available) or the user may lock the computer if leaving the computer unattended. Note that some instrument control software is incompatible with screen savers.

**4.2 Utility Services**

The laboratory area is equipped with the following utilities:

- Cold water
- Hot water
- Deionized water
- Compressed air
- Vacuum (at selected stations)
- 120 Volt AC
- 208 Volt AC (at selected stations)
- Specialty gases (as required)

#### 4.2.1 Deionized Water

We have one fully functioning deionized water system which services the whole laboratory. DI water is made from city water flowing through a deionization system capable of producing 5 gallons per minute of Type II laboratory water.

We monitor the unit by using the service/replacement indicator light on the filter assemblies. Because the laboratory requires water of purity such that scaling of glassware and analytes of interest are not detected, locally purchased distilled water may also be used.

#### 4.3 Prevention of Contamination

Work areas that are free of sample contaminants, constituents and measurement interferences are important to the generation of quality data. With this in mind, we designed our laboratory to prevent contamination and reinforce this design with good laboratory practices.

In addition to keeping our work areas free of dust and dirt accumulations, policies and features that prevent or minimize contamination include:

- Fume hoods to remove fumes and reduce the risk of aerosol and airborne contaminants and personal safety hazards are monitored in accordance with CF-FC-E-003 for Fume Hood Face Velocity Performance Checks.
- Restricted access to the laboratory (authorized personnel only).
- Designated area for glassware preparation wherein all glassware used in sample prep and analysis is cleaned according to CF-LB-E-003 for Glassware Preparation.
- Production, use, and monitoring of Type II DI water.
- Tracking and trending of any significant sample and/or reagent spills using the AlphaLIMS NCR system, allowing efficient analysis of any potential contamination.

#### 4.4 Assessment of Contamination Levels

We evaluate contamination resulting from the following sources on the basis of quality assurance and quality control data derived from the analytical method and method blanks:

- Sample containers
- Reagent water
- Reagents and solvents
- Sample storage
- Chemical and physical interference
- Constituent carryover during analysis

**SECTION 5  
EQUIPMENT AND REFERENCE MATERIALS****5. SECTION 5 - EQUIPMENT AND REFERENCE MATERIALS**

CFA's ability to efficiently generate data that are reproducible, accurate, and legally defensible is attributable to our use of high-quality instruments, equipment, and reference materials.

Provided in this section are:

- CFA's policies governing instruments, equipment, and reference materials
- Identification of instrumentation and support equipment
- Procurement protocol

**5.1 General Policies**

It is our policy to purchase instrumentation, equipment and high-quality reference materials that meet or exceed the method and regulatory requirements for the analyses for which we are accredited. If we need to use instruments or equipment not under our permanent control, we ensure that it also meets these standards.

Instrumentation and equipment are placed into service on the basis of ability to meet method or regulatory specified operating conditions such as range and accuracy. All laboratory instrumentation and testing equipment is maintained in accordance with standard operating procedures (SOPs).

Instrumentation and equipment is used in a manner that assures, where possible, that measurement uncertainty is known and consistent with specified quality requirements. Instruments and equipment are taken out of service and segregated or labeled as such under the following conditions:

- Mishandling and/or overloading
- Results produced are suspect
- Demonstrated defect or malfunction

Tagged or segregated instruments and equipment remain out of service until repaired and documented by test, calibration, or verification to perform satisfactorily. Instruments that are in service and normally calibrated prior to and during use are not tagged.

Each item of equipment, including reference materials is, if appropriate, labeled, marked or otherwise identified to indicate its calibration status. We maintain records for each major item of equipment, instrumentation, and all reference materials significant to quality performance. These records are often in the form of maintenance logs, which are kept in accordance with CF-LB-E-008 for Basic Requirements for the Use and Maintenance of Laboratory Notebooks, Logbooks, Forms, and Other Recordkeeping Devices.

Documentation included in these records includes but is not limited to:

- Equipment name
- Manufacturer's name
- Type identification
- Serial number or other unique identification
- Date received and date placed in service (if available)

- Current location
- Condition when received (if known)
- Manufacturer's instruction, where available
- Dates and results of calibrations and or verifications
- Date of next calibration and/or verification, where written procedures do not specify frequency
- Details of maintenance carried out to date and planned for the future
- History of any damage, malfunction, modification or repair

### 5.2 Instrumentation and Support Equipment

Appendix G lists the instruments we use for the analysis of environmental samples. Where feasible, our instruments are equipped with autosamplers that improve efficiency and facilitate consistent sample introduction to the sample detector. Instruments are also connected to an area network to facilitate data transfer.

Devices that may not be the actual test instrument but are necessary to support laboratory operations are referred to as support equipment. We also maintain this equipment in proper working order. Support equipment utilized at CFA includes:

- balances
- ovens
- refrigerators
- freezers
- water baths
- temperature measuring devices
- volumetric dispensing devices
- muffle furnaces
- grinders and homogenizers
- hot plates and heating mantles.

Guidelines for the required calibration and evaluation of this equipment are discussed in Section 7.

SOPs are used to describe our procedures for all routine analyses performed by our labs. These procedures include step-by-step instructions for sample collection, storage, preparation, analysis, instrument calibration, quality control, disposal, and data reporting.

### 5.3 CONTROL OF PURCHASED ITEMS

Materials, equipment, and services that affect the quality of our products are designated as Quality Materials, Equipment, and Services and are purchased from pre-approved suppliers whenever possible. Suppliers are approved and documented according to CF-QS-E-001 for the Conduct of Quality Audits.

At CFA, we maintain documentation of specific quality requirements for materials and services. Records that document the quality of a product or service may include:

- certificates of analysis and traceability
- verifications of chemical quality
- inspections of equipment or materials
- verifications or inspections of vendor product specifications

**SECTION 6  
HEALTH AND SAFETY****6. SECTION 6 - HEALTH AND SAFETY**

CFA maintains a safe work environment and promotes healthy work practices. CF-LB-N-001 is the laboratory Safety, Health and Chemical Hygiene Plan. Procedures outlined in the plan are consistent with OSHA, CERCLA and the EPA.

All employees are trained in the safety practices applicable to their job functions. This training is conducted in accordance with CF-HR-E-002 for Employee Training.

**6.1 Fire Safety**

Our facility is equipped with smoke detectors in key areas of the facility. Automatic halon extinguishers are used in areas with higher risk of fire such as the organic sample preparation lab fume hood. Fire blankets and dry chemical extinguishers are located at strategic points throughout the lab. We routinely inspect these extinguishers in accordance with CF-FC-E-004. Lab personnel are trained in the proper use and selection of fire extinguishers. In order to decrease the risk of fire, bulk solvents are stored in flammables cabinets.

**6.2 Evacuation**

In the unlikely event of a fire (or other emergency), we have defined evacuation routes depicted in Appendix H. This diagram is posted in pertinent areas of the facility.

**6.3 Safety Equipment**

Safety equipment, including safety glasses, lab coats, safety goggles and protective gloves, is available to all employees as needed. Eyewashes and overhead showers are located in the laboratory. We routinely inspect these as directed in CF-FC-E-002 for Testing Emergency Eyewash and Shower Equipment

**SECTION 7  
MEASUREMENT, TRACEABILITY, AND CALIBRATION****7. SECTION 7 - TRACEABILITY AND CALIBRATION**

Traceability of measurements and the calibration of testing equipment are imperative to our ability to produce accurate and legally defensible data. As such, we have implemented procedures to ensure that equipment calibration and measurement verification are traceable to nationally recognized standards.

Standards are obtained from the National Institute of Standards and Technology (NIST) or accredited reference material producer (RMP) with traceability to NIST. Reference materials purchased outside the United States must be traceable back to each country's national standards laboratory or another national or international reference organization such as ILAC, APLAC and/or IAAC. The RMP may also have established acceptability by its approval as an ISO Guide 34 RMP. ISO guide approval is only required for initial calibration standards.

Where possible, calibration certificates provide traceability to national standards of measurement. Calibration certificates provide measurement results and any associated uncertainty of measurement, and/or a statement of compliance with the identified specification. Calibration certifications are maintained as quality records.

When traceability to a national standard is not applicable, verification of measurement is achieved through inter-laboratory comparisons, proficiency tests, or independent analyses.

The following measurement and traceability practices are described in this section:

- Calibration criteria for support equipment
- General requirements
- Balances
- Temperature-sensitive devices and temperature monitoring
- Air displacement pipets
- Instrument calibration
- Calibration verification

**7.1 Calibration Criteria for Support Equipment**

This section addresses calibration protocols for support equipment, including balances, temperature -sensitive equipment, and air displacement pipets. The general criteria applicable to the calibration of support equipment are as follows:

- Equipment is maintained in proper working order. Records of all maintenance activities including service calls are kept.
- Calibrations or verifications over the entire range of use, using NIST-traceable references when available, are conducted at least annually.
- Temperature measuring devices with digital readouts are calibrated quarterly.
- Prior to use each day, balances, ovens, freezers, refrigerators, incubators, and water baths are checked with NIST-traceable references (where possible) in the expected use range.
- If prescribed by the test method, additional monitoring is performed for a device used in a critical test (such as an incubator or water bath).

- Reference standards of measurement such as Class S or equivalent weights or traceable thermometers may be used for calibration when demonstrated that their performance as reference standards will not be invalidated.
- Reference standards of measurement are calibrated by a body that can provide, where possible, traceability to a national standard.
- Reference standards and measuring and testing equipment are subject to in-service checks between calibrations and verifications, in accordance with ANSI/ISO/IEC 17025-2017.
- Mechanical volumetric dispensing devices used for quantitative measurements are checked daily for accuracy prior to use.
- If results of calibration and verification are not within the specifications for the equipment's application, then the equipment is removed from service until repaired. Under certain conditions, a deviation curve may be prepared. All measurements are corrected for the deviation, recorded and maintained.

#### 7.1.1 Balances

Our balances undergo annual calibration, maintenance, and cleaning. Each balance is labeled with a serial number, service date, date of next service, and signature of the service technician.

Balances are set up, calibrated, and operated in the range required by the analytical method in accordance with CF-LB-E-002 for Balances. Prior to using a balance, the analyst is responsible for checking its calibration.

Calibration and calibration verification are performed using weights that are or have been calibrated against Class S or equivalent weights. These weights are traceable to NIST and calibrated annually by a calibration service provider that meets the requirements of the ANSI/ISO/IEC 17025-2017 standard.

Calibration and calibration verification are recorded in the balance calibration logbook. If the calibration or calibration verification does not meet the specified acceptance criteria, the balance is recalibrated. If the calibration criteria are still not met, the balance is removed from service and tagged as such.

#### 7.1.2 Refrigerators, Freezers, Ovens, Water Baths, and Similar Devices

Careful control of temperature is often central to the production of acceptable data.

Temperature excursions beyond the established limits may invalidate a procedure and the associated data. Constant monitoring in accordance with CF-LB-E-004 for Temperature Monitoring and Documentation Requirements for Refrigerators, Freezers, Ovens, and Other Similar Devices assures us that regulatory and/or method temperature requirements are being met.

We measure temperatures with thermometers that are verified annually against a NIST-traceable thermometer. The NIST traceable thermometers are independently verified at least annually by a verification service that meets the requirements of the ANSI/ISO/IEC 17025-2017 standard. The protocol for thermometer verification is described in CF-QS-E-007. We monitor the temperature of the following equipment according to CF-LB-E-004:

- Refrigerators and freezers used to store samples, standards, and other temperature-sensitive materials
- Ovens
- Water baths

We monitor the temperatures of refrigerators and freezers prior to use each day. The temperatures of ovens, water baths, and other devices used as part of an analytical process must be monitored prior to, during, and immediately after use.

Temperature measurements are documented on logs specific to each piece of equipment. The logs are posted on or near each water bath, oven, or other temperature control device. Refrigerator and freezer logs are stored electronically. Each log includes the following information:

- Date and time of each measurement
- Initials of person taking measurement
- Acceptance limits for device being monitored
- Whether device conforms with specifications at time of measurement
- Name, location, and number of device being monitored
- Notation of any out-of-control condition

When the process to maintain and document temperatures within acceptance limits does not conform to specifications, a nonconformance report (NCR) is issued. Appropriate action is then taken to disposition the nonconformance according to CF-QS-E-004 for Documentation of Nonconformance Reporting and Dispositioning and Control of Nonconforming Items.

Examples of nonconformances are:

- Failure to maintain process temperature within acceptance limits
- Failure of device to achieve calibration
- Total failure of temperature control device
- Failure to monitor the temperature as required

### 7.1.3 Air Displacement Pipets

Air displacement pipets offer a level of precision and accuracy exceeded only by Class A transfer pipets. Due to the use of disposable tips, these pipets eliminate the possibility of cross-contamination.

We calibrate air displacement pipets quarterly using five replicate measurements of a frequently used volume setting in accordance with CF-LB-E-010 for Maintenance and Use of Air Displacement Pipets.

The acceptance criteria for each measurement are based on the average of the five calibration measurements. Tolerance limits for commonly used verification volumes and accuracy and precision checks are included in the pipet calibration logbook. Calibrations are traceable to each pipet using the unique identification found on its label.

If a pipet does not meet the calibration tolerance limits, it is removed from service until it again demonstrates compliance after being cleaned and/or repaired. Analysts whose jobs may require the use of air displacement pipets are trained in their proper use and calibration.

## 7.2 Instrument Calibrations

To ensure that the data generated by an instrument are accurate, we calibrate the instrument using standards containing known concentrations of target analytes. The stability of the instrument over the calibration range is verified by the analysis of a continuing calibration verification standard (CCV) obtained from a second source whenever possible.

Traceability of calibration, calibration verification, and other quality control standards to the recognized standard are documented per CF-LB-E-007 for Laboratory Standards Documentation. Individual identification numbers are assigned to each source standard and each subsequent intermediate and working standard prepared.

The identification number makes it possible to trace a standard to a parent standard and ultimately to the source standard and its Certificate of Analysis. The date each standard is prepared, the protocol used in the preparation, the person preparing the standard, and the standard's expiration date are documented in the appropriate standards log, maintained in AlphaLIMS. The information is accessible via the standard ID number.

We record standard and reagent ID numbers on instrument run logs, analytical logbooks, sample preparation logs, and instrument raw data. Calibration standards that are used in the analysis of a particular sample or group of samples can be traced to NIST, US EPA, or other nationally recognized standards.

#### 7.2.1 Initial Instrument Calibration

Calibration procedures for specific instruments, and the frequencies of performance for defined methods, are described in the applicable operating or analytical SOP. Calibration is discussed in general terms in CF-QS-E-014 and includes standard laboratory practices and formulas used for determinations made by these practices. General guidelines include:

- Preparation of calibration curves as specified in the reference method.
- If a test method does not specify the number of calibration standards, the minimum number is two, not including blanks, with one at the lowest quantitation limit. The reference SOP must establish the initial calibration requirements.
- Verification of initial calibrations with a standard obtained from a second source (unless one is not available).

#### 7.3 Calibration Verification

When an initial calibration curve is not established on the day of analysis, the integrity of the curve should be verified prior to sample analysis. Verification requires the analysis of a standard from a second source. The standard concentration should be at the method-defined level. If not specified, a standard at a mid-level concentration may be used.

If the calibration verification does not meet acceptance criteria, the analytical procedure is stopped and evaluated, and appropriate corrective measures are taken. Calibration verification (CCV) must be acceptable before any samples are analyzed. CCVs are analyzed at a frequency described in the referenced method. If an instrument consistently drifts outside the acceptance criteria before the next calibration, the frequency is increased.

If the recovery of a CCV does not meet the acceptance criteria and routine corrective actions fail to produce a second consecutive check within acceptance criteria, a new initial calibration curve should be constructed. Analytes of interest found in corresponding environmental samples may be reported, however, only if all of these criteria are met:

1. CCV recovery for target analyte exceeds the acceptance criteria (biased high)
2. Target analyte in the environmental sample is not detected at a concentration exceeding the level required by client contract (i.e., MDL, PQL).

Non-detects that meet these criteria are also referred to as "passable non-detects."

**QUALITY ASSURANCE PLAN**

Effective 06-May-2009  
Revision 21 Nov-2020

CF-QS-B-001  
Page 33 of 83

If the CCV recovery does not meet the acceptance criteria, and samples are found to contain target analytes at concentrations above the PQL, the affected samples must be re-analyzed.

**SECTION 8**  
**ANALYTICAL METHODS AND STANDARD OPERATING PROCEDURES**

**8. SECTION 8 - ANALYTICAL METHODS AND STANDARD OPERATING PROCEDURES (SOPs)**

We provide an array of parameters including dioxins/furans and PCB congeners. The procedures we use to determine these parameters are consistently executed due to our extensive system of SOPs and our training requirements for analytical staff.

A list of our SOPs and the analytical methods they represent (if applicable) is provided in Appendix I. Discussed here are:

- Selection of analytical methods
- Standard operating procedures
- Method validation and initial demonstration of capability
- Sample aliquots
- Data verifications
- Standard and reagent documentation and labeling (Refer to Section 10.1)
- Computers and data requirements

**8.1 Selection of Analytical Method**

CFA's Project Managers are ultimately responsible for selecting the test codes and methods assigned to a client based on client requirements and sample collection techniques. In selecting methods, our goal is to meet the specific needs and requirements of the client while providing data that are scientifically valid.

When the use of a specific test method is mandated, only that method is used. If the analysis cannot be performed by the client-requested method, we notify the client. We do not perform method substitutions without the client's consent. We recommend that clients who submit data to regulatory agencies also obtain the agency's approval of method modifications.

When clients have specific process or reporting deviations from CFA's standard practices, the laboratory may document the deviations in contracts, case narratives and/or with specific work instructions from the Project Management Team to the laboratory. Approval of the deviations is made after consideration of all safety and quality concerns have been resolved by CFA's management.

A Project Management AlphaLIMS Manual (CF-CS-M-001) is available to assist those managing client projects in selecting test codes and methods and communicating the client's analytical and data reporting specifications.

**8.2 Standard Operating Procedures (SOPs)**

We determine each parameter by the protocol detailed in the corresponding SOP. The defined protocol originates from the analytical method or methods referenced in the SOP and may incorporate regulatory and client requirements. Descriptions of the methods we employ can be found in:

- EPA SW-846, 3rd Edition, Revision III
- American Society for Testing and Materials (ASTM)
- Code of Federal Regulations (CFR) Titles 40 and 49

- EPA CLP

Laboratory sections have access to CFA's SOPs to ensure that each operational system and analytical procedure is performed in a uniform manner. SOPs are controlled according to CF-DC-E-001 for Document Control and are posted on the Intranet by the Quality Manager.

We write and issue SOPs in accordance with CF-ADM-E-001 for the Preparation, Authorization, Change, Revision, and Release of Standard Operating Procedures. A technical and/or quality review is made of each new or revised SOP prior to its implementation.

Technical reviews ensure that procedures are technically sound and method-compliant, and are conducted by a senior analyst or data reviewer. The quality review is an independent review by a member of management and ensures that the quality requirements of the method, regulatory agencies, and CFA are adequately and accurately identified.

SOPs are modified when:

- Instruments or equipment change
- An error is identified
- Improvements in technology and/or reagents need to be incorporated
- Reference methods are revised or discontinued

Proposed revisions are submitted for review on Documentation Initiation and Revision Request (DIRR) forms. Changes are not implemented without a technical and quality review.

We review our SOPs at least annually and revise them as necessary. Analytical SOPs either contain or reference other SOPs that contain:

- reference method
- applicable matrix or matrices
- method detection limit
- scope and application including parameters to be analyzed
- method summary
- definitions
- interferences and limitations
- specific safety requirements
- required equipment and supplies
- reagents and standards
- sample collection, preservation, shipment, and storage
- quality control
- calibration and standardization
- procedure
- calculations
- method performance
- pollution prevention
- data assessment and acceptance criteria for quality control measures
- corrective actions for out of control or unacceptable data
- waste management
- references
- tables, diagrams, flowcharts, validation data
- identification of any modifications we have made to the published procedure
- history of changes to the SOP

Administrative SOPs typically do not require all of the above sections. CFA's SOP CF-ADM-E-001 discusses more fully the laboratory practices and policies related to SOP creation and maintenance.

### 8.3 Method Validation and Initial Demonstration of Capability

An initial demonstration of method performance is required before a new analytical method is implemented and any time that there is a significant change in instrumentation or methodology. Exempted from this requirement are any tests for which spiking solutions are not available.

We conduct the initial demonstration as described in Section 8.3.1. Records of initial demonstration are maintained in accordance with CF-QS-E-008 for Quality Records Management and Disposition. These records are available upon request.

After we demonstrate our ability to perform a specific analysis, we continue to demonstrate method performance through the analysis of laboratory control samples and performance evaluation samples.

If spiking solutions or quality control samples are not available, an analyst is trained by a qualified trainer to conduct the analysis. Analyst capability and proficiency is evaluated by the Production Manager before the analyst is qualified to perform the analysis on client samples. The evaluation is documented and maintained according to CF-QS-E-017 for Maintaining Technical Training Records.

#### 8.3.1 Procedure for Initial and Continuing Demonstrations of Capability (IDOC and CDOC)

We conduct initial demonstrations of capability for mandated analytical or EPA reference test methods following the procedure outlined below. This procedure is adapted from the EPA test method published in 40 CFR part 136, Appendix A, NELAC 2003 and the 2016 TNI Standard. IDOCs are completed whenever there is a change in instrument type, method or personnel. CDOCs are completed annually.

Step 1: A quality control sample is obtained from an outside source (if possible). If one is not available, the sample may be prepared internally using stock standards that are prepared independently from those used in instrument calibration. The concentration is not known to the analyst.

Step 2: The QC sample is diluted in a volume of clean matrix. Sufficient volume of the diluted QC sample is prepared so that at least four aliquots of the required method are analyzed. Alternatively, four matrix spike samples may be evaluated for levels of precision and accuracy.

Step 3: Four aliquots of the diluted quality control sample are prepared and analyzed according to the analytical test method. This may occur concurrently or over a period of days.

Step 4: With the results obtained from the analysis of the diluted QC sample, the average recovery ( $\bar{x}$ ) in the appropriate reporting units (such as  $\mu\text{g/L}$ ) and the standard deviation of the population sample ( $s$ ) (in the same units) are calculated for each parameter of interest.

Step 5: For each parameter, the standard deviation ( $s$ ) and the average recovery ( $\bar{x}$ ) are compared to the corresponding acceptance criteria for precision and accuracy in the test method (if applicable) or in laboratory-generated acceptance criteria. If " $s$ " and " $\bar{x}$ " for all parameters meet the acceptance criteria, analysis of samples may begin. If any one parameter exceeds the acceptance range, the performance is unacceptable for that parameter.

Step 6: When one or more tested parameters fail one or more of the acceptance criteria, we locate and correct the source of the problem and repeat the test for every parameter of interest.

Other options for successful IDOCs are the following:

- PT Study- successful analysis of a PT Sample. The PT sample may be single-blind to the analyst or double blind to the laboratory.
- Supervised Analysis- where other options are not practical, supervised analysis of a procedure may be used to demonstrate capability.
- Analysis of authentic sample with results statistically matching those obtained by another trained analyst.
- Other – this option may be used for certain personnel having sufficient analytical skills to develop a new procedure, as deemed appropriate by the supervisor or Quality Assurance personnel.

#### 8.4 Sample Aliquots

When obtaining aliquots from a sample, it is imperative that the subsamples be representative of the parent sample. This ensures that the results obtained from the analysis of the aliquots are representative of the entire parent sample, not just the subsample. We employ different techniques to obtain subsamples. CFA's SOP for sample compositing is CF-LB-E-031. The appropriate techniques for obtaining sample aliquots for designated analyses are discussed in the applicable SOPs.

#### 8.5 Data Verification

All of the data we include in final reports to our clients undergoes extensive data verification. At CFA, we have a multi-level review process that takes place in all areas of the laboratory beginning with sample login. This process and the responsibilities of each level of review are delineated in the procedure for data review and packaging, CF-LB-E-005.

##### 8.5.1 Sample Login:

Samples are analyzed by the methods and for the target analytes identified when samples are logged into our database. If there is an error in this entry that is not promptly identified, the incorrect analytical method may be used or certain analytes may not be determined.

To prevent this, the person who enters the information into the database is generally the client's assigned Project Manager. This entered information is reviewed against the client confirmation letter and/or chain of custody. If errors are identified, they are immediately corrected.

##### 8.5.2 Data Validation in the Laboratory

The multi-level review process in our laboratory includes initial review by the analyst, a final review by the data reviewer, and a completeness review by the project manager.

Our analytical data reviews ensure that:

- The analytical procedures comply with current SOPs.
- Quality control samples are analyzed at the frequency specified in the SOP or client specifications.
- The acceptance criteria for quality control samples are met, including recoveries of matrix spikes and laboratory control samples, the relative percent difference for matrix duplicates, matrix spike duplicates, laboratory control sample duplicates, and concentrations of target analytes in the method blank.

- Instrument data, run logs, and logbooks are reviewed to ensure that all method quality control criteria were met (e.g., initial calibration and continuing calibration verifications).
- Documentation is sufficient to reconstruct the analytical procedure.
- Data are maintained according to CF-LB-E-008 for Basic Requirements for the Use and Maintenance of Laboratory Notebooks, Logbooks, Forms, and Other Recordkeeping Devices.
- Raw data are in agreement with the computer generated batch sheets and data reports.
- The calculations, dilution factors, concentration reported, and nominal concentrations are verified.
- Comments, qualifiers, or nonconformances for noncompliant or questionable data are documented.
- Data generated when the analytical process appears to be out of statistical control are not reported.

### 8.5.3 Validation of Data Reports and Packages

Before data is reported to the client, the data report is reviewed for package accuracy, completeness, and client specifications. Responsibilities for review are dependent upon the type of report or package being generated. (Refer to Section 11 for Laboratory Report Formats.)

The Project Manager (PM) reviews client information for accuracy, completeness and the addition of pertinent comments made by the laboratory about the analysis or sample. The PM also reviews data for consistency as described in the Project Management AlphaLIMS Manual, CF-CS-M-001.

The data validator reviews the analyst-prepared case narrative for accuracy and to assure its consistency with the information included on the certificate of analysis and Quality Control Summary Report. Each laboratory fraction of data is reviewed by that fraction's data validator. The data are then compiled into a final data package.

A minimum of 10% of all DoD ELAP data packages will be reviewed by the Quality Manager (or designee) for technical completeness and accuracy. This review is not required to be performed prior to release of the data to the client. The Quality Manager, or designee, must maintain documentation of the reviews to establish the minimum requirement having been met.

### 8.6 Standard and Reagent Documentation and Labeling

The documentation and labeling of standards and reagents is addressed in CF-LB-E-007 for Laboratory Standards Documentation, and in Section 10.1 of the QAP, Recordkeeping System and Design.

### 8.7 Computer and Electronic Data Related Requirements

Our Information Management System (IT) SOPs describe the way in which our software programs and hardware systems are managed. Control of software development and modification activities is described in the SOP for Requirements, Design, Operation, Validation, and Removal of Hardware and Software Systems. All development and revision activities are validated, verified, and controlled with revision software or other procedures prior to production use.

Analytical software that is purchased from a vendor is validated and verified in accordance with the SOP for Requirements, Design, Operation, Validation, and Removal of Applications. Documentation requirements are also described in this SOP.

**SECTION 9  
SAMPLE HANDLING, ACCEPTANCE, RECEIPT, AND INTERNAL CHAIN OF CUSTODY****9. SECTION 9 - SAMPLE HANDLING, ACCEPTANCE, RECEIPT, AND INTERNAL CHAIN OF CUSTODY**

The way we receive and handle samples is critical to providing our clients with data that are of the highest quality and are legally defensible. We have strict policies that govern the acceptance and receipt of a sample, sample handling and integrity, maintenance of the internal chain of custody, and storage of the sample upon completion of the required analytical processes. This section describes the policies and practices that we employ, including the following:

- Agreements to perform analysis
- Proper labeling of submitted samples
- Chains of custody
- Sample receipt procedures
- Sample tracking
- Sample storage
- Sample disposal
- Emergency Sample Storage

**9.1 Agreement to Perform Analysis**

Before we accept samples, we should have an agreement with the client that specifies the analytical methods, the number of samples to be analyzed, the price for the analysis, the date by which the client will receive results, and the reporting format. Any special requirements the client may have, such as non-routine methods and reporting limits, should be part of that agreement.

An agreement to perform analysis should be in one of three forms, further detailed in our SOPs for Delegated Authority to Commit the Company and Request for Proposal (RFP) and Contract Review (CF-CO-E-002 and CF-CO-E-003):

- Client confirmation letter (CCL) between the client and project manager for a specific group of samples. This letter includes the cost, turn-around time, requested analysis, sample matrix, number of samples, and type of client report.
- Sample acceptance by the Project Manager from an established client based on previously agreed conditions and confirmed by the client's submission of the sample(s).
- Contractual agreement for analytical services over a designated time period or project that delineates the agreed upon specifications.

When the laboratory agrees to perform analyses with exceptional departures from normal processes, these exceptions are clearly defined in the client-laboratory agreement.

**9.2 Sample Labels and Chain of Custody Forms**

Once an agreement is established, we assume joint responsibility with the client to ensure that the samples submitted are properly labeled and accompanied by full and complete documentation that includes chain of custody and, where possible, material safety data sheets. Samples that are submitted without proper documentation may be refused.

Sample labels should include:

- client sample identification
- location, date, and time of collection
- collector's name
- chemical preservatives used
- constituents of interest (if space permits)

When requested, we ship labeled sample containers with appropriate preservatives and a chain of custody to the client for use during sample collection. There are several advantages to using these containers, including:

- Dedication of appropriate type sample container for the intended analyte or analytical method.
- Proper sample preservation for analytical test
- Traceability of bottle lot number to the manufacturer's certification that the containers are clean and show no signs of contamination.

Chain of custody forms include the following information and are initiated at the time of sample collection:

- name and address of client
- client sample identification
- date and time of sample collection
- sample matrix
- description of sampling site location
- number of containers
- methods, chemical and physical constituents for which the analyses are to be conducted
- preservatives
- date and signature of person who collected the sample
- date of transfer and signature of person relinquishing sample to the laboratory.

Our standard chain of custody forms are available to our clients and are included with each shipment of pre-labeled and preserved containers. CFA chain of custody forms should always be used unless otherwise agreed to by contract.

### 9.3 Sample Conditions

In addition to properly documenting sample container labels and the chain of custody form, we need to make sure that samples meet the established requirements for analytical testing. This is particularly critical for samples that are being analyzed to meet regulatory requirements.

Samples should be collected in the appropriate type of container, preserved as directed, and stored under the conditions specified in the analytical method or established regulatory guidelines. In addition, samples should be submitted with sufficient time to conduct the specified analysis within the regulatory or method holding time. Aliquots should be of sufficient volume to perform the requested analyses. A summary of these conditions and holding times for routine analyses can be found in Appendix J.

### 9.4 Sample Receipt

Samples submitted to us are received in a central sample receiving area by our sample custodian or login clerk. Every sample is subject to the protocols established in CF-SR-E-001 for Sample Receipt, Login and Storage.

Our sample custodian acknowledges receipt of a sample by signing the chain of custody and recording the date and time custody was transferred from the client to the laboratory. The date, time, and person receiving the sample are also recorded on a standard or client-specific Sample Receipt Checklist (SRC) form.

The sample custodian is also responsible for noting the condition of a sample upon its arrival. This information is recorded on both the sample chain of custody and the Sample Review Receipt form. As detailed in CF-SR-E-001, the sample custodian should:

- Document whether custody seals are present and intact on the outside of the sample cooler.
- Inspect all sample containers for integrity.
- Document any unusual physical damage or signs of tampering with custody seals.
- Place any samples that appear to be leaking or have unusual odor under the fume hood while notifying the responsible project manager.
- Review the chain of custody submitted by the client for completeness.
- Compare descriptions and other information on the sample container labels to that listed on the chain of custody.
- Verify the sample is within the regulatory holding time for the analyses.
- Measure and record the temperature of the cooler using the temperature blank (if provided) or a representative sample container.
- Measure and record the pH of all sample aliquots submitted for analyses that require chemical preservation to a specific pH
- Check water samples for residual chlorine if dioxin/furan or PCB analysis is requested. If residual chlorine is present, preserve with sodium thiosulfate as directed in CF-SR-E-001, and document on the SRC.
- Verify that there are adequate sample aliquots for the requested analyses.
- Verify that appropriate sample containers were used for requested analyses.

If the sample custodian discovers any abnormalities or departures from standard conditions, the PM is informed immediately. The PM will then notify the client as quickly as possible so that a decision can be made to proceed with the analysis or submit another sample or additional sample aliquots.

Common abnormalities or departures from standard conditions include:

- Sample containers with signs of damage, leaking, or tampering.
- Incomplete/missing chain of custody.

NOTE: If a sample has no chain of custody, the sample custodian should initiate one. "INITIATED ON RECEIPT" should be documented on the chain of custody.

- Discrepancies between the information on the chain of custody and the sample container labels.
- Method or regulatory holding time is exceeded.
- Sample is not preserved to the method or regulatory-required pH.
- The sample container does not meet method or regulatory criteria.
- The sample temperature exceeds or falls below the thermal preservation regulation or method requirement of 0° - 6° C.

NOTE: If a sample is hand-delivered to the laboratory immediately after collection with evidence that the chilling process has begun (arrival on ice), the sample shall be deemed acceptable.

## 9.5 SAMPLE TRACKING

We track the samples we receive by a unique laboratory identification number that is automatically assigned when information pertaining to the sample is first entered into our database. Pursuant to CF-SR-E-001, the following information is entered for each sample received:

- client and/or project code
- client sample ID
- sample matrix
- chemical preservative (if applicable)
- date and time of collection
- date received
- initials of person making entries
- number of containers submitted for the sample
- requested analyses
- pertinent observations or comments affecting the sample analysis or rejection
- container type

As soon as this information is entered, AlphaLIMS automatically assigns a unique number to the sample and its containers. We use these numbers to track the location of a sample container and to link to any subsamples and subsequent leachates and extracts.

The unique laboratory identification number is printed on a durable barcode label that contains the client identification, sample date and time. Once labeled, the sample container's identification number is uploaded into the database by scanning the barcode. Information included in the database at the time of sample scanning is the container's storage location, bottle type and volume, physical characteristics of the bottle, preservative, and the initials of the person entering this information. Entering of this information into the database is an important part of initiating our electronic internal chain of custody.

#### 9.6 INTERNAL CHAIN OF CUSTODY

Chain of custody procedures ensure traceability and sample integrity. Our legal and evidentiary chain of custody protocol establishes a continuous record of the physical possession, storage, and disposal of sample containers, collected samples and aliquots, and sample digestates or extracts.

The internal chain of custody starts with the scanning of a container's barcode label into an electronic database while identifying the location of the sample and the person having custody, or placing the sample in a secured storage area. If we supply the containers, the chain of custody may begin when the containers are provided to the client.

With regard to the internal chain of custody, a sample is defined as being in someone's custody if:

- It is in one's actual physical possession, or
- It is in one's view after being in one's physical possession, or
- It is in one's possession and then is locked up so that no tampering may occur, or
- It is kept in a secured area restricted to authorized personnel only.

The protocol for ensuring sample integrity using the internal chain of custody is detailed in CF-LB-E-012 for Verifying the Maintenance of Sample Integrity. The electronic internal chain of custody works in conjunction with the chain of custody submitted by the client with a sample to:

- Account for all time associated with a sample, its subsamples, and extracts or digestates from the time the sample is received at CFA to its disposal
- Identify all individuals who physically handled the sample
- Provide evidence that the sample was stored in accordance with method and regulatory protocols

The electronic internal chain of custody is stored in AlphaLIMS so that information demonstrating the proper maintenance of custody can be provided to the client on the data reports or electronic data deliverables.

### 9.7 SAMPLE STORAGE

In order to ensure the maintenance of sample integrity, all aliquots are stored in secured areas designated for sample storage. The storage location of each sample aliquot can be tracked using the internal chain of custody. Areas designated for sample storage include:

- Main cooler where most samples requiring maintenance at a temperature range of 0° - 6° C are stored.
- Ambient storage for samples not requiring refrigeration.
- Freezers for the storage of samples requiring maintenance at a temperature of <-10°C (i.e. tissues).

The temperature of each refrigerated sample storage unit is monitored daily and documented per CF-LB-E-004 for Temperature Monitoring and Documentation Requirements for Refrigerators, Freezers, Ovens and Other Similar Devices. In addition, the main cooler is monitored twenty-four hours a day by temperature sensor that is connected to our main security system. If the temperatures exceed the required range, an alarm is sounded and the security system notifies the laboratory manager or his designee immediately. This allows corrective actions to be initiated promptly.

Prior to and immediately after analysis, samples and their leachates and extracts are stored in compliance with the requirements of the requested analytical methods and CF-SR-E-001 for Sample Receipt, Login, and Storage. If a single aliquot is supplied for analyses by several methods, the most stringent analytical storage requirements are applied to the sample.

After all analyses are complete and results are submitted to the client, sample aliquots are transferred to the sample archive area. They are stored in this area until they are disposed.

### 9.8 SAMPLE DISPOSAL

Our policies concerning sample disposal are described in the Laboratory Waste Management Plan, CF-LB-G-001 and can be divided into two categories: those governing the disposal of sample laboratory waste, and those directing the disposal of remaining sample aliquots after the completion of all analyses.

#### 9.8.1 Laboratory waste

Unless otherwise requested by contract, laboratory sample waste is collected throughout the laboratory in designated satellite containers found in sample collection and accumulation areas. Sample wastes are segregated based on the type of analysis by which they were generated and by matrix. This contains certain process contaminants thus decreasing the amount of waste material that may be labeled hazardous. It also ensures that solid and aqueous wastes are not mixed.

The composited sample wastes then undergo hazardous waste characterization. The analyses allow CFA to properly characterize the waste according to EPA regulations.

Sample waste is disposed in accordance with the Laboratory Waste Management Plan, CF-LB-G-001.

#### 9.8.2 Remaining Sample Aliquots

Samples not consumed during the sample preparation or analytical procedures are either returned to the client in accordance with CF-SR-E-002 for Transportation and Shipping of Samples and Pre-Preserved Sample Containers or disposed pursuant to the Laboratory Waste Management Plan. Samples are returned to a client under the conditions and terms agreed to by contract. A chain of custody listing the laboratory waste technician as the relinquishing party is enclosed with each set of samples being returned to a client. Unless otherwise specified by the client, all samples are shipped by an approved package carrier. The procedure for shipment is delineated in CF-SR-E-002 for Transportation and Shipping of Samples and Pre-Preserved Sample Containers.

It is our policy to hold samples for a minimum of thirty days after invoicing and before disposal, unless otherwise specified by contract or if the sample is part of litigation. If the sample is part of litigation, disposal of the physical sample shall occur only with concurrence of the affected legal authority, sample data user, and/or client.

When sample analyses are complete and regulatory and/or contractual holding times have expired, samples are moved from their storage locations to the sample archives. Samples that are to be returned to the client or held for an extended time period are segregated from the other samples.

When internal or client-specified storage time expires, samples with like matrices are composited into appropriate containers. The composites are then subject to the same treatment and disposal protocol as described in 9.8.1. Samples that are approved for disposal are scanned into our database and assigned the status of "Disposed."

#### 9.9 EMERGENCY SAMPLE STORAGE

In the event of an impending disaster (such as a hurricane), the laboratory will make arrangements to store samples and their extracts at an approved off-site facility. CF-QS-E-001 is used to identify acceptable storage facilities that meet the requirements of the laboratory policies pertaining to proper storage conditions and documented chain-of-custody.

#### 9.10 SAMPLE HOLDING TIMES

Ensuring that the holding times are met for every sample is the responsibility of the production manager. CFA requests that the samples arrive in such condition that sufficient time remains for our processes. Holding times for the persistent organic pollutants that are the bulk of the target analytes of the methods offered by CFA are typically one year from collection to analysis and 40 days from extraction to analysis. It is not uncommon for clients to hold or request that we hold samples for months or years before requesting analysis. In these situations, the client is informed of the holding times and CFA follows the client's direction with narration of any issues. CFA routinely meets holding times by followings it's SOPs, having redundant instrumentation, cross-trained employees, maintenance contracts, etc.

Our sample receipt process identifies the sampling date and evaluates the remaining time. Our quality records include extraction and analysis dates so that there is sufficient information to

verify holding time compliance. The client is consulted when there are short hold times remaining until extraction or analysis.

**SECTION 10  
RECORDS****10. SECTION 10 - RECORDS**

Our quality records provide the documentation we need to support analytical results and conclusions. Documented evidence that quality assurance and quality control requirements have been met is critical to providing data that fulfill the specifications of applicable procedures, programs, and contracts.

As described in Section 3 of this Quality Assurance Plan (QAP), quality records include but are not limited to:

- Observations
- Calculations
- Calibration data
- Certificates of analysis
- Certification records
- Chains of custody
- External, supplier, and internal audits
- Run logs
- Instrument data and analytical logbooks
- Instrument, equipment and building maintenance logs
- Material requisition forms
- Monitoring logs
- Nonconformance reports
- Corrective actions
- Method development and start-up procedures including MDL, LOD and LOQ verification studies
- Training records
- Waste management records
- Standard logs
- Software validation
- Standard operating procedures (SOPs)
- Sample collection and field data

Our procedures to provide a legal and evidentiary chain of custody are described in Section 9 of this QAP. Described in this section are:

- Recordkeeping system and design
- Records management and storage
- Sample handling records
- Records of support activities
- Analytical records
- Administrative records

**10.1 RECORDKEEPING SYSTEM AND DESIGN**

We manage, maintain and store our quality records according to CF-QS-E-008 for Quality Records Management and Disposition. The protocols established in this document work in

conjunction with those for specific types of records addressed in other SOPs to govern our record keeping system. Our record keeping system allows the historical reconstruction of all laboratory activities that produce analytical data.

We facilitate historical reconstruction by maintaining the following records and information, from the time a sample is received until it is disposed.

- A master list of all employee signatures and initials is maintained by the Quality Manager. This allows the identification of any CFA personnel who accept, handle, analyze, prepare, review, store, or dispose of a sample, its subsamples, associated data and reports, and other related documentation.
- If we provide bottles and containers to a client or sampling personnel, these records are kept in accordance with CF-SR-E-002 Transportation and Shipping of Sample and Pre-preserved Sample Containers.

The person or agency responsible for collecting a sample is documented on the chain of custody and entered into AlphaLIMS. Other records supporting the acceptance of a sample may include:

- Date and time of sample receipt
- Person accepting sample
- Condition of sample upon receipt
- Client chain of custody
- Electronically generated sample ID numbers specific to each sample aliquot and linked to the client's sample description, sample collection and receipt information, and analyses to be performed.
- Identification of each person who has custody of a sample, its subsamples, extracts, or leachates, as requested. (This is provided through the internal chain of custody procedures described in Section 9.)

Documentation that materials purchased for use in the analysis or preparation of samples meet specifications is maintained in accordance with CF-RC-E-001 for Receipt and Inspection of Material and Services.

Records of equipment calibrations are maintained and traceable by date and unique ID number to a specific analysis. These records include certifications of calibration and service that have been initialed or signed.

Our thermometers are verified against the NIST traceable thermometer and records of this verification are maintained as described in CF-QS-E-007 for Thermometer Verification. Records of the daily calibration verifications of our analytical balances are kept in accordance with CF-LB-E-002 for Balances. The calibration records for our air-displacement pipets are maintained in pipet calibration logs specific to each pipet according to CF-LB-E-010 for Maintenance and Use of Air Displacement Pipets.

When methods and/or regulations specify that samples, subsamples, extracts, and/or leachates be stored at designated temperatures, or when the method itself has temperature sensitive steps, we document those temperatures on monitoring logs at the frequency defined in the corresponding SOPs. We can trace the specific storage location of a sample through the internal chain of custody.

We require that the initials of all personnel responsible for monitoring temperatures be recorded in the temperature monitoring logs pursuant to CF-LB-E-004 for Temperature

Monitoring and Documentation Requirements for Refrigerators, Freezers, Ovens and Other Similar Devices. The logs are reviewed for completeness in accordance with CF-QS-E-005 for Review of Monitoring Device Logs.

Documentation on the instruments and equipment used for the analysis of samples is recorded in run logs, laboratory logbooks, instrument data and/or sample preparation logs. Routine or corrective maintenance that is performed on equipment or instruments is recorded in the maintenance log specific to the instrument. We document these records in accordance with CF-LB-E-008 for Basic Requirements for the Use and Maintenance of Laboratory Notebooks, Logbooks, Forms and Other Recordkeeping Devices.

The standards containing known quantities of target analytes that we use in instrument calibration, calibration verification, and as quality control samples, such as matrix spikes and laboratory control samples, are documented according to CF-LB-E-007 for Laboratory Standards Documentation. These records contain the following information:

- Protocol by which each standard was prepared
- Traceability of each child standard to its parent
- Date each standard was prepared
- Initials of person preparing the standard
- Expiration dates
- Concentration of each standard
- Certificate of Analysis, provided by the supplier (if available)

This information allows us to document that the standards used were prepared in accordance with the established protocol, produced using source standards that meet the method and regulatory criteria, and used prior to their expiration date.

If required, reagents used in the preparation, dilution, and analysis of samples are verified to be free of interferences or target analytes. We record these verifications in the reagent logs in accordance with CF-LB-E-008 for Basic Requirements for the Use and Maintenance of Laboratory Notebooks, Logbooks, Forms and Other Recordkeeping Devices.

Analytical and sample preparation methods applied to each sample aliquot are documented via the internal chain of custody, method information, and information recorded in lab notebooks, sample preparation logs, run logs, and instrument data. The laboratory protocol we employ during analysis is dictated by the SOP in effect at the time the sample was analyzed or prepared by a specific method.

Run logs, laboratory notebooks, instrument data and sample preparation logs are used to document the preparation and analysis of samples and the associated instrument calibrations. These logs and notebooks are governed by CF-LB-E-009 for Run Logs and CF-LB-E-008 for Basic Requirements for the Use and Maintenance of Laboratory Notebooks, Logbooks, Forms, and Other Recordkeeping Devices. As stated in these SOPs, sample preparation and analytical records that are not electronically generated should be:

- Legible
- Recorded in permanent ink
- Corrected using one line marked through the error, initialed and dated
- Initialed by the responsible party

We maintain electronic records for each analytical batch. These records include the ID numbers of each client and quality control sample prepared and/or analyzed together, the method of preparation and analysis, and the matrix of the samples included in the batch.

Through our electronic statistical process control system (SPC), the acceptance criteria applied for all quality control (QC) samples are stored and maintained as described in CF-QS-E-014. The acceptance limits for target analytes are method, matrix, and time-period specific, which allow us to generate the criteria applied to QC samples associated with identified client samples.

Our Quality Manager maintains the records of nonconformances and corrective actions associated with specific samples, batches, and processes. We maintain these records according to CF-QS-E-004 for the Documentation of Nonconformance Reporting and Dispositioning and Control of Nonconforming Items, and CF-QS-E-002 for Conducting Corrective/Preventative Action and Identifying Opportunities for Improvement.

Electronic data records are maintained in a secured database designed to protect the integrity of the data. Data that are uploaded directly from instruments and that are manually entered are backed up by a second system.

Permanent records of electronic data deliverables are maintained along with the corresponding sample preparation and analytical data review records. This documentation includes the initials of the reviewer and date of the review.

Records of the data we report to our clients are maintained in a manner that protects client confidentiality, as well as any potential national security concerns. These records include copies of certificates of analysis, quality control summary reports, case narratives, CLP forms, and other information we provided to the client. The copies may be paper or electronic.

Records of samples being disposed or returned to the client are documented in accordance with CF-SR-E-002 for Transportation and Shipping of Samples and Pre-Preserved Sample Containers. Such records include the date samples are returned or disposed, the destination of the samples, and name of the person transferring the samples.

## 10.2 RECORD STORAGE

We store quality records in compliance with CF-QS-E-008 for Quality Records Management and Disposition. The records are:

- Stored in a secured area to maintain data integrity and protect client confidentiality, including any national security concerns.
- Kept in areas where they are protected from fire loss, environmental deterioration, and, in the case of electronic records, electronic or magnetic sources.
- Indexed and filed in a manner allowing for ready retrieval.
- Retained for an identified period of time that equals or exceeds five years as determined by applicable law and client contract requirements.

Electronic data records are stored on compact disks.

All of the hardware and software we need to reconstruct data is maintained according to the SOP for Requirements, Design, Operation, Validation and Removal of Hardware and Software Systems. Records that are stored or generated by network or personal computers have either hard copy or write-protected backup.

### 10.3 SAMPLE HANDLING POLICY

Records of all procedures applicable to samples are maintained in our possession. These records include documents that pertain to:

- Preservation, including sample container and holding time
- Sample identification, receipt, acceptance or rejection, and login
- Sample storage and tracking including shipping receipts, transmittal forms, routing and assignment records
- Sample preparation (ID codes, cleanup and separation protocols, volumes, weights, instrument printouts, meter readings, calculations, reagents)
- Sample analysis
- Standard and reagent origin, receipt, preparation, and use
- Equipment receipt, use, specification, operating conditions and preventive maintenance
- Instrument calibration frequency and acceptance criteria
- Data and statistical calculations, review, confirmation, interpretation, assessment and reporting conventions
- Method performance criteria including expected quality control requirements
- Quality control protocols
- Electronic data security, software documentation and verification, software and hardware audits, backups and records of any changes to automated data entries
- Disposal of hazardous samples

### 10.4 RECORDS OF LABORATORY SUPPORT ACTIVITIES

In addition to sample handling records, we maintain the following:

- Original raw data for calibrations, samples and quality control measures, including worksheets and data output records (chromatograms, strip charts, and other instrument readout records)
- A written description of or reference to the specific method used, including the computational steps used to translate parameter observations into a reportable analytical value
- Copies of final reports
- Archived standard operating procedures
- Correspondence relating to project-specific laboratory activities
- Corrective action reports, audits and audit responses
- Proficiency test results

### 10.5 ANALYTICAL RECORDS

We document and maintain analytical records, such as strip charts, tabular printouts, computer data files, analytical notebooks, and run logs according to CF-LB-E-008 for Basic Requirements for the Use and Maintenance of Laboratory Notebooks, Logbooks, Forms, and Other Recordkeeping Devices, and CF-LB-E-009 for Run Logs.

The information that is documented in analytical records includes:

- Laboratory sample ID code
- Date and time of analysis
- Instrument ID and operating conditions/parameter (or reference to such data)
- Method of analysis
- All calculations
- Dilutions
- Initials of analyst or operator

- Units of measurement

Our policy is to produce and maintain analytical records that are:

- Accurate
- Reviewed and verified
- Legible and understandable
- Traceable and authentic to their source
- Grouped in a contemporary manner with data entered and information recorded as it is obtained

#### 10.6 ADMINISTRATIVE RECORDS

A number of pertinent records are maintained by the Quality Manager, including:

- Staff qualifications and experience.
- Training records, including initial demonstrations of proficiency. (Refer to procedure CF-HR-E-002 for Employee Training.)
- A log of names, initials and signatures for individuals having responsibility for initialing laboratory records.

We monitor continuing demonstrations of proficiency through AlphaLIMS per CF-HR-E-002 for Employee Training.

**SECTION 11  
LABORATORY REPORT FORMAT AND CONTENTS****11. SECTION 11 - LABORATORY REPORT FORMAT AND CONTENTS**

Accurate data are of little benefit to a client unless they are reported in a format that is easy to interpret and provides all pertinent information relating to the analysis of a sample. At CFA, we have developed certificate of analysis report formats that meet the different needs of our clients, yet provide all of the information necessary to satisfy regulatory requirements while allowing for the interpretation of the data. Each format provides accurate, clear, unambiguous and objective data.

In addition to a certificate of analysis, a client can request and receive an extended data package. This package may include any of the following: certificates of analysis; summaries of quality control; case narratives; instrument data; sample preparation data; measurement traceability and calibration information; and electronic data deliverables. If clients require the reporting of data following the established contract laboratory protocol (CLP), we can provide a CLP-like data package that will meet their needs.

It is important that the certificate of analysis format and data package requirements be discussed with the client prior to our acceptance of the samples. Project Managers are responsible for establishing an agreement with the client concerning data reporting and the potential cost to the client for data packages and/or specialized reporting. Our analytical data are reported to three significant figures unless otherwise required by client contract. The following rounding rules will also be used unless otherwise specified by the client contract:

- If the first non-significant digit is a 5 followed by other non-zero digits, round up the last significant digit (away from zero). For example, 1.2459 as the result of a calculation or measurement that only allows for 3 significant digits should be written 1.25.
- If the first non-significant digit is a 4 followed by other non-zero digits, the last significant digit remains the same. For example, 1.2449 as the result of a calculation or measurement that only allows for 3 significant digits should be written 1.24.

Laboratory reports and data packages are stored and transmitted in a manner that protects client confidentiality and potential matters of national security. No reports or data packages are released to persons or organizations outside CFA without the express consent of the client. If directed by a regulatory agency or subpoenaed to submit documents to a court of law, we will notify the client of the demand and the records being released.

Shipments to the EPA of deliverable packages, including re-submittals, shall be sealed with custody seals in a manner such that opening the packages would break the seals. Custody seals shall be signed and dated.

The following elements of report formats and data packages are described in this section:

- Certificates of analysis (C of A)
- Quality control summary reports (QCSR)
- Analytical case narratives
- Electronic data deliverables (EDDs)
- Types of data packages and reporting formats

- Review of data packages and reports

### 11.1 CERTIFICATES OF ANALYSIS

We have two primary C of A report formats, Level 1 and Level 2. Both contain the following information when applicable:

- Title
- CFA address and phone number
- Name of PM or person serving as the primary client contact
- Barcode identification of the C of A
- Number of page and total number of pages
- Name and address of client, where appropriate
- Project name or code if applicable
- Client-provided sample description
- Unique laboratory ID number for the sample
- Sample matrix
- Characterization and condition of the sample where relevant
- Date of receipt of sample
- Date and time of sample collection, if provided
- Date and time of sample analysis, reanalysis, and/or sample preparation
- Initials of analyst and person responsible for sample prep
- Analytical batch number
- Sample analysis and preparation methods (or unambiguous description of any non-standard method used)
- Reference to sampling procedure
- Additions to or deviations or exclusions from the test method, and other information relevant to a specific test, such as environmental conditions and the use and meaning of data qualifiers
- Nonconformances that affect the data
- Whether data are calculated on a dry weight or wet weight basis
- Identification of the reporting units, such as  $\mu\text{g/L}$  or  $\text{mg/kg}$
- Statement of the estimated uncertainty of the test result, if applicable
- Signature and title of the person(s) accepting responsibility for the content of the C of A
- Date C of A was issued
- Clear identification of data provided by outside sources, such as air temperature or ambient water temperature
- Identification of the reporting limit (RL) or practical quantitation limit (PQL) for each analyte, if applicable.
- If a portion of the sample analysis is subcontracted, the C of A will identify the subcontractor or applicable accreditation number, and the data that was determined by the subcontracting laboratory.

Level 2 Certificates of Analysis contain the following additional information:

- Dilution factors
- Method detection limits
- Surrogate recoveries and the acceptance criteria for all organic analyses
- Estimated concentrations determined for nondetects and appropriate "U" and "J" qualifiers for nondetects and concentrations that fall between the MDL and PQL respectively.

Once issued, a C of A is not altered unless a subsequent C of A is identified as a revised report.

### 11.2 QUALITY CONTROL SUMMARY REPORT (QCSR)

The quality control data that demonstrate the sample preparation and/or analytical efficiency of the batch are summarized on a QCSR. The data reported on the QCSR may be limited to a sample delivery group contained in the batch or may include all quality control for the batch.

Information reported on QCSR includes:

- Quality control sample ID number
- Type of quality control sample
- Concentrations determined, where applicable, for method blanks, matrix spikes, matrix spike duplicates, matrix duplicates, laboratory control samples, serial dilutions, and laboratory control sample duplicates
- Acceptance criteria for matrix spikes, matrix spike duplicates, matrix duplicates, laboratory control samples, and laboratory control sample duplicates
- Nominal concentrations of matrix spikes, matrix spike duplicates, LCSs, and LCS duplicates
- Concentration of parent sample for the matrix spikes, matrix spike duplicates, or sample duplicates
- Percent recoveries for LCS and matrix spikes
- Relative percent differences for the matrix spike duplicates, matrix duplicates, and LCS duplicates
- Analytical batch number with which the quality control data is associated
- Parent sample numbers for matrix spikes, matrix duplicates, and matrix spike duplicates
- Sample or sample delivery group ID
- Project code
- Date issued, page numbers/total number of pages
- Identification of recoveries or relative percent differences that do not meet the acceptance criteria

### 11.3 ANALYTICAL CASE NARRATIVES

Analytical case narratives are written by an analyst or data validator to describe the overall conditions affecting the analysis of a batch or a specific sample in the batch. Case narratives usually include:

- Sample delivery group ID number
- Analytical batch number
- Methods of preparation and analysis
- Sample matrix
- Initial of person preparing and/or reviewing the narrative
- Specific sample ID numbers
- Identification and description of batch quality control samples including parent sample identification
- Affirmation that all sample preparation conditions specified by the method or regulatory agencies were met or identification of specific deviations
- Affirmation that all analysis criteria specified by the method or regulatory agencies were met or identification of specific deviations
- Instrumentation employed if applicable and verification of its calibration
- Summary of batch quality control as compared to acceptance criteria
- Identification of nonconformances
- Pertinent comments and observations of factors that affect sample data quality

**11.4 ELECTRONIC DATA DELIVERABLES (EDDS)**

Electronic data deliverables are generated according to client specifications. EDDs use programs supplied by the client or created internally by our EDD team. Internally generated EDDs are usually written in Perl and/or PL/SQL.

**11.5 TYPES OF DATA PACKAGES AND REPORTS**

We offer seven levels of data reports and the ability to design packages to meet the needs of our clients. The levels of data reports are summarized in Table 1.

**TABLE 1: DATA REPORT FORMATS**

Level	Contents
1	Certificate of Analysis
2	Level 1 plus QC data
3	Level 2 plus case narrative
4	Level 3 plus instrument QC
5	Level 4 plus raw data
6	Level 5 plus standards traceability
7	CLP format

If a client so requests, the above reports can be accompanied by EDDs, case narratives, copies of associated nonconformance reports, and other support documentation. The client’s specific requirements are communicated to the laboratory and data reviewers through AlphaLIMS.

CFA’s SOP CF-CS-E-002 for The Internal Review of Contractually Required Quality Criteria for Client Package Delivery defines preparation and review of the package.

**11.6 REVIEW OF DATA REPORTS, EDDS, AND DATA PACKAGES**

All data reports are reviewed for accuracy and completeness by the PM . All data packages are reviewed in the laboratory by a data reviewer, who is responsible for reviewing specific fractions of the data package for accuracy, consistency, and completeness in accordance with the SOP for that lab area.

**11.7 ELECTRONIC SIGNATURE**

CFA utilizes a system administrator that has the appropriate education and training for development and maintenance of electronic signature systems. Electronic signatures are maintained in the LIMS database and require up to date usernames and passwords in order to be utilized on any electronically generated document. All electronic signatures executed by our employees, agents, or representatives, located anywhere in the world are the legally binding equivalent of traditional handwritten signatures. When an open system is used (e.g., transmission of data over the internet), electronic signatures are used to ensure authenticity and integrity of the electronic records from the point of their creation to the point of receipt.

**SECTION 12**  
**SUBCONTRACTING ANALYTICAL SAMPLES AND OUTSIDE SUPPORT SERVICES**

**12. SECTION 12 - SUBCONTRACTING ANALYTICAL SAMPLES AND OUTSIDE SUPPORT SERVICES**

The subcontracting of samples to other facilities may occur when:

- The client has requested analytical services for which we are not certified or do not offer as a routine product.
- The regulatory or method holding times and/or client due dates are in danger of not being met as the result of instrument malfunction or the unexpected influx of a large group of samples.

No samples are subcontracted without the client's consent. The laboratories selected to receive subcontracted samples are expected to meet the following criteria:

- Demonstrated technical capability to provide data that meet and conform to our quality standards.
- Established certification, if available, for the requested analyses.
- Successful proficiency evaluation results, if available.
- Commitment to meet time requirements for delivery of results to the client.
- Agreement to provide all documentation requested in conjunction with the analysis.
- TNI or ISO/IEC 17025 accreditation for the analysis if required by the client.

We audit potential subcontractors for technical and administrative compliance as directed in CF-QS-E-001 for Conduct of Quality Audits. An audit may be in the form of a book/desk audit or an on-site review.

If there is evidence of a technical, administrative, or quality deterioration, the laboratory is removed from our list of approved subcontractor laboratories pending further evaluation, which may include an on-site audit. Once the laboratory again demonstrates compliance with CFA's standards, it can be reclassified as an approved subcontractor laboratory.

At CFA, we have a multi-faceted and trained staff. There are occasions, however, when it may be necessary to obtain the services of professionals outside of CFA. This may be due to such things as sample workload, introduction of a new instrument or method requiring special knowledge, or employee leave of absence.

Any outside support services or service personnel are subject to the same scrutiny as a subcontract laboratory. If a service fails to meet our standards for excellence, the appropriate parties are promptly notified. If immediate corrections are not implemented and services are not of adequate quality to maintain confidence, the contract is cancelled.

**SECTION 13  
CLIENT SATISFACTION****13. SECTION 13 - CLIENT SATISFACTION**

Meeting the needs and expectations of our clients is essential to meeting our commitment to be the environmental laboratory of first choice. An important part of meeting this commitment involves receiving and resolving client concerns and complaints.

Client complaints that question the quality of laboratory data or data deliverables are directed to Quality Systems. These concerns are responded to with input from the laboratory, or support group as may be needed.

The types of complaints, area(s) affected, and any impacts on quality are trended on a quarterly basis. This information is available to management at any time.

We use AlphaLIMS to monitor client complaints, nonconformances and corrective actions. Every complaint is entered into the system upon receipt and assigned an internal and external due date. The external due date is often established by client contract. The internal due date allows time for the Quality Manager to review the response and transmit it to the client on or before the due date.

If we notice a trend that significantly affects the quality of our data, a corrective action is initiated following CF-QS-E-002 for Conducting Corrective/Preventive Action and Identifying Opportunities for Improvement. The implementation and verification of the corrective action affirms an effective and permanent solution. Corrective Action investigations are verified for effective implementation during subsequent internal audits of the laboratory area where changes were made.

**SECTION 14  
REVISION HISTORY****14. SECTION 14 – REVISION HISTORY**

Revision 1: Added SOP references

Revision 2: Updated DOD requirements.

Revision 3: Assignment of start/stop work order authority

Revision 4: Several changes for audit responses

Revision 5: Various updates from internal audit

Revision 6: Update organizational chart; Removed that a preparation batch could be extended over 24 hours.; Remove Verbiage about spiking LCS and MS/MSD with representative compounds.; Remove Verbiage about spiking LCS and MS/MSD with representative compounds.; Removed MAPEP PT option; Revise sentence related to logs posted near each temperature control device.; Added rounding rules.

Revision 7: Method revisions updated; TNI 2009 Update; Removed reference to obsolete IT SOPs; Updated Org chart and evacuation routes; Added RSO to org chart; Added reference to DOE Order 414.1D

Revision 8: VP of Operation to COO; Quality position in org chart corrected; Evacuation routes include Rad Room; Document reformatted to facilitate consistent headers

Revision 9: Quarterly Progress Report responsibility assigned to the Quality Manager.; Add revision history; Added login fume hood to equipment list; Change in start work policy.

Revision 10: Added computer system security comments. Added signature definitions and exceptions.

Revision 11: Additions for compliance with Kentucky Certification Manual.

Revision 12: Electronic signature policy; Added reference to TO-9a; Updated equipment list to include HRMS4; Updated SOP appendix for TO-9a and new SOPs.

Revision 13: Added ISO Guide 034 clarification and information to section 7's introduction. Added statements regarding confidential reporting of integrity issues.

Revision 14: Added appointment of deputies for key managerial positions.

Revision 15: Added AB notification responsibility to Quality Manager, such as owner change.

Revision 16: Reassigned deputies for key managerial positions. Added new equipment. Added Impartiality section in accordance to ISO/IEC 17025:2017. Added SW846 3546 to test methods. Updated references.

Revision 17: Update TNI 2016. Update HR5 information. Update Evacuation Route.

Revision 18: Update references in Appendix A.

Revision 19: Update Appendix I and Appendix J.

Revision 20: Added DoD MB acceptance limits.

Revision 21: Added EPA SOW HRSM02.0 and associated SOPs.

**APPENDIX B: DEFINITIONS**

The following definitions are used throughout the text of our Quality Systems Plan. These definitions were reprinted from “Definitions for Quality Systems,” NELAC, July 1, 1999. The original source of each definition is provided.

AlphaLIMS: CFA’s Laboratory Information Management System.

Acceptance Criteria: Specified limits placed on characteristics of an item, process, or service defined in the requirement documents. (ASQC)

Accreditation: The process by which an agency or organization evaluates and recognizes a program of study or an institution as meeting certain predetermined qualifications or standards, thereby accrediting the laboratory. In the context of the National Environmental Laboratory Accreditation Program (NELAP), this process is a voluntary one. (NELAC)

Accuracy: The degree of agreement between an observed value and an accepted reference value. Accuracy includes a combination of random error (precision) and systematic error (bias) components which are due to sampling and analytical operations; a data quality indicator. (Glossary of Quality Assurance Terms, QAMS, 8/31/92)

Aliquot: A discrete, measured, representative portion of sample taken for analysis. (DoD, EPA QAD Glossary)

Analyst: The designated individual who performs the “hands-on” analytical methods and associated techniques and who is the one responsible for applying required laboratory practices and other pertinent quality controls to meet the required level of quality. (NELAC)

Analyte: The specific chemicals or components for which a sample is analyzed; may be a group of chemicals that belong to the same chemical family, and are analyzed together. (EPA Risk Assessment Guide for Superfund, OSHA Glossary)

Analytical Detection Limit: The smallest amount of an analyte that can be distinguished in a sample by a given measurement procedure throughout a given confidence interval. (NELAC Quality Systems Committee)

Analytical Reagent (AR) Grade: Designation for the high purity of certain chemical reagents and solvents given by the American Chemical Society. (NELAC Quality Systems Committee)

ANSI: American National Standards Institute--this consensus standards body approves standards as a guide to aid the manufacturer, the consumer and the general public who may be concerned with its scope and provisions.

Audit: A systematic evaluation to determine the conformance to quantitative and qualitative specifications of some operational function or activity. (EPA-QAD)

Batch: Environmental samples prepared and/or analyzed together with the same process and personnel using the same lot(s) of reagents. A preparation batch is composed of one to 20 environmental samples of the same NELAC-defined matrix and meeting the above mentioned criteria. An analytical batch is composed of prepared environmental samples (extracts, leachates or concentrates) that are analyzed together as a group using the same calibration curve or factor. An analytical batch can include prepared samples originating from various environmental matrices and can exceed 20 samples. (NELAC Quality Systems Committee)

Blank: A sample that has not been exposed to the analyzed sample stream in order to monitor contamination during sampling, transport, storage or analysis. The blank is subject to the usual analytical and measurement process to establish a zero baseline or background value and is sometimes used to adjust or correct routine analytical results. NOTE: Blank correction is not performed on organic analytes. (ASQC)

Blind Sample: A subsample for analysis with a composition known to the submitter. The analyst/laboratory may know the identity of the sample but not its composition. It is used to test the analyst’s or laboratory’s proficiency in the execution of the measurement process. (NELAC)

Calibrate: To determine, by measurement or comparison with a standard, the correct value of each scale reading on a meter or other device, or the correct value for each setting of a control knob. The levels of the applied calibration standard should bracket the range of planned or expected sample measurements. (NELAC)

**Calibration:** The set of operations that establish, under specified conditions, the relationship between values indicated by a measuring device, or the correct value of each setting of a control knob. The levels of the applied calibration standard should bracket the range of planned or expected sample measurements. (NELAC)

**Calibration Curve:** The graphical relationship between the known values, such as concentrations, of a series of calibration standards and their analytical response. (NELAC)

**Calibration Standard:** A substance or reference material used to calibrate an instrument. (QAMS)

**Certified Reference Material (CRM):** A reference material, one or more of whose property values are certified by a technically valid procedure, accompanied by or traceable to a certificate or other documentation that is issued by a certifying body. (ISO Guide 30 - 2.2)

**Chain of Custody:** A record that documents the possession of the samples from the time of collection to receipt in the laboratory. This record generally includes: the number of and types of containers; the mode of collection; collector; time of collection; preservation; and requested analyses. (NELAC Quality Systems Committee)

**Confirmation:** Verification of the presence of a component through the use of an analytical technique that differs from the original test method. These may include: Second column confirmation, Alternate wavelength, Derivatization, Mass spectral interpretation, Alternative detectors or Additional cleanup procedures (NELAC)

**Corrective Action:** Action taken to eliminate the causes of an existing nonconformity, defect, or other undesirable situation in order to prevent recurrence. (ISO 8402)

**Data Audit:** A qualitative and quantitative evaluation of the documentation and procedures associated with environmental measurements to verify that the resulting data are of acceptable quality (i.e., that they meet specified acceptance criteria). (NELAC)

**Data Reduction:** The process of transforming raw data by arithmetic or statistical calculations, standard curves, concentration factors, etc., and collation into a more useful form. (EPA-QAD)

**Detection Limit:** The lowest concentration or amount of the target analyte that can be determined to be different from zero by a single measurement at a stated degree of confidence. Refer to Method Detection Limit. (NELAC)

**Document Control:** The act of ensuring that documents (and revisions thereto) are proposed, reviewed for accuracy, approved for release by authorized personnel, distributed properly, and controlled to ensure use of the correct version at the location where the prescribed activity is performed. (ASQC)

**Duplicate Analyses:** The analyses or measurements of the variable of interest performed identically on two subsamples of the same sample. The results from duplicate analyses are used to evaluate analytical or measurement precision but not the precision of sampling, preservation or storage internal to the laboratory. (EPA-QAD)

**Holding Time (Maximum Allowable Holding Time):** The maximum time that samples may be held prior to analysis and still be considered valid. (40 CFR Part 136)

**Initial and Continuing Demonstrations of Capability:** Procedures to establish the ability of the laboratory to generate acceptable accuracy and precision which is included in many of the EPA's analytical test methods. In general, the procedure includes the addition of a specified concentration of each analyte in each of four separate aliquots of laboratory pure water or authentic samples. These are carried through the analytical procedure and the percent recovery and the standard deviation are compared to specified limits. (40 CFR Part 136, 2003 NELAC)

**Internal Standard:** A known amount of standard added to a test portion of a sample and carried through the entire measurement process as a reference for evaluating and controlling the precision and bias of the applied analytical test method. (NELAC)

**ISO/IEC 17025:** The International Organization for Standardization and International Electrotechnical Commission form this specialized system for worldwide standardization. Members of ISO or IEC participate in the development of International Standards through technical committees established by their organization to deal with particular fields of activity. Other international organizations, government and non-government, also take part in development of these standards. The ANSI/ISO/IEC 17025-2017 is approved as an American National Standard and covers general requirements for the competence of testing and calibration laboratories.

Laboratory: A body that calibrates and/or tests. 1. In cases where a laboratory forms part of an organization that carries out other activities besides calibration and testing, the term “laboratory” refers only to those parts of that organization that are involved in the calibration and testing process. 2. As used herein, the term “laboratory” refers to a body that carries out calibration or testing at or from a permanent location, from a temporary facility, or a mobile facility. (ISO 25)

Laboratory Control Sample (LCS): A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes from a source independent of the calibration standards or a material containing known and verified amounts of analytes. It is generally used to establish intra-laboratory or analyst specific precision and bias to assess the performance of all or a portion of the measurement system. (NELAC)

Laboratory Duplicate: Aliquots of a sample taken from the same container under laboratory conditions and processed and analyzed independently. (NELAC Quality Systems)

Limit of Detection (LOD): An analyte, method and matrix specific estimate of the minimum amount of a substance that can be reliably detected. CFA has established  $LOD = 2 \times MDL$ .

Limit of Quantitation (LOQ): An analyte, method and matrix specific estimate of the minimum amount of a substance that can be reported with a specific level of confidence. The LOQ is set at or above the concentration of the lowest initial calibration standard. The laboratory must empirically demonstrate precision and bias at the LOQ. The LOQ and associated precision and bias must meet client requirements and must be reported.

CFA uses the following guidance:

( $LOD < LOQ$ ): When  $LOD < PQL$ ,  $PQL = LOQ$ . When  $LOD > PQL$ , LOQ is raised to next lowest calibration standard or verifiable level.

Matrix: The component or substrate that contains the analyte of interest. For purposes of batch determination, the following matrix types shall be used:

- Aqueous: Any aqueous sample excluded from the definition of a drinking water matrix or saline/estuarine source. Includes surface water, groundwater, and effluents.
- Drinking Water: Any aqueous sample that has been designated a potable or potential potable water source.
- Saline/Estuarine: Any aqueous sample from an ocean or estuary, or other salt-water source.
- Non-aqueous liquid: Any organic liquid with <15% settleable solids.
- Biological Tissue: Any sample of a biological origin such as fish tissue, shellfish, or plant material. Such samples shall be grouped according to origin.
- Solids: Includes soils, sediments, sludges and other matrices with >15% settleable solids.
- Chemical Waste: A product or by-product of an industrial process.
- Air Samples: Media used to retain the analyte of interest from an air sample such as sorbent tubes, summa canisters, XAD resin or PUFs. Each medium shall be considered as a distinct matrix. (Quality Systems)

Matrix Spike (MS): Prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available. Matrix spikes are used, for example, to determine the effect of the matrix on a method's recovery efficiency. (Glossary of Quality Assurance Terms, QAMS, 8/31/92)

Matrix Spike Duplicate (spiked sample/fortified sample duplicate): A second replicate matrix spike is prepared in the laboratory and analyzed to obtain a measure of the precision of the recovery for each analyte. (Glossary of Quality Assurance Terms, QAMS, 8/31/92)

May: Denotes permitted action, but not required action. (NELAC)

Method Blank (MB): A sample of a matrix similar to the batch of associated samples (when available) that is free from the analytes of interest and is processed simultaneously with and under the same conditions as samples containing an analyte of interest through all steps of the analytical procedures, and in which no target analytes or interferences are present at concentrations that impact the analytical results for sample analyses. (NELAC)

Method Detection Limit (MDL): The minimum concentration of a substance (an analyte) that can be measured and reported with 99% confidence that the analyte concentration is greater than zero and is determined from analysis of a sample in a given matrix containing the analyte. (40 CFR Part 136 Appendix B)

Minimum Reporting Level (MRL): The lowest concentration of an analyte that can be reliably quantified that is greater than the method detection limit, of sufficient accuracy and precision to meet the intended purpose, and acceptable quality control criteria for the analyte at this concentration are met. This defined concentration can be no lower than the concentration of the lowest calibration standard for that analyte. (Kentucky Wastewater Manual, June 2013)

Must: Denotes an item that is required to be met. (Random House College Dictionary)

Negative Control: Measures taken to ensure that a test, its components, or the environment does not cause undesired effects, or produce incorrect test results. (NELAC)

NELAC: National Environmental Laboratory Accreditation Conference. A voluntary organization of state and federal environmental officials and interest groups purposed primarily to establish mutually acceptable standards for accrediting environmental laboratories. A subset of National Environmental Laboratory Accreditation Program (NELAP). Also known as The NELAC Institute (TNI).

Performance Audit: The routine comparison of independently obtained quantitative measurement system data with routinely obtained data in order to evaluate the proficiency of an analyst or laboratory. (NELAC)

Performance Based Measurement System (PBMS): A set of processes wherein the data quality needs, mandates, or limitations of a program or project are specified and serve as criteria for selecting appropriate test methods to meet those needs in a cost-effective manner. (NELAC)

Positive Control: Measures taken to ensure that a test and/or its components are working properly and producing correct or expected results from positive test subjects. (NELAC)

Precision: The degree to which a set of observations or measurements of the same property, obtained under similar conditions, conform to themselves; a data quality indicator. Precision is usually expressed as standard deviation, variance, or range, in either absolute or relative terms. (NELAC)

Preservation: Refrigeration and or reagents added at the time of sample collection to maintain the chemical and/or biological integrity of the sample. (NELAC)

Proficiency Test Sample (PT): A sample, the composition of which is unknown to the analyst and is provided to test whether the analyst/laboratory can produce analytical results within specified acceptance criteria. (Glossary of Quality Assurance Terms, QAMS, 8/31/92)

Proficiency Testing: A means of evaluating a laboratory's performance under controlled conditions relative to a given set of criteria through analysis of unknown samples provided by an external source. (NELAC, Section 2.1)

Proficiency Testing Program: The aggregate of providing rigorously controlled and standardized environmental samples to a laboratory for analysis, reporting of results, statistical evaluation of the results in comparison to peer laboratories and the collective demographics and results summary of all participating laboratories. (NELAC)

Protocol: A detailed written procedure for field and/or laboratory operation (e.g., sampling, analysis) that must be strictly followed. (EPA-QAD)

Pure Reagent Water: Shall be water in which no target analytes or interferences are present at a concentration that would impact the results when using a particular analytical test method. (NELAC)

Quality Assurance: An integrated system of activities involving planning, quality control, quality assessment, reporting and quality improvement to ensure that a product or service meets defined standards of quality within a stated level of confidence. (Glossary of Quality Assurance Terms, QAMS, 8/31/92)

Quality Control: The overall system of technical activities whose purpose is to measure and control the quality of a product or service so that it meets the need of users. (Glossary of Quality Assurance Terms, QAMS, 8/31/92)

**Quality Manual:** A document stating the quality policy, quality system and quality practices of an organization. This may also be called a Quality Assurance Plan or a Quality Plan. NOTE: The quality manual may call up other documentation relating to the laboratory's quality arrangements. (CFA)

**Quality System:** A structured and documented management system describing the policies, objectives, principles, organizational authority, responsibilities, accountability, and implementation plan of an organization for ensuring quality in its work processes, products (items), and services. The quality system provides the framework for planning, implementing, and assessing work performed by the organization and for carrying out required QA and QC. (ANSI/ASQC E-41994)

**Quantitation Limits:** The value at which an instrument can accurately measure an analyte at a specific concentration that includes the maximum or minimum levels, concentrations, or quantities of a target that can be quantified with the accuracy required by the data user. These values establish the upper and lower limits of the calibration range. (NELAC with DoD clarification)

**Range:** The difference between the minimum and the maximum set of values. (EPA-QAD)

**Raw Data:** Any original factual information from a measurement activity or study recorded in a laboratory notebook, worksheets, records, memoranda, notes, or exact copies thereof that are necessary for the reconstruction and evaluation of the report of the activity or study. Raw data may include photography, microfilm or microfiche copies, computer printouts, magnetic media, including dictated observations, and recorded data from automated instruments. If exact copies of raw data have been prepared (e.g., tapes that have been transcribed verbatim, dated and verified accurate by signature), the exact copy or exact transcript may be submitted. (EPA-QAD)

**Reagent Blank** (method reagent blank): A sample consisting of reagent(s), without the target analyte or sample matrix, introduced into the analytical procedure at the appropriate point and carried through all subsequent steps to determine the contribution of the reagents and of the involved analytical steps. (Glossary of Quality Assurance Terms, QAMS, 8/31/92)

**Reference Material:** A material or substance one or more properties of which are sufficiently well established to be used for the calibration of an apparatus, the assessment of a measurement method, or for assigning values to materials. (ISO Guide 30 -2.1)

**Reference Standard:** A standard, generally of the highest metrological quality available at a given location, from which measurements made at that location are derived. (VIM - 6.08)

**Reporting Limit Standard (RLS):** A procedural standard that is analyzed to evaluate instrument performance at or below the minimum reporting limit. (Kentucky Wastewater Manual, June 2013)

**Required Reporting Limit (RRL):** The minimum limit that can be reported and meet the limits established within the KPDES Permit. (Kentucky Wastewater Manual, June 2013)

**Requirement:** Denotes mandatory specification; often designated by the term "shall." (NELAC)

**Sample:** Portion of material collected for chemical analysis, identified by a single, unique term. A sample may consist of portions in multiple containers, if a single sample is submitted for multiple or repetitive analysis. (DoD)

**Selectivity:** The capability of a test method or instrument to respond to a target substance or constituent in the presence of non-target substances. (NELAC Quality Systems)

**Sensitivity:** The capability of a test method or instrument to discriminate between measurement responses representing different levels (e.g., concentrations) of a variable of interest. (NELAC Quality Systems)

**Shall:** Denotes a requirement that is mandatory whenever the criterion for conformance with the specification requires that there will be no deviation. This does not prohibit the use of alternative approaches or methods for implementing the specification so long as the requirement is fulfilled. (ANSI)

**Should:** Denotes a guideline or recommendation whenever noncompliance with the specification is permissible. (ANSI)

**Signature, Digital:** means an electronic signature based upon cryptographic methods of originator authentication, computed by using a set of rules and a set of parameters such that the identity of the signer and the integrity of

the data can be verified. (21CFR11.3(b)(5)) Note that CFA may use a digital signature that is not fully compliant with the requirements in 21CFR11 subpart C for electronic signatures.

Signature, Electronic: means a computer data compilation of any symbol or series of symbols executed, adopted, or authorized by an individual to be the legally binding equivalent of the individual's handwritten signature. (21CFR11.3(b)(7)) Note that CFA may use an electronic signature that is not fully compliant with the requirements in 21CFR11 subpart C for electronic signatures.

Signature, Handwritten: means the scripted name or legal mark of an individual handwritten by that individual and executed or adopted with the present intention to authenticate a writing in a permanent form. The act of signing with a writing or marking instrument such as a pen or stylus is preserved. The scripted name or legal mark, while conventionally applied to paper, may also be applied to other devices that capture the name or mark. (21CFR11.3(b)(8))

Spike: A known mass of target analyte added to a blank sample or subsample; used to determine recovery efficiency or for other quality control purposes.

Standard Operating Procedure (SOP): A written document that details the method of an operation, analysis or action whose techniques and procedures are thoroughly prescribed and is accepted as the method for performing certain routine or repetitive tasks. (Glossary of Quality Assurance Terms, QAMS, 8/31/92)

Standard Reference Material (SRM): A certified reference material produced by the U.S. National Institute of Standards and Technology and characterized for absolute content, independent of analytical test method. (NELAC)

Surrogate: A substance with properties that mimic the analyte of interest. It is unlikely to be found in environmental samples and is added to them for quality control purposes. (Glossary of Quality Assurance Terms, QAMS, 8/31/92)

Test: A technical operation that consists of the determination of one or more characteristics or performance of a given product, material equipment, organism, physical phenomenon, process or service according to a specified procedure. The result of a test is normally recorded in a document sometimes called a test report or a test certificate. (ISO/IEC Guide 2 - 12.4)

Test Method: The adoption of a scientific technique for a specific measurement problem, as documented in a laboratory SOP. (NELAC)

Traceability: The property of a result of a measurement whereby it can be related to appropriate standards, generally international or national standards, through an unbroken chain of comparisons. (VIM-6.12)

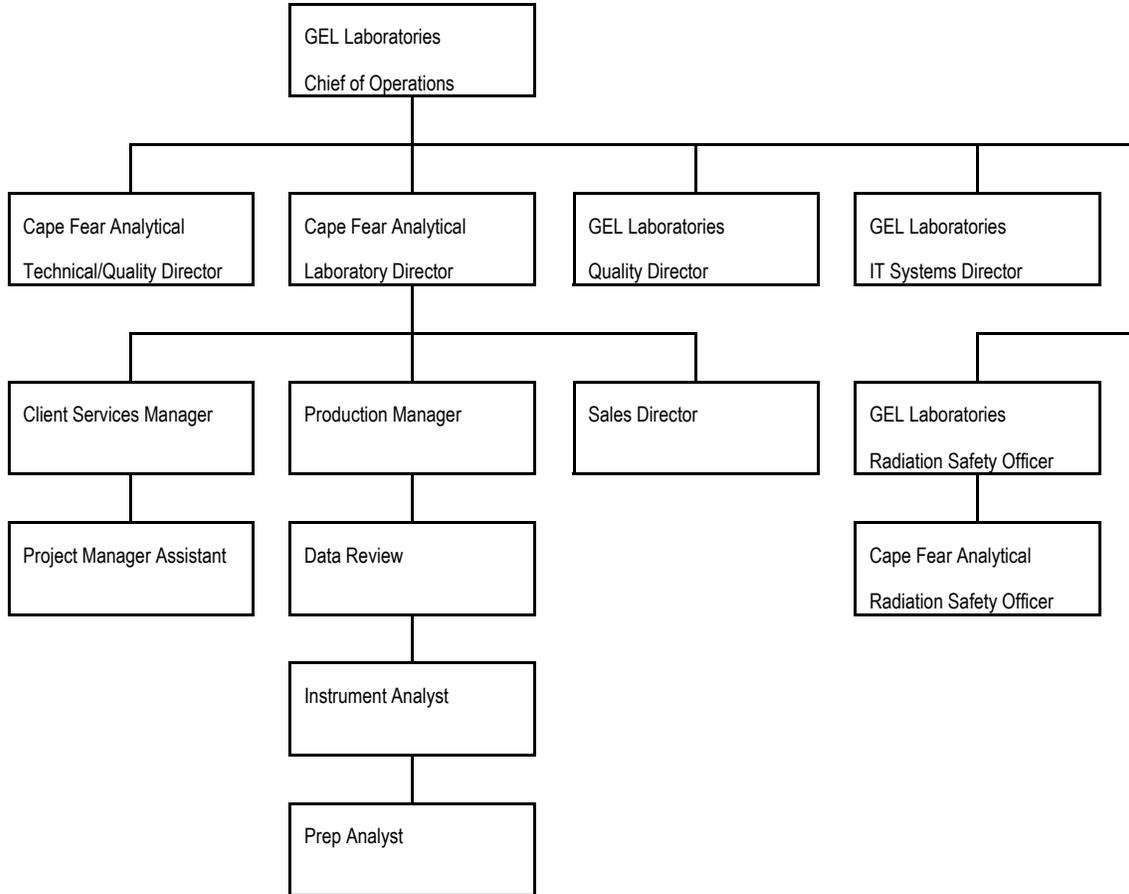

Validation: The process of substantiating specified performance criteria.

Verification: Confirmation by examination and provision of evidence that specified requirements have been met. (NELAC)

NOTE: Verification provides a means for checking that the deviations between values indicated by a measuring instrument and corresponding known values of a measured quantity are consistently smaller than the maximum allowable error defined in a standard, regulation, or specification peculiar to the management of the measuring equipment.

The result of verification leads to a decision either to restore in service, to perform adjustments, to repair, to downgrade, or to declare obsolete. In all cases it is required that a written trace of the verification performed shall be kept on the measuring instrument's individual record.

APPENDIX C: CORPORATE ORGANIZATION CHART

**APPENDIX D: CERTIFICATIONS**

Cape Fear Analytical, LLC maintains primary environmental laboratory certification from TNI in Utah. We expand our list of certification as needed.

Original Scope of Accreditations is maintained in the Quality Assurance work area. Electronic copies are available in .pdf form on the CFA intranet. Please call to confirm the status of any certification of interest to you.

The NELAC Institute - Primary issued through the State of Utah, Department of Health, Bureau of Laboratory Improvement;

Secondary TNI accreditation issued through:

California

Florida

Illinois

Louisiana

New Jersey

New York

Mississippi

Pennsylvania

Texas

Washington

North Carolina Department of Health and Human Services, North Carolina State Laboratory Public Health Environmental Sciences, Safe Drinking Water.

Pennsylvania Department of Environmental Protection, Registered to perform analysis on Air samples

Delaware River Basin Commission

DoD QSM

A2LA ANSI/ISO/IEC 17025-2017

## APPENDIX E: ESSENTIAL QUALITY CONTROL REQUIREMENTS

At CFA, we enforce strict adherence to quality control measures. Quality control measures for each type of analysis are delineated in the associated standard operating procedure and include those specified in the identified analytical method. Client requests for additional quality control agreed to by us will be communicated to the laboratory by the Project Manager and performed accordingly.

All quality control measures are assessed and evaluated on an ongoing basis. We use these measures to establish statistically derived quality control acceptance criteria. The acceptance criteria are used to evaluate whether the analytical process is in control and to assist us in establishing the validity of the data. Our procedures for handling out- of-control situations are written in the analytical standard operating procedure.

Method-specific quality measures are described in the appropriate standard operating procedure. Essential but general quality control requirements are summarized in the sections below for chemical testing, including organic analyses.

### E1 CHEMICAL TESTING

This section includes our quality control requirements for organic analyses, and discusses:

- Negative controls
- Positive controls
- Analytical variability and reproducibility
- Method evaluation
- Method detection limits
- Data reduction
- Quality of standards and reagents
- Selectivity
- Constant and consistent test condition

#### E1.1 NEGATIVE CONTROLS

We implement a negative control at least once per analytical batch of samples having the same matrix, and where, if applicable, the same extraction or preparation method is employed. The negative control is a method blank that we use to determine the presence of contamination. If discovered, we must investigate the source of contamination and take measures to correct, minimize, or eliminate the source if:

1. The concentration of target analyte exceeds the established practical quantitation limit and exceeds a concentration greater than 1/10 of the measured concentration of any sample in the analytical batch;
2. The concentration of a target analyte in the method blank exceeds that present in the samples and is greater than 1/10 of the specified regulatory limit.
3. For DOD work, an acceptable blank must have no analytes detected  $> \frac{1}{2}$  the laboratory's LOQ or  $> 1/10^{\text{th}}$  the amount measured in any sample or  $1/10^{\text{th}}$  the regulatory limit, whichever is greater. (see QSM v5.3 table B-6)

If a method blank is indicative of contamination, we must assess each sample in that batch against the above criteria to determine if the data are acceptable. Any sample associated with a contaminated method blank shall be reprocessed for analysis, as needed, or the results will be reported with appropriate data qualifiers.

## **E1.2 POSITIVE CONTROL - METHOD PERFORMANCE**

### **E1.2.1 LABORATORY CONTROL SAMPLE (LCS)**

**Purpose:** The LCS is used to evaluate the performance of the total analytical system, including all preparation and analysis steps. Results of the LCS are compared to established criteria and, if found to be outside of these criteria, indicate that the analytical system is “out of control.” Any affected samples associated with an out-of-control LCS shall be reprocessed for re-analysis or the results reported with appropriate data qualifying codes, as necessary.

**Frequency:** The LCS is analyzed at a minimum of 1 per preparation batch.

**Composition:** The LCS is a controlled matrix, known to be free of analytes of interest, spiked with known and verified concentrations of analytes. NOTE: The matrix spike may be used in place of this control as long as the acceptance criteria are as stringent as for the LCS. Alternatively the LCS may consist of a medium containing known and verified concentrations of analytes such as Certified Reference Material (CRM). All analyte concentrations shall be within the calibration range of the method. The following shall be used in choosing components for the spike mixtures:

The components to be spiked shall be as specified by the mandated test method or other regulatory requirement or as requested by the client.

NOTE: Unless otherwise noted in project quality assurance plans or if components interfere with an accurate assessment, all Department of Defense projects will have LCS, MS, and MSD that contain all target analytes.

**Evaluation Criteria and Corrective Action:** The results of the individual batch LCS are calculated in percent recovery. The laboratory shall document the calculation for percent recovery. The individual LCS is compared to the acceptance criteria as published in the mandated test method. Where there are no established criteria, the laboratory determines internal criteria or utilizes client specified assessment criteria.

An LCS that is determined to be within the criteria effectively establishes that the analytical system is in control and validates system performance for the samples in the associated batch. Samples analyzed along with a LCS determined to be “out of control” should be considered suspect and the samples reprocessed and re-analyzed or the data reported with appropriate data qualifying codes as necessary.

### **E1.2.2 Sample Specific Controls**

The laboratory must document procedures for determining the effect of the sample matrix on method performance. These procedures relate to the analyses of matrix specific Quality Control (QC) samples and are designed as data quality indicators for a specific sample using the designated test method. These controls alone are not used to judge laboratory performance. Examples of matrix specific QC include: Matrix Spike (MS); Matrix Spike Duplicate (MSD); Post Spike (PS) and Post Spike Duplicate (PSD) sample duplicates; and surrogate spikes.

### **E1.2.3 Matrix Spike; Matrix Spike Duplicates, Post Spike ; Post Spike Duplicates:**

**Purpose:** Matrix specific QC samples indicate the effect of the sample matrix on the precision and accuracy of the results generated using the selected method. The information from these controls is sample/matrix specific and would not normally be used to determine the validity of the entire batch.

**Frequency:** The frequency of the analysis of matrix specific samples shall be determined as part of a systematic planning process (e. g. Data Quality Objectives) or as specified by the required mandated test method.

**Composition:** The components to be spiked shall be as specified by the mandated test method or other regulatory requirement or as requested by the client. Any permit specified analytes, as specified by regulation or client requested analytes shall also be included.

**Evaluation Criteria and Corrective Action:** The results from matrix spike/matrix spike duplicate and post spike/post spike duplicate are primarily designed to assess the precision and accuracy of analytical results in a given matrix and are expressed as percent recovery (%R) and relative percent difference (RPD).

Results are compared to the acceptance criteria as published in the mandated test method. Where there are no established criteria, the laboratory should determine internal criteria and document the method used to establish the limits. For matrix spike or post spike results outside established criteria, corrective action shall be documented or the data reported with appropriate data qualifying codes.

#### **E1.2.4 Matrix Duplicates:**

**Purpose:** Matrix duplicates are defined as replicate aliquots of the same sample taken through the entire analytical procedure. The results from this analysis indicate the precision of the results for the specific sample using the selected method. The matrix duplicate provides a usable measure of precision only when target analytes are found in the sample chosen for duplication.

**Frequency:** The frequency of the analysis of matrix duplicates may be determined as part of a systematic planning process (e. g. Data Quality Objectives) or as specified by the mandated test method.

**Composition:** Matrix duplicates are performed on replicate aliquots of actual samples. The composition is usually not known.

**Evaluation Criteria and Corrective Action** The results from matrix duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD) or another statistical treatment (e. g., absolute differences). The laboratory shall document the calculation for relative percent difference or other statistical treatments.

Results are compared to the acceptance criteria as published in the mandated test method. Where there are no established criteria, the laboratory shall determine internal criteria and document the method used to establish the limits. For matrix duplicates results outside established criteria corrective action shall be documented or the data reported with appropriate data qualifying codes.

#### **E1.2.5 Surrogate Spikes:**

**Purpose** Surrogates are used most often in organic chromatography test methods and are chosen to reflect the chemistries of the targeted components of the method. Added prior to sample preparation/extraction, they provide a measure of recovery for every sample matrix.

**Frequency** Except where the matrix precludes its use or when not available, or is not a method requirement, surrogate compounds are added to all samples, standards, and blanks for all appropriate test methods.

**Composition:** Surrogate compounds are chosen to represent the various chemistries of the target analytes in the method. They are often specified by the mandated method and are deliberately chosen

for their being unlikely to occur as an environmental contaminant. Often this is accomplished by using deuterated analogs of select compounds.

**Evaluation Criteria and Corrective Action:** The results are compared to the acceptance criteria as published in the mandated test method or determined using statistical process controls (SPC). Where there are no established criteria, the laboratory determines internal criteria and documents the method used to establish the limits.

Surrogates outside the acceptance criteria must be evaluated for the effect indicated for the individual sample results. The appropriate corrective action may be guided by the data quality objectives or other site specific requirements. Results reported from analyses with surrogate recoveries outside the acceptance criteria include appropriate data qualifiers.

### **E1.3 Method Evaluation**

The following procedures, as described in the other sections of the QAP, are in place in order to ensure the accuracy of the reported result:

- Procedure for initial demonstration of analytical capability performed initially (prior to the analysis of any samples) and if there is a significant change in instrument type, personnel, matrix or test method. Refer to Section 8.
- Procedures for initial and continuing calibration protocols as specified in Section 7.
- Procedures for utilizing proficiency test samples to evaluate the ability of a procedure and/or analyst laboratory to produce accurate data as specified in Section 3.

### **E1.4 Method Detection Limits**

Method detection limits (MDLs) are determined as described in CF-LB-E-001 for The Determination of Method Detection Limits. This procedure is based on that established in 40 CFR Part 136, Appendix B. The laboratory processes for determining Practical Quantitation Limit (PQL), Limit of Detection (LOD) and Limit of Quantitation (LOQ) is also discussed in the SOP CF-LB-E-001.

Where possible, MDL studies are conducted for aqueous, solid and tissue matrices using a clean matrix appropriate to the test method (such as laboratory pure reagent water, Ottawa sand, glass beads or corn oil). MDL studies for the majority of routine parameters are conducted by:

- analyzing a minimum of seven replicates of the lowest calibration standard.
- determining the standard deviation of the seven replicates
- multiplying the standard deviation by 3.143 (based on six degrees of freedom and representing a 99% confidence level) to obtain the calculated MDL.

If the MDL study is being conducted for a new method or target analyte, the following steps are taken:

- the MDL is estimated based on information provided in the method or analytical experience
- a standard with a concentration three to five times the estimated MDL is prepared and analyzed a minimum of seven times
- the MDL is calculated as above based on the standard deviation and degrees of freedom
- the MDL is evaluated for reasonableness by verification through analysis of a prepared standard solution one to three times the calculated MDL.

Additionally, when the MDL is required for use with the Kentucky Certification Manual:

- The replicates shall be analyzed over 2 – 3 non consecutive days.

- The spiked concentration shall be less than 10 times the calculated MDL.
- The calculated MDL shall be less than the RRL.

MDL studies are not performed for any target analyte for which spiking solutions are not available.

Practical quantitation limits (PQLs) are determined by either multiplying the MDL by approximately 2 to 10 or are equal to that of the lowest calibration standard. Concentrations of a target analyte determined to be greater than its PQL are defined as quantitative results. All quantitative reported results are preceded by or bracketed by calibration or calibration verification standards.

The LOD is calculated using  $MDL \times 2 = LOD$ . CFA Laboratories performs quarterly verifications of LODs by spiking a quality system matrix at approximately two to three times the detection limit (for a single-analyte standard) or one to four times the detection limit (for a multi-analyte standard). LOD Verifications are performed on all instruments used to report samples requiring LOD reporting.

The LOD is compared to the PQL and if  $LOD < PQL$ , then  $LOQ = PQL$ . If  $LOD > PQL$ , then LOQ is established at the next lowest level of the calibration curve. CFA Laboratories performs quarterly verifications of LOQs by spiking a quality system matrix at approximately one to two times the claimed LOQ.

The laboratory demonstrates precision and bias at the LOQ by calculating Statistical Process Control (SPC) limits using LOQ measurements, as discussed in SOP CF-QS-E-14, Quality Assurance Measurement Calculations and Processes.

All MDL studies conducted by the laboratory are submitted to the Quality Group for an independent review. Upon acceptance of the MDL study, the MDLs reported to clients via our computer system are updated unless otherwise specified by contract. PQLs are also updated as directed by the new MDLs or changes to procedures.

All data pertaining to the study and the calculation of MDLs is maintained as quality records by the Quality Manager.

**Reporting Limit Standard (RLS - Kentucky Certification Manual)** In order to demonstrate the laboratory's capability to report down to the required reporting limit, the laboratory shall analyze a known standard at or below the required reporting limit. The reporting limit standard (RLS) shall be analyzed as a stand-alone verification standard. The verification will be performed quarterly. The acceptance criteria for a successful RLS verification is the measurement of the analyte spiked at or below the minimum reporting limit that passes all qualification criteria. The concentration of this spike is typically one-half level of the MRL and is not taken through the labs entire sample process, this is an instrument performance verification only.

**Minimum Reporting Level (MRL - Kentucky Certification Manual)** CFA will analyze an MDL on each instrument. If this is not possible in all circumstances, CFA shall demonstrate that the Minimum Reporting Level (MRL) is achievable on all instruments that the MDL study is applied by the extraction, cleanup, and analysis of a verification standard at the MRL. The verification will be performed quarterly. The acceptance limits for this verification is that the analyte recovery is within 50-150%.

### **E1.5 Data Reduction**

The procedures for data reduction, such as use of linear regression, are documented in the individual analytical standard operating procedures. CFA's policy governing the manual integration of chromatographic data is detailed in CF-LB-E-017, Procedure and Policy for Manual Integration.

Manual integrations of chromatographic peaks can only be performed in accordance with CF-LB-E-017. This ensures that the integrations are done in a consistent and technically justifiable manner while meeting the requirements set forth under the Good Automated Laboratory Practices.

SOP CF-QS-E-014, Quality Assurance Measurement Calculations and Processes, discusses the use of laboratory data in statistical determinations and includes discussion of Estimation of Total Analytical Uncertainty, Statistical Process Control (SPC) Limits, and Calibration of Instrumentation.

Understanding of the procedures used for data generation and reduction is an important part of an analyst demonstrating proficiency in an analytical procedure. All analysts and technicians responsible for generating curves and using curve-generated data are trained to this SOP per CFA annual and interim training requirements.

### **E1.6 Quality of Standards and Reagents**

The quality of standards used in instrument calibration or quality control samples and reagents used in sample preparation and/or analysis must meet the criteria described in Section 7. In methods where the purity is not specified, analytical grade reagents are used. Reagents of lesser purity than those specified by the test method are never used. Upon receipt and prior to use, the labels on the container are checked to verify that the purity of the reagents meets the documented requirements of the particular test method.

The quality of water sources is monitored and documented as described in Section 4. The quality of water used in sample preparation or analysis meets the method-specified requirements. The type of water available in the laboratory is described in Section 4.

### **E1.7 Selectivity**

Absolute and relative retention times aid in the identification of components in chromatographic analyses and in evaluation of the effectiveness of a column in separating constituents. The procedures governing retention time windows are documented in the applicable analytical SOP and meet all regulatory and method requirements.

In addition to retention time windows, the acceptance criteria for mass spectral tuning are also documented in the appropriate analytical SOP. In all cases, the acceptance criteria meet or exceed those specified in the analytical methods.

Unless stipulated in writing by the client, confirmations may be performed to verify the compound identification of positive results detected on a sample. Such confirmations are performed on a second analytical column for organic tests. All confirmation is documented.

### **E1.8 Constant and Consistent Test Conditions**

CFA's implementation of standard operating procedures that specify quality criteria including initial and continuing calibrations assures that our test instruments consistently operate within the specifications required of the application for which the equipment is used.

In addition to the specifications applied to instrumentation, glassware used for sample preparation or analysis is cleaned in a manner that reduces the potential for positive or negative interferences.

Glassware is prepared in accordance with CF-LB-E-003 for Glassware Preparation.

This SOP details the procedures used to clean the following groups of glassware:

- Reusable bottles and plasticware
- Glassware used for determination of dioxins/furans or PCB congeners
- Glassware used in the determination of other organic compounds

- Generic glassware used in all other analyses

If the method specifies that the glassware be stored in a particular manner, this requirement is documented in the appropriate analytical SOP.

**APPENDIX F: ETHICS AND DATA INTEGRITY AGREEMENT**

**CAPE FEAR ANALYTICAL, LLC**

**ETHICS AND DATA INTEGRITY AGREEMENT**

- I. I, \_\_\_\_\_, state that I understand the high standards of integrity required of me with regard to the duties I perform and the data I report in connection with my employment at Cape Fear Analytical, LLC.
- II. I agree that in the performance of my duties at Cape Fear Analytical, LLC:
- A. I shall not intentionally report data values that are not the actual values obtained;
  - B. I shall not intentionally report data that does not meet method or procedural specifications unless that data is properly qualified through comments or other notations in the analytical report.
  - C. I shall not intentionally report dates and times of data analyses that are not the actual dates and times of data analyses; and,
  - D. I shall not intentionally represent another individual's work as my own.
- III. I agree to inform Cape Fear Analytical, LLC of any accidental or intentional reporting of non-authentic data by myself or by other employees in a timely manner.
- IV. I will not knowingly participate in any questionable activities or violations of the Procurement Integrity Act during purchasing or sales activities. I will report any questionable activities to Cape Fear Analytical management. This includes discussions on analytical services, pricing and contracts, vendor pricing or other essential business information to anyone outside of The GEL Group, Inc. family.

This Ethics and Data Integrity Agreement has been explained to me by the Quality Manager and I have been provided the opportunity to ask questions on any part of this agreement that I did not understand. It has also been explained to me that any violation of this agreement conducted during work performed under a subcontract or direct contract to a government agency could subject me to potential prosecution.

I understand that violation of this policy subjects me to disciplinary action, up to and including termination of my employment with The GEL Group, Inc and/or Cape Fear Analytical, LLC.

**1.0 STANDARD OPERATING PROCEDURE FOR THE MODIFIED ELUTRIATE TEST****2.0 PURPOSE**

This standard operating procedure describes the manner in which a modified elutriate test is conducted.

**3.0 METHOD DISCUSSION**

3.1 The modified elutriate test should be conducted, and the appropriate chemical analyses should be performed as soon as possible after sample collection. The volume of elutriate sample needed for analysis depends on the number and types of analyses to be conducted (Plumb 1981). Both dissolved and total concentrations of contaminants may be determined from this procedure.

3.2 The volume required for each analysis, the number of parameters measured, and the desired analytical replications influence the total elutriate sample volume required. A glass jar capable of holding at least 8 liters of sample or 55 gallon stainless steel drums are normally used to conduct the testing. The supernatant volume available for sample extraction will vary, depending on the sediment properties, settling times, and the initial concentration of the slurry. It may be necessary to composite several extracted samples to obtain the total required volume.

**4.0 APPLICABLE MATRICES**

4.1 Soils

4.2 Sludges

4.3 Sediments

**5.0 HOLD TIME**

Holding time is 14 days from the time and date of collection until the start of elutriate extraction unless otherwise specified by contract.

**6.0 SAMPLE CONTAINER/PRESERVATION/COLLECTION/STORAGE REQUIREMENTS**

Solid samples are not preserved but must be stored at  $0^{\circ} \leq 6^{\circ} \text{ C}$ .

**7.0 INTERFERENCES**

There are rarely any interferences with this prep. If any are encountered, consult the group leader or quality officer before continuing.

**8.0 DEFINITIONS**

8.1 AlphaLIMS: The Laboratory Information Management System used at GEL.

8.2 Quiescent settling: Undisturbed settling of particles.

**9.0 ANALYST VERIFICATION**

Before a technician/analyst is allowed to analyze samples without supervision, he or she is trained by qualified personnel and is required to successfully analyze a

proficiency sample. Training records are maintained as quality records (Refer to GL-QS-E-008).

#### **10.0 DOCUMENTATION OF DATA**

Sample preparation data are recorded in AlphaLIMS.

#### **11.0 SAFETY, HEALTH, AND ENVIRONMENTAL HAZARDS**

Always wear eye protection with side shields, gloves and laboratory coats while performing this work in the laboratory. For detailed information on chemical safety refer to the Safety, Health, and Chemical Hygiene Plan, GL-LB-N-001.

#### **12.0 SAMPLE RECEIPT FOR ANALYSIS**

12.1 The analyst/technician submits the list of samples needed to the sample custodian group. The sample custodian removes the appropriate sample from the cooler and scans it using the barcode scanner to the appropriate area of the lab. The analyst then takes custody of the samples and scans them to the sample batch. The samples are now ready to be prepared or analyzed.

12.2 Analysts/technicians are responsible for retrieving their own samples when the sample custodian is unavailable.

#### **13.0 APPARATUS**

13.1 Laboratory mixer, preferably with Teflon shaft and blades

13.2 Glass jars of at least 8 L total volume

13.3 Assorted glassware for sample extraction and handling

13.4 Vacuum or pressure filtration equipment, including vacuum pump, peristaltic pump, or compressed air source and appropriate filter holder capable of accommodating 47, 105, or 155 mm filters

13.5 0.45 µm pore-size diameter in-line filters

13.6 Plastic sample bottles, 500 mL capacity for storage of water and liquid phase samples for metal and nutrient analyses

13.7 1 liter capacity glass jars should also be used as sample containers when samples are to be analyzed for semi-volatile constituents

13.8 250 mL centrifuge tubes

13.9 Assorted sizes Tygon tubing

13.10 55 gallon stainless steel open-ended drums

13.11 Laboratory centrifuge capable of handling 250 ml centrifuge tubes

13.12 Laboratory balance or drum scale

#### **14.0 MODIFIED ELUTRIATE TEST PROCEDURE**

14.1 Slurry Preparation: The sediment and dredging site water should be mixed to approximately equal the expected average field inflow concentration. If estimates of the average field inflow concentration cannot be made based

on past data, a slurry concentration of 150 g (dry weight basis) / 1 L of dredge water should be used.

14.1.1 Refer to GL-LB-E-029 for specific directions on sub-sampling. To determine the percent solids of the sediment, obtain a well-mixed aliquot of the sediment (about 100 g) and place in an appropriate sized tin. Dry the sample for approximately 12 hours at 104° C (± 2° C) or until the sample is completely dry. Allow the sample to cool in a desiccator for at least one hour. Record the weight and place the sample in the drying oven for another 30 minutes. Cool the sample again for one hour in a desiccator and take a second weight. If the final weights are within 0.5 g of each other, calculate the % solids using the following equation:

$$\% \text{ solids} = 100 \times \frac{\text{Final Weight}}{\text{Initial Weight}}$$

If the final weights are not within 0.5 g of each other, repeat the drying and cooling process until they are consistent.

14.1.2 Once the % solids value is obtained, use the following equation to determine the amount of well-mixed sample to use for the elutriate test:

$$\text{Total Sample Amount (g)} = \frac{150\text{g}}{(\% \text{ solids}/100)}$$

14.1.3 Weigh out the total sample amount required in a glass jar and add the appropriate amount of dredge water to the sample. The sample is now ready for mixing.

14.2 Mix the slurry for 5 minutes using a laboratory mixer. The slurry should be mixed to a uniform consistency with no unmixed agglomerations of sediment.

14.3 Remove the laboratory mixer and allow the slurry to undergo quiescent settling for 24 hours. The settling time can be altered if requested by a client.

- 14.4 After the settling period, an interface will usually be evident between the supernatant water with low concentration of suspended solids and the more concentrated settled material. Aliquots of the supernatant water should be extracted from the glass jar at a point midway between the water surface and the interface using siphoning techniques. Care should be taken not to re-suspend the settled material.
- 14.5 Aliquoting for analyses should be performed according to the methods for each analysis required. Volume, preservation, and holding time requirements should be followed for each analysis according to their relevant methods and SOPs.
- 14.6 If dissolved fractions are required, filtration or centrifugation will need to be performed on those elutriate samples.
- 14.6.1 Samples to be analyzed for dissolved pesticides and/or PCBs must be free of particles but should not be filtered due to the tendency for these materials to absorb to the filter. Particulate matter can be removed before analysis by high-speed centrifugation.
- 14.6.2 Samples to be analyzed for all other dissolved analyses should be filtered through a 0.45  $\mu\text{m}$  pore-size diameter filter using a filtration assembly. The filtration assembly should be thoroughly rinsed with DI water in between samples.
- 14.7 Subsamples for analyses of total and dissolved fractions should undergo appropriate digestion and/or prep procedures prior to analysis. All digestion and chemical analyses should be performed using accepted procedures.

## 15.0 PREPARATION OF STANDARDS

Documentation of standards and their preparation is maintained in AlphaLIMS in accordance with GL-LB-E-007 for Laboratory Standards Documentation.

## 16.0 INSTRUMENT/EQUIPMENT START-UP PROCEDURE

There are no start up procedures for this prep.

## 17.0 QUALITY CONTROL (QC) REQUIREMENTS

- 17.1 There are no QC requirements for this extraction. QC should be applied to samples as per the prep method being performed after the extraction is complete.
- 17.2 Handling Out-Of-Control Situations:  
If sample does not exhibit settling after 24 hours, contact team leader or group leader.

## 18.0 RUN SEQUENCE

Not applicable

**19.0 INSTRUMENT/EQUIPMENT SHUT-DOWN PROCEDURE**

Not applicable

**20.0 METHOD VARIATION**

Not applicable

**21.0 DATA REVIEW, VALIDATION, AND APPROVAL PROCEDURE**

21.1 Upon completion of batch preparation, digestion data shall be entered into the AlphaLIMS Prep Logbook (refer to Appendix 1) following the guidelines in GL-LB-E-008 for Basic Requirements for the Use and Maintenance of Laboratory Notebooks, Logbooks, Forms, and Other Recordkeeping Devices.

21.2 Data to be entered into the electronic logbook include analyst name, prep data and time, initial weight with units, and final volume with units.

**22.0 RECORDS MANAGEMENT**

Records pertaining to the activity described in this procedure are maintained as quality documents in accordance with GL-QS-E-008 for Quality Records Management and Disposition.

**23.0 LABORATORY WASTE**

For the proper disposal of sample and reagent wastes from this procedure, refer to the Laboratory Waste Management Plan, GL-LB-G-001.

**24.0 REFERENCES**

24.1 "Environmental Effects of Dredging (Technical Notes)," US Army Engineer Waterways Experiment Station, June 1985.

24.2 American Public Health Association, 1985, EPA 1980a, and EPA 1979.

**25.0 HISTORY**

Revision 4: Corrected settling time to reflect proper unit of time.

Revision 5: Added containers to equipment list.

Revision 6: Reformatted SOP to conform to technical procedure format.

Revision 7: Added balance or scale to Apparatus list

## **APPENDIX A.4**

### **Northwest Testing, Inc. Laboratory Information**

The Northwest Testing SOPs listed in Worksheet #23 and the laboratory QA Manual are confidential business information and have not been included in this appendix. The documents are available on request from the Northwest Testing point of contact listed in Worksheet #3/5. The cover and signature pages for Northwest Testing's laboratory QA Manual are included in this appendix for reference. Northwest Testing's SOPs are included in the QA Manual and are not independent documents; therefore, do not have covers or signature pages.

## Accredited Laboratory

A2LA has accredited

### **NORTHWEST GEOTECH, INC. D/B/A NORTHWEST TESTING, INC.**

*Wilsonville, OR*

for technical competence in the field of

## Construction Materials Testing

This laboratory is accredited in accordance with the recognized International Standard ISO/IEC 17025:2017 *General requirements for the competence of testing and calibration laboratories*. This accreditation demonstrates technical competence for a defined scope and the operation of a laboratory quality management system (refer to joint ISO-ILAC-IAF Communiqué dated April 2017).

Presented this 10<sup>th</sup> day of March 2021.

A blue ink signature of the Vice President of Accreditation Services.

Vice President, Accreditation Services  
For the Accreditation Council  
Certificate Number 3087.01  
Valid to December 31, 2022

*For the tests to which this accreditation applies, please refer to the laboratory's Construction Materials Testing Scope of Accreditation.*

SCOPE OF ACCREDITATION TO ISO/IEC 17025:2017

NORTHWEST GEOTECH, INC.  
d/b/a NORTHWEST TESTING, INC.  
9120 SW Pioneer Court, Suite B  
Wilsonville, OR 97070  
Thomas Ginsbach, P.E. Phone: 503 682 1880

Valid To: December 31, 2022

Certificate Number: 3087.01

In recognition of the successful completion of the A2LA evaluation process, accreditation is granted to this laboratory for:

CONSTRUCTION MATERIALS ENGINEERING

ASTM: C1077 (Standard Practice for Agencies Testing Concrete and Concrete Aggregates for Use in Construction and Criteria for Testing Agency Evaluation);  
C1093 (Standard Practice for Accreditation of Testing Agencies for Masonry);  
D3666 (Standard Specification for Minimum Requirements for Agencies Testing and Inspecting Road and Paving Materials);  
D3740 (Standard Practice for Minimum Requirements for Agencies Engaged in Testing and/or Inspection of Soil and Rock as Used in Engineering Design and Construction);  
E329 (Standard Specification for Agencies Engaged in Construction Inspection, Testing, or Special Inspection)

CONSTRUCTION MATERIALS TESTING

<u>Test Method:</u>	<u>Test Description:</u>
<b>Aggregates:</b>	
ASTM C29	Bulk Density (“Unit Weight”) and Voids in Aggregate
ASTM C88	Soundness of Aggregates by Use of Sodium Sulfate or Magnesium Sulfate
ASTM C117	Materials Finer than 75-µm (No. 200) Sieve in Mineral Aggregates by Washing
ASTM C123	Lightweight Particles in Aggregate
ASTM C127	Density, Relative Density (Specific Gravity), and Absorption of Coarse Aggregate
ASTM C128	Density, Relative Density (Specific Gravity), and Absorption of Fine Aggregate
ASTM C131	Resistance to Degradation of Small-Size Coarse Aggregate by Abrasion and Impact in the Los Angeles Machine
ASTM C136	Sieve Analysis of Fine and Coarse Aggregates
ASTM C142	Clay Lumps and Friable Particles in Aggregates
ASTM C535	Resistance to Degradation of Large-Size Coarse Aggregate by Abrasion and Impact in the Los Angeles Machine
ASTM C566	Total Evaporable Moisture Content of Aggregate by Drying
ASTM C702	Reducing Samples of Aggregate to Testing Size

<b><u>Test Method:</u></b>	<b><u>Test Description:</u></b>
ASTM D75 <sup>1</sup>	Sampling Aggregates
ASTM D4791	Standard Test Method for Flat Particles, Elongated Particles, or Flat and Elongated Particles in Coarse Aggregate
ASTM D5821	Determining the Percentage of Fractured Particles in Coarse Aggregate
AASHTO T2	Sampling of Aggregates
AASHTO T11	Test for Materials Finer Than 75- $\mu$ m (No. 200) Sieve in Mineral Aggregates by Washing
AASHTO T19	Bulk Density ("Unit Weight") and Voids in Aggregate
AASHTO T27	Sieve Analysis of Fine and Coarse Aggregates
AASHTO T84	Specific Gravity and Absorption of Fine Aggregate
AASHTO T85	Specific Gravity and Absorption of Coarse Aggregate
AASHTO T96	Resistance to Degradation of Small-Size Coarse Aggregate by Abrasion and Impact in the Los Angeles Machine
AASHTO T104	Soundness of Aggregates by Use of Sodium Sulfate or Magnesium Sulfate
AASHTO T112	Clay Lumps and Friable Particles in Aggregate
AASHTO T113	Lightweight Pieces of Aggregate
AASHTO T248	Reducing Samples of Aggregate to Testing Size
AASHTO T255	Total Evaporable Moisture Content of Aggregate by Drying
<b><u>Bituminous:</u></b>	
ASTM D75	Sampling Aggregates
ASTM D979 <sup>1</sup>	Sampling Bituminous Paving Mixtures
ASTM D1188	Bulk Specific Gravity and Density of Compacted Bituminous Mixtures Using Coated Samples
ASTM D2041	Theoretical Maximum Specific Gravity and Density of Bituminous Paving Mixtures
ASTM D2726	Bulk Specific Gravity and Density of Non-Absorptive Compacted Bituminous Mixtures
ASTM D2950 <sup>1</sup>	Density of Bituminous Concrete in Place by Nuclear Methods
ASTM D3203	Percent Air Voids in Compacted Dense and Open Bituminous Paving Mixtures
ASTM D3549	Thickness or Height of Compacted Bituminous Paving Mixture Specimens
ASTM D5444	Mechanical Size Analysis of Extracted Aggregate
ASTM D6307	Asphalt Content of Hot-Mix Asphalt by Ignition Method
ASTM D6925	Preparation and Determination of the Relative Density of Hot Mix Asphalt (HMA) Specimens by Means of the Superpave Gyrotory Compactor
ASTM D6926	Preparation of Bituminous Specimens Using Marshall Apparatus
ASTM D6927	Marshall Stability and Flow of Bituminous Mixtures
AASHTO T30	Mechanical Analysis of Extracted Aggregate
AASHTO T166	Bulk Specific Gravity of Compacted Hot Mix Asphalt (HMA) Using Saturated Surface-Dry Specimens
AASHTO T168	Sampling Bituminous Paving Mixtures
AASHTO T209	Theoretical Maximum Specific Gravity and Density of Hot Mix Asphalt (HMA)
AASHTO T269	Percent Air Voids in Compacted Dense and Open Asphalt Mixtures

<b><u>Test Method:</u></b>	<b><u>Test Description:</u></b>
AASHTO T312	Preparing and Determining the Density of Hot Mix Asphalt (HMA) Specimens by Means of the Superpave Gyrotory Compactor
<b><u>Concrete:</u></b>	
ASTM C31/C31M <sup>1</sup>	Making and Curing Concrete Test Specimens in the Field
ASTM C39/C39M	Compressive Strength of Cylindrical Concrete Specimens
ASTM C42/C42M	Obtaining and Testing Drilled Cores and Sawed Beams of Concrete
ASTM C78/C78M	Flexural Strength of Concrete (Using Simple Beam with Third-Point Loading)
ASTM C138/C138M <sup>1</sup>	Density (Unit Weight), Yield, and Air Content (Gravimetric) of Concrete
ASTM C143/C143M <sup>1</sup>	Slump of Hydraulic-Cement Concrete
ASTM C172/C172M <sup>1</sup>	Sampling Freshly Mixed Concrete
ASTM C173 <sup>1</sup>	Air Content of Freshly Mixed Concrete by the Volumetric Method
ASTM C192/C192M	Making and Curing Concrete Test Specimens in the Laboratory
ASTM C231/C231M <sup>1</sup>	Air Content of Freshly Mixed Concrete by the Pressure Method
ASTM C496/C496M	Splitting Tensile Strength of Cylindrical Concrete Specimens
ASTM C617	Standard Practice for Capping Cylindrical Concrete Specimens
ASTM C642	Density, Absorption, and Voids in Hardened Concrete
ASTM C805/C805M <sup>1</sup>	Rebound Number of Hardened Concrete
ASTM C1064/C1064M <sup>1</sup>	Temperature of Freshly Mixed Hydraulic-Cement Concrete
ASTM C1140	Preparing and Testing Specimens from Shotcrete Test Panels
ASTM C1231/C1231M	Unbonded Caps in Determination of Compressive Strength of Hardened Concrete Cylinders
AASHTO T22	Compressive Strength of Cylindrical Concrete Specimens,
AASHTO T23	Making and Curing Concrete Test Specimens in the Field
AASHTO T24	Obtaining and Testing Drilled Cores and Sawed Beams of Concrete
AASHTO T97	Flexural Strength of Concrete (Using Simple Beam with Third-Point Loading)
AASHTO T119	Slump of Hydraulic Cement Concrete,
AASHTO T121	Density (Unit Weight), Yield, and Air Content (Gravimetric) of Concrete
AASHTO T141	Sampling Freshly Mixed Concrete
AASHTO T152	Air Content of Freshly Mixed Concrete by the Pressure Method
AASHTO T196	Air Content of Freshly Mixed Concrete by the Volumetric Method
AASHTO T198	Splitting Tensile Strength of Cylindrical Concrete Specimens
AASHTO T231	Capping Cylindrical Concrete Specimens
AASHTO T309	Temperature of Freshly Mixed Hydraulic Cement Concrete
<b><u>Fireproofing:</u></b>	
ASTM E605 (excluding section 8.3)	Thickness and Density of Sprayed Fire-Resistive Material (SFRM) Applied to Structural Members
ASTM E736 <sup>1</sup> (field only) (excluding section 7.1)	Cohesion/Adhesion of Sprayed Fire-Resistive Materials Applied to Structural Members
AWCI Technical Manual 12-A	Field Applied Sprayed Fire-Resistive Materials
ASTM E2174	On-site Inspection of Installed Firestops
ASTM E2393	On-site Inspection of Installed Fire Resistive Joint Systems and Perimeter Fire Barriers

<b><u>Test Method:</u></b>	<b><u>Test Description:</u></b>
<b><u>Masonry:</u></b>	
ASTM C140	Sampling and Testing Concrete Masonry Units and Related Units
ASTM C1019 <sup>1</sup>	Sampling and Testing Grout
ASTM C1314	Compressive Strength of Masonry Prisms
ASTM C1552	Capping Concrete Masonry Units, Related Units and Masonry Prisms for Compression Testing
C780 Annex A.6	Standard test method for Preconstruction and Construction Evaluation of Mortar for Plain and Reinforced Unit Masonry
<b><u>Soils:</u></b>	
ASTM D422-2007	Particle-Size Analysis of Soils
ASTM D698	Laboratory Compaction Characteristics of Soil Using Standard Effort
ASTM D854	Specific Gravity of Soil Solids by Water Pycnometer
ASTM D1140	Determining the Amount of Material Finer than 75- $\mu$ m (No. 200) Sieve in Soils by Washing
ASTM D1557	Laboratory Compaction Characteristics of Soil Using Modified Effort
ASTM D1883	CBR (California Bearing Ratio) of Laboratory-Compacted Soils
ASTM D2166	Unconfined Compressive Strength of Cohesive Soil
ASTM D2216	Laboratory Determination of Water (Moisture) Content of Soil and Rock by Mass
ASTM D2419	Sand Equivalent Value of Soils and Fine Aggregate
ASTM D2435	One-Dimensional Consolidation Properties of Soils Using Incremental Loading
ASTM D2487	Classification of Soils for Engineering Purposes (Unified Soil Classification System)
ASTM D2488 <sup>1</sup>	Description and Identification of Soils (Visual-Manual Procedure)
ASTM D2850	Unconsolidated-Undrained Triaxial Compression Test on Cohesive Soils
ASTM D2937 <sup>1</sup>	Density of Soil in Place by the Drive-Cylinder Method
ASTM D3080	Direct Shear Test of Soils Under Consolidated Drained Conditions
ASTM D3282	Classification of Soils and Soil-Aggregate Mixtures for Highway Construction Purposes
ASTM D4318	Liquid Limit, Plastic Limit, and Plasticity Index of Soils
ASTM D4718	Unit Weight and Water Content for Soils Containing Oversize Particles
ASTM D4767	Consolidated Undrained Triaxial Compression Test for Cohesive Soils
ASTM D4829	Expansion Index of Soils
ASTM D5084	Measurement of Hydraulic Conductivity of Saturated Porous Materials Using a Flexible Wall Permeameter
ASTM D6913	Particle-Size Distribution (Gradation) of Soils Using Sieve Analysis
ASTM D6938 <sup>1</sup>	In-Place Density and Water Content of Soil and Soil-Aggregate by Nuclear Methods (Shallow Depth)
AASHTO T099	Moisture-Density Relations of Soils Using a 2.5-kg (5.5-lb) Rammer and a 305-mm (12-in.) Drop
AASHTO T100	Specific Gravity of Soils
AASHTO T180	Moisture-Density Relations of Soils Using a 4.54-kg (10-lb) Rammer and a 457-mm (18-in.) Drop
AASHTO T208	Unconfined Compressive Strength of Cohesive Soil
AASHTO T216	One-Dimensional Consolidation Properties of Soils
AASHTO T236	Direct Shear Test of Soils under Consolidated Drained Conditions
AASHTO T297	Consolidated, Undrained Triaxial Compression Test on Cohesive Soils

<b><u>Test Method:</u></b>	<b><u>Test Description:</u></b>
<b><u>Steel (Shop &amp; Field)<sup>1</sup>:</u></b>	
AWS D1.1 Structural Welding Code (Clause 6, Inspection)	Structural Welding Code- Steel
AWS D1.3 Structural Welding Code (Clause 6, Inspection)	Structural Welding Code - Sheet Steel
AWS D1.4 Structural Welding Code (Clause 6, Inspection)	Structural Welding Code - Reinforcing Steel
AWS D1.5 Bridge Welding Code (Clause 6, Inspection)	Bridge Welding Code
AWS D1.8 Structural Welding Code (Clause 7, Inspection)	Seismic Supplement
AISC 360 (Chapter N, QA/QC Fabrication & Erection)	Specification for Structural Steel Buildings
RCSC (Section 9, Inspection)	Specification for Structural Joints Using High-Strength Bolts
<b><u>Nondestructive:</u></b>	
ASTM E709 <sup>1</sup> (Yoke - Dry)	Magnetic Particle Testing
AWS D1.1 (Clause 6 Part C)	Magnetic Particle Testing
AWS D1.8 (Annex G)	Magnetic Particle Testing
ASTM E797, E164, E587 (Contact Straight Beam, Contact Angled Beam)	Ultrasonic Testing
AWS D1.1 (Clause 6 Part C)	Ultrasonic Testing
AWS D1.8 (Annex G)	Ultrasonic Testing
<b><u>Rock:</u></b>	
ASTM D4543 Methods S1, FP2, P2	Preparing Rock Core as Cylindrical Test Specimens and Verifying Conformance to Dimensional and Shape Tolerances
ASTM D7012 (Method C only)	Unconfined Compressive Strength of Intact Rock Core Specimens

<sup>1</sup> This laboratory performs field testing activities for these tests.

<sup>2</sup> This laboratory's scope contains withdrawn or superseded methods. As a clarifier, this indicates that the applicable method itself has been withdrawn or is now considered "historical" and not that the laboratory's accreditation for the method has been withdrawn.

*The laboratory is only accredited for the test methods listed above. The accredited test methods are used in determining compliance with the specifications listed below or, in some cases, the specification is used to show that the required environment for testing has been established. The inclusion of these specifications on this Scope does not confer laboratory accreditation to the specifications nor does it confer accreditation for any method(s) embedded within the specifications.*

<b><u>Specification</u></b>	<b><u>Description</u></b>
ASTM C511	Specification for Mixing Rooms, Moist Cabinets, Moist Rooms, and Water Storage Tanks Used in the Testing of Hydraulic Cements and Concretes
ACI 301	Specifications for Structural Concrete of Buildings
ACI 318	Building Code Requirements for Structural Concrete
ACI 530	Building Code Requirements & Specifications for Masonry Structures

## Policy Statements

NGI/NTI's quality system's policies and objectives are defined in this quality manual. The quality policy statement issued under the authority of the Quality Manager includes the following:

- a) The agency shall have managerial and technical personnel who, irrespective of other responsibilities, have the authority and resources needed to carry out their duties, and to identify the occurrence of departures from the quality system or from the procedures for performing tests and/or calibrations, and to initiate actions to prevent or minimize such departures. See Section 4.2.4 for personnel descriptions.
- b) The agency shall have arrangements to ensure that its management and personnel are free from any undue internal and external commercial, financial and other pressures and influences that may adversely affect the quality of their work; these arrangements include ongoing review of staff performance, prohibiting outside employment, or internal or external financial interests in related activities.

All personnel shall understand the policies contained in the QSM and through reviewing and signing the "Quality System Manual Review Documentation" at the front of the QSM, acknowledge they understand and will comply with the statements of confidentiality business ethics, conflicts of interest, and prohibiting of outside employment that adversely affect the quality of their work.

- c) The agency will ensure the protection of its client's confidential information and proprietary rights by maintaining controlled access for client files including electronic files. Procedures will include protecting electronic storage using passwords and other protocol to limit access. The transmission of test results and inspection reports will be controlled by selected administrative staff with oversight by management. Facsimile and electronic transmissions will include a transmittal confidentiality note in the event that information is miss-sent.
- d) The agency will have policies and procedures to avoid involvement in any activities that would diminish confidence in its competence, impartiality, judgment, or operational integrity. The Quality Manager will ensure that only projects within the agency areas of expertise are contracted and that any apparent conflicts of interest are a completely avoided.
- e) Any actual potential or perceived conflict of interest shall be immediately disclosed, confidentially, to NGI's quality manager for resolution. The quality manager shall determine whether any conflict of interest exists and determine an appropriate resolution. Resolutions shall be documented by the Quality Manager.
- f) The agency shall specify the responsibility, authority and interrelationships of all personnel who manage, perform, or verify work affecting the quality of the inspections and tests. See Section 4.2 for descriptions.
- g) The agency shall provide adequate supervision of inspection and testing, including trainees, by persons familiar with methods and procedures, purpose of each inspection and test, and with the assessment of the test results. See Section 4.2.2 for descriptions.
- h) The agency shall have technical management which has overall responsibility for the technical operations and the provisions of the resources needed to ensure the required quality of agency operations. The quality of agency operations is ensured by the Quality Manager, Technical Director, Field Supervisor, and Laboratory Supervisor. See Section 4.2.4 for appointees.

- i) The agency shall appoint members of the agency staff as quality managers who, irrespective of other duties and responsibilities, shall have defined responsibility and authority for ensuring that the quality system is implemented and followed at all times; the Quality Manager shall have direct access to the highest level of management at which decisions are made on agency policy or resources. See Section 4.2.4 for Quality Manager description.
- j) The agency shall appoint deputies for key managerial personnel. See Section 4.2.4 for appointees.
- k) The agency shall ensure that its personnel are aware of the relevance and importance of their activities and how they contribute to the achievement of the objectives of the management system.
- l) The agency management shall ensure that appropriate communication processes are established within the laboratory and that communication takes place regarding the effectiveness of the management system. Note: Examples of forms of communication can include emails, memos, text, or verbal.
- m) The agency management is committed to good professional practice and to the quality of its testing in servicing its clients. The standard of service will be the highest possible within reasonable economic, technical, and time constraints. The objectives of the quality system are to implement and maintain the agency standard of service.
- n) All personnel concerned with field and agency testing activities are required to familiarize themselves with quality documentation and implement the policies and procedures in their work.
- o) The agency is committed to compliance with ASTM E329 and International Standards ISO/IEC 17020 and 17025 and to continually improve the effectiveness of the management system. Inspections and tests shall always be carried out in accordance with stated methods and clients' requirements.
- p) The agency management shall provide evidence of commitment to the development and implementation of the management system and to continually improving its effectiveness.
- q) The agency management shall communicate to the organization the importance of meeting customer requirements as well as statutory and regulatory requirements.
- r) The agency shall ensure that the integrity of the management system is maintained when changes to the management system are planned and implemented.
- s) The agency shall seek feedback, both positive and negative, from its customers. The feedback shall be used and analyzed to improve the management system, testing and calibration activities and customer service. *Note: Examples of the type of feedback include customer satisfaction surveys and a review of test or calibration reports with customers.*
- t) The agency shall continually improve the effectiveness of its management system through the use of the quality policy, quality objectives, audit results, analysis of data, corrective and preventive actions and management review.

The quality policies contained in this section are issued under the authority of the following personnel:

Thomas S. Ginsbach, P.E. President

Date: 10/15/20

Michael A. Ginsbach, Quality Manager, Field Supervisor,  
Laboratory Supervisor (Interim)

Date: 10/15/20

Desmond Weber, Laboratory Supervisor (Incoming)

Date: 10/15/20

Geoff Gagner, Deputy Quality Manager, Senior Technician

Date: 10/15/20

Analyte	Method/Tech	Category	Certification Type	Effective Date
11-Chloroeicosafluoro-3-oxaundecane-1-sulfonic Acid (11-CIPF3OUdS)	EPA 533	Group III Unregulated Contaminants	NELAP	12/1/2020
11-Chloroeicosafluoro-3-oxaundecane-1-sulfonic Acid (11-CIPF3OUdS)	EPA 537.1	Group III Unregulated Contaminants	NELAP	5/26/2020
1H,1H,2H,2H-Perfluorodecanesulfonic Acid (8:2 Fluorotelomersulfonate, 8:2 FTS)	EPA 533	Group III Unregulated Contaminants	NELAP	12/1/2020
1H,1H,2H,2H-Perfluorohexanesulfonic acid (4:2 Fluorotelomersulfonate, 4:2 FTS)	EPA 533	Group III Unregulated Contaminants	NELAP	12/1/2020
1H,1H,2H,2H-Perfluoro-octanesulfonic Acid (6:2 Fluorotelomersulfonate, 6:2 FTS)	EPA 533	Group III Unregulated Contaminants	NELAP	12/1/2020
2-(N-Ethyl-perfluorooctane sulfonamido) acetic acid	EPA 537	Group III Unregulated Contaminants	NELAP	4/25/2017
2-(N-Ethyl-perfluorooctane sulfonamido) acetic acid	EPA 537.1	Group III Unregulated Contaminants	NELAP	5/26/2020
2-(N-Methyl-perfluorooctane sulfonamido) acetic acid	EPA 537	Group III Unregulated Contaminants	NELAP	4/25/2017
2-(N-Methyl-perfluorooctane sulfonamido) acetic acid	EPA 537.1	Group III Unregulated Contaminants	NELAP	5/26/2020
4,8-Dioxa-3H-perfluorononanoic Acid (ADONA)	EPA 533	Group III Unregulated Contaminants	NELAP	12/1/2020
4,8-Dioxa-3H-perfluorononanoic Acid (ADONA)	EPA 537.1	Group III Unregulated Contaminants	NELAP	5/26/2020
9-Chlorohexadecafluoro-3-oxanonane-1-sulfonic Acid (9-CIPF3ONS)	EPA 533	Group III Unregulated Contaminants	NELAP	12/1/2020
9-Chlorohexadecafluoro-3-oxanonane-1-sulfonic Acid (9-CIPF3ONS)	EPA 537.1	Group III Unregulated Contaminants	NELAP	5/26/2020
Hexafluoropropylene Oxide Dimer Acid (HFPO-DA, GenX)	EPA 533	Group III Unregulated Contaminants	NELAP	12/1/2020
Hexafluoropropylene Oxide Dimer Acid (HFPO-DA, GenX)	EPA 537.1	Group III Unregulated Contaminants	NELAP	5/26/2020
Nonafluoro-3,6-dioxaheptanoic Acid (NFDHA)	EPA 533	Group III Unregulated Contaminants	NELAP	12/1/2020
Perfluoro(2-ethoxyethane) Sulfonic Acid (PFEEESA)	EPA 533	Group III Unregulated Contaminants	NELAP	12/1/2020
Perfluoro-3-methoxypropanoic Acid (PFMPA)	EPA 533	Group III Unregulated Contaminants	NELAP	12/1/2020
Perfluoro-4-methoxybutanoic Acid (PFMBA)	EPA 533	Group III Unregulated Contaminants	NELAP	12/1/2020
Perfluorobutane Sulfonate (PFBS, Perfluorobutane Sulfonic Acid)	EPA 533	Group III Unregulated Contaminants	NELAP	12/1/2020
Perfluorobutane Sulfonate (PFBS, Perfluorobutane Sulfonic Acid)	EPA 537	Group III Unregulated Contaminants	NELAP	4/25/2017
Perfluorobutane Sulfonate (PFBS, Perfluorobutane Sulfonic Acid)	EPA 537.1	Group III Unregulated Contaminants	NELAP	5/26/2020
Perfluorobutanoate (PFBA, Perfluorobutanoic Acid)	EPA 533	Group III Unregulated Contaminants	NELAP	12/1/2020
Perfluorodecanoate (PFDA, Perfluorodecanoic Acid)	EPA 533	Group III Unregulated Contaminants	NELAP	12/1/2020
Perfluorodecanoate (PFDA, Perfluorodecanoic Acid)	EPA 537	Group III Unregulated Contaminants	NELAP	4/25/2017
Perfluorodecanoate (PFDA, Perfluorodecanoic Acid)	EPA 537.1	Group III Unregulated Contaminants	NELAP	5/26/2020

## ORGANICS/HRMS TECHNICAL EVALUATION CHECKLIST FOR STAGE 2A DV

(Covers summaries of blanks; accuracy; precision; and sample results)

DV Criteria Table:  Default  Client/Program Specific - Control Limits:  Lab  QAPP/SAP  Other:

Qualifiers Issued:  No  Yes      Qualifiers added to:  EDD/Database  Form 1s

### 1.0 Chain-of-Custody/Holding Time/Preservation

Y    N    N/A

1.1 Are COCs included, properly signed, and dated?			
1.2 Are all cooler temperatures within the control limits? <input type="checkbox"/> 0-6°C <input type="checkbox"/> Frozen <-20°C±10°C <input type="checkbox"/> see attached Holding Time worksheet or spreadsheet <input type="checkbox"/> see below			
1.3 Were all samples preserved properly? Indicate method(s) of preservation: <input type="checkbox"/> Cool <input type="checkbox"/> Frozen <input type="checkbox"/> HCl to pH <2 <input type="checkbox"/> MeOH <input type="checkbox"/> NaHSO <sub>3</sub> <input type="checkbox"/> Other:			
1.4 Samples analyzed within holding time? <input type="checkbox"/> see HT eval spreadsheet <input type="checkbox"/> see below			
<i>Secondary:</i> Technical Agreement with HT evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
<b>Comments:</b> <input type="checkbox"/> Data judged as not significantly affected by outliers; no qualifiers assigned.			

### 2.0 Method/Field Blanks

Y    N    N/A

2.1 Are Method Blanks free from contamination? <input type="checkbox"/> see attached Blank Summary Form or data package page <input type="checkbox"/> see below			
2.2 Are there any <input type="checkbox"/> trip and/or <input type="checkbox"/> equipment/field blanks included in the data package? (list below)			
2.3 Are trip and/or equipment/field blanks free from contamination? <input type="checkbox"/> see attached Blank Summary Form or data package page <input type="checkbox"/> see below			
<i>Secondary:</i> Technical Agreement with MB/FB evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
<b>Comments:</b> <input type="checkbox"/> No positive results in associated samples; no action required for method / trip / equip. / other. <input type="checkbox"/> 10X action level established for common lab cont.; 5X action level for others.			

### 3.0 Laboratory Control Sample (Blank Spike/OPR Sample) LCS or OPR LCS/LCSD

Y    N    N/A

3.1 Are all %R-values within the control limits? <b>Limits:</b> <input type="checkbox"/> Lab <input type="checkbox"/> Method <input type="checkbox"/> Project <input type="checkbox"/> see attached Summary Form or data package page <input type="checkbox"/> see below			
3.2 Are all RPD values within control limits (if duplicate analyzed)? <input type="checkbox"/> see attached Summary Form or data package page <input type="checkbox"/> see below			
<i>Secondary:</i> Technical Agreement with LCS/LCSD/OPR evaluation and qualification? <input type="checkbox"/> no qualifiers <input type="checkbox"/> evaluation and DV report agree <input type="checkbox"/> see below			
<b>Comments:</b> <input type="checkbox"/> No positive results in associated samples; no qualifiers as all outliers were > UCL (high bias) <input type="checkbox"/> No qualifiers assigned; one outlier per fraction/column acceptable if > 10%.			

#### 4.0 Surrogate/Labeled Compounds

Y    N    N/A

<b>4.1</b> Are all recovery values within the control limits? <b>Limits:</b> <input type="checkbox"/> Lab <input type="checkbox"/> Method <input type="checkbox"/> Project <input type="checkbox"/> see attached Surrogate Summary Form or data package page <input type="checkbox"/> see below			
<i>Secondary:</i> Technical Agreement with labeled compound evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
<b>Comments:</b> <input type="checkbox"/> No positive results; no qualifiers as all outliers were > UCL (high bias). <input type="checkbox"/> No qualifiers assigned; one outlier per fraction/column acceptable (if > 10%). <input type="checkbox"/> No qualifiers assigned; sample diluted to a conc < low std preventing accurate recovery.			

#### 5.0 Matrix Spike/Matrix Spike Duplicate or Sample and Lab Duplicate (*List Parent Sample ID below*)

Y    N    N/A

<b>5.1</b> Are all %R-values within the control limits? <b>Limits:</b> <input type="checkbox"/> Lab <input type="checkbox"/> Method <input type="checkbox"/> Project <input type="checkbox"/> see attached MS/MSD Summary Form or data package page <input type="checkbox"/> see below			
<b>5.2</b> Are all RPD values within control limits? <input type="checkbox"/> see attached MS/MSD Summary Form or data package page <input type="checkbox"/> see below			
<i>Secondary:</i> Technical Agreement with matrix spike and/or lab duplicate evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
<b>Comments:</b> <input type="checkbox"/> No positive results in parent sample; no qualifiers as all outliers were > UCL (high bias) or RPD only outlier & parent ND. <input type="checkbox"/> Not required by method. <input type="checkbox"/> No qualifiers assigned; sample diluted to a conc < low std preventing accurate recovery. <input type="checkbox"/> The following analyte parent concentrations > 4X spike level; no action.			

#### 6.0 Field Duplicate (FD) (*List Field Duplicate Sample IDs below*)

Y    N    N/A

<b>6.1</b> Were field duplicates collected and analyzed? <input type="checkbox"/> RPD/Difference Calculation Attached			
<b>6.2</b> For results >5X the RL, are RPD values within the control limit? <b>Limits:</b> <input type="checkbox"/> EC Default <input type="checkbox"/> Project <input type="checkbox"/> see attached Calculation Sheet <input type="checkbox"/> see below			
<b>6.3</b> For results less than 5X the RL, are the differences less than the RL (2X the RL for solid matrices)? <input type="checkbox"/> see attached Calculation Sheet <input type="checkbox"/> see below			
<i>Secondary:</i> Technical Agreement with FD evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
<b>Comments:</b> <input type="checkbox"/> No qualifiers assigned based on FD outliers <input type="checkbox"/> Qualify FD samples			

**7.0 Standard Reference Material (SRM) or Certified Reference Material (CRM)**

Y N N/A

7.1 Was an SRM sample(s) analyzed? SRM/CRM Sample ID(s): _____			
7.2 Are all values within control limits? <b>Limits:</b> <input type="checkbox"/> EC Default <input type="checkbox"/> Project <input type="checkbox"/> no outliers <input type="checkbox"/> see below <input type="checkbox"/> see attached			
<i>Secondary:</i> Technical Agreement with SRM/CRM evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
<b>Comments:</b> <input type="checkbox"/> No qualifiers assigned based on SRM/CRM outliers			

**8.0 Sample Results/Completeness Check**

Y N N/A

8.1 Are there results for all analytes on the client required target compound list(s)? <b>see SAP/QAPP for lists</b>			
8.2 Are reporting limits and sample results adjusted for sample size, final volume, dilutions, etc.?			
8.3 Are concentrations reported on the appropriate basis? <input type="checkbox"/> Dry weight <input type="checkbox"/> Wet weight <input type="checkbox"/> Both			
8.4 Do detection limits meet project-specific or method-specific limits?			
8.5 Results were DNR-11 flagged to indicate most appropriate result from multiple reported results.			
8.6 Results qualified J-20 to indicate concentration is greater than calibration range.			
8.7 DLs/RLs elevated due to <input type="checkbox"/> Dil <input type="checkbox"/> %M <input type="checkbox"/> Sample Vol <input type="checkbox"/> Final volume <input type="checkbox"/> Interference (UJ-22) <input type="checkbox"/> Other:			
8.8 Results qualified J-23H due to <input type="checkbox"/> diphenyl ether <input type="checkbox"/> chromatographic interference.			
8.8 Are GC/HPLC second column results within RPD limits? <input type="checkbox"/> All ND <input type="checkbox"/> J-3 for 40%<RPD<60% <input type="checkbox"/> NJ-3 for >60% <input type="checkbox"/> see below <input type="checkbox"/> see attached			
8.9 Were TICS requested for this project and, if so, are they reported as required?			
8.10 TICs qualified NJ-4 to indicate tentatively identified compound.			
8.11 Are all COCs/sections/forms/raw data present and accurate?			
8.12 In the EDD or database, has the Result Reportable field been verified?			
8.13 Data reporting units: <input type="checkbox"/> ug/l <input type="checkbox"/> mg/l <input type="checkbox"/> ng/l <input type="checkbox"/> ug/kg <input type="checkbox"/> mg/kg <input type="checkbox"/> ug/kg <input type="checkbox"/> %			
<i>Secondary:</i> Technical Agreement with sample results evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
<b>Comments:</b> <input type="checkbox"/> Dilutions (see HT Table). <input type="checkbox"/> Results estimated J-14 – see details below.			

**9.0 Secondary Report Narrative Review**

Y N N/A

9.1 Does the narrative report meet all client specifications for content and format?			
9.2 Does the narrative report note any deviations from project validation guidance documents and if so, is rationale provided?			
9.3 Does the report adequately document and discuss <input type="checkbox"/> data anomalies and/or resubmitted data?			
9.4 Were client/field sample IDs used in the report narrative (verify transcription against COC)?			
9.5 Does the Overall Assessment include all required elements? (Adherence to methods; discussion of precision and accuracy; summary of assigned qualifiers, and usability statement)			
9.6 Does the usability statement properly reflect the assigned qualifiers and/or rejected data?			
<b>Comments:</b>

## HRMS TECHNICAL EVALUATION CHECKLIST FOR STAGE 4 DV

(Covers summaries of blanks, accuracy, precision, sample results, calibration, instrument performance, compound ID & recalculations)

DV Criteria Table:  Default  Client/Program Specific - Control Limits:  Lab  QAPP/SAP  Other:

Qualifiers Issued:  No  Yes      Qualifiers added to:  EDD/Database  Form 1s

### 1.0 Chain-of-Custody/Holding Time/Preservation

Y    N    N/A

1.1 Are COCs included, properly signed, and dated?			
1.2 Are all cooler temperatures within the control limits? <input type="checkbox"/> 0-6°C <input type="checkbox"/> Frozen <-20°C±10°C <input type="checkbox"/> see attached Holding Time worksheet or spreadsheet <input type="checkbox"/> see below			
1.3 Were all samples preserved properly? Indicate method(s) of preservation <input type="checkbox"/> Cool <input type="checkbox"/> Frozen <input type="checkbox"/> Other:			
1.4 Samples analyzed within holding time? <input type="checkbox"/> see HT eval spreadsheet <input type="checkbox"/> see below			
<i>Secondary:</i> Technical Agreement with HT evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
<b>Comments:</b> <input type="checkbox"/> Data judged as not significantly affected by outliers; no qualifiers assigned.			

### 2.0 Method/Field Blanks

Y    N    N/A

2.1 Are Method Blanks free from contamination? <input type="checkbox"/> see attached Blank Summary Form or data package page <input type="checkbox"/> see below			
2.2 Are there any equipment/field blanks included in the data package? (list below)			
2.3 Are equipment/field blanks free from contamination? <input type="checkbox"/> see attached Blank Summary Form or data package page <input type="checkbox"/> see below			
<i>Secondary:</i> Technical Agreement with MB/FB evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
<b>Comments:</b> <input type="checkbox"/> No positive results in associated samples; no action required for method / equip. / other.			

### 3.0 Laboratory Control Sample (OPR Sample) LCS or OPR LCS/LCSD

Y    N    N/A

3.1 Are all %R-values within the control limits? <b>Limits:</b> <input type="checkbox"/> Lab <input type="checkbox"/> Method <input type="checkbox"/> Project <input type="checkbox"/> see attached Summary Form or data package page <input type="checkbox"/> see below			
3.2 Are all RPD values within control limits (if duplicate analyzed)? <input type="checkbox"/> see attached Summary Form or data package page <input type="checkbox"/> see below			
<i>Secondary:</i> Technical Agreement with LCS/LCSD/OPR evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
<b>Comments:</b> <input type="checkbox"/> No positive results in associated samples; no qualifiers as all outliers were > UCL (high bias) <input type="checkbox"/> No qualifiers assigned; one outlier per fraction/column acceptable if > 10%.			

#### 4.0 Labeled Compounds

Y N N/A

4.1 Are all recovery values within the control limits? <b>Limits:</b> <input type="checkbox"/> Lab <input type="checkbox"/> Method <input type="checkbox"/> Project <input type="checkbox"/> see attached Labeled Compound Summary Form or data package page <input type="checkbox"/> see below			
<b>Secondary:</b> Technical Agreement with labeled compound evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
<b>Comments:</b> <input type="checkbox"/> No positive results; no qualifiers as all outliers were > UCL (high bias). <input type="checkbox"/> No qualifiers assigned; one outlier per fraction/column acceptable (if > 10%). <input type="checkbox"/> No qualifiers assigned; sample diluted to a conc < low std preventing accurate recovery.			

#### 5.0 Matrix Spike/Matrix Spike Duplicate or Sample and Lab Duplicate (List Parent Sample ID below)

Y N N/A

5.1 Are all %R-values within the control limits? <b>Limits:</b> <input type="checkbox"/> Lab <input type="checkbox"/> Method <input type="checkbox"/> Project <input type="checkbox"/> see attached MS/MSD Summary Form or data package page <input type="checkbox"/> see below			
5.2 Are all RPD values within control limits? <input type="checkbox"/> see attached MS/MSD Summary Form or data package page <input type="checkbox"/> see below			
<b>Secondary:</b> Technical Agreement with matrix spike and/or lab duplicate evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
<b>Comments:</b> <input type="checkbox"/> No positive results in parent sample; no qualifiers as all outliers were > UCL (high bias) or RPD only outlier & parent ND. <input type="checkbox"/> Not required by method. <input type="checkbox"/> No qualifiers assigned; sample diluted to a conc < low std preventing accurate recovery. <input type="checkbox"/> The following analyte parent concentrations > 4X spike level; no action.			

#### 6.0 Field Duplicate (FD) (List Field Duplicate Sample IDs below)

Y N N/A

6.1 Were field duplicates collected and analyzed? <input type="checkbox"/> RPD/Difference Calculation Attached			
6.2 For results >5X the RL, are RPD values within the control limit? <b>Limits:</b> <input type="checkbox"/> EC Default <input type="checkbox"/> Project <input type="checkbox"/> see attached Calculation Sheet <input type="checkbox"/> see below			
6.3 For results less than 5X the RL, are the differences less than the RL (2X the RL for solid matrices)? <input type="checkbox"/> see attached Calculation Sheet <input type="checkbox"/> see below			
<b>Secondary:</b> Technical Agreement with FD evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
<b>Comments:</b> <input type="checkbox"/> No qualifiers assigned based on FD outliers <input type="checkbox"/> Qualify FD samples			

**7.0 Standard Reference Material (SRM) or Certified Reference Material (CRM)** Y   N   N/A

7.1 Was an SRM sample(s) analyzed? <b>SRM/CRM Sample ID(s):</b>			
7.2 Are all values within control limits? <b>Limits:</b> <input type="checkbox"/> EC Default <input type="checkbox"/> Project <input type="checkbox"/> see below <input type="checkbox"/> see attached			
<i>Secondary:</i> Technical Agreement with SRM/CRM evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
<b>Comments:</b> <input type="checkbox"/> No qualifiers assigned based on SRM/CRM outliers			

**8.0 Instrument Performance** Y   N   N/A

8.1 Are PFK static resolving power checks performed at the required frequency?			
8.2 Was PFK resolving power at least 10,000 (10% valley definition) for an appropriate mass?			
8.3 Was the resolving power zeroed correctly (i.e. were the bases of peak displays within the lower grid intersections)?			
8.4 Was the exact mass within 5 ppm of the theoretical mass? (see method for specific mass and criteria) <input type="checkbox"/> see below			
8.5 Was the GC windows-defining mixture analyzed at the required frequency?			
8.6 Are any/all chromatographic separation (valley/peak) criteria met? <input type="checkbox"/> see below			
8.7 Are retention time windows established for all homologue groups?			
<i>Secondary:</i> Technical Agreement with instrument performance evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
<b>Comments:</b>			

**9.0 Initial Calibration** Y   N   N/A

9.1 Are ICALs analyzed on all instruments on which samples are analyzed?			
9.2 Are the correct number and concentration of standards used?			
9.3 Are all ion abundance ratios for unlabeled and labeled compounds within method QC limits? <input type="checkbox"/> see attached ICAL Summary Form or data package page <input type="checkbox"/> see below			
9.4 Is the method-specified signal to noise (S/N) criteria met? <input type="checkbox"/> see attached ICAL Summary Form or data package page <input type="checkbox"/> see below			
9.5 Are the %RSD values for the native compounds within QC limits? <input type="checkbox"/> ±20%RSD <input type="checkbox"/> Other: <input type="checkbox"/> see attached ICAL Summary Form or data package page <input type="checkbox"/> see below			
9.6 Are the %RSD values for the labeled compounds within QC limits? <input type="checkbox"/> ±30%RSD <input type="checkbox"/> ±35%RSD <input type="checkbox"/> Other: <input type="checkbox"/> see attached ICAL Summary Form or data package page <input type="checkbox"/> see below			
9.7 Are any/all absolute retention time criteria met? <input type="checkbox"/> see attached ICAL Summary Form or data package page <input type="checkbox"/> see below			
<i>Secondary:</i> Technical Agreement with initial calibration evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
<b>Comments:</b> <input type="checkbox"/> No positive results assoc. w/ outliers; RL judged as not affected – no qualifiers assigned.			

### 10.0 Continuing Calibration

	Y	N	N/A
10.1 Are continuing calibration/calibration verification standards analyzed at the proper frequency?			
10.2 Are all ion abundance ratios for unlabeled and labeled compounds within method QC limits? <input type="checkbox"/> see attached CCAL Summary Form or data package page <input type="checkbox"/> see below			
10.3 Is the method-specified signal to noise (S/N) criteria met? <input type="checkbox"/> see attached CCAL Summary Form or data package page <input type="checkbox"/> see below			
10.4 Are any/all absolute retention time criteria met? <input type="checkbox"/> see attached CCAL Summary Form or data package page <input type="checkbox"/> see below			
10.5 Are CCALs acceptable <input type="checkbox"/> %D <input type="checkbox"/> %R 70%-130% natives/50-150% labeled <input type="checkbox"/> Conc Values <input type="checkbox"/> other? <input type="checkbox"/> see attached CCAL Summary Form or data package page <input type="checkbox"/> see below			
<b>Secondary:</b> Technical Agreement with continuing calibration evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
<b>Comments:</b> <input type="checkbox"/> No positive results assoc. w/ outliers; RL judged as not affected – no qualifiers assigned. <input type="checkbox"/> RF historically low; no qualifiers assigned since response is stable			

### 11.0 Compound Identification

	Y	N	N/A
11.1 Were all retention time criteria met? <input type="checkbox"/> see below			
11.2 Were the retention times of all the native compound ions within ±2 seconds of the labeled compound ions? <input type="checkbox"/> see below			
11.3 Were the ion abundance ratios within the method QC limits? <input type="checkbox"/> see below			
11.4 Were all S/N ratio criteria met? <input type="checkbox"/> see below			
11.5 Lab used column: _____. Adequate TCDF separation achieved; confirmation not required. <input type="checkbox"/> When checked, lab does not confirm results <RL.			
11.6 If a DB-5 (or equivalent) was used, was confirmation performed for 2378-TCDF hits?			
11.7 Were there any false positives or negatives?			
<b>Secondary:</b> Technical Agreement with compound identification calibration evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
<b>Comments:</b> EMPC flagged values indicate ion abundance ratio criterion for positive ID not met. Results have been Qualified as: <input type="checkbox"/> U-25 for native compounds & <input type="checkbox"/> J-25 for homolog groups <input type="checkbox"/> Lab does not EMPC homolog groups OR <input type="checkbox"/> Lab reported these results as ND (not detected)			

### 12.0 Sample Results/Completeness Check

Y N N/A

12.1 Are there results for all analytes on the client required target compound list(s)? <b>see SAP/QAPP for lists</b>			
12.2 Are reporting limits and sample results adjusted for sample size, final volume, dilutions, etc.?			
12.3 Are concentrations reported on the appropriate basis? <input type="checkbox"/> Dry weight <input type="checkbox"/> Wet weight <input type="checkbox"/> Both			
12.4 Do detection limits meet project-specific or method-specific limits?			
12.5 Results were DNR-11 flagged to indicate most appropriate result from multiple reported results.			
12.6 Results qualified J-20 to indicate concentration is greater than calibration range.			
12.7 DLs/RLs elevated due to <input type="checkbox"/> Diln <input type="checkbox"/> %M <input type="checkbox"/> Samp Vol <input type="checkbox"/> Final volume <input type="checkbox"/> Interference (UJ-22) <input type="checkbox"/> Other:			
12.8 Results qualified J-23H due to diphenyl ether interference.			
12.9 Are all COCs/sections/forms/raw data present and accurate?			
12.10 In the EDD or database, has the Result Reportable field been verified?			
12.11 Data reporting units: <input type="checkbox"/> ug/l <input type="checkbox"/> mg/l <input type="checkbox"/> ng/l <input type="checkbox"/> ug/kg <input type="checkbox"/> mg/kg <input type="checkbox"/> ug/kg <input type="checkbox"/> %			
<b>Secondary:</b> Technical Agreement with sample results evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
<b>Comments:</b> <input type="checkbox"/> Dilutions (see HT Table). <input type="checkbox"/> Results estimated J-14 – see details below.			

### 13.0 Recalculation Checks

Y N N/A

13.1 Recalculation completed for: <input type="checkbox"/> Initial & <input type="checkbox"/> Continuing Calibration(s) # <b>points for curve:</b>			
13.2 Recalculation completed for: <input type="checkbox"/> LCS <input type="checkbox"/> LCS/LCSD <input type="checkbox"/> MS <input type="checkbox"/> MS/MSD			
13.3 Recalculation completed for field sample(s)?			
13.4 Transcription checks completed for: <input type="checkbox"/> Tune <input type="checkbox"/> Interference Check Std <input type="checkbox"/> RL Std <input type="checkbox"/> Serial Dilution			
13.5 Transcription checks completed for blanks? <input type="checkbox"/> Laboratory <input type="checkbox"/> Instrument <input type="checkbox"/> Field			
<b>Secondary:</b> Technical Agreement with recalculations? <input type="checkbox"/> evaluation and DV report agree <input type="checkbox"/> see below			
<b>Comments:</b> <input type="checkbox"/> Dilutions (see HT Table)			

### 14.0 Secondary Report Narrative Review

Y N N/A

14.1 Does the narrative report meet all client specifications for content and format?			
14.2 Does the narrative report note any deviations from project validation guidance documents and if so, is rationale provided?			
14.3 Does the report adequately document and discuss <input type="checkbox"/> data anomalies and/or resubmitted data?			
14.4 Were client/field sample IDs used in the report narrative (verify transcription against COC)?			
14.5 Does the Overall Assessment include all required elements? (Adherence to methods; discussion of precision and accuracy; summary of assigned qualifiers, and usability statement.)			
14.6 Does the usability statement properly reflect the assigned qualifiers and/or rejected data?			
<b>Comments:</b>

## INORGANICS TECHNICAL EVALUATION CHECKLIST FOR STAGE 2A DV

(Covers summaries of blanks; accuracy; precision; and sample results)

DV Criteria Table:  Default  Client/Program Specific - Control Limits:  Lab  QAPP/SAP  Other:

Qualifiers Issued:  **No**  **Yes**      Qualifiers added to:  EDD/Database  Form 1s

### 1.0 Chain-of-Custody / Holding Time / Preservation

Y      N      N/A

1.1 Are COCs included, properly signed, and dated?			
1.2 Are all cooler temperatures within the control limits? <input type="checkbox"/> 0-6°C <input type="checkbox"/> Frozen <-20°C±10°C <input type="checkbox"/> see attached Holding Time worksheet or spreadsheet <input type="checkbox"/> see below			
1.3 Were all samples chemically preserved properly? Indicate method(s) of preservation <input type="checkbox"/> Cool <input type="checkbox"/> Frozen <input type="checkbox"/> HCl to pH <2 <input type="checkbox"/> HNO <sub>3</sub> to pH <2 <input type="checkbox"/> H <sub>2</sub> SO <sub>4</sub> <input type="checkbox"/> NaOH to pH>12 <input type="checkbox"/> Other:			
1.4 Samples analyzed within holding time? <input type="checkbox"/> see HT eval spreadsheet <input type="checkbox"/> see below			
Secondary: Technical Agreement with HT evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
Comments: <input type="checkbox"/> Data judged as not significantly affected by outliers; no qualifiers assigned.			

### 2.0 Method Blank(s)

Y      N      N/A

2.1 Are method blanks free from contamination? <input type="checkbox"/> see attached Blank Summary Forms <input type="checkbox"/> see blank eval spreadsheet <input type="checkbox"/> see below			
Secondary: Technical Agreement with MB evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
Comments: <input type="checkbox"/> Analyzed at proper frequency			

### 3.0 Field Blank(s)

Y      N      N/A

3.1 Are there any field blanks associated with the field samples? (list below)			
3.2 Are equipment/field blanks free from contamination? <input type="checkbox"/> see attached Blank Summary Forms <input type="checkbox"/> see blank eval spreadsheet <input type="checkbox"/> see below			
Secondary: Technical Agreement with EB/FB evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
Comments:

--------------	------

#### 4.0 Laboratory Control Sample and/or Standard Reference Material (SRM/CRM)

Y N N/A

4.1 Are all LCS %R values within the control limits? <b>Limits:</b> <input type="checkbox"/> Lab <input type="checkbox"/> Method <input type="checkbox"/> Project <input type="checkbox"/> see attached LCS Summary Forms <input type="checkbox"/> see below			
4.2 If an LCSD was analyzed, are all RPD values within control limits? <input type="checkbox"/> see attached LCS Summary Forms <input type="checkbox"/> see below			
4.3 Are all SRM recoveries within the acceptance limits? <b>Limits:</b> <input type="checkbox"/> EC Default <input type="checkbox"/> Project <input type="checkbox"/> Other: <input type="checkbox"/> see attached SRM Summary Forms <input type="checkbox"/> see below			
<i>Secondary:</i> Technical Agreement with LCS and/or SRM evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
Comments: <input type="checkbox"/> Analyzed at proper frequency			

#### 5.0 Matrix Spike (and Matrix Spike Duplicate - if analyzed)

Y N N/A

5.1 Are all %R values within the control limits? <b>Limits:</b> <input type="checkbox"/> Lab <input type="checkbox"/> Method <input type="checkbox"/> Project <input type="checkbox"/> see attached MS/MSD Summary Forms or data package pages <input type="checkbox"/> see below			
5.2 If an MSD was analyzed, are all RPD values within control limits? <input type="checkbox"/> see attached MS/MSD Summary Forms or data package pages <input type="checkbox"/> see below			
<i>Secondary:</i> Technical Agreement with MS or MS/MSD evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
Comments: <input type="checkbox"/> Analyzed at proper frequency <input type="checkbox"/> Outliers: Post Digestion Spike Required for %R<30%. <i>List all QC samples associated with each prep batch.</i>			

#### 6.0 Laboratory Duplicate

Y N N/A

6.1 For results >5X the RL, are RPD values within the control limit? <b>Limits:</b> <input type="checkbox"/> EC Default <input type="checkbox"/> Project <input type="checkbox"/> see attached summary forms or spreadsheet <input type="checkbox"/> see below			
6.2 For results less than 5X the RL, are the differences less than the RL (2X the RL for solid matrices)? <input type="checkbox"/> see attached summary forms <input type="checkbox"/> see below			
<i>Secondary:</i> Technical Agreement with LD evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
Comments: <input type="checkbox"/> Analyzed at proper frequency. <i>List all QC samples associated with each prep batch.</i>			

Project No.:	SDG:
--------------	------

7.0 Field Duplicates (List Field Duplicate Sample IDs below)

Y N N/A

7.1 Were field duplicates collected and analyzed? <input type="checkbox"/> RPD/Difference Calculation Attached			
7.2 For results >5X the RL, are RPD values within the control limit? <b>Limits:</b> <input type="checkbox"/> EC Default <input type="checkbox"/> Project <input type="checkbox"/> see attached Calculation Sheet <input type="checkbox"/> see below			
7.3 For results less than 5X the RL, are the differences less than the RL (2X the RL for solid matrices)? <input type="checkbox"/> see attached Calculation Sheet <input type="checkbox"/> see below			
Secondary: Technical Agreement with FD evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
Comments: <input type="checkbox"/> No qualifiers assigned based on field duplicate outliers. <input type="checkbox"/> Qualify field duplicate samples.			

8.0 Serial Dilutions

Y N N/A

8.1 Are serial dilution %D values within the control limits? Limits: <input type="checkbox"/> 6010D: 20% >25xRL <input type="checkbox"/> 6010C: 10% >10xRL <input type="checkbox"/> 6010B: 10% >50x MDL <input type="checkbox"/> Other: <input type="checkbox"/> see attached summary forms or spreadsheet <input type="checkbox"/> see below			
Secondary: Technical Agreement with serial dilution evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
Comments: <input type="checkbox"/> Not required for 200.8.			

9.0 Sample Results/Completeness Check

Y N N/A

9.1 Are there results for all analytes on the client required target compound list(s)? see SAP/QAPP for lists			
9.2 Are reporting limits and sample results adjusted for sample size, final volume, dilutions, etc.?			
9.3 Are concentrations reported on the appropriate basis? <input type="checkbox"/> Dry weight <input type="checkbox"/> Wet weight <input type="checkbox"/> Both			
9.4 Do detection limits meet project-specific or method-specific limits?			
9.5 Results were DNR-11 flagged to indicate most appropriate result from multiple reported results.			
9.6 Results qualified J-20 to indicate concentration is greater than calibration range.			
9.7 DLs/RLs elevated due to <input type="checkbox"/> Dilution <input type="checkbox"/> Moisture <input type="checkbox"/> Sample volume <input type="checkbox"/> Final volume <input type="checkbox"/> Other: _____			
9.8 Are related results appropriately qualified i.e., speciated chromium?			
9.9 Are total results greater than corresponding dissolved results? <input type="checkbox"/> within lab precision criteria			
9.10 Are all COCs/sections/forms/raw data present and accurate?			
9.11 In the EDD or database, has the Result Reportable field been verified?			
9.12 Data reporting units: <input type="checkbox"/> ug/l <input type="checkbox"/> mg/l <input type="checkbox"/> ng/l <input type="checkbox"/> ug/kg <input type="checkbox"/> mg/kg <input type="checkbox"/> ug/kg <input type="checkbox"/> %			
Secondary: Technical Agreement with sample results evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
Comments: <input type="checkbox"/> Dilutions (see HT Table.)

## INORGANICS TECHNICAL EVALUATION CHECKLIST FOR STAGE 3 DV

(Covers summaries of blanks, accuracy, precision, sample results, calibration, instrument performance, compound ID & recalculations)

DV Criteria Table:  Default  Client/Program Specific - Control Limits:  Lab  QAPP/SAP  Other:

Qualifiers Issued:  No  Yes      Qualifiers added to:  EDD/Database  Form 1s

### 1.0 Chain-of-Custody / Holding Time / Preservation

Y      N      N/A

1.1 Are COCs included, properly signed, and dated?			
1.2 Are all cooler temperatures within the control limits? <input type="checkbox"/> 0-6°C <input type="checkbox"/> Frozen <-20°C±10°C <input type="checkbox"/> see attached Holding Time worksheet or spreadsheet <input type="checkbox"/> see below			
1.3 Were all samples chemically preserved properly? Indicate method(s) of preservation <input type="checkbox"/> Cool <input type="checkbox"/> Frozen <input type="checkbox"/> HCl to pH <2 <input type="checkbox"/> HNO <sub>3</sub> to pH <2 <input type="checkbox"/> H <sub>2</sub> SO <sub>4</sub> <input type="checkbox"/> NaOH to pH>12 <input type="checkbox"/> Other:			
1.4 Samples analyzed within holding time? <input type="checkbox"/> see HT eval spreadsheet <input type="checkbox"/> see below			
Secondary: Technical Agreement with HT evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
Comments: <input type="checkbox"/> Data judged as not significantly affected by outliers; no qualifiers assigned.			

### 2.0 Method Blank(s)

Y      N      N/A

2.1 Are method blanks free from contamination? <input type="checkbox"/> see attached Blank Summary Forms <input type="checkbox"/> see blank eval spreadsheet <input type="checkbox"/> see below			
Secondary: Technical Agreement with MB evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
Comments: <input type="checkbox"/> Analyzed at proper frequency.			

### 3.0 Field Blank(s)

Y      N      N/A

3.1 Are there any field blanks associated with the field samples? (list below)			
3.2 Are equipment/field blanks free from contamination? <input type="checkbox"/> see attached Blank Summary Forms <input type="checkbox"/> see blank eval spreadsheet <input type="checkbox"/> see below			
Secondary: Technical Agreement with EB/FB evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
Comments:			

### 8.0 Serial Dilutions

Y    N    N/A

8.1 Are serial dilution %D values within the control limits? Limits: <input type="checkbox"/> 6010D: 20% >25xRL <input type="checkbox"/> 6010C: 10% >10xRL <input type="checkbox"/> 6010B: 10% >50x MDL <input type="checkbox"/> Other: <input type="checkbox"/> see attached summary forms or spreadsheet <input type="checkbox"/> see below			
<i>Secondary:</i> Technical Agreement with serial dilution evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
Comments: <input type="checkbox"/> Not required for 200.8.			

### 9.0 Internal Standards (IS) -- ICP-MS only

Y    N    N/A

9.1 Were IS recoveries within the control limits? Limits: <input type="checkbox"/> 6020B >30% <input type="checkbox"/> 6020A > 70% <input type="checkbox"/> NFG 65-125% <input type="checkbox"/> Other: <input type="checkbox"/> see attached IS Summary Forms <input type="checkbox"/> see below			
<i>Secondary:</i> Technical Agreement with internal standard evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
Comments:			

### 10.0 ICP-MS Tune

Y    N    N/A

10.1 Are the mass calibration values less than +/- 0.1amu from the true value? <input type="checkbox"/> see attached Tune <input type="checkbox"/> see below			
10.2 Are the peak resolution values less than 0.9 amu at 10% peak height? (or <0.75 amu at 5% pk ht) <input type="checkbox"/> see attached Tune <input type="checkbox"/> see below			
10.3 Are the %RSD values for mass range monitoring ions less than 5%? ( <i>Not applicable to 6020B.</i> ) <input type="checkbox"/> see attached Tune <input type="checkbox"/> see below			
<i>Secondary:</i> Technical Agreement with ICP-MS Tuner evaluation and qualification? <input type="checkbox"/> no qualifiers <input type="checkbox"/> evaluation and DV report agree <input type="checkbox"/> see below			
Comments:			

### 11.0 Instrument Calibration

Y    N    N/A

11.1 Were ICALs analyzed on all instruments on which samples are analyzed?			
11.2 Were a sufficient number of standards analyzed for the ICAL?			
11.3 Are ICAL calibration factors acceptable? Limits: <input type="checkbox"/> 6010D/6020B: $r > 0.995$ or $r^2 > 0.990$ <input type="checkbox"/> 6010C/6020A: $r > 0.998$ <input type="checkbox"/> Other: <input type="checkbox"/> see attached ICAL <input type="checkbox"/> see below			
11.4 Were ICVs and CCVs analyzed at the proper frequency?			
11.5 Are ICVs and CCVs acceptable (ICP& ICP-MS 90-110%, Hg & CN 85-115%)? <input type="checkbox"/> see attached ICV/CCV Summary Forms <input type="checkbox"/> see below			
<i>Secondary:</i> Technical Agreement with instrument calibration evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
Comments: <input type="checkbox"/> ICP and/or ICP-MS calibrated with one blank and one standard; no linearity check available.			

### 12.0 Calibration/Instrument Blanks

Y    N    N/A

12.1 Are instrument blanks free from contamination? <input type="checkbox"/> see attached Blank Summary Forms <input type="checkbox"/> see below			
<i>Secondary:</i> Technical Agreement with calibration/instrument blank evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
Comments: <input type="checkbox"/> Analyzed at proper frequency.			

### 13.0 Reporting Limit (CRQL) Standards

Y    N    N/A

13.1 Are reporting limit standard %R values within the control limits? <input type="checkbox"/> see attached RL Standard Summary Forms <input type="checkbox"/> see below			
<i>Secondary:</i> Technical Agreement with Reporting Limit Standard evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
Comments: 6010D, 6020B – ICVLL, CCVLL			

### 14.0 Interference Check Samples (ICSA/ICSAB/SIC)

Y    N    N/A

14.1 For the ICSAB, are results within $\pm 20\%$ of the true value? ( <i>ICSAB not required for 6010D &amp; 6020B</i> ) <input type="checkbox"/> see attached ICS Summary Forms <input type="checkbox"/> see below			
14.2 a. For the ICSA/SIC, are results for non-spiked elements within $\pm 2x$ the RL (CRQL, LLOQ)? <input type="checkbox"/> see attached ICS Summary Forms <input type="checkbox"/> see below			
14.3 b. For elements that are greater than $\pm 2x$ the RL, are the concentrations of the associated interfering elements in the field samples less than the ICS/SIC levels? <input type="checkbox"/> see below (if "yes" – no action required, if no, evaluate using TM-09/TM-14)			
<i>Secondary:</i> Technical Agreement with Interference Check Sample evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
Comments: Methods 6010D, 6020B – SIC is unspiked, no spiked interference check sample required.			

### 15.0 Recalculation Checks

Y    N    N/A

15.1 Recalculation completed for: <input type="checkbox"/> Initial & <input type="checkbox"/> Continuing Calibration(s) # points for curve:			
15.2 Recalculation completed for: <input type="checkbox"/> LCS <input type="checkbox"/> LCS/LCSD <input type="checkbox"/> MS <input type="checkbox"/> MS/MSD			
15.3 Recalculation completed for field sample(s)?			
15.3 Transcription checks completed for: <input type="checkbox"/> Tune <input type="checkbox"/> Interference Check Std <input type="checkbox"/> RL Std <input type="checkbox"/> Serial Dil			
15.4 Transcription checks completed for blanks? <input type="checkbox"/> Laboratory <input type="checkbox"/> Instrument <input type="checkbox"/> Field			
<i>Secondary:</i> Technical Agreement with recalculation evaluation and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
Comments: <input type="checkbox"/> Dilutions (see HT Table.)

## ORGANICS/HRMS TECHNICAL EVALUATION CHECKLIST FOR STAGE 2A DV

(Covers summaries of blanks; accuracy; precision; and sample results)

DV Criteria Table:  Default  Client/Program Specific - Control Limits:  Lab  QAPP/SAP  Other:

Qualifiers Issued:  **No**  **Yes**      Qualifiers added to:  EDD/Database  Form 1s

### 1.0 Chain-of-Custody/Holding Time/Preservation

Y    N    N/A

1.1 Are COCs included, properly signed, and dated?			
1.2 Are all cooler temperatures within the control limits? <input type="checkbox"/> 0-6°C <input type="checkbox"/> Frozen <-20°C±10°C <input type="checkbox"/> see attached Holding Time worksheet or spreadsheet <input type="checkbox"/> see below			
1.3 Were all samples chemically preserved properly? Indicate method(s) of preservation <input type="checkbox"/> Cool <input type="checkbox"/> Frozen <input type="checkbox"/> HCl to pH <2 <input type="checkbox"/> MeOH <input type="checkbox"/> NaHSO <sub>3</sub> <input type="checkbox"/> Other:			
1.4 Samples analyzed within holding time? <input type="checkbox"/> see HT eval spreadsheet <input type="checkbox"/> see below			
Secondary: Technical Agreement with HT evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
Comments: <input type="checkbox"/> Data judged as not significantly affected by outliers; no qualifiers assigned.			

### 2.0 Method/Field/Trip Blanks

Y    N    N/A

2.1 Are Method Blanks free from contamination? <input type="checkbox"/> see attached Blank Summary Form or data package page <input type="checkbox"/> see below			
2.2 Are there any <input type="checkbox"/> trip and/or <input type="checkbox"/> equipment/field blanks included in the data package? (list below)			
2.3 Are trip and/or equipment/field blanks free from contamination? <input type="checkbox"/> see attached Blank Summary Form or data package page <input type="checkbox"/> see below			
Secondary: Technical Agreement with MB/FB/TB evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
Comments: <input type="checkbox"/> No positive results in associated samples; no action required for method / trip / equip. / other. <input type="checkbox"/> 10X action level established for common lab cont.; 5X action level for others.			

### 3.0 Laboratory Control Sample (Blank Spike/OPR Sample) LCS or OPR LCS/LCSD

Y    N    N/A

3.1 Are all %R-values within the control limits? <b>Limits:</b> <input type="checkbox"/> Lab <input type="checkbox"/> Method <input type="checkbox"/> Project <input type="checkbox"/> see attached Summary Form or data package page <input type="checkbox"/> see below			
3.2 Are all RPD values within control limits (if duplicate analyzed)? <input type="checkbox"/> see attached Summary Form or data package page <input type="checkbox"/> see below			
Secondary: Technical Agreement with LCS/LCSD/OPR evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
<b>Comments:</b> <input type="checkbox"/> No positive results in associated samples; no qualifiers as all outliers were > UCL (high bias) <input type="checkbox"/> No qualifiers assigned; one outlier per fraction/column acceptable if > 10%.			

Project No.:	SDG:
--------------	------

#### 4.0 Surrogate/Labeled Compounds

Y N N/A

4.1 Are all recovery values within the control limits? <b>Limits:</b> <input type="checkbox"/> Lab <input type="checkbox"/> Method <input type="checkbox"/> Project <input type="checkbox"/> see attached Surrogate Summary Form or data package page <input type="checkbox"/> see below			
<i>Secondary:</i> Technical Agreement with surrogate/labeled compound evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
<b>Comments:</b> <input type="checkbox"/> No positive results; no qualifiers as all outliers were > UCL (high bias). <input type="checkbox"/> No qualifiers assigned; one outlier per fraction/column acceptable (if > 10%). <input type="checkbox"/> No qualifiers assigned; sample diluted to a conc < low std preventing accurate recovery.			

#### 5.0 Matrix Spike/Matrix Spike Duplicate or Sample and Lab Duplicate (*List Parent Sample ID below*)

Y N N/A

5.1 Are all %R-values within the control limits? <b>Limits:</b> <input type="checkbox"/> Lab <input type="checkbox"/> Method <input type="checkbox"/> Project <input type="checkbox"/> see attached MS/MSD Summary Form or data package page <input type="checkbox"/> see below			
5.2 Are all RPD values within control limits? <input type="checkbox"/> see attached MS/MSD Summary Form or data package page <input type="checkbox"/> see below			
<i>Secondary:</i> Technical Agreement with matrix spike and/or lab duplicate evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
<b>Comments:</b> <input type="checkbox"/> No positive results in parent sample; no qualifiers as all outliers were > UCL (high bias) or RPD only outlier & parent ND. <input type="checkbox"/> Not required by method. <input type="checkbox"/> No qualifiers assigned; sample diluted to a conc < low std preventing accurate recovery. <input type="checkbox"/> The following analyte parent concentrations > 4X spike level; no action.			

#### 6.0 Field Duplicate (FD) (*List Field Duplicate Sample IDs below*)

Y N N/A

6.1 Were field duplicates collected and analyzed? <input type="checkbox"/> RPD/Difference Calculation Attached			
6.2 For results >5X the RL, are RPD values within the control limit? <b>Limits:</b> <input type="checkbox"/> EC Default <input type="checkbox"/> Project <input type="checkbox"/> see attached Calculation Sheet <input type="checkbox"/> see below			
6.3 For results less than 5X the RL, are the differences less than the RL (2X the RL for solid matrices)? <input type="checkbox"/> see attached Calculation Sheet <input type="checkbox"/> see below			
<i>Secondary:</i> Technical Agreement with FD evaluation and qualification? <input type="checkbox"/> no qualifiers <input type="checkbox"/> evaluation and DV report agree <input type="checkbox"/> see below			
<b>Comments:</b> <input type="checkbox"/> No qualifiers assigned based on FD outliers <input type="checkbox"/> Qualify FD samples			

7.0 Standard Reference Material (SRM) or Certified Reference Material (CRM) Y    N    N/A

7.1 Was an SRM sample(s) analyzed? SRM/CRM Sample ID(s): _____			
7.2 Are all values within control limits? <b>Limits:</b> <input type="checkbox"/> EC Default <input type="checkbox"/> Project <input type="checkbox"/> no outliers <input type="checkbox"/> see below <input type="checkbox"/> see attached			
<i>Secondary:</i> Technical Agreement with SRM/CRM evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
<b>Comments:</b> <input type="checkbox"/> No qualifiers assigned based on SRM/CRM outliers			

8.0 Sample Results/Completeness Check Y    N    N/A

8.1 Are there results for all analytes on the client required target compound list(s)? see SAP/QAPP for lists			
8.2 Are reporting limits and sample results adjusted for sample size, final volume, dilutions, etc.?			
8.3 Are concentrations reported on the appropriate basis? <input type="checkbox"/> Dry weight <input type="checkbox"/> Wet weight <input type="checkbox"/> Both			
8.4 Do detection limits meet project-specific or method-specific limits?			
8.5 Results were DNR-11 flagged to indicate most appropriate result from multiple reported results.			
8.6 Results qualified J-20 to indicate concentration is greater than calibration range.			
8.7 DLs/RLs elevated due to <input type="checkbox"/> Dil <input type="checkbox"/> %M <input type="checkbox"/> Sample Vol <input type="checkbox"/> Final volume <input type="checkbox"/> Interference (UJ-22) <input type="checkbox"/> Other:			
8.8 Results qualified J-23H due to <input type="checkbox"/> diphenyl ether <input type="checkbox"/> chromatographic interference.			
8.8 Are GC/HPLC second column results within RPD limits? <input type="checkbox"/> All ND <input type="checkbox"/> J-3 for 40%<RPD<60% <input type="checkbox"/> NJ-3 for >60% <input type="checkbox"/> see below <input type="checkbox"/> see attached			
8.9 Were TICS requested for this project and, if so, are they reported as required?			
8.10 TICs qualified NJ-4 to indicate tentatively identified compound.			
8.11 Are all COCs/sections/forms/raw data present and accurate?			
8.12 In the EDD or database, has the Result Reportable field been verified?			
8.13 Data reporting units: <input type="checkbox"/> ug/l <input type="checkbox"/> mg/l <input type="checkbox"/> ng/l <input type="checkbox"/> ug/kg <input type="checkbox"/> mg/kg <input type="checkbox"/> ug/kg <input type="checkbox"/> %			
<i>Secondary:</i> Technical Agreement with sample results evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
<b>Comments:</b> <input type="checkbox"/> Dilutions (see HT Table). <input type="checkbox"/> Results estimated J-14 – see details below.			

9.0 Secondary Report Narrative Review Y    N    N/A

9.1 Does the narrative report meet all client specifications for content and format?			
9.2 Does the narrative report note any deviations from project validation guidance documents and if so, is rationale provided?			
9.3 Does the report adequately document and discuss <input type="checkbox"/> data anomalies and/or resubmitted data?			
9.4 Were client/field sample IDs used in the report narrative (verify transcription against COC)?			
9.5 Does the Overall Assessment include all required elements? (Adherence to methods; discussion of precision and accuracy; summary of assigned qualifiers, and usability statement)			
9.6 Does the usability statement properly reflect the assigned qualifiers and/or rejected data?

## ORGANICS TECHNICAL EVALUATION CHECKLIST FOR STAGE 4 DV

(Covers summaries of blanks, accuracy, precision, sample results, calibration, instrument performance, compound ID & recalculations)

DV Criteria Table:  Default  Client/Program Specific - Control Limits:  Lab  QAPP/SAP  Other:

Qualifiers Issued:  **No**  **Yes**      Qualifiers added to:  EDD/Database  Form 1s

### 1.0 Chain-of-Custody/Holding Time/Preservation

Y    N    N/A

1.1 Are COCs included, properly signed, and dated?			
1.2 Are all cooler temperatures within the control limits? <input type="checkbox"/> 0-6°C <input type="checkbox"/> Frozen <-20°C±10°C <input type="checkbox"/> see attached Holding Time worksheet or spreadsheet <input type="checkbox"/> see below			
1.3 Were all samples chemically preserved properly? Indicate method(s) of preservation <input type="checkbox"/> Cool <input type="checkbox"/> Frozen <input type="checkbox"/> HCl to pH <2 <input type="checkbox"/> MeOH <input type="checkbox"/> NaHSO <sub>3</sub> <input type="checkbox"/> Other _____			
1.4 Samples analyzed within holding time? <input type="checkbox"/> see HT eval spreadsheet <input type="checkbox"/> see below			
Secondary: Technical Agreement with HT evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
Comments: <input type="checkbox"/> Data judged as not significantly affected by outliers; no qualifiers assigned.			

### 2.0 Method/Field/Trip Blanks

Y    N    N/A

2.1 Are Method Blanks free from contamination? <input type="checkbox"/> see attached Blank Summary Form or data package page <input type="checkbox"/> see below			
2.2 Are there any <input type="checkbox"/> trip and/or <input type="checkbox"/> equipment/field blanks included in the data package? (list below)			
2.3 Are trip and/or equipment/field blanks free from contamination? <input type="checkbox"/> see attached Blank Summary Form or data package page <input type="checkbox"/> see below			
Secondary: Technical Agreement with MB/FB/TB evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
Comments: <input type="checkbox"/> No positive results in associated samples; no action required for method / trip / equip. / other. <input type="checkbox"/> 10X action level established for common lab cont.; 5X action level for others.			

### 3.0 Laboratory Control Sample (Blank Spike/OPR Sample) LCS or OPR LCS/LCSD

Y    N    N/A

3.1 Are all %R-values within the control limits? <b>Limits:</b> <input type="checkbox"/> Lab <input type="checkbox"/> Method <input type="checkbox"/> Project <input type="checkbox"/> see attached Summary Form or data package page <input type="checkbox"/> see below			
3.2 Are all RPD values within control limits (if duplicate analyzed)? <input type="checkbox"/> see attached Summary Form or data package page <input type="checkbox"/> see below			
Secondary: Technical Agreement with LCS/LCSD/OPR evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		

**Comments:**  No positive results in associated samples; no qualifiers as all outliers were > UCL (high bias)  
 No qualifiers assigned; one outlier per fraction/column acceptable if > 10%.

4.0 Surrogate/Labeled Compounds Y N N/A

4.1 Are all recovery values within the control limits? **Limits:**  Lab  Method  Project  
 see attached Surrogate Summary Form or data package page  see below

*Secondary:* Technical Agreement with surrogate/labeled compound evaluation and qualification and the evaluation and DV report agree?  see below

Quals			
<input type="checkbox"/>			

**Comments:**  No positive results; no qualifiers as all outliers were > UCL (high bias).  
 No qualifiers assigned; one outlier per fraction/column acceptable (if > 10%).  
 No qualifiers assigned; sample diluted to a conc < low std preventing accurate recovery.

5.0 Matrix Spike/Matrix Spike Duplicate or Sample and Lab Duplicate (*List Parent Sample ID below*) Y N N/A

5.1 Are all %R-values within the control limits? **Limits:**  Lab  Method  Project  
 see attached MS/MSD Summary Form or data package page  see below

5.2 Are all RPD values within control limits?  
 see attached MS/MSD Summary Form or data package page  see below

*Secondary:* Technical Agreement with matrix spike and/or lab duplicate evaluation and qualification and the evaluation and DV report agree?  see below

Quals			
<input type="checkbox"/>			

**Comments:**  No positive results in parent sample; no qualifiers as all outliers were > UCL (high bias) or RPD only outlier & parent ND.  Not required by method.  
 No qualifiers assigned; sample diluted to a conc < low std preventing accurate recovery.  
 The following analyte parent concentrations > 4X spike level; no action.

6.0 Field Duplicate (FD) (*List Field Duplicate Sample IDs below*) Y N N/A

6.1 Were field duplicates collected and analyzed?  RPD/Difference Calculation Attached

6.2 For results >5X the RL, are RPD values within the control limit? **Limits:**  EC Default  Project  
 see attached Calculation Sheet  see below

6.3 For results less than 5X the RL, are the differences less than the RL (2X the RL for solid matrices)?  
 see attached Calculation Sheet  see below

*Secondary:* Technical Agreement with FD evaluation and qualification and the evaluation and DV report agree?  see below

Quals			
<input type="checkbox"/>			

Comments:  No qualifiers assigned based on FD outliers     Qualify FD samples

7.0 Standard Reference Material (SRM) or Certified Reference Material (CRM) Y    N    N/A

7.1 Was an SRM sample(s) analyzed? SRM/CRM Sample ID(s): _____			
7.2 Are all values within control limits? <b>Limits:</b> <input type="checkbox"/> EC Default <input type="checkbox"/> Project <input type="checkbox"/> no outliers <input type="checkbox"/> see below <input type="checkbox"/> see attached			
<i>Secondary:</i> Technical Agreement with SRM/CRM evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
<b>Comments:</b> <input type="checkbox"/> No qualifiers assigned based on SRM/CRM outliers.			

9.0 Internal Standards Y    N    N/A

9.1 Are all internal standard areas within the control limits? <b>List limits:</b> <input type="checkbox"/> 50-200% Other: _____ <input type="checkbox"/> no outliers <input type="checkbox"/> see attached Int. Std. Summary Form or data package page <input type="checkbox"/> see below			
9.1 Are all internal standard RRT within the control limits? <input type="checkbox"/> no outliers <input type="checkbox"/> see attached Int. Std. Summary Form or data package page <input type="checkbox"/> see below			
<i>Secondary:</i> Technical Agreement with internal standard evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
Comments:			

10.0 Instrument Tune Y    N    N/A

10.1 Were instruments tuned at the required frequency? <b>List frequency:</b> <input type="checkbox"/> 12-Hours <input type="checkbox"/> With ICAL <input type="checkbox"/> Other:			
10.2 Are all instrument tune criteria within the required control limits? <input type="checkbox"/> see attached data package page <input type="checkbox"/> see below			
<i>Secondary:</i> Technical Agreement with tune evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
Comments:			

11.0 Breakdown (Pesticides only) Y    N    N/A

11.1 Are breakdown products less than 15%? <input type="checkbox"/> see attached Breakdown Summary Form or data package page <input type="checkbox"/> see below			
11.2 Are breakdown check standards analyzed prior to initial calibration and/or each 12-hour shift?			
<i>Secondary:</i> Technical Agreement with breakdown evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		

Comments:  No positive results assoc. w/ outliers; RL judged as not affected – no qualifiers assigned.  
 Not required for target analytes.  
Date:                      Time:                      Endrin:                      DDT:

12.0 Initial Calibration

Y      N      N/A

12.1 Are ICALs analyzed on all instruments on which samples are analyzed?			
12.2 Are response factors/calibration factors stable? Limits: <input type="checkbox"/> 20% RSD <input type="checkbox"/> $r^2 \geq 0.990$ <input type="checkbox"/> $r \geq 0.995$ <input type="checkbox"/> Other: <input type="checkbox"/> see attached ICAL Summary Form or data package page <input type="checkbox"/> see below			
12.3 Are GC/MS response factors greater than the required minimum control limit?			
12.3 Are GC retention times within required retention time windows (RTW)?			
<i>Secondary:</i> Technical Agreement with initial calibration evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
Comments: <input type="checkbox"/> No positive results assoc. w/ outliers; RL judged as not affected – no qualifiers assigned. <input type="checkbox"/> RF historically low; no qualifiers assigned because response is stable.			

13.0 Continuing Calibration

Y      N      N/A

13.1 Are CCALs analyzed at the proper frequency? <b>List freq:</b> <input type="checkbox"/> 12-Hr Shift <input type="checkbox"/> Every 10 Samples <input type="checkbox"/> Other: <input type="checkbox"/> see attached CCAL Summary Form or data package page <input type="checkbox"/> see below			
13.2 Are CCALs acceptable? Limits: <input type="checkbox"/> $\pm 20\%D$ <input type="checkbox"/> $\pm 25\%D$ <input type="checkbox"/> Other <input type="checkbox"/> see attached CCAL Summary Form or data package page <input type="checkbox"/> see below			
13.3 Are response factors greater than the required minimum control limit? <input type="checkbox"/> see attached CCAL Summary Form or data package page <input type="checkbox"/> see below			
13.3 Are retention times within required retention time windows (RTW) (GC)?			
<i>Secondary:</i> Technical Agreement with continuing calibration evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
Comments: <input type="checkbox"/> No positive results assoc. w/ outliers; RL judged as not affected – no qualifiers assigned. <input type="checkbox"/> RF historically low; no qualifiers assigned since response is stable.			

14.0 Sample Results/Completeness Check

Y      N      N/A

14.1 Are there results for all analytes on the client required target compound list(s)? see SAP/QAPP for lists			
14.2 Are reporting limits and sample results adjusted for sample size, final volume, dilutions, etc.?			
14.3 Are concentrations reported on the appropriate basis? <input type="checkbox"/> Dry weight <input type="checkbox"/> Wet weight <input type="checkbox"/> Both			
14.4 Do detection limits meet project-specific or method-specific limits?			
14.5 Results were DNR-11 flagged to indicate most appropriate result from multiple reported results.			
14.6 Results qualified J-20 to indicate concentration is greater than calibration range.			
14.7 DLs/RLs elevated due to <input type="checkbox"/> Diln <input type="checkbox"/> %M <input type="checkbox"/> Samp Vol <input type="checkbox"/> Final volume <input type="checkbox"/> Interference (UJ-22) <input type="checkbox"/> Other:			
14.8 Are GC/HPLC second column results within RPD limits? <input type="checkbox"/> All ND <input type="checkbox"/> J-3 for 40%<RPD<60% <input type="checkbox"/> NJ-3 for >60% <input type="checkbox"/> see below <input type="checkbox"/> see attached			

Project No.:	SDG:
--------------	------

14.9 Results qualified J-23H due to chromatographic interference.			
14.10 Were TICS requested for this project and, if so, are they reported as required?			
14.11 TICs qualified NJ-4 to indicate tentatively identified compound.			
14.12 Are all COCs/sections/forms/raw data present and accurate?			
14.13 In the EDD or database, has the Result Reportable field been verified?			
14.14 Data reporting units: <input type="checkbox"/> ug/l <input type="checkbox"/> mg/l <input type="checkbox"/> ng/l <input type="checkbox"/> ug/kg <input type="checkbox"/> mg/kg <input type="checkbox"/> ug/kg <input type="checkbox"/> %			
Secondary: Technical Agreement with sample results evaluation and qualification and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
Comments: <input type="checkbox"/> Dilutions (see HT Table). <input type="checkbox"/> Results estimated J-14 – see details below.			

### 15.0 Recalculation Checks

Y N N/A

15.1 Recalculation completed for: <input type="checkbox"/> Initial & <input type="checkbox"/> Continuing Calibration(s) # points for curve:			
15.2 Recalculation completed for: <input type="checkbox"/> LCS <input type="checkbox"/> LCS/LCSD <input type="checkbox"/> MS <input type="checkbox"/> MS/MSD			
15.3 Recalculation completed for field sample(s)?			
15.4 Transcription checks completed for: <input type="checkbox"/> Tune <input type="checkbox"/> Interference Check Std <input type="checkbox"/> RL Std <input type="checkbox"/> Serial Dilution			
15.5 Transcription checks completed for blanks? <input type="checkbox"/> Laboratory <input type="checkbox"/> Instrument <input type="checkbox"/> Field			
Secondary: Technical Agreement with recalculations and the evaluation and DV report agree? <input type="checkbox"/> see below	Quals <input type="checkbox"/>		
Comments: <input type="checkbox"/> Dilutions (see HT Table)			

### 16.0 Secondary Report Narrative Review

Y N N/A

16.1 Does the narrative report meet all client specifications for content and format?			
16.2 Does the narrative report note any deviations from project validation guidance documents and if so, is rationale provided?			
16.3 Does the report adequately document and discuss <input type="checkbox"/> data anomalies and/or resubmitted data?			
16.4 Were client/field sample IDs used in the report narrative (verify transcription against COC)?			
16.5 Does the Overall Assessment include all required elements? (Adherence to methods; discussion of precision and accuracy; summary of assigned qualifiers, and usability statement.)			
16.6 Does the usability statement properly reflect the assigned qualifiers and/or rejected data?

**Fieldwork Objectives, Tasks, and Equipment:**

The goal of the fieldwork is to achieve the objectives of the Pre-Design Investigation (PDI) Work Plan (WP). To facilitate and allow for the adaptive collection of data to support the RD, the PDI is anticipated to require two phases. This Health and Safety Plan (HASP) covers work to be completed under Phase 1.

Phase 1 Sampling includes:

- Surface Sediment – collected from a boat using a power-grab sampler or manual-grab sampler in shallow water areas.
- Subsurface Sediment – collected from a boat using a vibracore sampler or direct-push probe rig for shallow areas. If necessary, a hand auger may be used.
- Riverbank Soil – collected via upland access using a hand auger.
- Sediment Erodibility – collected using a core barrel.
- Geotechnical Exploratory Borings – collected using a drill rig. For in-water samples, the rig will be placed on a barge.
- Stormwater and Stormwater Solids – collected by grab sampling from public manhole sumps and using in-line sediment traps.
- Willamette River Surface Water – water levels will be monitored using information from U.S. Geological Survey gauge stations.

**Phase 1 Engineering Analysis includes:**

- Bathymetric survey from a boat using multibeam hydrographic survey equipment.
- Detection of buried utilities and debris using the following:
  - Watercraft,
  - Light detection and ranging survey equipment,
  - Multibeam hydrographic survey equipment,
  - Sub-bottom profiler system, and
  - Marine magnetometer.
- Structures evaluation via the following:
  - Visual site walk,
  - Visual observations by boat,
  - Dive inspection, and
  - Laser scan.
- Hydro- and sediment dynamics
  - Water levels and current velocities,
  - Wind-wave and boat wakes, and
  - Suspended sediments.

**Description and Features:**

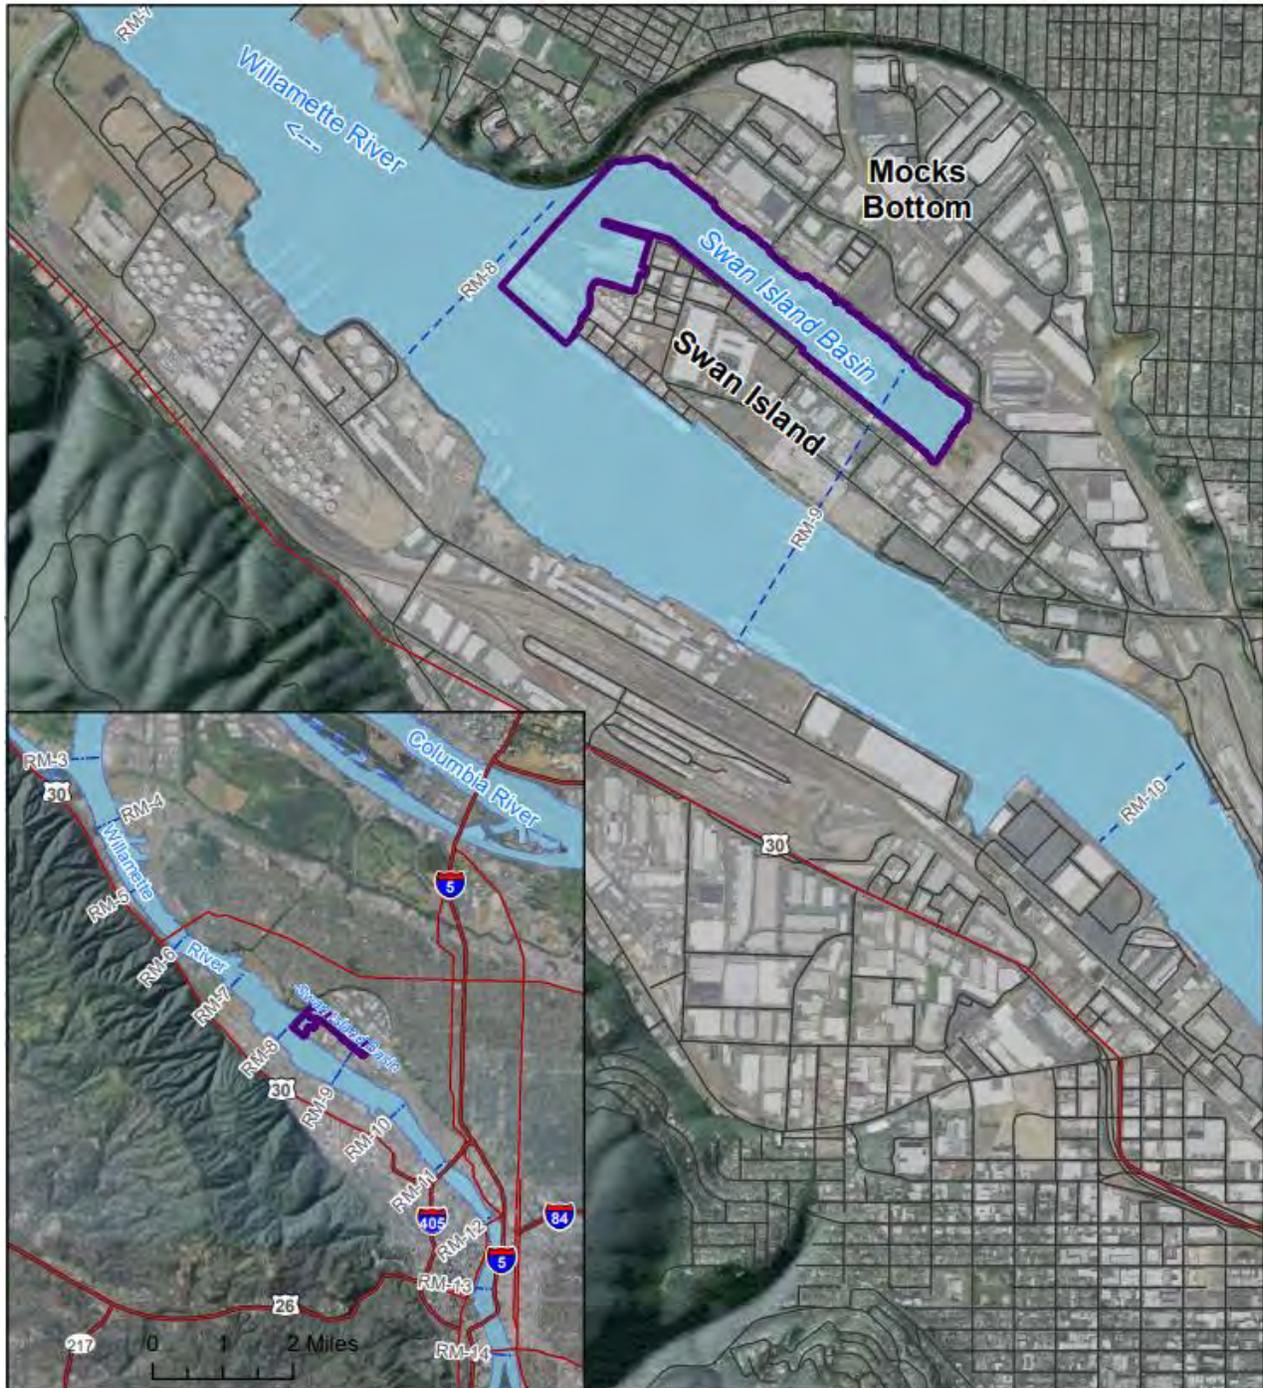

The Portland Harbor Superfund Site is comprised of a 10-mile stretch of the Lower Willamette River where approximately 370 acres of contaminated sediments are designated for remediation to reduce health risks to people and the environment. Field activities are planned to support the RD for the SIB Project Area portion of the Portland Harbor Superfund Site, which is located approximately 4 miles northwest of downtown Portland, Oregon. The site is located north of the main channel of the Willamette River between river mile (RM) markers 8.1 and RM 9.2. The four chemical groups of interest that are primarily related to historical releases from nearby industrial sources include: polychlorinated biphenyls (PCBs), dioxin/furans, the pesticide DDT, and polynuclear aromatic hydrocarbons (PAHs) associated with petroleum products. Of these, PCBs are the most significant and widespread compounds posing potential risks to people and the environment.

The Field Sampling Plan (FSP), which is Appendix A of the SIB PDI WP, describes the sampling objectives and activities for completing RD data collection. The FSP includes guidance for fieldwork by defining in detail the sampling and data-gathering methods to be used during sampling activities. The FSP supports the PDI sampling within the SIB Project Area and the SIB Upland Area. It also provides details for proposed field sampling locations along with procedures for the planned PDI project tasks.

Surrounding Population:  Residential  Industrial  Rural  Urban  Other:

**Figure 1 Site Location**

The site is located approximately 4 miles north of Portland, Oregon, near RM-8 and RM-9 of the Willamette River. For more detailed site maps, see the figures in the FSP.

**Site History:** Detailed information for the site is presented in the FSP.

The Willamette River is the 19th largest river in the U.S. During its 309-mile course, which ends at its confluence with the Columbia River, it drains 11.7% of the area in Oregon. Since the late 1800s, the Portland Harbor section of the lower Willamette River has been extensively modified to accommodate a vigorous shipping industry. Historically, contaminants from many facilities entered the river system from different activities including, but not limited to ship building and repair; ship dismantling; wood treatment and lumber milling; bulk fuels storage; manufactured gas production; chemical manufacturing and storage; metal recycling, production, and fabrication; steel mills, smelters, and foundries; and electrical production and distribution. These activities have resulted in direct discharges from upland areas through stormwater and wastewater outfalls, releases and spills from commercial operations occurring over the water, municipal combined sewer overflows, and indirect discharges through overland flow, bank erosion, groundwater, and other nonpoint sources. In addition, contaminants from off-site sources have reached the site through surface water and sediment transport from upstream and through atmospheric deposition. Operations that continue today along the riverbanks include bulk fuel storage; barge building; ship repair; automobile scrapping; recycling; steel manufacturing; cement manufacturing; operation and repair of electrical transformers (including electrical substations); and many smaller industrial operations.

**Waste Types:**  Liquid  Solid  Sludge  Gas  Unknown  Other Specify: Sediment

**Waste Characteristics:** Check as many as applicable.

Corrosive  Flammable  Radioactive  Toxic  Volatile  
 Reactive  Inert Gas  Unknown  Carcinogenic  
 Other Specify: Wastes are not anticipated to be hazardous.

**Hazards of Concern:**

Exhaust

Inorganic Chemicals

*(Activity Hazard Analysis [AHAs]: Hand Auger Sampling, Water Level Gauging, and Decontamination)*

Organic Chemicals

*(AHAs: Hand Auger Sampling, Water Level Gauging, and Decontamination)*

Slips, Trips, and Falls

*(AHAs: General Site Work, Drilling, Direct-Push Drilling (DPT) -- Sediment Sampling on Land and Over Water, and Sampling from Watercraft)*

Biological: stinging insects, venomous reptiles

*(AHA: General Site Work)*

Infectious Disease Hazards: Coronavirus (Follow current CDC guidelines on social distancing, masking, etc.)

*(AHA: Coronavirus Practices to Prevent Exposure)*

Explosive/Flammable

Motorized Traffic (Attachment B: Traffic Control Plans)

*(AHAs: General Site Work [vehicle inspection checklist is included as Attachment C] & Equipment Decontamination)*

Noise

*(AHAs: General Site Work, Drilling (Land Based and Barge Mounted), Direct-Push Drilling (DPT) – Sediment Sampling on Land and Over Water, Equipment Decontamination)*

Radiological

Heavy Machinery

(AHA: *General Site Work*)

Heat/Cold Stress

(AHA: *General Site Work*)

High Traffic Area

Other Specify:

- Coronavirus (wear mask and/or social distance in accordance with current CDC guidelines. See AHA Coronavirus Practices to Prevent Exposure ),
- Hazards associated with working on a marine vessel, and
- Hazards associated with diving in a river (to be addressed by subcontractor Dive Operations Plan. The subcontractor's plan will be submitted to EPA at a minimum 45 days before dive operations begin.)

**Work Zones (exclusion, contamination reduction, and support):**

To be determined in fieldwork plans prior to mobilization; however, due to the nature of the planned field activities and low potential for exposure; exclusion, contamination reduction, and support zones are not anticipated to be required for the field efforts. Analytical results from contaminant characterization will be used to adjust the need for Work Zones. Initial health and safety briefings will be completed prior to the start of each workday to address potential hazards within the work zones, such as heavy equipment, chemicals brought to the site, and site-related environmental contaminants.

**Principle Disposal Methods and Practices for Investigative-Derived Waste:**

***Containment and Disposal Method***

Not Needed     Needed, summarize below:

Soil, sediment and liquid investigation-derived waste (IDW) will be characterized to determine if it is Resource Conservation and Recovery Act (RCRA) or Toxic Substances Control Act (TSCA) hazardous waste and consequently, its appropriate disposal endpoint. The waste may be characterized through knowledge of the process generating the waste, analytical results of samples collected during the investigation, or laboratory analytical results from waste characterization sampling. Hazardous waste will be shipped and transported only by properly licensed haulers in accordance with applicable state, local, and federal regulations.

If solid IDW (including drilling mud and associated fluids) is characterized as nonhazardous waste, it will be placed in steel drums on pallets, staged, transported, and disposed of at an approved off-site landfill. Nonhazardous soil cuttings will require off-site disposal at a Subtitle D facility. If the IDW is characterized as hazardous waste, it will be disposed of at a permitted RCRA Subtitle C treatment, storage, and disposal facility. Expendable equipment and used personal protective equipment (PPE) will be double bagged and disposed of as municipal waste. See the Waste Management Plan in the FSP (Appendix B of PDI WP).

**Section 2 Project-Specific Hazardous Material Summary:** Indicate waste type and media in which the material is contained, estimate quantity if material exists in bulk quantities.

Chemicals Amounts/Units:	Solids Amounts/Units:	Sludges Amounts/Units:	Solvents Amounts/Units:	Oils Amounts/ Units:	Other Amounts/Units:
<input type="checkbox"/> Acids <input type="checkbox"/> Pickling Liquors <input type="checkbox"/> Caustics <input checked="" type="checkbox"/> Pesticides <input type="checkbox"/> Dyes/Inks <input type="checkbox"/> Cyanides <input type="checkbox"/> Phenols <input type="checkbox"/> Halogens <input checked="" type="checkbox"/> Dioxins <input checked="" type="checkbox"/> Other <b>Specify:</b> Herbicides, PCDD/PCDFs	<input type="checkbox"/> Fly ash <input type="checkbox"/> Asbestos <input type="checkbox"/> Milling/Mine Tailings <input type="checkbox"/> Ferrous Smelter <input type="checkbox"/> Non-ferrous Smelter <input checked="" type="checkbox"/> Metals <input type="checkbox"/> Other <b>Specify:</b>	<input type="checkbox"/> Paint <input type="checkbox"/> Pigments <input type="checkbox"/> Metal Sludges <input type="checkbox"/> POTW Sludge <input type="checkbox"/> Aluminum <input type="checkbox"/> Distillation Bottoms <input type="checkbox"/> Other <b>Specify:</b>	<input type="checkbox"/> Halogenated (chloro, bromo) <input checked="" type="checkbox"/> Solvents <input checked="" type="checkbox"/> Hydrocarbons <input type="checkbox"/> Alcohols <input type="checkbox"/> Ketones <input type="checkbox"/> Esters <input type="checkbox"/> Ethers <input type="checkbox"/> Other <b>Specify:</b>	<input checked="" type="checkbox"/> Oily Wastes <input type="checkbox"/> Gasoline <input checked="" type="checkbox"/> Diesel Oil <input type="checkbox"/> Lubricants <input checked="" type="checkbox"/> PCBs <input checked="" type="checkbox"/> Polycyclic Aromatics <input type="checkbox"/> Other <b>Specify:</b>	<input type="checkbox"/> Laboratory <input type="checkbox"/> Pharmaceutical <input type="checkbox"/> Hospital <input type="checkbox"/> Radiological <input type="checkbox"/> Municipal <input type="checkbox"/> Construction <input type="checkbox"/> Munitions <input type="checkbox"/> Other <b>Specify:</b>

**Overall Hazard Evaluation:**  High  Medium  Low  Unknown  
 Task hazard evaluation is included within the specific AHA

**Justification:** Exposure routes are through ingestion and inhalation of contaminated soil, sediment, and water. Dermal contact and/or inhalation of particulates entrained in air is low. Proper personal hygiene (i.e., laundering, showering, and washing hands) after field activities and the use of proper PPE (gloves) during soil screening will minimize skin contact with contaminants. Screening will take place outdoors. Dust masks will be worn if dust is generated during field activities.

**Fire/Explosion Potential:**  High  Medium  Low  Unknown

**Background Review:**  Complete  Incomplete  
 Additional information to be collected in this and future investigations.

**Section 3 Contaminants of Interest**

Known Contaminants	Highest Observed Concentration (specify units and media)	ACGIH TLV TWA ppm or mg/m <sup>3</sup> (specify)/ OSHA PEL	STEL/ Ceiling Limit	IDLH ppm or mg/m <sup>3</sup> (specify)	IP (eV)	Symptoms/Effects of Acute Exposure
<b>VOCs and SVOCs</b>						
Benzene (71-43-2)	PW-8,200 µg/L	0.5 ppm/1ppm (See 1910.1028) Skin A1 Carcinogen	2.5 ppm	500 ppm Carcinogen	9.24	Irritation of eyes, skin, nose, respiratory system; dizziness; headache, nausea, staggered gait; lassitude.
bis(2-ethylhexyl)phthalate	Soil-27.1 mg/kg Sed-440 mg/kg SW-64 µg/L	ND	ND	ND	ND	ND
Chlorobenzene (106-90-7)	PW-30,000 µg/L	10 ppm/75 ppm A3 Carcinogen	-	1,000 ppm	9.07	Liver damage; irritation of eyes, skin, nose; drowsiness.
PCBs (54% chlorine) Aroclor 1254, Polychlorinated biphenyl (11097-69-1) (Chlorodiphenyl)	Soil-1.02 mg/kg Sed-37 mg/kg SW-0.02 µg/L	0.5 mg/m <sup>3</sup> Skin A3 Carcinogen	-	5 mg/m <sup>3</sup>	NA	Irritation to eyes; chloracne; liver damage and reproductive effects; tumors of pituitary gland and liver; leukemia.
Vinylidene chloride/ 1,1-Dichloroethene (75-35-4)	PW-283 µg/L	5 ppm A4 carcinogen	-	ND	10.0	Liver and kidney damage.
cis-1,2-dichloroethene (540-59-0)	PW-574,000 µg/L	200 ppm	-	1,000 ppm	9.65	Irritation of eyes and skin; central nervous system depression.
Ethyl benzene (100-41-4)	SW-11.4 µg/L PW-905 µg/L	20/100 ppm	125 ppm	800 ppm	8.76	Irritation of eyes, skin, and mucous membrane; headache; dermatitis; narcosis; coma.
Naphthalene	SW-605 µg/L PW-19,700 µg/L	10 ppm Skin	STEL removed in Notice of Intended Changes 2013	250 ppm	8.12	Irritation of eyes, optic neuritis, and corneal damage; headache; confusion; excitement.

Known Contaminants	Highest Observed Concentration (specify units and media)	ACGIH TLV TWA ppm or mg/m <sup>3</sup> (specify)/ OSHA PEL	STEL/ Ceiling Limit	IDLH ppm or mg/m <sup>3</sup> (specify)	IP (eV)	Symptoms/Effects of Acute Exposure
<b>VOCs and SVOCs (continued)</b>						
PAHs Benzo[k]fluoranthene (207-08-9) No U.S. standards or published TLV limits by ACGIH Indeno(1,2,3-cd)pyrene (193-39-5) No U.S. standards or published TLV limits by ACGIH	Soil-600 mg/kg Sed-53,000 mg/kg SW-7.4 µg/L PW-21,000 µg/L					Benzo[k]fluoranthene: Although there is no human data that specifically links exposure to benzo[k]fluoranthene to human cancers, benzo[k]fluoranthene is a component of mixtures that have been associated with human cancer. These include coal tar, soots, coke oven emissions and cigarette smoke. Inhalation hazard, possible skin absorption, irritant to eyes and skin. Indeno(1,2,3-cd)pyrene: Dermal exposure to coal tar and shale oils containing PAHs have been associated with increased incidences of skin tumors in human emissions. PAHs have been linked to increased incidence of lung and genitourinary cancer mortality in coke oven workers. Sufficient data of carcinogenicity in animals.
Tetrachloroethene (127-18-4) Perchloroethylene (PCE)	PW-12,000 µg/L	25/100 ppm	100 ppm A3 carcinogen	150 ppm	9.32	Irritation to eyes, nose, throat; flushed face and neck; dizziness and vertigo.

**Notes:**

- = none  
 µg/L = micrograms per liter

ACGIH = American Conference of Governmental Industrial Hygienists  
 Ceiling = limit not to be exceeded  
 eV = electron volt  
 IDLH = Immediately Dangerous to Life and Health (NIOSH)  
 IP = ionization potential  
 mg/kg = milligrams per kilogram  
 mg/m<sup>3</sup> = milligrams per cubic meter  
 NA = not applicable  
 ND = not determined  
 NIOSH = National Institute for Occupational Safety and Health  
 OSHA = Occupational Safety and Health Administration Permissible Exposure Limit (PEL). Standard enforced by law.

PID = photoionization detector  
 ppm = parts per million  
 PW = porewater  
 Sed = sediment  
 Skin = absorbed through the skin  
 STEL = Short Term Exposure Limit (15 minute)  
 SVOC = semi-volatile organic compound  
 SW = surface water  
 TLV = Threshold Limit Value (recommended by ACGIH)  
 TWA = time-weighted average (average concentration for a normal 8-hour working day and 40-hour working week)  
 VOC = volatile organic compound

American Conference of Governmental Industrial Hygienists (ACGIH) Carcinogens

A1 = confirmed human carcinogen  
 A2 = suspected human carcinogen, confirmed animal carcinogen

A3 = confirmed animal carcinogen with unknown relevance to humans  
 A4 = Not classifiable as a human carcinogen

**Section 4 General Site Rules**

- Conduct an initial briefing and address this HASP; site and task hazards; equipment hazards; chemicals brought to the site (hazards, hazard controls, location of safety data sheets [SDSs]); potential emergencies and responses; site control requirements; and PPE. A quick reference for emergencies is contained as Attachment D.
- Confirm that site personnel have required training and qualifications.
- Conduct follow-up briefings, at least weekly, to address changes in scope or hazards.
- Conduct regular inspections to verify implementation and effectiveness of hazard controls (see form, Attachment C).
- Do not consume food, beverages, or tobacco products while working with hazardous chemicals or hazardous waste.
- Decontaminate personnel and equipment after contact with hazardous waste or hazardous chemicals.
- Use a buddy system (visual or by cell phone) to track personnel and render aid, if needed.
- Report incidents and significant near misses in accordance with HGL's Health and Safety Procedure 09, Incident Reporting and Investigation.
- Report or correct unsafe and potentially unsafe conditions or practices.
- Wear required PPE.
- Remove jewelry that may become entangled in equipment.
- Biologicals: Eliminate contact with poisonous and thorny plants, allergens, insects, and animal hazards (e.g., spiders, hornets, reptiles, snakes, deer ticks (Lyme disease), mosquitoes, bird and rodent droppings, biting and stinging insects etc.). Field staff with severe allergic reactions to stinging insects shall alert the SSHO and other field staff during the daily Tailgate Safety Meeting and carry an Epi-pen (if prescribed by a physician) with them while on site.
- Prohibit running and horseplay.
- Personnel, while on duty, shall not operate motor vehicles after being in a duty status (regardless of their role or function) for more than 12 hours during any 24-hour period without at least 8 consecutive hours of rest. Personnel may work an additional 2 hours at the motel or their home (for a total 14-hour day), though still subject to reduction by the other requirements and factors described below. A minimum of 8 consecutive hours shall be provided for rest in each 24-hour period.
- No employee may drive continuously for more than 10 hours in any single on-duty period (continuous period of more than 10 hours in any 24-hour period without at least 8 consecutive hours of rest).
- An automated external defibrillator (AED) is required to be on site and on vessels whenever work is being conducted. At least 2 personnel on site at any one time will have CPR/AED certification.
- There is the potential for sudden, heavy rains at the site and field personnel should keep abreast of weather conditions, carry adequate raingear, and be aware of potential shelter locations if conditions should require suspension of activities.

### Section 5 Activity Hazard Analysis

AHAs will be reviewed with field team members before starting work and will be revised, as necessary, to incorporate additional task-specific considerations. AHAs are to be reviewed periodically to confirm that the work processes have not changed and that the hazards are addressed and controlled. Employees will be briefed on changes made to AHAs. Additional AHAs will be prepared, as appropriate, for new tasks. The AHAs needed for this task are listed below and are included with this HASP:

- Coronavirus Practices to Prevent Exposure
- DPT – Sediment Sampling on Land and Over Water
- Drilling (Land Based and Barge Mounted)
- Drilling/DPT – Sample Processing
- Equipment Decontamination
- General Site Work (including mobilization and demobilization activities)
- Hand Auger Sampling
- Mobilization and Demobilization
- Inspections, Surveys, and Sampling from a Watercraft
- Water Level Gauging
- Working Over and Near Water
- Dive Operations (*pending subcontract*)
- Vessel Operations (*pending subcontract*)

### PPE

PPE Level for this task =  D     D modified     C

Definitions of PPE levels are available in the Corporate Health and Safety Procedures Manual.

Level D = Safety glasses, hard hat, safety toe boots, high visibility vest.

Level D modified = personal flotation device while on watercraft or working near shoreline.

Does the project require air monitoring?

Yes     No

Exposure Monitoring instrument(s) =  PID  PDR (dust monitor) CGI  O<sub>2</sub> meter  Other specify:

***Does the project have permit-required confined spaces that will need to be entered to accomplish the identified project tasks?***

Yes     No

If yes, attach HGL's Health and Safety Procedure 26, Confined Space Entry (Attachment E), which complies with the OSHA General Industry Confined Space Standard, 29 CFR 1910.146 and the OSHA regulation that addresses confined spaces in the construction industry, 29 CFR 1926 Subpart AA. Confined space entry locations will be determined in the field.

***Does the project have work that will require a Hot Work Permit (e.g., welding, metal cutting)?***

Yes     No

If yes, attach Hot Work Permit

***Does the project require specialized training or competent persons for excavations, fall protection, equipment operators, etc.?***

Yes     No

If yes, state specialized training and competent person(s)

Specialized training will be required for confined space entry, boating, barge, and diving activities. However, HydroGeoLogic, Inc. (HGL) personnel will not be operating marine vessels or conducting diving activities. Trained subcontractors will conduct these activities and prepare their own HASPs/AHAs as appropriate for each task.

**Section 6 Additional Personal Protective Equipment Requirements:**  
**This is to assist in the packing preparation and should closely match lists in the Uniform Federal Policy-Quality Assurance Project Plan (or other planning document) and in the Readiness Review forms.**

**Protective Clothing:**  Not Needed

- Splash Suit
- Apron
- High Visibility Vests
- Tyvek® coverall
- Coverall – Specify:
- Encapsulated suit

**Gloves:**  Not Needed

- Undergloves
- Overgloves
- Gloves – Specify: Leather for handling tools and equipment; nitrile for handling samples

**Head & Eye:**  Not Needed

- Face Shield
- Goggles
- Hearing Protection
- Other – Specify:

**Safety glasses** are needed whenever there is a splash potential.

**Face masks** are not considered PPE unless they are N95s or KN95s. Face masks are more source control, and they are to be worn in accordance with current CDC guidelines. See the AHA Coronavirus Practices to Prevent Exposure.

**Respiratory:**  Not Needed

- APR Full face:
- Cartridge/Filter type:
- Escape Mask:
- SCUBA, Airline  Other:

**Note:** Use of respirators requires a respiratory protection plan and assessment to verify that planned respirator use will be effective.

**Boots:**  Not Needed

- Boots: Leather steel-toe or composite toe.
- Disposable covers are to be worn over the boots by visitors and infrequent staff when working/walking on contaminated sediment.
- Overboots: for waders if slippery conditions
- Rubber: on sediment sampling vessels, shallow water (if waders not required), and whenever working on contaminated sediment. Rubber boots are required for primary field staff in these situations.

**Other PPE – specify below:**

Type I (off shore) and V (on shore) personal flotation devices and Waders. To be worn whenever working on or near water.

**Section 7 Personnel and Responsibilities (include subcontractors)**

<b>Name</b>	<b>Firm/Region</b>	<b>Medical Monitoring Clearance* (yes/no)</b>	<b>First Aid &amp; CPR/ AED (yes/no)</b>	<b>Responsibilities</b>	<b>On-Site Involvement</b>
Philip Spadaro	The Intelligence Group			Project Coordinator	Yes
Jeff Hodge	HGL			Senior Project Manager (PM)	Yes
Jennifer Norman	HGL			Deputy PM	Yes
Shane Cherry	HGL			Technical Director	Yes

TBD	TBD			Barge Operator	Yes

\*Health clearance meets the medical surveillance requirements of 29 CFR 1910.120. Medical surveillance certification for on-site personnel is presented in HGL Health and Safety Procedure Manual, Procedure 8.0. HGL personnel are in a medical surveillance program per 29 CFR 1910.120 regardless of their accumulated exposure days or their frequency of respirator use. If they involved in hazard waste field-work, noise louder than 85 decibels, respirator use and potential over exposure to other materials as required by OSHA (lead, asbestos, etc.) they are in the annual/biennial medical surveillance program. Subcontractors are required to meet the medical requirements of 29 CFR 1910.120, if applicable.

Subcontractors shall be solely responsible for the health and safety of their employees and shall comply with applicable laws and regulations. In accordance with 1910.120(b)(1)(iv) and (v), HGL will inform subcontractors of the site emergency response procedures, and potential fire, explosion, health, safety, or other hazards by conducting a site kick-off meeting/training, conducting regular tailgate safety meetings (see form in Attachment C), and making this HASP and site information obtained by others available during regular business hours. Contractors and subcontractors are responsible for: (1) developing their specific AHAs, having a written Hazard Communication Program, and other written hazard specific programs required by federal, state, and local laws and regulations; (2) providing their own PPE; (3) providing documentation that their employees have been health and safety trained in accordance with applicable federal, state and local laws and regulations; (4) providing evidence of medical surveillance and medical approvals for their employees; and (5) designating their own competent persons such as: site safety officer, equipment operators, excavation competent persons, etc. and for ensuring that their employees comply with their own health and safety requirements and taking other additional measures required by their site activities.

**Section 8 Health and Safety Monitoring Equipment and Action Levels**

<b>Instrument</b>	<b>Task</b>	<b>Action Level Guidelines</b>	<b>Response</b>
Photoionization Detector Type: Multi-Rae <input type="checkbox"/> <b>Not Needed</b> Lamp: <input checked="" type="checkbox"/> 10.6 <input type="checkbox"/> 11.7 <input type="checkbox"/> Other	Active HAZWOPER work areas	Total organic vapor(benzene, ethylbenzene, toluene, xylenes) >10 ppm above background in breathing zone  Rationale for >10ppm action level is as follow: Eight of the 11 VOCs of concern have STELS and/or TLVs above 10 ppm. 1,2-dichoroethane has a TLV of 200 ppm an makes up 60% of the total vapor in air concentration.	Suspend the task, withdraw from the area of elevated readings, and evaluate the situation to determine cause(s) of elevated readings. Correct cause(s) if possible. Options include natural ventilation, powered ventilation, changing work schedules, working upwind, altering the task/method, changing schedule, and if none of the preceding options are effective, notify the SSHO. Re-test the area and if concentration is below action level, resume work. If elevated concentrations continue to occur, notify the PM and corporate health and safety personnel before upgrading to respiratory protection. Collect sufficient breathing zone readings to characterize exposure.
Combustible Gas Indicator LEL/O <sub>2</sub> Meter <input type="checkbox"/> <b>Not Needed</b>	Confined Space entry	>5% of LEL <19.5% >23.5 %	Monitoring with a Combustible Gas Indicator is required during any confined space entry. In accordance with HGLs Health and Safety Procedure 26, Confined Space Entry (Attachment E).
Sound level meter or smart phone app <input type="checkbox"/> <b>Not Needed</b>	Active Work areas	>85 dBA (Whenever it is difficult to carry on a conversation with a person when they are standing at an arm’s length away).	Require use of hearing protective devices at >85 dBA.
Dust Monitor (Digital) Type: <input type="checkbox"/> <b>Not Needed</b>	Active HAZWOPER work areas	2 – 2.5 mg/m <sup>3</sup> for visible dust	Visible dust will be controlled in active HAZWOPER work areas. Sources of PM-2.5 (fine grained particle) would not typically be found at construction and remediation sites, as excavation and soil moving activities tend to stir up larger sized dust particles. It should be noted that airborne dust is visible at approximately 2 to 2.5 mg/m <sup>3</sup> . If deemed necessary, particulates will be monitored by a DataRAM 4 or equivalent instrument.
OSHA heat stress app for temperature extremes-heat and cold stress	Active work areas	Variable depending on the individual and work activity. OSHA heat stress app to be used or ACGIH TLVs	Take breaks in the shade, drink chilled fluids. Provide for ample shelter and breaks for hot/cold weather exposure. Personnel to be trained in the recognition of symptoms and treatment of heat and cold stress.

- Notes:**
- ACGIH = American Conference of Governmental Industrial Hygienists
  - dBA = decibel
  - HAZWOPER = Hazardous Waste Operations and Emergency Response
  - LEL = lower explosive limit
  - mg/m<sup>3</sup> = milligrams per cubic meter
  - OSHA = Occupational Safety and Health Administration Permissible Exposure Limit (PEL). Standard enforced by law.
  - PM = Project Manager
  - ppm = parts per million
  - SSHO = Site Safety and Health Office
  - STEL = Short Term Exposure Limit
  - TLV = Threshold Limit Value (recommended by ACGIH)
  - VOC = volatile organic compound

**Section 9 Decontamination Procedures**

**Personalized Decontamination**

Wash well with soap and water before hand to mouth contact is made. A shower will be taken as soon as possible after leaving the field.

Wet or dry decontamination procedures will be selected per project.

**Dry Decon Procedure**

**Not Needed**

Place disposable PPE in a garbage bag as removed in the following order:

- (1) Brush off work boots, remove disposable over boots, or booties
- (2) Remove gloves
- (3) Remove safety glasses
- (4) Remove Tyvek or cloth coverall, if used
- (5) Remove respirator, if used
- (6) Remove inner gloves
- (7) Wash hands/face before eating/drinking

**Wet Decon Procedure**

**Not Needed**

- (1) Wash overboots in soapy water and rinse
- (2) Remove overboots or booties
- (3) Remove gloves
- (4) Remove safety glasses
- (5) Remove Tyvek or cloth coverall, if used
- (6) Remove respirator, if used
- (7) Remove inner gloves
- (8) Wash hands/face before eating/drinking

**Sampling Equipment Decontamination**

**Not Needed**

Sampling equipment will be thoroughly decontaminated as follows:

- (1) Wash and scrub with low phosphate detergent
- (2) Potable tap water rinse 1
- (3) Potable tap water rinse 2
- (4) Thoroughly rinse with deionized water, if specified by the FSP
- (5) Air dry
- (6) Wrap in aluminum foil for transport, if specified by the FSP

**Heavy Equipment Decontamination**

**Not Needed**

Heavy equipment and tool parts that contact subsurface soil are constructed of heavy gauge steel and have no natural or synthetic components that could absorb and retain most soil-borne organic contaminants.

Prior to removal from the work site, potential contaminated soil/sediment/groundwater will be scraped or brushed from the exterior surfaces.

The drill/DPT probe rig, augers, rods, and other large equipment in the exclusion zone will be taken to a decon pad and steam cleaned. Rain suits to protect from overspray and runoff of decontamination fluids will be used if necessary.

**Section 10 Hazardous Materials Inventory (Safety Data Sheets) for Investigation-Associated Substances**

If SDS are accessible online from the site, hard copies are not needed.

**Preservatives**

- Hydrochloric Acid (HCl)
- Ascorbic Acid
- Nitric Acid (HNO<sub>3</sub>)
- Sulfuric Acid (H<sub>2</sub>SO<sub>4</sub>)  Other:
- Sodium Hydroxide (NaOH)
- Zinc Acetate (ZnOAc)

**Decontamination**

- Alconox™  Hexane
- Liquinox™  Isopropanol
- Acetone  Nitric Acid
- Methanol  Other:
- Mineral Spirits

**Calibration Gases and Fluids**

- Isobutylene  pH Standard
- Methane  Propane
- Pentane  Zobell Solution
- Hydrogen  Other:
- Conductivity Standard

**Spill Response: The following materials will be kept on site for spill response (check all appropriate materials)**

- Absorbent Pads  Granular absorbent material(non-flammable)  Polyethylene Sheeting
- Waste Container  Shovels or assorted hand tools  Other: materials specified in the SPCC.

If a hazardous waste spill or material release to the air, soil, or water at the site is observed, the U.S. Environmental Protection Agency (EPA) site representative and the local fire department will be immediately notified. An assessment will be made of the magnitude and potential impact of the release. If it is safe to do so, site personnel will attempt to locate the source of the release, prevent further release, and contain the spilled and/or affected materials. Additional details are presented in the sitewide Emergency Response Plan and its Appendix A, Spill Prevention, Control, and Countermeasures Plan.

**Section 11 Emergency Contacts**

**Section 12 Medical Emergency**

<b>Hospital Name, Address, and Phone:</b> Legacy Emanuel Medical Center 2801 N. Gantenbein Avenue, Portland, Oregon 97227 503-413-2200	<b>Name of Contact at Hospital if needed:</b>
---	---

<b>Name of 24-Hour Ambulance:</b>	<b>Distance to Hospital:</b> 2.7 miles
-----------------------------------	--

**Route to Hospital with approximate time and distance to the site. (See Figure 2a):**

Life threatening emergencies:

- On land (off Vigor property): Dial 911
- On land (on Vigor property): Radio Vigor staff on Channel 1-VHS radio -or- call (503) 247-1799 ext. #1799
- On the water: Radio the Coast Guard on Channel 16 on the VHS radio.

Time-critical emergencies: Proceed to the Legacy Emanuel Medical Center. The center is 2.7 miles southeast of the site. The estimated drive time is 10 minutes.

Note: On-water emergencies that require landing the vessel at the Swan Island Boat Ramp before heading to the hospital. Driving directions to the hospital listed below are from the boat ramp.

1. Start out going southeast on N. Basin Ave. toward N. Emerson Ct. (0.27 miles)
2. Stay straight to go onto N. Anchor St. (0.30 miles)
3. Turn slight left onto N. Channel Ave.
4. N. Channel Ave. becomes N. Going St. (0.95 miles)
5. Turn right onto N. Interstate Ave. (0.10 miles)
6. Turn left onto N. Skidmore St. (0.70 miles)
7. Turn right onto N. Vancouver Ave. (0.75 miles)
8. Turn right onto N. Stanton St. (0.06 miles)
9. Turn right onto N. Gantenbein Ave. (0.02 miles)
10. Destination is on the right.
11. Emergency Room is on the west side of the hospital, off N. Kerby Ave. and N. Morris St.

For nonlife-threatening emergencies: Field staff are recommended to use Urgent Care (Figure2b).

**Section 13 Contingency Plans Summarized below:**

If the field team members observe hazards which require response from public-level emergency services, they will withdraw from the area and contact public emergency services to handle the situation. They will subsequently call HGL CHSD Steve Davis or the HSM Edie Scala-Hampson.

**Wildfire smoke safety protocol**

Smoke from wildfires contains chemicals, gases and fine particles that can harm health. The greatest hazard comes from breathing fine particles in the air, which can reduce lung function, worsen asthma and other existing heart and lung conditions, and cause coughing, wheezing and difficulty breathing.

Protection from Wildfire Smoke will apply when the current Air Quality Index (AQI) for PM2.5 particulate is 101 or greater ("unhealthy") and when it is reasonably anticipated that employees may be exposed to wildfire smoke.

- At the start of each shift and periodically thereafter, as needed, AQI forecasts and current AQI for PM<sub>2.5</sub> will be checked at the following websites or using another effective method (telephone, email, text, etc.) from the agencies listed below:
  - o The EPA AirNow
  - o The U.S. Forest Service
  - o The Interagency Wildland Fire Air Quality Response Program
  - o The local air pollution control district
  - o The local air quality management district
- The SSHO will notify field personnel when the ambient air concentration at the work location is at or above the following levels and when it drops below levels requiring protection:
  - o 35.5 µg/m<sup>3</sup> (AQI 101);
  - o 150.5 µg/m<sup>3</sup> (AQI 201);
  - o 500.4 µg/m<sup>3</sup> (AQI 501); and
- The following exposure controls will be implemented:
  - o AQI ≥ 101. Control by use of NIOSH-approved respirators that protect from PM<sub>2.5</sub> particulates.
  - o AQI ≥ 201.
    - Implement engineering controls, where feasible, to reduce employee exposure. Examples include providing enclosed structures or vehicles for employees to work in where the air is filtered.
    - Whenever engineering controls are not feasible or do not reduce employee exposures changes will be made to work procedures or schedules (delay) when practicable. Examples include changing the location where employees work or their work schedules.
    - When engineering and administrative controls cannot reduce hazardous levels, KN-95 or NIOSH approved respirators will be used.
  - o AQI ≥ 501. Stop work until conditions approve.

In the event of medical emergency, see contact instructions in Sections 12 and 13.

If breathing zone contaminant levels are above the action level, additional ventilation or engineering controls will be implemented. If these controls do not eliminate the exposure, personnel protection will be reevaluated.

The weather will be monitored routinely. If lightning is seen or thunder heard, the “30-30 Rule” will be used where visibility is good and there is nothing obstructing the view of the thunderstorm. When lightning is seen, the time until thunder is heard, is counted. If that time is 30 seconds or less, then the thunderstorm is within 6 miles and is dangerous. Activities with exposure will cease at that time and will not resume until at least 30 minutes after the last clap of thunder. If immediate shelter is required, personnel will go to the nearest available shelter and wait until hazardous conditions pass.

A temporary field office is planned inside Building #10 of the Vigor Industrial LLC facility, which covers the western half of Swan Island. Staff will follow Vigor Industrial LLC evacuation plans while at the temporary field office or anywhere on the Vigor property. The routes are illustrated in Attachment F. The proposed muster point for the field activities is the Swan Island Boat Ramp located approximately 0.50 miles southeast of the temporary facility. Evacuation from the boat ramp will proceed according to the City of Portland plan (<https://www.portlandoregon.gov/pbem/article/668061>). Additional rally points and evacuation methods for severe weather will be identified on site as needed. If no shelter is available, move into field vehicles and travel to hotel if necessary.

When a medical facility or physician is not accessible within 5 minutes of the work site, a minimum of two personnel on each shift will be qualified to administer first aid and CPR/AED.

#### Emergency Equipment

- A minimum of one ANSI Z308.1, Type III first aid kit for portable outdoor settings;
- A minimum of one approved fire extinguisher (10-B:C).
- An AED.

Subcontractors operating watercraft will prepare a Capsize/Water Rescue Plan to be included with their HASP.

**ACTIVITY HAZARD ANALYSIS FORMS**

*This page was intentionally left blank.*

ACTIVITY HAZARD ANALYSIS (AHA)						
<b>Activity/Work Task:</b> Coronavirus Practices to Prevent Exposure <b>Project Location:</b> Swan Island Basin, Portland Harbor Superfund Site, Multnomah County, Oregon <b>Contract number:</b> DT2002 <b>Date Prepared:</b> May 2021 <b>Prepared by:</b> Steve Davis CIH, CSP <b>Corporate Health and Safety Reviewer:</b> Edie Scala-Hampson <b>Notes:</b> (Field Notes, Review Comments, etc.)	<b>Overall Risk Assessment Code (RAC) (Use highest code)</b>				<b>L</b>	
	<b>Risk Assessment Code (RAC) Matrix</b>					
	<b>Severity</b>	<b>Probability</b>				
		Frequent	Likely	Occasional	Seldom	Unlikely
	Catastrophic	<b>E</b>	<b>E</b>	<b>H</b>	<b>H</b>	<b>M</b>
	Critical	<b>E</b>	<b>H</b>	<b>H</b>	<b>M</b>	<b>L</b>
	Marginal	<b>H</b>	<b>M</b>	<b>M</b>	<b>L</b>	<b>L</b>
	Negligible	<b>M</b>	<b>L</b>	<b>L</b>	<b>L</b>	<b>L</b>
	Step 1: Review each "Hazard" with identified safety "Controls" and determine RAC (See above)					
	<b>Probability</b> the likelihood the activity will cause a Mishap (near miss, incident, or accident). Identify as: Frequent, Likely, Occasional, Seldom, or Unlikely.				<b>RAC Chart</b>	
<b>Severity</b> the outcome/degree if a mishap occurred. Identify as: Catastrophic, Critical, Marginal, or Negligible				<b>E = Extremely High Risk</b>		
Step 2: Identify the RAC (Probability/Severity) as E, H, M, or L for each "Hazard" on AHA. Annotate the overall highest RAC at the top of AHA.				<b>H = High Risk</b>		
				<b>M = Moderate Risk</b>		
				<b>L = Low Risk</b>		
Job Steps	Hazards	Controls			RAC	
Mobilization to site	Failure to plan/warn/train Infection	<p>Conduct readiness review with field team members prior to fieldwork. Site Safety and Health Officer (SSHO) to identify potential infection sources due to the task, location, and surrounding areas. Include discussion of same in site-specific training.</p> <p>SSHO to identify and implement any applicable local or state requirements for infection control measures.</p> <p>SSHO to discuss Coronavirus hazards and controls in the readiness review and initial tailgate safety meeting and address the topics listed below. The meetings should be held remotely, outdoors, or in a space large enough to allow space between participants. SSHO to verify that the necessary equipment and supplies are available and in good condition: face coverings, disinfectant, gloves, and safety glasses.</p> <ol style="list-style-type: none"> <li>The virus is highly contagious and is spread primarily by airborne droplets ejected when infected people cough, sneeze, or possibly just breathe. Most of these droplets settle out of the air within about 6 feet.</li> </ol>			<b>L</b>	

Job Steps	Hazards	Controls	RAC
Mobilization to site (continued)	Failure to plan/warn/train Infection (continued)	<ol style="list-style-type: none"> <li>2. The most frequent symptoms are fever, coughing, and shortness of breath.</li> <li>3. Maintain 6-foot separation unless the job task requires working closely. If unable to maintain 6-foot distance when working with other personnel inside buildings or in a group outside, wear tight-fitting filtering face mask over nose and mouth (unless NIOSH-approved respirator is required due to other airborne hazards). Face masks must have at least two filtering layers and must not have exhalation valves.</li> <li>4. Do not share tools, pens, or anything else without disinfecting between uses. Use your own pen.</li> <li>5. Site personnel are required to report travel to high-risk areas, potential exposure to infected people, and symptoms of illness. Site personnel should consider bringing personal thermometers to monitor their temperatures.</li> <li>6. Limit vehicle occupancy to two people and adjust vehicle's air handling system to maximize outside air. Both occupants must wear face coverings.</li> <li>7. Discuss and follow any state and local restrictions on gatherings (number of people that can congregate) and closings. Be aware that stores, restaurants, and coffee locations that you may have frequented may be closed. Bring your own food and drinks.</li> </ol> <p>See Center for Disease Control document <i>How It Spreads</i>:  <a href="https://www.cdc.gov/coronavirus/2019-ncov/prepare/transmission.html">https://www.cdc.gov/coronavirus/2019-ncov/prepare/transmission.html</a></p>	L
Travel to site	Infection	<p>Avoid air travel if possible. If air travel is necessary, wear face covering over mouth and nose in airports, planes, and any other situation where 6-foot spacing is not possible. Disinfect high contact surfaces in and around plane seats with disinfectant wipes. Adjust seat air ventilation to high flow.</p> <p>If renting a vehicle, request a rental vehicle that has been idle. Three days is best because all or nearly all virus particles on surfaces are inactivated by 72 hours of exposure to air. At least 75% of virus particles are inactivated by 24 hours of exposure to air. See the following link for additional information:  <a href="https://www.nejm.org/doi/full/10.1056/NEJMc2004973">https://www.nejm.org/doi/full/10.1056/NEJMc2004973</a>.</p>	L

Job Steps	Hazards	Controls	RAC
Travel to site (continued)	Infection (continued)	<p>Wipe the steering wheel and other high-contact surfaces of rental vehicles with disinfectant. Use any cloth or tissue saturated with disinfectant such as &gt;60% isopropyl alcohol, &gt;120 proof clear liquor (keep sealed or in trunk when in transit), or commercial disinfectant. Concentrated alcohol is flammable so use in well-ventilated area away from ignition sources. Any disinfectant product from a reputable supplier should inactivate the virus.</p> <p>Use gloves or wash or disinfect hands after touching commonly handled items such as gas dispenser handles.</p> <p>Use disinfectants in area with good ventilation and away from ignition sources.</p>	L
Hotel stays	Infection	<p>Request a room that has been idle. Three days is best because all or nearly all virus particles on surfaces are inactivated by 72 hours of exposure to air. At least 75% of virus particles are inactivated by 24 hours of exposure to air. See the following link for additional information:  <a href="https://www.nejm.org/doi/full/10.1056/NEJMc2004973">https://www.nejm.org/doi/full/10.1056/NEJMc2004973</a>.</p> <p>Request no maid service for short stays.</p> <p>Minimize time spent in common areas like the hotel lobby, exercise facility, or restaurant. Practice social distancing with hotel staff and other guests.</p> <p>Wipe high-contact areas like doorknobs and countertops with disinfectant. Use any cloth or tissue saturated with disinfectant such as &gt;60% isopropyl alcohol, &gt;120 proof clear liquor, or commercial disinfectant spray. Concentrated alcohol is flammable so use in well-ventilated area away from ignition sources. Note that any disinfectant from a reputable supplier (Lysol, Clorox) is likely to be effective on Coronavirus.</p> <p>Use disinfectants in area with good ventilation and away from ignition sources.</p>	L

Job Steps	Hazards	Controls	RAC
Transportation or shipment of disinfectants	Violation of U.S. Department of Transportation hazardous materials shipping regulations Spills, leaks, and fires	<p>Comply with airline requirements for transporting disinfectants in carry-on or checked luggage.</p> <p>Transport disinfectants in vehicles in compliance with U.S. Department of Transportation Materials of Trade exception:</p> <ul style="list-style-type: none"> <li>• Materials in labeled and leak-tight containers.</li> <li>• Containers secured so that they do not move while in transit, driver aware of hazardous materials in vehicle.</li> <li>• No more than 5 gallons of flammable liquid in any single container.</li> </ul> <p>If disinfectants must be shipped (for example by FedEx) use ground shipment.</p>	L
Tasks that involve large crews and travel to distant locations	Logistical issues related to managing infected personnel far from home	<p>SSHO to acquire a limited supply (5 to 10) of N95 or KN95 masks or half face elastomeric respirators with particulate filters, if possible, to be maintained on site and used for infection control if necessitated by potential exposure to field team members who are known or suspected to be infected.</p> <p>HGL's Project Manager (PM), in concert with senior management, will provide coordination and support to facilitate quarantine. If suspected infected personnel must be within 6 feet of other personnel (in a car, for instance) the suspected infected individual and any personnel within a 6-foot radius must wear a N95 or KN95 mask (without exhalation valve) or double layer surgical mask with cloth mask on top.</p>	L
Site tasks	Infection or spread of infection	<ul style="list-style-type: none"> <li>• Stay at least 6 feet from other personnel unless closer spacing is necessary for the work (and maintain this spacing during breaks and lunch). If unable to maintain 6-foot distance, wear a face mask over mouth and nose. Face masks must have at least two layers of filtering material.</li> <li>• Hold tailgate safety meetings outdoors or in a space large enough to allow separation.</li> <li>• Do not share pens or tools.</li> <li>• Do not pass or exchange items like paperwork or clipboards.</li> <li>• Limit vehicle occupancy to two, if possible, and set the vehicle's air handling system to maximize intake of outside air. The driver and passenger should both wear face coverings.</li> </ul>	L

Job Steps	Hazards	Controls	RAC
Site tasks (continued)	Infection or spread of infection (continued)	<ul style="list-style-type: none"> <li>• Avoid touching high-contact surfaces like shared pens, toilet valve handles, doorknobs, etc. with your bare skin and if you cannot avoid that, wash, or disinfect your hands afterward.</li> <li>• Avoid handshakes and hugs.</li> <li>• Provide handwashing station or hand sanitizer and use often.</li> <li>• Disinfect high-contact surfaces (i.e., door handles, copy machine keypad, coffee pot, refrigerator door handle, etc.) frequently.</li> <li>• Personnel must perform a self-assessment each morning and if symptoms like fever, cough, or shortness of breath that might indicate infection are present, must self-quarantine and notify the SSHO and their supervisor by phone call or email. SSHO is to notify PM and Human Resources (HR). SSHO may not release the name of quarantined personnel to others without authorization from HR.</li> <li>• Surfaces that have been touched by personnel who are ill should be thoroughly disinfected (door handles, vehicles) or disposed (pens, pencils, hard hat liners) to minimize potential for disease transmission. Enclosed areas such as vehicles or equipment cabs will be placed under lockout/tag out procedures for 24 hours to remove airborne virus particles, then thoroughly disinfected prior to return to service. Alternatively, if feasible, such surfaces and areas can be allowed to self-disinfect by leaving them unused for 7 days, which will allow virus particles to become inactivated.</li> </ul>	L
Use of sanitizers and cleaning sprays	Skin irritations-dermatitis, increased risk of eczema	Wear gloves when cleaning high-contact surfaces. When sanitizing hands, if soap and water cleaning is not available, wait for the sanitizer to dry completely before donning gloves. Sanitizer can breakdown the skin making an individual more prone to chemical and biological exposures. Sanitizers in close contact with the skin may also cause dermatitis. Use hand sanitizers from reputable manufacturers. Conduct hazard communication training on disinfectants that are being used.	L

<b>Add Steps, Hazards, and Actions to Eliminate or Minimize Hazards based on conditions encountered in the field.</b>			

Equipment	Training	Inspection
<p><u>Personal Protective Equipment Level D:</u></p> <ul style="list-style-type: none"> <li>• Hard hat (if there are overhead hazards)</li> <li>• Safety glasses</li> <li>• Safety-toed boots</li> <li>• Work gloves/chemical resistant gloves</li> </ul> <p><u>Other Equipment:</u></p> <ul style="list-style-type: none"> <li>• Face coverings</li> <li>• Hand sanitizer</li> <li>• Disinfectant wipes</li> <li>• Gloves</li> </ul>	<p><u>Competent Person (CP) / Qualified Person (QP):</u></p> <p>CP/SSHO _____</p> <p><u>Training Requirements (as determined by the SSHO):</u></p> <ul style="list-style-type: none"> <li>• Tailgate meetings</li> <li>• Emergency procedures</li> <li>• Hazard communication</li> </ul>	<ul style="list-style-type: none"> <li>• Daily inspection (SSHO)</li> <li>• Housekeeping (daily)</li> <li>• Hand washing station or hand sanitizer solution available and used.</li> <li>• Distancing being practiced.</li> </ul> <p>Do any personnel show signs of infection?</p> <p>SSHO (Parker) to notify PM and HR of any reports or signs of infection immediately. SSHO is not to provide names of involved personnel to others without authorization from HR.</p>

ACTIVITY HAZARD ANALYSIS (AHA)						
<b>Activity/Work Task:</b> Direct-Push Technology (DPT) – Sediment Sampling on Land and Over Water  <b>Project Location:</b> Swan Island Basin, Portland Harbor Superfund Site, Multnomah County, Oregon  <b>Contract number:</b> DT2002  <b>Date Prepared:</b> May 2021  <b>Prepared by:</b> Steve Davis CIH, CSP  <b>Corporate H&amp;S Reviewer:</b> Edie Scala-Hampson  <b>Notes:</b> (Field notes, review comments, etc.)	Overall Risk Assessment Code (RAC) (Use highest code)				L	
	<b>Risk Assessment Code (RAC) Matrix</b>					
	<b>Severity</b>	<b>Probability</b>				
		Frequent	Likely	Occasional	Seldom	Unlikely
	Catastrophic	E	E	H	H	M
	Critical	E	H	H	M	L
	Marginal	H	M	M	L	L
	Negligible	M	L	L	L	L
	Step 1: Review each “ <b>Hazard</b> ” with identified safety “ <b>Controls</b> ” and determine RAC (See above)					
	“ <b>Probability</b> ” the likelihood to cause an incident, near miss, or accident and identified as: Frequent, Likely, Occasional, Seldom, or Unlikely.				<b>RAC Chart</b>	
“ <b>Severity</b> ” the outcome/degree if an incident, near miss, or accident did occur and identified as: Catastrophic, Critical, Marginal, or Negligible				E = Extremely High Risk		
				H = High Risk		
Step 2: Identify the RAC (Probability/Severity) as E, H, M, or L for each “Hazard” on AHA. Annotate the overall highest RAC at the top of AHA.				M = Moderate Risk		
				L = Low Risk		
Job Steps	Hazards	Controls	RAC			
Mobilization/demobilization	Driving hazards	See Mobilization and Demobilization AHA	L			
Loading/unloading DPT rig on barge (To be conducted by subcontractor)	Falling, tripping, slipping into water, and drowning  Undercut banks and sloughing ground	See Working Over and Near Water AHA	L			
Borehole setup	Struck by vehicle traffic	Position drill rig and support vehicles to shield work zone.  Wear highly visible clothing, set up work zone suitable to site conditions (i.e., traffic cones, caution tape, vehicle placement). Do not assume equipment and vehicle operators have seen you unless operator has made eye contact with you and signaled to you.  These requirements apply to any work that exposes HydroGeoLogic, Inc. (HGL) employees, HGL temporary employees, and HGL subcontractors to traffic hazards. Examples of such work include the following: <ul style="list-style-type: none"> <li>• Work in a travel lane of a public road.</li> <li>• Work on the shoulder of a public road.</li> </ul>	L			

Job Steps	Hazards	Controls	RAC
Borehole setup (continued)	Struck by vehicle traffic (continued)	<ul style="list-style-type: none"> <li>• Work beyond the shoulder of a public road but within the road’s right of way that potentially exposes personnel to being struck by traffic.</li> <li>• Work at any location where there is extensive vehicle movement and a risk of personnel being struck by moving vehicles.</li> </ul> <p><b>CONTROLS</b></p> <ul style="list-style-type: none"> <li>• Ensure that substantial physical barriers such as concrete traffic barriers or stationary vehicles are placed between personnel and oncoming traffic when working in or near a public road, publicly accessible parking areas, or any other situation where vehicles operated by third parties may endanger personnel.</li> <li>• Ensure that site- or project-specific plans and controls are in place to protect personnel whenever traffic hazards are present.</li> <li>• Ensure that all work on or near roadways complies with federal, state, local, and facility laws and requirements.</li> <li>• Notify the applicable road authority (municipality, state Department of Transportation [DOT], etc.) prior to performing work that will or may disrupt traffic.</li> <li>• Ensure that a traffic control plan and permit in compliance with the requirements of the local jurisdiction, or DOT Manual of Uniform Traffic Control Devices (MUTCD) is prepared and implemented for work in or on the right of way of a public or facility road.</li> <li>• Ensure that a qualified traffic control subcontractor or a law enforcement officer is used to control traffic for any work in a public road or on the shoulder of a public road with a speed limit greater than 35 miles per hour (mph), or as required by applicable traffic authority requirements.</li> <li>• Ensure that personnel working on or near public roads wear at least Class 2 high visibility garments if speeds exceed 25 mph and Class 3 if speeds exceed 50 mph.</li> <li>• Ensure that personnel working in off-road locations where moving vehicles pose a hazard wear high visibility garments.</li> </ul> <p>See HGL Procedure 25 for MUTCD Requirements:  <a href="https://hydrogeologic.sharepoint.com/:b:/r/sites/CorporateDocumentLibrary/Shared%20Documents/200%20-%20Health%20and%20Safety/201%20-%20Personnel%20Safety/HGL%20HS%20Procedure%2025%20Traffic%20Control%20Program.pdf?csf=1&amp;web=1&amp;e=0cBL4Z">https://hydrogeologic.sharepoint.com/:b:/r/sites/CorporateDocumentLibrary/Shared%20Documents/200%20-%20Health%20and%20Safety/201%20-%20Personnel%20Safety/HGL%20HS%20Procedure%2025%20Traffic%20Control%20Program.pdf?csf=1&amp;web=1&amp;e=0cBL4Z</a> </p>	<b>L</b>

Job Steps	Hazards	Controls	RAC
Borehole setup (continued)	Vehicle damage	Use a spotter standing to side of rig (not behind) when backing drill rig. Confirm proper operation of backup alarm.	L
	Uneven terrain	Use jacks and proper blocking to level rig. Choose level, open areas to drill. If client requires plastic sheeting under the rig, keep it away from the mechanical portions of the rig that contact the ground (i.e., tracks, wheels, jacks).	L
	Overhead utilities	<p>Maintain distance of at least 20 feet from overhead power lines. Avoid borehole locations near overhead lines. Do not move drill rig with tower/mast in the upward position.</p> <p>Complete a Site Layout Plan prior to mobilizing the equipment. The plan should identify all overhead hazards.</p> <p>Survey the travel route for overhead and terrain hazards before equipment is moved. The minimum distances from electrical lines must be observed.</p> <p>Maintain clearance distances stated above when operating beneath a power line that has not been verified as de-energized and grounded. Power lines should be assumed to be energized unless verified to be de-energized and visibly grounded. Erect a high-visibility elevated warning line or barricades at the minimum approach distance.</p> <p>Train each field team member in the electrocution hazards and emergency procedures associated with energized power lines.</p> <p>See Procedure 11 <a href="#">Electrical Safety</a></p>	L
	Underground utilities	<p>Follow the procedure for intrusive activities in the Field Sampling Plan (FSP). Additional details are included in the Subsurface Utility Avoidance Standard Operating Procedure (411.03) included in the FSP.</p> <p>Complete the Pre-Boring/Checklist for each boring.</p> <p>Complete a Site Layout Plan prior to mobilizing the equipment. The plan should identify all underground hazards.</p> <p>Locate and mark utilities prior to commencing intrusive activities. Retain a copy of mark-out ticket for documentation purposes and quality control purposes.</p> <p>Document utility mark-out using the Utility Mark-out Documentation form. No boring work is to be performed until all utility mark-outs are verified.</p>	L

Job Steps	Hazards	Controls	RAC
Borehole setup (continued)	Underground utilities (continued)	<p>Ensure that buried utilities are daylighted and visible when drilling must be conducted within 5 feet of the utility.</p> <p>DO NOT proceed with intrusive activities until the construction manager/field superintendent and site safety and health officer (SSHO) have issued an Intrusive Activities Permit.</p> <p>Advance by hand digging, probing, and/or air knife to 5 feet below ground surface if markings are unclear or utilities known to be present are not marked.</p> <p>Contact Digger's Hotline if an underground facility is damaged, dislocated, or disturbed.</p>	<b>L</b>
	Slips, trips, and falls	<p>Understand the hazard of slips, trips, and falls – consider the consequences.</p> <p>Do not jump from equipment or elevated surfaces.</p> <p>Clean up work areas throughout the day and at the end of each workday. Use three-point contact rule for entering/exiting vehicles, trucks, and equipment.</p> <p>Use handrails and other stationary objects (door frames, doorknobs, steering wheels, walls, etc.) to increase stability.</p> <p>Use extra caution when walking on wet, muddy, frosty, icy, or snow-covered surfaces.</p> <p>Increase your awareness, keep alert, stay focused, and know your environment.</p> <p>Provide warning signs or cordon off areas where necessary.</p> <p>Consider postponing work as necessary and feasible.</p> <p>Avoid slippery areas when possible.</p> <p>Stay away from slopes, hills, and grades. Be cautious when using stairs.</p> <p>Remove snow and ice when possible (shoveling, chipping, and salt application).</p> <p>Apply traction aids, such as sand, gravels, and straw. Choose footwear wisely.</p> <p>Slow down - take smaller steps.</p> <p>Lower your center of gravity when necessary.</p>	<b>L</b>

Job Steps	Hazards	Controls	RAC
Borehole setup (continued)	Slips, trips, and falls (continued)	Maintain proper illumination in work areas.  Provide fall protection when personnel are exposed to fall hazards greater than 4 feet.	L
	Strains and sprains from improper lifting of loads	Lift with legs, a straight back, and do not twist while lifting heavy loads.  Use multiple employees or mechanical lifting devices for lifting objects over the 50-pound limit.	L
Watercraft operation (To be conducted by subcontractor)	Hazards of boat operation Falling overboard and/or stranded	See Working Over and Near Water AHA. AHA will be provided by subcontractor.	L
Connecting drill tools to drive head or other tools (To be conducted by subcontractor)	Pinch points between rig and tooling	Keep hands clear of joints when connecting drill tools. Wear PVC gloves when connecting tools. If joining tools requires operation of winch or feed controls, have two workers present: one to operate controls and one to align tools. One person should not operate controls and join tools simultaneously.  Be aware of pinch-point hazards and work in a manner to prevent injuries.  Keep hands out of areas that may present pinching hazards and personnel should not position themselves between equipment.	L
Advancing percussion tools (driving sampler, driving casing, direct-push hammering) (To be conducted by subcontractor)	Struck by broken drill tooling from drill tooling improperly lined up	Maintain percussion force in line with hammer and tool string (minimize bending of tool string or driving at an angle). If conditions become difficult, use stop work authority and re-evaluate.  Maintain a safe distance from operations.	L
	Noise	Wear ANSI NRR 30 or higher hearing protection when direct push activities exceed 85 dBA while advancing tools.	L
	Cuts from cutting plastic tubing	Prevent lacerations by cutting away from hands and body. Watch the line of fire with the cutter. Wear cut resistant gloves.	L
Collecting sediment samples	Slip, trip, and fall hazards  Contact/struck by drilling equipment  Strains, sprains, awkward bending/lifts, and ergonomic hazards  Noise  Inhalation and skin contact hazards	Refer to Drilling/DPT – Sampling Processing AHA	L

Job Steps	Hazards	Controls	RAC
Down-hole tool removal (To be conducted by subcontractor)	Struck by cable from cable recoil from strained winch	<p>Use rod clamp, vice or slide ring to support loads.</p> <p>Minimize time that objects are suspended above ground or secure supporting surface.</p> <p>Minimize slippage by using proper tools for material being lifted.</p> <p>Lift straight up using safety hook or hoisting plug whenever possible.</p> <p>Remove drill tools in 6-foot sections, or less.</p> <p>Stay clear of strained winch cables or drive shafts. Never place body between pulling force and load.</p>	L
Decontamination of equipment	<p>High pressure water</p> <p>Skin contact</p> <p>Inhalation</p>	<p>Wear modified Level D protection, including a face shield and safety goggles.</p> <p>Ensure that other personnel are out of the area prior to decontamination when pressure washing equipment is used. Secure the area around the decon pad with cones, caution tape, or barricades.</p> <p>Ensure that safe work practices and precautions are taken to minimize the potential for physical injury.</p> <p>Avoid skin and eye contact with isopropyl alcohol, Alconox, or other cleaning materials.</p> <p>Stand upwind to minimize any potential inhalation exposure.</p> <p>Dispose of spent cleaning solutions and rinses accordingly.</p> <p>Ensure that area is clean after equipment is decontaminated.</p>	L
General site work	<p>General site hazards: insect bites and stings</p> <p>Contact dermatitis from poisonous and irritating plants (poison ivy, poison oak, and poison sumac)</p> <p>Severe weather</p> <p>Heat stress</p> <p>Cold stress</p> <p>Noise</p> <p>Lifting</p> <p>UV hazards, etc.</p>	See General Site Work AHA	L

Over 1,000	As established by the utility owner/operator or registered professional engineer who is a qualified person with respect to electrical power transmission and distribution).																				

Job Steps	Hazards	Controls	RAC
Site preparatory communication phase and inspection (continued)	Overhead utilities: arc flash and electrocution  Underground utilities: electrocution, arc flash, fire, property damage  (continued)	Complete a dig permit prior to mobilizing equipment. Use subcontractor utility locator and/or ground penetrating radar if there is uncertainty regarding the presence or location of high-hazard (gas, high voltage) or high-value utilities. Have high-hazard utilities turned off and locked out if possible.  Walk the excavation area to visually verify that the identified utility locations are consistent with visible clues like power poles, depressions over old trenches, etc.  Expose (daylight) high-hazard or high-value utilities that are within the excavation footprint or within 5 feet of the edge of planned excavation, using low impact techniques such as shovel or hand auger. Expose such utilities, using low-impact techniques, at least every 5 feet to confirm location and depth. Do not use drilling equipment within 6 inches of high-hazard utilities.	L
Bore hole setup Determine location for setup/staging equipment	Traffic-struck by hazards  Vehicle damage  Driving over soft ground  Uneven terrain  Slip, trip, fall, and flying debris	Position drill rig and support vehicles to shield work zone.  Place barricades for work site protection, if necessary (i.e., traffic cones, caution tape, vehicle placement).  Wear high-visibility vest.  Do not assume equipment and vehicle operators have seen you unless operator has made eye contact with you and signaled to you.  Use a spotter standing to side of rig (not behind) when backing drill rig.  Confirm proper operation of backup alarm.  Choose location with level and firm soils.  Use jacks and proper blocking to level rig. Choose level, open areas to drill. If client requires plastic sheeting under the rig, keep it away from the mechanical means of the rig that contact the ground (i.e., tracks, wheels, jacks).  Keep work area picked up and as clean as feasible and free of tripping and fall hazards. Apply traction aids, such as sand, gravels, and straw.  Wear safety glasses when near rig or where there is a potential for flying debris.  Wear slip-resistant footwear.  Maintain proper illumination in work areas.	L
Boarding, disembarking, and working on barge	Falling, tripping, slipping into water and drowning	See Working Over and Near Water AHA	L
Drilling (To be conducted by subcontracted driller)	Rolling, spreading, or sliding of tools and supplies	Conduct/document weekly drilling inspection in a logbook or checklist.  Maintain adequate clearance for the movement of vehicles and operation of drilling equipment.  Use spotters when vision is impaired.  Determine safe tool placement to prevent struck by injuries.	L
			L

Job Steps	Hazards	Controls	RAC
Drilling (To be conducted by subcontracted driller) (continued)	Caught by rotating machinery Fire Hand injuries Rolling, spreading, or sliding of tools and supplies Caught by rotating machinery Fire Hand injuries	Inspect all drilling equipment in presence of site safety and health officer (SSHO). Verify (lead driller) that all safety interlock and engine kill switches on the equipment operate correctly. Wear leather gloves when handling materials with potential for sharp edges, splinters, burrs, rough surfaces, etc. Be aware of and avoid pinch point hazards. Conduct repairs that require HOT WORK under a HOT WORK PERMIT. Inform SSHO of HOT WORK and provide fire watch and suitable fire extinguisher. Use screens to control sparks and UV (welding flash burns to eyes) exposure as necessary. Advance by hand digging, probing, post hole digging, and/or air knifed to 5 feet below ground surface if markings are unclear, or utilities known to be present are not marked. Contact Digger's Hotline if an underground facility is damaged, dislocated, or disturbed.	L
Connecting drill tools to drive head or other tools (To be conducted by subcontracted driller)	Pinch points between rig and tooling Struck by or caught between moving machinery	Keep hands clear of joints when connecting drill tools. Wear PVC gloves when connecting tools. If joining tools requires operation of winch or feed controls, have two workers present: one to operate controls and one to align tools. One person should not operate controls and join tools simultaneously. Be aware of pinch-point hazards and work in a manner to prevent injuries. Keep hands out of areas that may present a pinching hazard and personnel will not position themselves between equipment. Do not wear loose coveralls, clothing, or jewelry that may entangle in moving equipment. Confirm that the operator verbally alerts employees and visually ensures employees are clear from dangerous parts of equipment prior to starting or engaging equipment.	L
Advancing percussion tools (driving sampler, driving casing, direct push hammering).	Struck by broken drill tooling from drill tooling improperly lined up	Maintain percussion force in-line with hammer and tool string (minimize bending of tool string or driving at an angle). If conditions become difficult, use stop work authority and re-evaluate. Maintain a safe distance from operations.	L
Down-hole tool removal (To be conducted by subcontracted driller)	Struck by cable from cable recoil from strained winch	Use rod clamp, vice or slide ring to support loads. Minimize time that objects are suspended above ground or secure supporting surface. Minimize slippage by using proper tools for material being lifted. Lift straight up using safety hook or hoisting plug whenever possible. Remove drill tools in 6-foot sections, or less. Stay clear of strained winch cables or drive shafts. Never place body between pulling force and load.	L

Job Steps	Hazards	Controls	RAC
Decon of equipment	High pressure water Skin contact Inhalation	<p>Wear modified Level D protection, including a face shield and safety goggles.</p> <p>Ensure that other personnel are out of the area prior to decontamination when pressure washing equipment is used. Secure the area around the decon pad with cones, caution tape, or barricades.</p> <p>Ensure that safe work practices and precautions are taken to minimize the potential for physical injury.</p> <p>Avoid skin and eye contact with isopropyl alcohol, Alconox, or other cleaning materials.</p> <p>Stand upwind to minimize any potential inhalation exposure.</p> <p>Dispose of spent cleaning solutions and rinses accordingly.</p> <p>Ensure that area is clean after equipment is decontaminated.</p>	L
Wrap up	Take home toxics	<p>Decon with soap and water or wipes.</p> <p>Remove all contaminated clothing and materials and leave on site. Use plastic as a barrier for soil, truck bed, or foot well contact.</p>	L
General site work	<p>General site hazards:</p> <p>Insect bites and stings</p> <p>Contact dermatitis from poisonous and irritating plants (poison ivy, poison oak, and poison sumac)</p> <p>Vehicle traffic</p> <p>Severe weather</p> <p>Heat stress</p> <p>Cold stress</p> <p>Noise</p> <p>Lifting</p> <p>Slips, trips, and falls</p> <p>UV hazards, etc.</p>	Refer to General Site Work AHA. **ACTIVITY HAZARD ANALYSIS (AHA)**

<b>Activity/Work Task:</b> Drilling/DPT – Sample Processing <b>Project Location:</b> Swan Island Basin, Portland Harbor Superfund Site, Multnomah County, Oregon <b>Contract Number:</b> DT2002 <b>Date Prepared:</b> May 2021 <b>Prepared By:</b> Steve Davis CIH, CSP <b>Corporate H&amp;S Reviewer:</b> Edie Scala-Hampson <b>Notes:</b> (Field Notes, review comments, etc.)	<b>Overall Risk Assessment Code (RAC) (Use highest code)</b>				<b>L</b>	
	<b>Risk Assessment Code (RAC) Matrix</b>					
	<b>Severity</b>	<b>Probability</b>				
		Frequent	Likely	Occasional	Seldom	Unlikely
	Catastrophic	<b>E</b>	<b>E</b>	<b>H</b>	<b>H</b>	<b>M</b>
	Critical	<b>E</b>	<b>H</b>	<b>H</b>	<b>M</b>	<b>L</b>
	Marginal	<b>H</b>	<b>M</b>	<b>M</b>	<b>L</b>	<b>L</b>
	Negligible	<b>M</b>	<b>L</b>	<b>L</b>	<b>L</b>	<b>L</b>
	Step 1: Review each “Hazard” with identified safety “Controls” and determine RAC (See above)					
	“Probability” is the likelihood to cause an incident, near miss, or accident and identified as: Frequent, Likely, Occasional, Seldom, or Unlikely.				<b>RAC Chart</b>	
“Severity” is the outcome/degree if an incident, near miss, or accident did occur and identified as: Catastrophic, Critical, Marginal, or Negligible				<b>E = Extremely High Risk</b>		
				<b>H = High Risk</b>		
Step 2: Identify the RAC (Probability/Severity) as E, H, M, or L for each “Hazard” on AHA. Annotate the overall highest RAC at the top of AHA.				<b>M = Moderate Risk</b>		
				<b>L = Low Risk</b>		

Job Steps	Hazards	Controls	RAC
Determine location for setup/staging equipment	Traffic-struck by hazards Driving over soft ground Uneven terrain	See Mobilization/Demobilization AHA and Drilling (Land Based and Barge Based) AHA	<b>L</b>
Accept precut tube from driller	Slip, trip, and fall hazards	Wear slip-resistant footwear.  Keep work area picked up and as clean as feasible and free of tripping and fall hazards.	<b>L</b>
	Hand injuries	Items to be handled shall be inspected for sharp edges, splinters, burrs, rough surfaces, etc. prior to being handled.  Personnel shall wear leather gloves when handling materials with sharp edges, splinters, burrs, rough surfaces, etc.  Personnel should be aware of and avoid pinch point hazards.	<b>L</b>
	Flying debris	Wear safety glasses when near rig or where there is a potential for flying debris.  Ensure eyewash is available.	<b>L</b>

Job Steps	Hazards		RAC
Accept precut tube from driller (continued)	Strains, sprains, awkward bending/lifts and ergonomic hazards	Lift with straight back and legs. Avoid twisting. Ensure walking pathway is clear. Do not lift greater than 50 pounds. Use mechanical assistance or two-person lift whenever possible. Limit repetitive awkward motions.	L
	Noise	Wear hearing protection if noise levels from neighboring equipment exceeds 85 dBA (if you cannot be heard speaking in a normal voice at arms distance).	L
Accept precut tube from driller	Contact with/struck by drilling equipment	Maintain eye contact with driller when entering zone of operation. Don't stand too close to rig; honor the exclusion zone. Use qualified drillers to operate drilling equipment. Conduct real-time monitoring with photoionization detector (PID) when drillers are aware of your presence.	L
Measure with PID for volatile organic compound	Inhalation of contaminants	Follow personal protective equipment (PPE) dictates of Health and Safety Plan (HASP) based on airborne measurements and action levels.	L
Sample collection	Inhalation and skin contact hazards	Wear chemical-resistant gloves based on the identified chemicals. Use boot covers and splash suit protection if necessary. Follow respirator action level dictates of HASP. Perform decontamination as specified in the HASP. The restricted areas/exclusion zones and contamination reduction zones should be set up and appropriately marked with signage, as necessary, and indicated in HASP. Avoid contact with contaminated materials. Wear PPE, as specified in the HASP. The site safety and health officer (SSHO) will perform chemical air monitoring, as specified in the HASP. Verify emergency eyewash stations have been inspected, cleaned, filled, and in service. Notify all personnel of the emergency eyewash station locations. Notify the SSHO if odors are detected.	L

Job Steps	Hazards	Controls	RAC
Put sample in preserved jar	Inhalation and skin contact with sample preservatives: NaOH, HNO <sub>3</sub> , HCl	<p>Read and follow safety data sheets for each chemical used.</p> <p>Provide emergency eyewash station for all areas where acid (sample preservative) and methanol are being used.</p> <p>Do not use any chemical that you have not been trained to safely use. Provide ventilation as necessary.</p> <p>Wear appropriate PPE (gloves, safety glasses).</p> <p>Use in well-ventilated area.</p> <p>Properly label all containers.</p>	L
	Spills	Use absorbents and containers for spills.	
Log/label and put sample in cooler	Cut hazards	Set up stable work area for labeling samples, logging, and doing paperwork.	L
Observation of drillers: DPT, rotary, mud, etc.	Exposure to site contaminants	Instruct drillers of potential or known contaminants on site.	L
	Hazards associated with drilling: electrical such as overhead or underground utilities, rolling, spreading or sliding of tools and supplies, caught by rotating machinery, and Fire	<p><b><u>Actions to be taken by drillers:</u></b></p> <ul style="list-style-type: none"> <li>• Conduct/document weekly drilling inspection in a logbook or checklist.</li> <li>• Require dig permit (utility clearance) before invasive work begins.</li> <li>• Mark/locate underground utilities. No drilling within 5 feet of marked underground utilities or within a minimum of 20 feet of overhead lines.</li> <li>• Maintain adequate clearance for the movement of vehicles and operation of drilling equipment.</li> <li>• Use spotters when vision is impaired.</li> <li>• Determine safe tool placement to prevent struck by injuries.</li> <li>• Inspect all drilling equipment in presence of SSHO.</li> <li>• Verify (lead driller) that all safety interlock and engine kill switches on the drilling equipment operate correctly.</li> <li>• Conduct repairs that require HOT WORK under a HOT WORK PERMIT. Inform SSHO of HOT WORK and provide fire watch and suitable fire extinguisher. Use screens to control sparks and UV (welding flash burns to eyes) exposure as necessary.</li> </ul>	L

Job Steps	Hazards	Controls	RAC
Decon of equipment	Skin contact Inhalation	Wear modified Level D protection, including a face shield and safety goggles. Avoid skin and eye contact with isopropyl alcohol, Alconox, or other cleaning materials. Stand upwind to minimize any potential inhalation exposure. Dispose of spent cleaning solutions and rinses accordingly. Ensure that area is clean after equipment is decontaminated.	L
Wrap up	Take home toxics	Decon with soap and water or wipes. Remove all contaminated clothing and materials and leave on site. Use plastic as a barrier for soil, truck bed, or foot well contact.	L
General site work	General site hazards: insect bites and stings; contact dermatitis from poisonous and irritating plants (poison ivy, poison oak, and poison sumac); vehicle traffic; severe weather; heat stress; cold stress; noise; lifting; slips, trips, falls; and UV hazards	See General Site Work AHA.	L

<b>Job Steps</b>	<b>Hazards</b>	<b>Controls</b>	<b>RAC</b>			
Review–health and safety (H&S) needs, communication, and preparatory instructions	Behavioral: human error - failure to plan/warn/train  Inadequate preparation can lead to personal injuries, property damage and project delays  Employees not trained in the safe execution of their assigned task may harm themselves or others	Readiness review with field team members prior to fieldwork.  Site safety and health officer (SSHO) to identify applicable portions of Health and Safety Plan (HASP) and include those AHAs in site-specific job training for workers.  SSHO to perform on-site verification that HASP and AHAs capture all important site hazards and controls.  SSHO to verify that access to the necessary equipment to evaluate and control site hazards is available and complete and in good condition (i.e., equipment, tools, personal protective equipment (PPE), materials, etc. required to perform the tasks. For example: PID with correct lamp for evaluating chemical hazards in breathing zone.	<b>L</b>			
	Unfamiliarity with site, general site hazards, project safety rules, chain of command, and emergency procedures  Adding new personnel to work team, visitors	Conduct training and coordination with team.  New employees will be trained and proficient before they are assigned to their jobs.  Visitors will receive a site safety briefing and PPE.	<b>L</b>			

Job Steps	Hazards	Controls	RAC
Review–H&S needs, communication, and preparatory instructions (continued)	Emergency response unfamiliarity Delay in response and treatment	<p>SSHO to verify that emergency safety supplies and first aid supplies are available and complete.</p> <p>SSHO to review emergency procedures, contact numbers, evacuation plans, severe weather shelters, and rally points.</p> <p>The SSHO will monitor weather conditions each day to plan and prepare for hazardous conditions. Work activities, especially those conducted on the water, will be suspended prior to weather conditions becoming hazardous so that workers have ample time to seek shelter. Upon seeing lightning or hearing thunder, outdoor activities should be suspended and personnel should be evacuated to safe areas.</p> <p>SSHO to confirm that all personnel know what to do in the event of an accident (personal or property damage).</p>	L
Transportation to site and site vehicle maneuvering	Struck by vehicle accidents/traffic	<p>Prohibit cell phone use by driver while vehicle is in motion.</p> <p>Practice defensive driving and wear safety restraints when vehicle is in motion. (See <a href="#">Safe Driving H&amp;S Procedure 16</a>)</p> <p>Adjust vehicle per personal specifications and confirm that it is in good working order and all cargo is secured and distractions are minimized.</p> <p>Familiarize yourself with the route and directions.</p> <p>Keep vehicle speed appropriate to road conditions.</p> <p>Be aware of the onset of driving fatigue and take breaks as needed.</p> <p>Perform a walk-around vehicle inspection at least daily (See Appendix A of this HASP).</p>	L
	Weather: poor road conditions, ruts, snow, ice mud puddles, and poor traction	<p>Monitor weather conditions and consider postponing travel or decreasing speed in poor travel conditions.</p> <p>Match driving speed to the conditions.</p>	L
	Struck by or against: maneuvering in tight areas/potential vehicle or personnel damage	<p>Use a spotter to help maneuver in tight areas.</p> <p>Avoid backing if possible.</p> <p>Check all blind spots before you attempt to move vehicle.</p> <p>Sound horn before backing and move slowly.</p>	L
Secure site	Unwanted entry: security/site access control	Establish positive site access control prior to on-site operations using barricades, signs, or fencing.	L

Job Steps	Hazards	Controls	RAC
Material handling and setup	Strains, sprains, awkward bending/lifting positions and ergonomic hazards	<p>Know your own limitations and ask for help if you need it. Size up the load before the lift.</p> <p>Use mechanical assistance or two-person lift for loads greater than 50 pounds and for large awkward loads.</p> <p>Lift with the legs and keep back straight.</p> <p>DO NOT lift and twist torso at the same time.</p> <p>Confirm that the walking pathway is clear of depressions or debris.</p> <p>Limit repetitive awkward motions and unbalanced lifting as much as possible.</p>	L
Working around vehicles, drill/direct-push technology (DPT) rigs, and vessels/on-water platforms	Struck-by hazards, crushing hazards, caught-between, noise-hearing loss	<p>Select work location away from traffic.</p> <p>Discuss active work areas in daily briefings.</p> <p>Place barricades or stationary vehicles for work site protection, if necessary.</p> <p>Wear high-visibility vest.</p> <p>STAY CLEAR of traffic on land and on the water.</p> <p>Make eye contact with operators of equipment to make sure they know your intentions.</p> <p>Prohibit machinery or equipment, requiring an operator, to run unattended.</p> <p>Confirm all heavy equipment has functional backup alarms.</p> <p>Minimize the number of ground personnel working around heavy equipment.</p> <p>Never position yourself between moving and fixed objects.</p> <p>Wear hearing protection if noise levels are &gt;85 dBA.</p>	L

Job Steps	Hazards	Controls	RAC
Working around/near other trades or contractors	Hazards caused by other trades-failure to communicate hazards (various hazards: toxic dusts, chemicals, physical hazards, biological hazards)	<p>Coordinate with subcontractors and other personnel daily.</p> <p>Notify others of potential hazards posed by HydroGeoLogic, Inc. (HG)L work and ask them to do the same for us. Stop work or implement controls if the work of others poses a hazard for HGL or subcontractor personnel.</p> <p>Inform subcontractors of locations of warning signs, hazards, and precautions they should take. Provide specific hazard communication training tailored to the project workplace.</p> <p>Inspect the work of subcontractors to verify safe operation and compliance with applicable requirements and require correction of deficiencies.</p> <p>Ask the “creating” employers (subcontractors) to correct hazards. NEVER tell the “creating” employer how to do their job but tell subcontractors to get the hazard corrected and hold them accountable. If HGL detects a safety violation, it has an obligation to see that it gets corrected by the subcontractor that created the hazard.</p> <p>Ensure that all site workers have the required Occupational Safety and Health Administration (OSHA) training.</p> <p>Require that each subcontractor be responsible for conducting inspections of their specific operations and equipment, conducting exposure monitoring for their workers, and providing site data sheets (SDSs), PPE, medical surveillance, and specialized worker training (e.g., forklift, excavation and trenching, fall protection, etc.).</p>	L
	Fire	<p>Maintain at least one dry chemical fire extinguisher having a minimum UL rating of 1A5BC on site.</p> <p>10B:C should be in cab of bulldozer, crane, front-end-loader, etc.</p> <p>4A:60B:C in immediate area of hot work</p> <p>40-B:C in immediate re-fueling area</p> <p>3A:40B:C (within 30 feet) near generator</p> <p>Limit smoking to designated areas</p>	L
Working in remote areas and on steep slopes while collecting river bank samples.	Criminal activity, wild animals, falls leading to inability to self-evacuate Getting lost	<p>Use the buddy system, if possible; however, if it cannot be used, follow the lone worker procedure by contacting the project manager or alternate point of contact at work start, mid-day, and when leaving work site at end of day. Let others on site (non-HGL staff) know where you are working and establish a check in procedure.</p> <p>Bring a smart phone, topographic and/or site map, compass, GPS.</p>	L

Job Steps	Hazards	Controls	RAC
Working in remote areas and on steep slopes while collecting river bank samples (continued)	Injuries and accidents from driving/walking over soft ground, uneven and rough terrain, and steep slopes.	Choose location with level and firm soils, when possible. Have gravel added to site roads to improve traction, if needed. Maintain vehicle speed corresponding to road conditions. Watch footing when walking in mud or wet soils.	L
	Unhygienic conditions	Confirm that restroom facilities, if installed on site, are adequately provided and maintained. Maintain hand disinfectant, wipes, and wash stations.	L
	Slip, trip, and fall hazards	Wear slip-resistant footwear. Inspect the work area for slip, trip, and fall hazards. Use sand, salt, or slip-on traction aids to control ice slip hazards, as needed, during winter months. Keep work area picked up and as clean as feasible. Keep egress routes as clear and unobstructed as possible.	L
Working outdoors Walking on site	Biologicals—contact with poisonous and thorny plants, allergens, insects, and animal hazards (for example: spiders, hornets, reptiles, snakes, deer ticks (Lyme disease), mosquitoes, bird and rodent droppings, biting and stinging insects etc.). Specify below any site-specific details and or review HASP for specific biological hazards.	Note: All personnel have the option to complete the Voluntary Allergy/Sensitivity/Medical Questionnaire. Conduct visual inspection before work begins and note (mark) areas of poisonous vegetation, insect (hornet wasp) nests, and snake habitats. Use mosquito repellent with DEET and tick repellent with permethrin, as required. <a href="#">DEET SDS</a> Treat clothing with permethrin-based products if ticks are prevalent. Know the local fauna and review emergency preparedness measures. Review potential animal dangers specific to the site and precautions (actions to take if run-in with wild animal occurs) and treatments. Inspect your body and clothing for ticks during outdoor activity and at the end of the day. Wear light-colored clothing so ticks can be more easily seen. Remove ticks right away to prevent infections. Tuck pants into socks when in areas with tick potential. Wear long-sleeved shirts that should be tucked in. Review information for poison ivy/oak recognition and treatment if plants are present. Use existing footpaths when possible.	L

Job Steps	Hazards	Controls	RAC
Working outdoors Walking on site (continued)	Biologicals—contact with poisonous and thorny plants, allergens, insects, and animal hazards (for example: spiders, hornets, reptiles, snakes, deer ticks (Lyme disease), mosquitoes, bird and rodent droppings, biting and stinging insects etc.). Specify below any site-specific details and or review HASP for specific biological hazards. (continued)	Avoid walking in un-cleared areas with poison ivy or biological hazard potential. Use barrier cream and cleaning products such as Zanfel, Ivy Block, Tecnu, IvyX if poison ivy or poison oak is prevalent. <ul style="list-style-type: none"> <li>• Wash hands using Ivy cleanser, prior to eating, using restroom, operating motor vehicle, and after leaving the field.</li> <li>• Do not touch face with hands or clothing while in the field.</li> <li>• Remove contaminated work clothing with gloves. Store, bag and wash separately.</li> </ul> Use poison ivy cleansers (not lotion soap) to clean affected skin. Lotion soaps will spread the irritant oil on larger areas of the skin. Shower immediately upon leaving work. Wear snake chaps if poisonous snakes are present.	L
Working in heat and sun	UV exposure—sunburn  Temperature stress: heat exhaustion, stroke	Wear UVA/UVB SPF sunscreen (minimum 30 SPF) and reapply frequently. Wear hats and clothing that shield skin from direct sun. Implement heat stress controls when the heat index is greater than 75 degrees Fahrenheit (°F), when the temperature is 75°F or more with relative humidity of 55% or more: Acclimatize by gradually working in heat, systematically building up tolerance. Conduct field activities in the early morning, if possible, to avoid heat. Have enough water on site so that each worker can consume, at a minimum, one quart per hour per shift. Have frequent reminders to personnel, to take water breaks so that each person can consume enough water. Provide access to shade that is reasonably close to the work area. Take breaks as necessary in shady or cool areas and hydrate. Conduct training on risk factors, signs and symptoms of heat illness, importance of hydration and acclimatization, and importance of reporting symptoms and what to do in case of heat illness emergency and contacting emergency medical services (see HASP).	L

Job Steps	Hazards	Controls	RAC
Working in heat and sun (continued)	UV exposure—sunburn  Temperature stress: heat exhaustion, stroke  (continued)	Follow the requirements for physiological monitoring as stated in the HASP. (e.g., during work in temperatures above 90 adjusted temperature, perform physiological monitoring—see safety plan if wearing Tyvek for when to start monitoring.)  Be conscious of individual tolerances to work in hot weather and medication contraindication for heat exposure.  Monitor yourself and co-workers for signs and symptoms of heat stress. (See <a href="#">Procedure 14.1 Heat Stress</a> )	L
Working in cold temperatures	Temperature stress: cold, hypothermia	Institute cold stress controls when air temperature or wind chill is or may drop below 40° F, when parts of the body are or may become immersed in cold water, and when working in snow or ice.  Train employees on the dangers and symptoms of cold-related illnesses and the applicable hazard controls. (See <a href="#">Procedure 14 Cold Stress</a> )  Train workers on the personal factors that may increase risk such as advanced age and circulatory problems and medications.  Establish a buddy system and ensure that personnel watch each other for signs of cold-related illnesses.  Provide a warm break area and establish a schedule for warm-up breaks and increase the frequency of warm-up breaks with decreasing temperatures. Take warm-up breaks if personnel exhibit shivering or report pain in the extremities that might be due to incipient frostbite.  Prevent or minimize exposure of bare skin if temperature or wind chill is less than minus (-) 25°F.  Schedule tasks to avoid long periods during which workers must sit or stand still.  Adjust work schedules or tasks for new employees to permit acclimatization to the cold conditions.  Encourage personnel to drink adequate quantities of water, soup, or other fluids to ensure adequate hydration.  Establish emergency plans to include immediately available dry clothing if there is a potential for personnel to be splashed or immersed in liquid.	L

Job Steps	Hazards	Controls	RAC
On-water activities	Hazards associated with working near open water	See Working Over and Near Water AHA	L
Repetition of work tasks for periods longer than 8 hours	Behavioral: human error - fatigue associated with extended work shifts including general drowsiness and also associated driving fatigue	<p>Operators of heavy equipment must not exceed 12 hours of duty time in any 24-hour period.</p> <p>Motor vehicle operators must not exceed 10 hours of driving in any 24-hour period.</p> <p>Do not operate motor vehicles after working for more than 12 hours during any 24-hour period.</p> <p>Know personal physical and psychological limitations.</p> <p>Stop working/driving, when necessary, to take breaks and hydrate.</p> <p>Stop work all together if fatigue endangers your safety or the safety of others. If appropriate, find a replacement for your job tasks.</p> <p>Schedule more demanding tasks for when endurance and alertness is best.</p> <p>Postpone more demanding and hazardous jobs if you are fatigued.</p> <p>Follow guidelines of HASP for work-rest regimens under adverse conditions of heat or cold stress.</p>	L
Completion of work shift and cleanup	<p>Clothing contact with potentially irritant materials/insects</p> <p>Take home toxics</p>	<p>Decontaminate yourself and gear, as appropriate, for contaminants and dust.</p> <p>If appropriate, wear Tyvek and washable or disposable over-boots to keep personal clothing and boots clean and free of any contaminated soils.</p> <p>Use liners to prevent contamination of truck.</p> <p>Shower immediately at end of workday.</p> <p>Check body for ticks, bites, and signs of irritation or cuts.</p>	L

Job Steps	Hazards	Controls	RAC
Determine location for setup/load and unload/stage equipment	Traffic-struck by hazards	Determine best access route before transporting equipment. Select location away from traffic. Place barricades for work site protection, if necessary. Wear high-visibility vest.	L
	Driving over soft ground Uneven terrain	Choose location with level and firm soils.	L
Collect soil/sediment samples	Ergonomic	Use good body mechanics. Do not twist at waist when pulling. Avoid awkward hand and body positions. Maintain good fitness routine.	L
	Slip, trip, and fall hazards	Wear slip-resistant footwear. Look before you step to ensure secure footing. Watch for rocks and animal burrows. Keep work area picked up and as clean as feasible and free of tripping and fall hazards.	L
	Flying debris, dirt, dust, and rocks	Wear safety glasses when there is a potential for flying debris. Ensure eyewash bottle or stations are available and first aid supplies are adequate.	L

Job Steps	Hazards	Controls	RAC
Collect soil samples (continued)	Strains, sprains, awkward bending/lifts, and ergonomic hazards	Size up the lift. Use proper lifting techniques. Ensure walking pathway is clear. Do not lift greater than 50 pounds. Use mechanical assistance or two-person lift for loads heavier than 50 pounds. Limit repetitive awkward motions. Never twist or turn when lifting. Use your legs to lift and keep a straight back.	L
	Noise	Wear hearing protection if noise levels from neighboring equipment exceeds 85 dBA (if you cannot be heard speaking in a normal voice at arms distances).	L
	Struck by hazards/pinch points	Maintain eye contact with machine operators and acknowledge they see you before moving into the work zone. Honor exclusion zone. Conduct real-time monitoring with photoionization detector (PID), if needed, when all operators are aware of your presence. Keep hands, fingers, and feet clear of moving equipment and pinch points.	L
Measure with PID for volatile organic compound	Inhalation of contaminants/chemical exposure	Follow personal protective equipment (PPE) dictates of HASP based on airborne measurements and action levels. Communicate air monitoring results to all those affected. Assure all chemicals brought to site are labeled as to contents (for example, methanol, hexane, acids) and hazards, and then disposed of properly. Obtain safety data sheets (SDSs) for all chemicals brought to the site	L
Collect soil samples	Inhalation and skin contact hazards	Wear chemical-resistant gloves based on the identified chemicals. Use boot covers and splash suit protection if necessary. Follow respirator action level dictates of HASP.	L
	Take home toxics	Decontaminate with soap and water. Remove all contaminated clothing and materials and leave on site. Use plastic as a barrier for soil, truck bed, or foot well contact. Practice good hygiene. Not eating or smoking until decontaminated. Shower as soon as possible.	L
	Unattended worker	Use "Buddy system."	L

Job Steps	Hazards	Controls	RAC
Put sample in preserved jar	Inhalation and skin contact with preservatives: NaOH, HNO <sub>3</sub> , HCl	Use in well ventilated area. Wear appropriate PPE (cuffed gloves, safety glasses). Review SDS.	L
	Spills	Use absorbents and containers for spills.	L
Label and put sample in cooler	Cut hazards	Set up stable work area for labeling samples. Wear adequate hand protection. Use care when handling glassware.	L
General site work (if not covered specifically in this AHA, refer to the General Site Work AHA)	General site hazards: insect bites and stings. Contact dermatitis from poisonous and irritating plants (poison ivy, poison oak, and poison sumac). Vehicle traffic Severe weather Heat stress Cold stress Noise Lifting Slips, trips, and falls UV hazards, etc.	See General Site Work AHA.	L

Job Steps	Hazards	Controls	RAC

ACTIVITY HAZARD ANALYSIS (AHA)						
<b>Activity/Work Task:</b> Mobilization and Demobilization (includes setup, take down, and staging of equipment) <b>Project Location:</b> Swan Island Basin, Portland Harbor Superfund Site, Multnomah County, Oregon <b>Contract number:</b> DT2002 <b>Date Prepared:</b> May 2021 <b>Prepared By:</b> Steve Davis CIH, CSP <b>Corporate H&amp;S Reviewer:</b> Edie Scala-Hampson <b>Notes:</b> (Field notes, review comments, etc.)	<b>Overall Risk Assessment Code (RAC) (Use highest code)</b>				<b>L</b>	
	<b>Risk Assessment Code (RAC) Matrix</b>					
	<b>Severity</b>	<b>Probability</b>				
		Frequent	Likely	Occasional	Seldom	Unlikely
	Catastrophic	<b>E</b>	<b>E</b>	<b>H</b>	<b>H</b>	<b>M</b>
	Critical	<b>E</b>	<b>H</b>	<b>H</b>	<b>M</b>	<b>L</b>
	Marginal	<b>H</b>	<b>M</b>	<b>M</b>	<b>L</b>	<b>L</b>
	Negligible	<b>M</b>	<b>L</b>	<b>L</b>	<b>L</b>	<b>L</b>
	Step 1: Review each "Hazard" with identified safety "Controls" and determine RAC (See above)					
	"Probability" is the likelihood to cause an incident, near miss, or accident and identified as: Frequent, Likely, Occasional, Seldom, or Unlikely.				<b>RAC Chart</b>	
"Severity" is the outcome/degree if an incident, near miss, or accident did occur and identified as: Catastrophic, Critical, Marginal, or Negligible				<b>E = Extremely High Risk</b>		
				<b>H = High Risk</b>		
Step 2: Identify the RAC (Probability/Severity) as E, H, M, or L for each "Hazard" on AHA. Annotate the overall highest RAC at the top of AHA.				<b>M = Moderate Risk</b>		
				<b>L = Low Risk</b>		
Job Steps	Hazards	Controls			RAC	
Review-health and safety needs	Inadequate planning, preparation, and training that can lead to the pain and suffering of an accident or personal injury	Readiness review to confirm all field personnel understand the project hazards and hazard controls and are trained in the procedures corresponding to work assignments.  Conduct pre-entry health and safety briefing.  Confirm all site hazards are recognized.  Confirm all necessary equipment to evaluate and control site hazards is available, calibrated, and in good working condition.  Confirm applicable engineering, administrative, and personal protective equipment (PPE) controls are ready to be implemented as needed.  Confirm emergency safety and first aid supplies are available.  Review emergency procedures and evacuation plans.			<b>L</b>	

Job Steps	Hazards	Controls	RAC
Mobilize equipment, tools and safety gear/demobilization same	Strains, sprains, awkward bending/lifts, and ergonomic hazards	<p>Move the load inside the truck as close to the edge of the bed as possible to be ready for unloading/ loading.</p> <p>Test the load first by nudging the item or container to estimate its weight and to determine if it can be moved alone. Know your limitations.</p> <p>Seek assistance in moving the object or load if it is heavier than 50 pounds.</p> <p>Do not lift greater than 50 pounds without mechanical assistance or two-person lift.</p> <p>Slide the load across the truck bed, do not lift and move.</p> <p>Move obstructions inside the truck to allow the load to slide across the truck bed.</p> <p>Use a step stool or step ladder to gain access to bed.</p> <p>Use proper lifting techniques. Lift with legs and a straight back. Do not twist while carrying a load. Move feet to avoid twisting.</p> <p>Ensure walking pathway is clear.</p> <p>Limit repetitive awkward motions.</p> <p>See General Site Work AHA.</p>	L
Travel to site	Traffic (road and site traffic) Infection	<p>Adjust seat and mirrors to ensure that you can reach controls and see behind you. Inspect vehicle to confirm it is in good working order and all cargo is secured and distractions are minimized. Familiarize yourself with the route and directions. (See <a href="#">HGL H&amp;S Procedure 16 Driving Safety</a>)</p> <p>See Coronavirus Practices to Prevent Exposure AHA</p>	L
<p>On-site mobilization/ demobilization</p> <ul style="list-style-type: none"> <li>Determine location for setup/staging equipment. Determine strategy for demobilization.</li> <li>Develop capability at the site, to include installation of office/equipment storage trailers, etc., as needed</li> <li>Set up/ take down trailers and other support services, as needed</li> <li>Load and unload equipment from barge/boat</li> </ul>	Traffic-struck by hazards	<p>Select location away from traffic.</p> <p>Place barricades for work site protection, if necessary.</p> <p>Wear high-visibility vest.</p> <p>Stay clear of traffic and equipment. Have all necessary PPE (hardhat, safety glasses, hearing protection, vest, etc.)</p>	L
	Driving over soft ground Uneven and rough terrain	Choose location with level and firm soils	L
	Site access control-unwanted entry	Use barricades or caution tape to mark the work area limits if there is potential for intrusion by unauthorized personnel	L
	Electric shock	Require that all electrical power hook up, installations, and disconnections be made or certified by a qualified electrician who will provide written certification of installation and grounding.	L
	Falling, tripping, slipping into water and drowning	See Working Over and Near Water AHA.	L

Job Steps	Hazards	Controls	RAC
Removal and transport of equipment and supplies from the site	Take home toxics	Decontaminate equipment and clothing as needed to minimize transfer of contaminants. Do not bring contaminated PPE or boots into truck. Use liners to prevent contamination of truck.	L
	Same hazards as in step above	See action to eliminate or minimize hazards in step above.	L
General site work	General site hazards: Insect bites and stings. Contact dermatitis from poisonous and irritating plants (poison ivy, poison oak, and poison sumac). Vehicle traffic Severe weather Heat stress Cold stress Noise. Lifting Slips, trips, and falls UV hazards, etc.	Refer to General Site Work AHA.	L

Note: This AHA will be revised and modified daily during the daily Tailgate Safety Meeting to include specific daily weather and river conditions for the portion of the Willamette River where activities will occur.

ACTIVITY HAZARD ANALYSIS (AHA)						
<b>Activity/Work Task:</b> Inspections, Surveys, and Sampling from a Watercraft <b>Project Location:</b> Swan Island Basin, Portland Harbor Superfund Site, Multnomah County, Oregon <b>Contract Number:</b> DT2002 <b>Date Prepared:</b> May 2021 <b>Prepared By:</b> Steve Davis CIH, CSP <b>Corporate H&amp;S Reviewer:</b> Edie Scala-Hampson <b>Notes:</b> (Field Notes, review comments, etc.)	<b>Overall Risk Assessment Code (RAC) (Use highest code)</b>				L	
	<b>Risk Assessment Code (RAC) Matrix</b>					
	<b>Severity</b>	<b>Probability</b>				
		Frequent	Likely	Occasional	Seldom	Unlikely
	Catastrophic	E	E	H	H	M
	Critical	E	H	H	M	L
	Marginal	H	M	M	L	L
	Negligible	M	L	L	L	L
	Step 1: Review each "Hazard" with identified safety "Controls" and determine RAC (See above)					
	"Probability" is the likelihood to cause an incident, near miss, or accident and identified as: Frequent, Likely, Occasional, Seldom, or Unlikely.				<b>RAC Chart</b>	
"Severity" is the outcome/degree if an incident, near miss, or accident did occur and identified as: Catastrophic, Critical, Marginal, or Negligible				E = Extremely High Risk		
Step 2: Identify the RAC (Probability/Severity) as E, H, M, or L for each "Hazard" on AHA. Annotate the overall highest RAC at the top of AHA.				H = High Risk		
				M = Moderate Risk		
				L = Low Risk		

Job Steps	Hazards	Controls	RAC
Determine location for setup/staging equipment-load and unload	Struck by hazards	Select location away from traffic. Place barricades for work site protection, if necessary. Wear high-visibility vest.	L
	Driving over soft ground Uneven terrain	Choose location with level and firm soils. Add gravel or use mud ramps on soft ground.	L
	Slip, trip, and fall hazards	Determine best access route before transporting equipment. Wear slip-resistant footwear. Look before you step to ensure safe and secure footing. Use Type I or V U.S. Coast Guard-approved personal floatation devices (PFDs) when working within 10 feet of water and/or entering shallow waters. Do not enter waters greater than waist depth. Keep work area clean and free of trip and fall hazards.	L

Note: This AHA will be revised and modified daily during the daily Tailgate Safety Meeting to include specific daily weather and river conditions for the portion of the Willamette River where activities will occur.

Job Steps	Hazards	Controls	RAC
Determine location for setup/staging equipment-load and unload (continued)	Heavy lifting- strains, sprains, awkward bending/lifts, and ergonomic hazards	Ensure walking pathway is clear. Do not lift greater than 50 pounds. Use mechanical assistance or two-person lift whenever possible. Limit repetitive awkward motions and twisting.	L
	Eye hazards-flying debris/splash and UV hazards	Wear safety glasses or a face shield when there is a potential for flying debris or splash hazards. Wear glasses with UV protection. Ensure eyewash station is available.	L
Weather evaluation	Severe weather and cold and/or heat stresses and water temperature hazards	Monitor weather forecasts for predicted inclement weather. Review heat and cold stress recognition and prevention instructions. Monitor heat stress index, air temperature, humidity and wind. Follow American Conference of Governmental Industrial Hygienists guidelines for work-rest regimens, as necessary. (Download the free smart phone Occupational Safety and Health Administration app for monitoring heat index on smartphone) <a href="http://www.osha.gov/SLTC/heatillness/heatindex/heatapp.html">www.osha.gov/SLTC/heatillness/heatindex/heatapp.html</a> Drink small amounts (4 oz.) of liquids for rehydration during breaks, per the work/rest regimen required based on temperature, workload, and acclimatization. Conduct work during the warmer/cooler part of the day if feasible. Wear sunscreen. Refer to Working Over and Near Water AHA. Refer to General Site Work AHA for actions not listed here.	L
Watercraft operation (To be conducted by subcontractor)	Hazards of boat operation	Refer to Working Over and Near Water AHA and watercraft subcontractor Health and Safety Plan (HASP).	L
Sample collection	Water hazards-falling overboard and/or stranded	Refer to Working Over and Near Water AHA.	L

Note: This AHA will be revised and modified daily during the daily Tailgate Safety Meeting to include specific daily weather and river conditions for the portion of the Willamette River where activities will occur.

Job Steps	Hazards	Controls	RAC	
Sample collection (continued)	Inhalation, ingestion, and skin contact hazards of chemicals of concern	<p>Conduct real-time monitoring before and during sampling activities if contaminant of concern concentrations in media warrant sampling.</p> <p>Follow personal protective equipment (PPE) dictates of HASP based on airborne measurements and action levels.</p> <p>Wear chemical-resistant gloves based on the identified chemicals. Use boot covers and splash suit protection, if necessary. Follow respirator action level dictates of HASP.</p> <p>Follow good hygiene practices.</p> <p>Move exposed person away from source of contamination and rinse mouth if contaminant has been ingested.</p> <p>If exposure to skin occurs, promptly wash contaminated skin using soap or mild detergent and water.</p>	L	
	Hand and power tool use	<p>Ensure all tools are working properly.</p> <p>Beware of sharp edges.</p> <p>Beware of electrical connections and water hazards when working with electric powered tools especially on vessels or on-water platforms.</p>		L
	Pinch points	<p>Secure objects on deck.</p> <p>Keep hands clear of closing mechanisms and moving parts.</p> <p>Avoid placing body parts between vessels and other objects.</p>		L
	Take home toxics	<p>Decontaminate with soap and water.</p> <p>Remove all contaminated clothing and materials and leave on site. Use plastic as a barrier for soil, truck bed, or foot well contact.</p> <p>Shower as soon as possible.</p>		L
	Environmental hazards <ul style="list-style-type: none"> <li>• Biologicals - Plants, insects, wildlife</li> <li>• Adverse weather</li> <li>• Temperature stresses</li> <li>• UV hazards</li> </ul>	See General Site Work AHA.		L
	Unattended worker	<p>Use the "buddy system."</p> <p>Maintain visual contact with the sampling technician during sampling activities.</p>		L

Note: This AHA will be revised and modified daily during the daily Tailgate Safety Meeting to include specific daily weather and river conditions for the portion of the Willamette River where activities will occur.

Job Steps	Hazards	Controls	RAC
Put sample in preserved jar	Inhalation, ingestion, and skin contact with preservatives such as: acids, methanol and hexane	Use in well-ventilated area. Wear appropriate PPE (gloves, safety glasses). Obtain safety data sheets for preservatives being used. Follow safe handling procedures. Follow good hygiene practices. Move exposed person away from source of contamination and rinse mouth if contaminant has been ingested. If exposure to skin occurs, promptly wash contaminated skin using soap or mild detergent and water.	L
	Spills	Use absorbents and containers for spills.	L
Label and put sample in cooler	Cut hazards	Set up stable work area for labeling samples. Label all containers as to contents. Wear adequate hand protection. Use care when handling glassware.	L
	Heavy lifting - strains, sprains, awkward bending/lifts, and ergonomic hazards	Use proper lifting techniques. Ensure walking pathway is clear. Do not lift greater than 50 pounds. Use mechanical assistance or two-person lift whenever possible. Limit repetitive awkward and twisting motions.	L

Job Steps	Hazards	Controls	RAC
<b>Add Steps, Hazards, and Actions to Eliminate or Minimize Hazards based on conditions encountered in the field.</b>

Weather evaluation	Severe weather and cold and/or heat stresses Water temperature hazards	<p>Monitor weather forecasts for predicted inclement weather. Check weather prior to departure and reschedule if severe weather is forecasted. Personnel will depart the location near the open water if lightning is within 10 miles.</p> <p>Review heat and cold stress recognition and prevention instructions.</p> <p>Monitor heat stress index, air temperature, humidity and wind. Follow American Conference of Governmental Industrial Hygienists guidelines for work-rest regimens, as necessary. (Download the free smart phone Occupational Safety and Health Administration app for monitoring heat index: <a href="http://www.osha.gov/SLTC/heatillness/heatindex/heatapp.html">www.osha.gov/SLTC/heatillness/heatindex/heatapp.html</a>.)</p> <p>Drink small amounts (4 oz.) of liquids for rehydration during breaks, per the work-rest regimen required based on temperature, workload, and acclimatization.</p> <p>Conduct work during the warmer/cooler part of the day if feasible.</p> <p>Wear 30+ SPF sunscreen.</p> <p>Suspend work at winds above 25 miles per hour, rough water, freezing rain, lightning/thunder, or during extreme temperatures.</p> <p>Check that communication device's function. For overwater work, communication devices will be provided by vessel operators. HydroGeoLogic, Inc., will use VHS radios for all near water work.</p> <p>Refer to General Site Work AHA and the sitewide Emergency Response Plan for additional detail and actions not listed here.</p>	<b>L</b>

Job Steps	Hazards	Controls	RAC
General site work	Falling, tripping, slipping into water, and drowning	<p>Where the hazard of drowning exists, always wear a U.S. Coast Guard-approved Type I or Type V personal flotation device (PFD) when working around water, even when inside mobile equipment. Auto-inflatable models are preferred, if available. Ring buoys with at least 90 feet of line should be provided and readily available for emergency rescue operations. Distance between staged/stored ring buoys shall not exceed 200 feet.</p> <p>Use the “buddy system” while working on or near water.</p> <p>Keep water rescue equipment easily accessible and know where they are stored.</p> <p>Ensure there are markings or barricades at the edge of vessels.</p> <p>Use lifeline, harness, and appropriate anchorage if deemed necessary.</p> <p>Practice good housekeeping and keep all travel ways clear around water hazards.</p> <p>Prevent placement of non-secured loads at the edge of vessels that workers may lean against or sit on.</p> <p>Means of access and egress and their approaches should be free from obstruction and, as far as practicable, kept clear of any substance likely to cause a slip, trip, or fall hazards.</p> <p>Add slip-resistant tape or surfacing where possible.</p> <p>Use handrails where available.</p> <p>Wear non-slip footwear.</p> <p>Maintain visual contact with staff during all activities.</p> <p>Maintain communication with staff working near water.</p> <p>Formulate relevant emergency preparedness procedures, e.g., contingency plans, rescue/evacuation arrangements, and drills. A rescue vessel may also be required.</p> <p>Conduct daily workplace examinations.</p>	L
	Pinching Entrapment	<p>Secure objects on deck.</p> <p>Maintain safe distance from moving mechanical parts.</p> <p>Barricade, mark with high-visibility taping or signage, or point out pinch point hazards.</p> <p>Keep hand clear of closing mechanisms and moving parts.</p> <p>DO NOT place body parts over the side of the vessel when another object is in close proximity.</p>	L
	Tension hazards	<p>Recognize cables, ropes, and straps may be under tension or force. Stand sufficiently back to prevent whiplash hazards from snapped cables or hydraulic lines.</p> <p>Communicate with the field team members whenever an object is being moved, hoisted, or tension is placed on a cable or hydraulic line.</p>	L

Job Steps	Hazards	Controls	RAC
General site work (continued)	Exceeding capacity	Do not exceed the weight limit of the vessel and be mindful to changes in its center of gravity when stowing equipment or heavy loads.  Do not exceed the posted number of passengers and weight limits	L
	Fire, smoke inhalation, injury from blast shrapnel, or burns	Ensure that a functioning fire extinguisher is available and personnel know where it is located.  Call 911.  Be prepared to abandon vessel in case of major fire. <ul style="list-style-type: none"> <li>• Review abandon ship procedures (to be provided by the boating subcontractor) with field team members prior to work.</li> <li>• Only the vessel captain or platform lead can order abandon ship.</li> <li>• Communicate the intent to abandon ship to all personnel onboard.</li> <li>• Notify the U.S. Coast Guard (USCG) and nearby vessels of intent to abandon ship.</li> <li>• Be aware of the propeller position and any floating spills of petroleum fluids before abandoning ship.</li> </ul>	L
	Slips and falls due to undercut banks and sloughing ground	Suitable footwear is required to reduce the risk of slipping.  Use caution: Look before you step to ensure safe and secure footing. Slopes are extremely dangerous.  Watch out for burrowing animals.  Use slow cautious steps in descending and ascending slopes. Tall weeds make visibility difficult.	L
	Noise	Wear hearing protection in high noise environments (greater than 85 dBA for a time weighted 8-hour average). At noise levels above 85 dBA you will not be able to carry on a conversation at arms-length without yelling.  Ensure hearing protection is available.	L
	Contact with contaminated water	Use nitrile gloves.  Rinse skin with clean potable water immediately and thoroughly after coming into contact with possible contaminated water.  Cover any broken skin areas with disinfectant and bandages.	L
	Electrical hazards contact with energized line (shock; electrocution)	All electrical installations and equipment should be constructed, installed, operated, protected, and maintained to prevent the risk of danger from electric shock or burns.  NEVER string or hang temporary power cords, wires, etc., on metal or near water.	L

Job Steps	Hazards	Controls	RAC
General site work (continued)	Person overboard, drowning	<p>PFD must be worn within 10 feet of water's edge on overwater vessels or platforms.</p> <p>Ensure a throw ring and throw rope are readily accessible.</p> <p>Be able to identify and address hypothermia.</p> <p>If you witness someone fall overboard:</p> <ul style="list-style-type: none"> <li>• Yell "Person Overboard!"</li> <li>• Throw a flotation device immediately.</li> <li>• If the vessel engine is running, take it out of gear and swing the stern clear to keep from hitting the person</li> <li>• Call 911 or USCG via marine radio (channel 16)</li> <li>• Assign a spotter to keep the person overboard in sight at all times.</li> <li>• Contact nearby vessels for assistance.</li> <li>• Recover the person from the water.</li> <li>• Lift from the shoulders of the life vest during retrieval, not the person's body, unless there is no other option.</li> </ul> <p>If you fall overboard:</p> <ul style="list-style-type: none"> <li>• Hold your mouth and nose closed and protect your head.</li> <li>• At the surface, look for movement, listen for sounds, and call for help.</li> <li>• Use the whistle attached to your PFD and activate the beacon light.</li> <li>• It is only sensible to swim if there is reason to believe you have a chance of reaching your destination. Too much movement in cold water can speed risk of hypothermia.</li> </ul>	L
Watercraft operation/navigation (To be conducted by subcontractor)	Hazards of boat operation	<p>Boat operator(s) must meet all education and licensing requirements of the State of Oregon, which includes the Oregon Marine Safety Board Boater Education Course.</p> <p>Observe all boating regulations.</p> <p>Familiarize yourself with any movement of boat traffic on the stream or river.</p> <p>Maintain a safe operating distance from shoreline and other vessels.</p> <p>Obtain information about water temperature and depths, and be familiar with locations of rocks, ledges, and manmade surface obstructions noted within the study area.</p> <p>Tie down equipment when necessary if there are issues of boat instability.</p> <p>Acquire USCG-approved lighting and signaling devices as required.</p> <p>Acquire marine emergency and rescue equipment.</p>	L

Job Steps	Hazards	Controls	RAC
Sample collection from watercraft	Water hazards - Falling overboard and/or stranded	<p>Remain seated except when working.</p> <p>Wear USCG-approved PFDs while on watercraft.</p> <p>Wear non-slip work shoes.</p> <p>Properly secure, guard, and maintain the boat access and walking areas free of tripping and slipping hazards.</p> <p>Maintain an adequate number of USCG throw rings.</p> <p>Do not exceed maximum weight capacity for watercraft.</p> <p>Do not use watercraft without shore support personnel.</p> <p>Maintain radio/cell phone contact with shore personnel.</p> <p>Review float plan with shore personnel so they can track whereabouts.</p> <p>Review training for person overboard emergencies and conduct drills to verify personnel are aware of their responsibilities.</p> <p>Follow water safety rules.</p> <p>Refer to USCG regulations. For more extensive information on working on or around water, refer to the Marine Operations Requirements.</p> <p>Review the prepared plan for marine emergencies such as fire, sinking, flooding, severe weather, person overboard, etc.</p>	L
Sample collection from shore/wading	Slipping into water and drowning	<p>Wear waders and USCG-approved PFDs. Check for leaks in waders prior to entering water.</p> <p>Work in pairs, using the “buddy system” to complete all tasks.</p> <p>Work during low tide. Check depths and flows.</p> <p>Use pole to probe depth of water ahead of where steps are taken to avoid drop-offs and boulders/rocks with gaps that could trap a foot.</p> <p>Do not enter water deeper than waist height.</p> <p>Be aware of potentially slippery surfaces and tripping hazards.</p> <p>Do not enter areas of high flow or when large floating debris is present.</p>	L
Boat refueling, if required (To be conducted by subcontractor)	Fire and fuel spills	<p>Store fuel in an area free of vegetation and debris with proper signage.</p> <p>Transport all flammable liquids in approved containers.</p> <p>Prohibit smoking while refueling.</p> <p>Turn motor off before refueling.</p> <p>Maintain a fully charged fire extinguisher that is readily accessible.</p> <p>Verify spill kit is on board all vessels or platforms that use petroleum fuel or hydraulics.</p>	L

Job Steps	Hazards	Controls	RAC
<b><i>Add Steps, Hazards, and Actions to Eliminate or Minimize Hazards based on conditions encountered in the field.</i></b>			
		Refer to the sitewide Emergency Response Plan for additional details and responses to boating related incidents.

**ACTIVITY HAZARD ANALYSIS (AHA) CERTIFICATION**

<b>Activity/Work Task:</b> Encountering Houseless Community Members <b>Project Location:</b> Swan Island Basin, Portland Harbor Superfund Site, Multnomah County, Oregon <b>Contract number:</b> DT2002 <b>Date Prepared:</b> January 2021, revised May 2022 <b>Prepared by:</b> Jeff Gadt <b>Corporate Health and Safety Approval:</b> Edie Scala-Hampson CIH, CHMM <b>Notes:</b> (Field Notes, Review Comments, etc.)	<b>Overall Risk Assessment Code (RAC) (Use highest code)</b>					<b>L</b>
	<b>Risk Assessment Code (RAC) Matrix</b>					
	<b>Severity</b>	<b>Probability</b>				
		Frequent	Likely	Occasional	Seldom	Unlikely
	Catastrophic	<b>E</b>	<b>E</b>	<b>H</b>	<b>H</b>	<b>M</b>
	Critical	<b>E</b>	<b>H</b>	<b>H</b>	<b>M</b>	<b>L</b>
	Marginal	<b>H</b>	<b>M</b>	<b>M</b>	<b>L</b>	<b>L</b>
	Negligible	<b>M</b>	<b>L</b>	<b>L</b>	<b>L</b>	<b>L</b>
	Step 1: Review each <b>"Hazard"</b> with identified safety <b>"Controls"</b> and determine RAC (See above)					
	<b>Probability</b> the likelihood the activity will cause a Mishap (near miss, incident, or accident). Identify as: Frequent, Likely, Occasional, Seldom, or Unlikely.					<b>RAC Chart</b> <b>E = Extremely High Risk</b> <b>H = High Risk</b> <b>M = Moderate Risk</b> <b>L = Low Risk</b>
<b>Severity</b> the outcome/degree if a mishap occurred. Identify as: Catastrophic, Critical, Marginal, or Negligible						
Step 2: Identify the RAC (Probability/Severity) as E, H, M, or L for each "Hazard" on AHA. Annotate the overall highest RAC at the top of AHA.						

Job Steps	Hazards	Controls	RAC
Mobilization to site	Failure to plan/warn/train about the houseless community and potential hazards	<p>Conduct readiness review with field team members prior to fieldwork. Site Safety and Health Officer (SSHO) to identify properties with houseless communities or individuals in relation to the task, work locations, and surrounding areas.</p> <p>SSHO to confirm Houseless Outreach Flyers notifying the houseless community of field activities at the properties they occupy are available for distribution. This flyer, which is to be updated quarterly, will be distributed to each houseless community member encountered during field activities. When applicable per direction from EPA, SSHO to confirm Houseless Outreach Flyers have been distributed in the work area 3-5 days ahead of the start of field activities.</p> <p>SSHO to facilitate/confirm field personnel have received the <i>Intro to Trauma Informed Care Training</i>, as recommended by EPA. Review the <a href="#">HGL Bloodborne Pathogens Program (H&amp;S Procedure 19)</a>.</p> <p>SSHO to discuss interactions with houseless community members and lessons learned in the readiness review and initial tailgate safety meeting and address the topics listed below. SSHO to verify that the necessary equipment and supplies are available and in good condition: nitrile gloves,</p>	<b>L</b>

Job Steps	Hazards	Controls	RAC
		Kevlar® or equivalent gloves resistant to cut/puncture wounds, steel-toed boots, and safety glasses.	
Site Tasks	Sharp objects (e.g., broken glass, needles)	<ol style="list-style-type: none"> <li>1. Wear proper PPE as described above.</li> <li>2. Be aware of your surroundings with regard to the presence of the houseless community members and debris that could contain needles (<u>bloodborne pathogens</u>), broken glass or metal. Avoid the handling of these objects unless wearing proper protective puncture resistant gear.</li> <li>3. If clearing debris from an area of ground, use a shovel or broom to move the debris and limit hand contact with surfaces/material that cannot be visually inspected.  Use traffic cones to delineate areas of hazardous debris.</li> <li>4. If a sharp object breaks the skin of an individual:               <ol style="list-style-type: none"> <li>a. Get first aid to treat the wound.</li> <li>b. If it's suspected that the individual may have been exposed to blood or other potentially infectious body fluids, follow the notification requirements in Section 5.3 <i>Post Exposure Actions of the Bloodborne Pathogens Program</i>.</li> </ol> </li> </ol>	<b>L</b>
	Other potentially infectious material (OPIM)	<ol style="list-style-type: none"> <li>1. Implement the controls for sharp objects. In particular, use of nitrile gloves.</li> <li>2. Be aware that bodily fluids (e.g., saliva, semen, any bodily fluid that is visibly contaminated with blood) and feces may be present in or near areas where houseless individuals camp. HBV, HCV, and HIV can be spread through contact with OPIM.</li> </ol>	

Job Steps	Hazards	Controls	RAC
Site Tasks (continued)	Person-to-person encounters with aggressive houseless individuals	<ol style="list-style-type: none"> <li>1. Maintain the buddy system at all times during work activities in areas the houseless community occupy.</li> <li>2. During the tailgate meeting each morning, discuss notable houseless individuals other field personnel have encountered.</li> <li>3. Procedures for encounters with houseless community members:               <ol style="list-style-type: none"> <li>a. If houseless individuals occupy a property to be sampled, make eye contact and treat them with dignity/respect and apply principles from the <i>Intro to Trauma Informed Care Training</i>. Distribute Houseless Outreach flyers to each individual encountered. When applicable per direction from EPA, SSHO to confirm Houseless Outreach Flyers have been distributed in the work area 3-5 days ahead of the start of field activities.</li> <li>b. If an individual becomes aggressive, back away to a safe location. When you are in a safe location, away from the aggressor and out of ear shot, call a community social work organization and/or police.                   <ol style="list-style-type: none"> <li>i. Portland Police Bureau 911 AND ask for PORTLAND STREET RESPONSE (this program dispatches unarmed and trauma-informed staff)</li> <li>ii. Multnomah County's 24/7 mental health crisis line: 503-988-4888</li> </ol> </li> </ol> </li> </ol> <p>If the houseless community member is a panhandler: make eye contact as you speak with them; apologize first to the panhandler to keep them calm, but use a firm tone; say sorry, and that you are working and need to continue with your tasks; if they become aggressive back away and follow steps above.</p>

## EMERGENCY RESPONSE IMMEDIATE NOTIFICATION

**SECURITY**  
**MEDICAL**

**=**

**CHANNEL 1** or **Ext. # 1799**

**503-247-1799**

Call Security to notify them of the emergency (type of emergency, location, number of injured, etc.) For emergency on vessels, notify Security *and* the Ship's Superintendent. Security personnel will contact on-site First Aid and any outside Emergency response agencies as needed. (see VI Emergency Response Plan)

*Notify first available Supervisor of the emergency.*

**OILS SPILLS AND CHEMICAL RELEASE NOTIFICATION PROCEDURE**

IF THERE IS A SPILL OF OIL OR CHEMICALS, IMMEDIATELY CONTACT THE ON SITE SHIP SUPERINTENDENT AND VIGOR'S ENVIRONMENTAL DEPARTMENT. STOP THE RELEASE OF MATERIAL, ATTEMPT TO CONTAIN SPILLED MATERIAL – ONLY IF YOU CAN DO SO SAFELY AND HAVE THE PROPER EQUIPMENT AND TRAINING.

(see VI Emergency Response Plan)

 Job Location: N Basin Ave & N Ensign St  
 City, State: Portland, OR  
 Type of Work: Manhole Access  
 Job Duration: 1 Night

### Equipment List

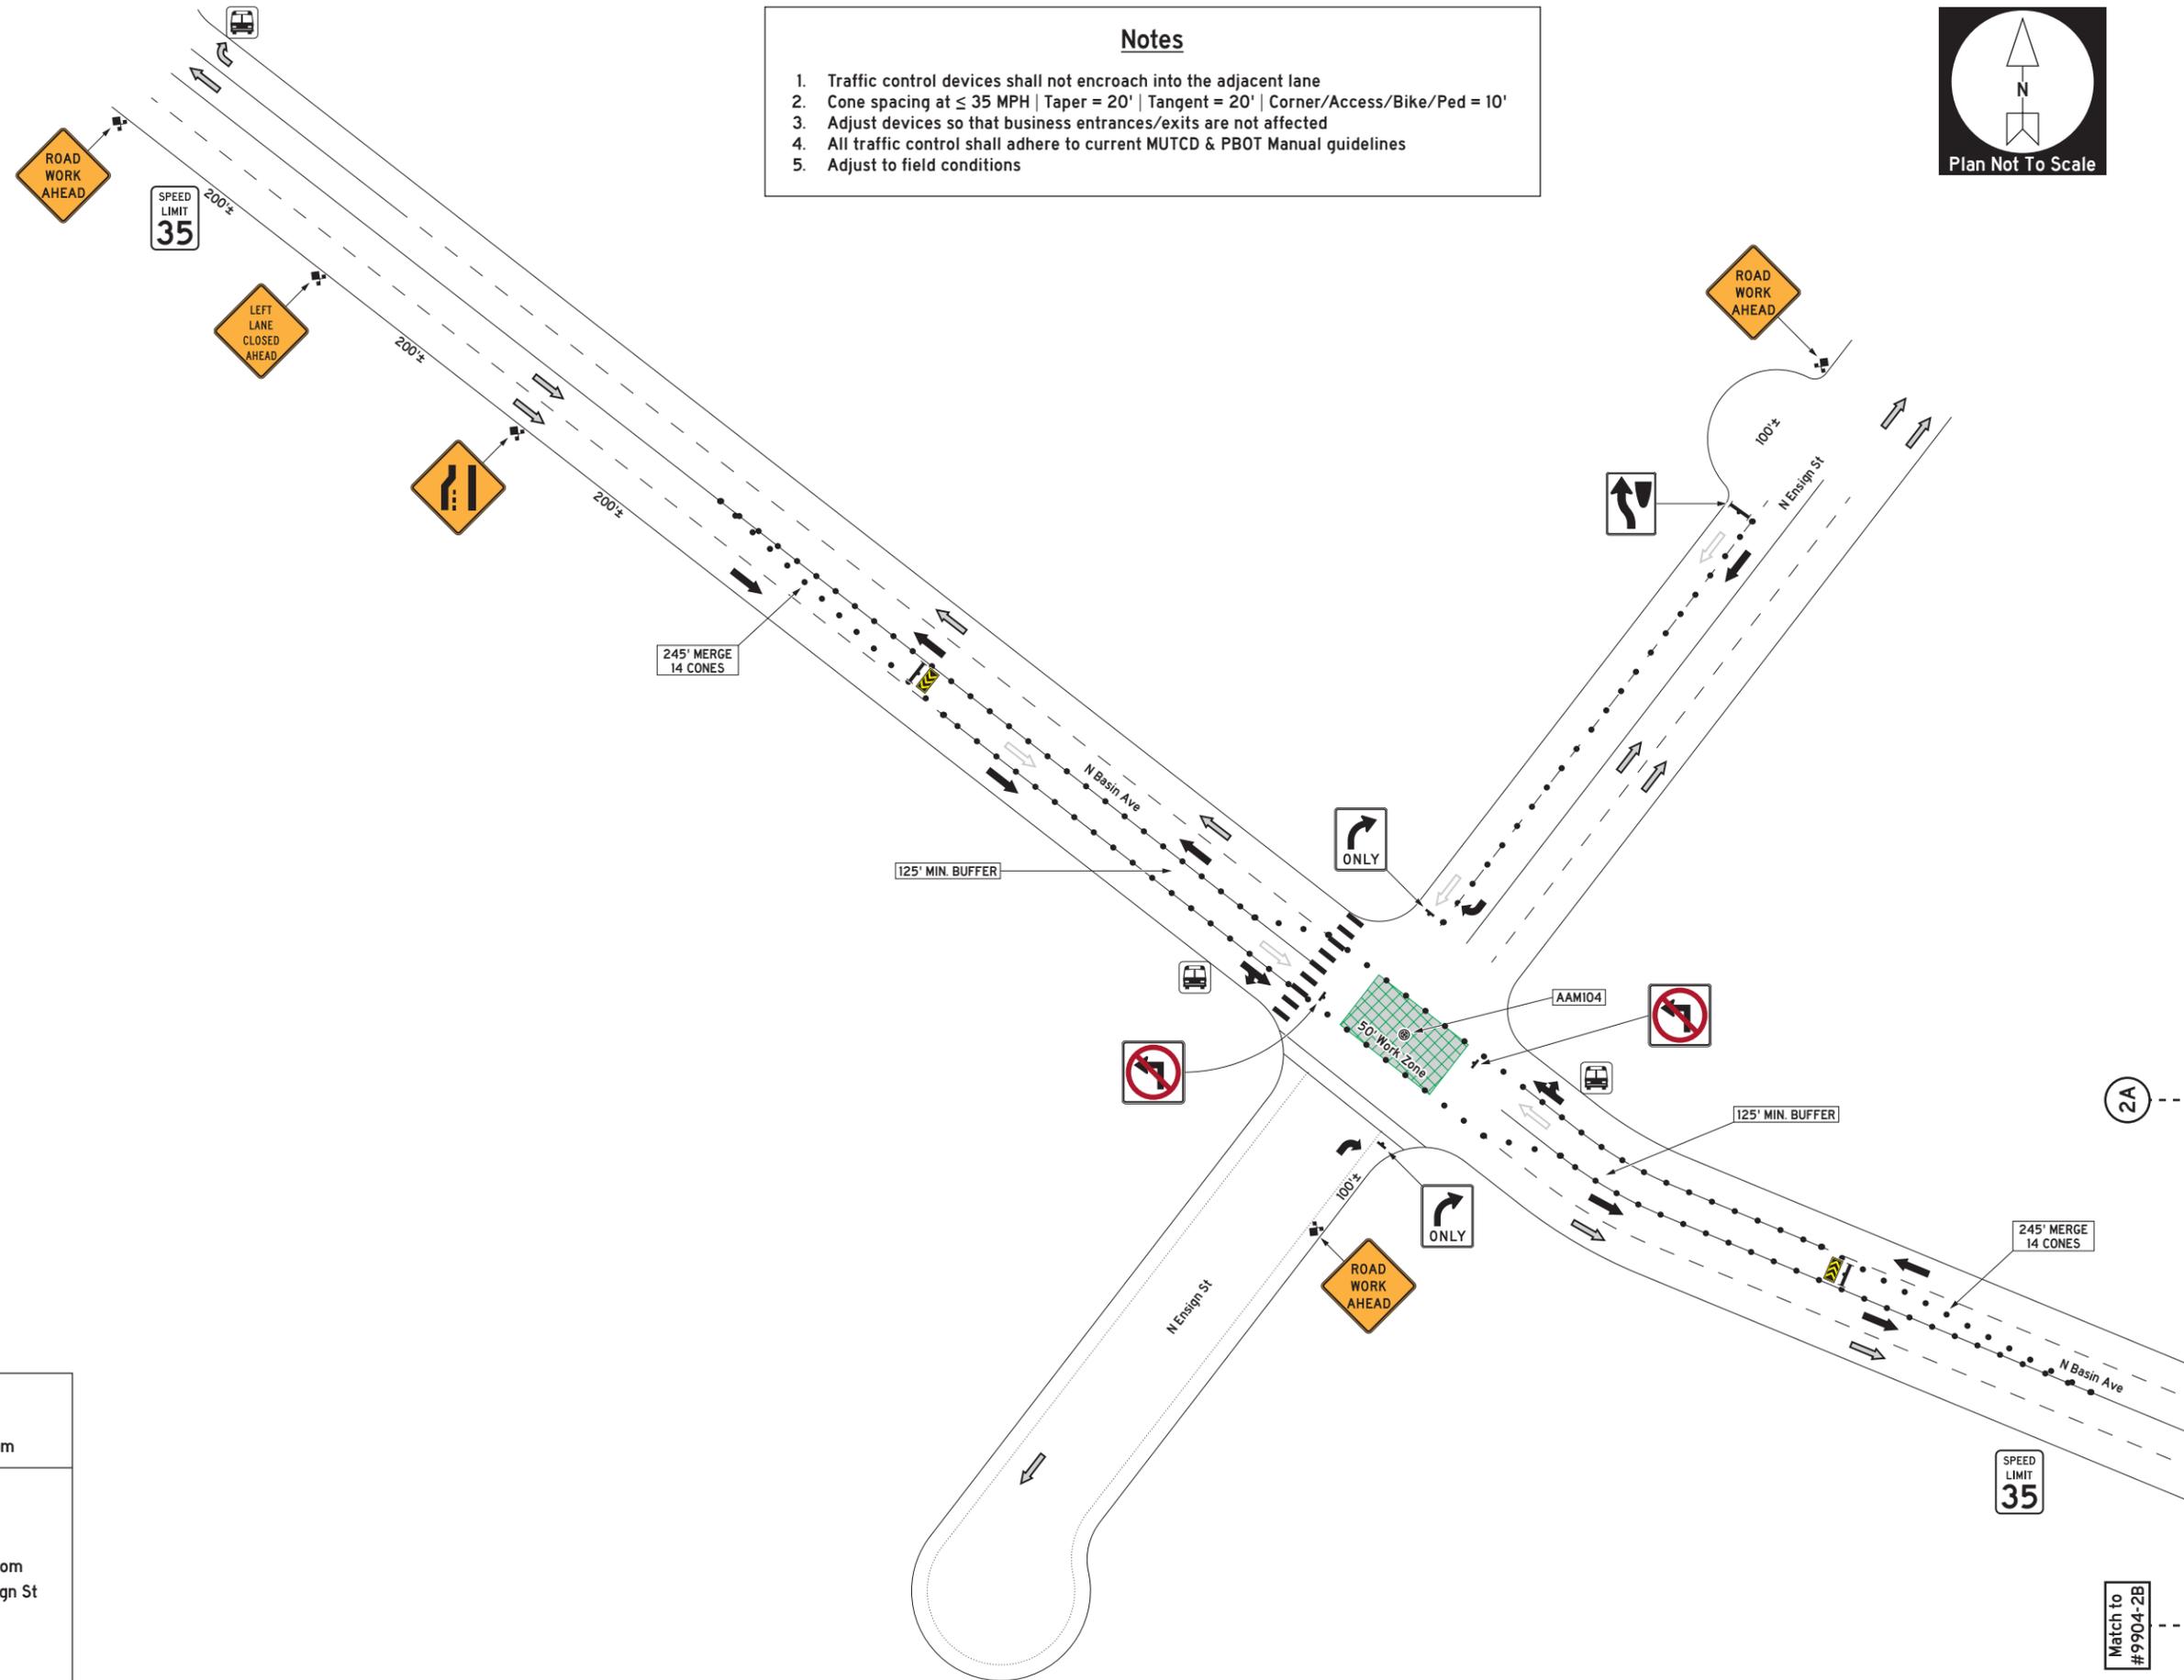

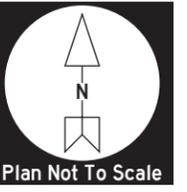

- 4 Road Work Ahead
- 2 Left Lane Closed Ahead
- 2 Transition
- 2 Type II - Right Turn Only
- 2 Type II - No Left Turn
- 1 Type III - Median Shift (L)
- 2 Arrow Boards with Type III Barricades
- 135 28" Cones

### Legend

-  36" x 36" Signs w/ Flags
-  Type II Barricade
-  Type III Barricade
-  Arrow Board
-  28" Cones
-  Work Zone
-  Parking Lane

### Notes

1. Traffic control devices shall not encroach into the adjacent lane
2. Cone spacing at  $\leq 35$  MPH | Taper = 20' | Tangent = 20' | Corner/Access/Bike/Ped = 10'
3. Adjust devices so that business entrances/exits are not affected
4. All traffic control shall adhere to current MUTCD & PBOT Manual guidelines
5. Adjust to field conditions

# DAILY PROJECT SAFETY INSPECTION REPORT

Project: \_\_\_\_\_ Date: \_\_\_\_\_

Inspector Name: \_\_\_\_\_

Work Area Description: \_\_\_\_\_

Site Activities at Time of Inspection \_\_\_\_\_

	YES	NO	NA
<u>FIRST AID</u>			
1. Are first aid kit locations identified and accessible?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Are emergency eye wash/safety showers available and inspected monthly?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Are first aid kits inspected weekly?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Is a qualified first aid/CPR provider on site?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<u>PERSONAL PROTECTIVE EQUIPMENT</u>			
1. Have levels of personnel protection been established?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Are respirators decontaminated, inspected, changed and stored according to standard procedures?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Have employees been fit-tested?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Is defective personal protective equipment tagged and taken out of service?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Does compressed breathing air meet CGA Grade "D" minimum?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6. Are there sufficient sizes and quantities of protective equipment? Coveralls, gloves, reflective vests?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
7. At a minimum, are employees utilizing safety glasses, hearing protection, hard hats, and safety toe boots, chemical protective gloves (if applicable) and following SSHP requirements?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
8. Is there protection against insects, sunburn, heat stress, cold stress, vibration and other environmental hazards? Shade, warming shelters, drinking water, work-rest regimen enforced?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<u>FIRE PREVENTION</u>			
1. Are employees smoking only in designated outdoor areas?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Are fire lanes established and maintained?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Are flammable liquid dispensing systems bonded?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Are approved safety cans available for storage of flammable liquids?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Has the local fire department been contacted?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6. Are flammables and combustibles properly stored?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
7. Are flammable storage cabinets available and used when needed?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<u>AIR MONITORING</u>			
1. Is required air monitoring being conducted?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Are air monitoring instruments calibrated daily?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Are air monitoring logs up to date?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Are instrument user manuals available?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Are instruments being maintained?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6. Are employees notified of personal sampling results within 5 days of receipt?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
7. Is dust being controlled?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

# DAILY PROJECT SAFETY INSPECTION REPORT (continued)

Project: \_\_\_\_\_

Date: \_\_\_\_\_

	YES	NO	NA
<u>WELDING AND CUTTING</u>			
1. Are fire extinguishers present at welding and cutting operations? Is a fire watch assigned?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Are confined spaces evaluated prior to and during cutting and welding operations?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Have Hot Work Permits been completed?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Are proper helmets, goggles, aprons, and gloves available for welding and cutting operations?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Are welding machines properly grounded?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6. Are oxygen and fuel gas cylinders stored a minimum of 20 feet apart?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
7. Are only trained personnel permitted to operate welding and cutting equipment?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
8. Are gas cylinders transported in a secured vertical position with caps in place?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
9. Is there adequate ventilation to prevent inhalation of metal fume (manganese)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<u>HAND AND POWER TOOLS</u>			
1. Are defective hand and power tools tagged and taken out of service?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Is eye protection available and used when operating power tools?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Are guards and safety devices in place on power tools?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Are power tools inspected before each use?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Are non-sparking tools available when necessary?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6. Is the correct tool being used for the job?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<u>MOTOR VEHICLES</u>			
1. Are vehicles clean and regularly inspected?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Are personnel licensed for the vehicles they operate?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Are unsafe vehicles tagged and reported to supervision?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Is vehicles safety equipment operating properly?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Are loads secure?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6. Are vehicle occupants using safety belts?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
7. Are current insurance cards and blank accident report forms located in vehicles?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<u>EMERGENCY PLANS</u>			
1. Are emergency numbers posted?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Have emergency escape routes been designated?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Are employees familiar with the emergency signal?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Has the emergency route to the hospital been established and posted?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Is a vehicle on site that can transport injured employees to the hospital?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6. Is there emergency support documentation (written agreements, telephone conversation log)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<u>MATERIALS HANDLING/ MANLIFTS/OPERATOR EQUIPMENT QUALIFICATIONS</u>			
1. Are materials stacked and stored to prevent sliding or collapsing?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Are tripping hazards identified?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Are semi-trailers chocked?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Are fixed jacks used under semi-trailers?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Are riders prohibited on materials handling equipment?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6. Are approved manlifts provided for the lifting of personnel?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
7. Are personnel in manlifts wearing approved fall protection devices?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
8. Are only qualified operators utilized i.e., forklift trained, heavy equipment, crane operator? Documentation of qualification?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

# DAILY PROJECT SAFETY INSPECTION REPORT (continued)

Project: \_\_\_\_\_

Date: \_\_\_\_\_

	YES	NO	NA
<u>FIRE PROTECTION</u>			
1. Has a fire alarm system been established?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Do employees know the location and use of all fire extinguishers?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Are fire extinguisher locations posted?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Are combustible materials segregated from open flames?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Have fire extinguishers been professionally inspected during the last year?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6. Are fire extinguishers visually inspected monthly?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
7. Has a fire drill occurred within the last 12 months?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<u>ELECTRICAL/CONTROL OF HAZARDOUS ENERGY</u>			
1. Is electrical equipment and wiring properly guarded and maintained in good condition?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Are extension cords kept out of wet areas?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Is damaged electrical equipment tagged and taken out of service?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Have underground electrical lines been identified by proper authorities?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Has a lockout/tagout system been established?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6. Are GFCIs being used on all temporary electrical systems and as needed?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
7. Are extension cords being inspected daily?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
8. Are warning signs exhibited on high voltage equipment (250V or greater)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
9. Is adequate distance maintained from overhead electrical lines?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
10. Are switches, circuit breakers, and switchboards installed in wet locations enclosed in weatherproof enclosures?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
11. Are restricted or limited approach boundaries identified on electrical panels?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
12. Are authorized electricians trained in NFPA 70?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
13. Are only electrically rated tools being used for electrical work?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<u>CRANES/RIGGING/CRITICAL LIFTS</u>			
1. Are cranes inspected daily prior to use?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Are crane swing areas barricaded or demarked?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Is all rigging equipment tagged with an identification number and rated capacity?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Is rigging equipment inspection documented?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Are slings, chains, and rigging inspected before each use?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6. Are damaged slings, chains, and rigging tagged and taken out of service?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
7. Are slings padded or protected from sharp corners?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
8. Do employees keep clear of suspended loads?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
9. Are rated load capacities and special hazard warnings posted on crane?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
10. Are the records of annual crane inspection available?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
11. Has accessible areas within the swing radius of the rear of the crane been barricaded?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
12. Do crane operators have required training/certification?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

# DAILY PROJECT SAFETY INSPECTION REPORT (continued)

Project: \_\_\_\_\_

Date: \_\_\_\_\_

	YES	NO	NA
<u>COMPRESSED GAS CYLINDERS/PRESSURIZED SYSTEMS</u>			
1. Are breathing air cylinders charged only to prescribed pressures?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Are like cylinders segregated and stored in well ventilated areas?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Is smoking prohibited in cylinder storage areas?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Are cylinders stored secure and upright?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Are cylinders protected from snow, rain, etc.?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6. Are cylinder caps in place before cylinders are moved?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
7. Are fuel gas and oxygen cylinders stored a minimum of 20 feet apart?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
8. Are propane cylinders stored and used only outside of buildings?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<u>SCAFFOLDING/ AERIAL WORK PLATFORMS</u>			
1. Is scaffolding placed on a flat, firm surface?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Are scaffold planks free of mud, ice, grease, etc.?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Is scaffolding inspected before each use?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Are defective scaffold parts taken out of service?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Have employees completed scaffold user training?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6. On scaffolds where platforms are overlapped, is planking overlapped a minimum of 12 inches?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
7. Does scaffold planking extend over end supports between 6 to 18 inches (dependent upon platform length)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
8. Are employees restricted from working on scaffolds during storms and high winds?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
9. Are all pins in place and wheels locked?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
10. Is required perimeter guarding (top rail, mid rail, and toe board) present?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
11. Has a competent person been designated to oversee scaffold construction?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
12. Are employees prohibited from moving mobile scaffold horizontally while employees are on them?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
13. Are all scaffold components manufactured by the same company?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<u>WALKING AND WORKING SURFACES AND GENERAL SITE HOUSEKEEPING</u>			
1. Are ladders regularly inspected?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Are access ways, stairways, ramps, and ladders clean of ice, mud, snow, or debris?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Are ladders being used in a safe manner?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Are ladders kept out of passageways, doors, or driveways?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Are broken or damaged ladders tagged and taken out of service?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6. Are metal ladders prohibited in electrical service?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
7. Are stairways and floor openings guarded?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
8. Are safety feet installed on straight and extension ladders?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
9. Is general housekeeping being maintained?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
10. Are ladders tied off?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
11. Are handrails and side rails installed along the unprotected sides of stairways having 4 or more risers or rising more than 30 inches?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<u>SITE SAFETY PLAN</u>			
1. Is a site safety plan available on site or accessible to all employees?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Does the safety plan accurately reflect site conditions and tasks?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Have potential hazards been described to employees on site?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Is there a designated safety official on site?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Have all employees signed the safety plan acknowledgment form?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

# DAILY PROJECT SAFETY INSPECTION REPORT (continued)

Project: \_\_\_\_\_

Date: \_\_\_\_\_

	YES	NO	NA
<u>SITE POSTERS</u>			
1. Are the following posters displayed in a prominent and accessible area?			
A. Minimum Wage	<input type="checkbox"/>	<input type="checkbox"/>	
B. OSHA Job Protection	<input type="checkbox"/>	<input type="checkbox"/>	
2. Are all required state-specific posters displayed?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<u>SITE CONTROL</u>			
1. Are work zones clearly marked?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Are support trailers located to minimize exposure from a potential release?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Are support trailers accessible for approach by emergency vehicles?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Is the site properly secured during and after work hours?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Is an exclusion zone sign-in/sign-out log maintained?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6. Are only personnel with current training and physicals permitted in exclusion or contamination reduction zone?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<u>HEAVY EQUIPMENT</u>			
1. Is heavy equipment inspected as prescribed by the manufacturer? Records available?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Is defective heavy equipment tagged and taken out of service?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Are project roads and structures inspected for load capacities and proper clearances?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Is heavy equipment shut down for fueling and maintenance?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Are backup alarms installed and working on mobile equipment?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6. Have qualified equipment operators been designated? Licenses and training verified?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
7. Are riders prohibited on heavy equipment?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
8. Are guards and safety appliances in place and used?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
9. Are operators using the "three point" system when mounting/dismounting equipment?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<u>EXCAVATION</u>			
1. Has a "competent person" been designated to oversee excavation activities?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Prior to opening excavations, are utilities located and marked?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Has a professional engineer evaluated all excavations greater than 20 feet deep?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Is there rescue equipment on site and accessible to the excavation area?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Is excavated material placed a minimum of 24 inches from the excavation?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6. Are the sides of excavations sloped or shored to prevent cave ins?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
7. Have excavations greater than 4 ft deep been monitored for hazardous atmospheres (i.e., LEL/O <sub>2</sub> deficiency, toxics)?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
8. Are ladders or ramps used in excavations over 4 feet deep?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
9. Are means of egress available so as to require no more than 25 feet of lateral travel?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
10. Are barriers, i.e., guardrails or fences, placed around excavations near pedestrian or vehicle thoroughfares?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
11. Is excavation inspected daily by competent persons and documented?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<u>CONFINED SPACES</u>			
1. Have employees been trained in the hazards of confined spaces?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Are all confined spaces identified and labeled to prevent entry?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Is a copy of the confined space entry procedure available?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Has a rescue plan been established?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Is an entry supervisor present at each permit-required entry?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6. Are required extraction/fall protection devices being used?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

## DAILY PROJECT SAFETY INSPECTION REPORT (continued)

Project: \_\_\_\_\_

Date: \_\_\_\_\_

	YES	NO	NA
<u>DECONTAMINATION</u>			
1. Are decontamination stations set up on site?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Is decontamination water properly contained and disposed of?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Are all pieces of equipment inspected for proper decontamination before leaving the site?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Are shin/metatarsal guards being used during power washing activities?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<u>HAZARD COMMUNICATION</u>			
1. Is there a copy of the HAZCOM procedure on site?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Are there SDSs for required materials/chemicals present on site?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Are all containers properly labeled, as to content, hazard?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Have employees been trained in accordance with the HAZCOM procedure?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Do employees (including subcontractors) know and understand the effects of exposure from the chemicals on site?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6. Have all personnel signed the HAZCOM acknowledgment form?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
7. Is there an updated list of chemicals maintained on site?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<u>TRAINING</u>			
1. Are tailgate safety meetings being conducted daily or before each shift?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Are current training/medical records maintained on site?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. 40 hour and 8 hour refresher training certificates available, if applicable?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. 30 hour OSHA construction certificate available for SSHO?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<u>DOCUMENTATION</u>			
1. Is an OSHA 300 Log maintained and the 300A posted during February 1 to April 30?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Are accident report forms available?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Is a copy of health and safety policy and procedures available on site?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
<u>RADIOACTIVE MATERIALS/X-RAY GENERATING EQUIPMENT</u>			
1. Is there a license or registration? (examples: Troxler gauge or XRF device)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Is radioactive material stored on site?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Is the radioactive material storage area posted with a sign stating "Caution Radioactive Materials"?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

# EMERGENCIES QUICK REFERENCE

## PORTLAND HARBOR SUPERFUND SITE

### 1. VESSEL COLLISIONS

- Stop the vessel.
- Complete roll call for all passengers.
- Alert vessel master that there a person overboard.
- If person is missing, scan the water for passenger.
- Stop the vessel immediately.
- If possible, position the overboard person between the boat and the wind by approaching the swimmer from downwind.
- Use lifeslings™, a roped buoy, swim platforms, ladders, and even brute strength to bring the person on board.
- Never have anyone go into the water as this will add another person to be rescued.
- Provide assistance to passenger overboard.
- If passenger cannot be retrieved immediately, maintain visual contact with the passenger overboard and have another passenger or the vessel master radio for help on VHS Channel 16 or call 911.
- Evacuate boat at nearest muster point, vessel master inspects the boat.

### 2. FIRE ABOARD

- Stop the vessel immediately.
- Position the boat so that the fire is downwind of the field team members.
- Shut off the fuel supply if the fire is close to an engine and it is safe to do so.
- Use a fire extinguisher to battle small flames, aiming at the base and moving it in a sweeping motion.
- Call for help using a VHS Channel 16 or 911 on a cellular phone and follow the instructions provided by public emergency services personnel.
- Abandoned the vessel as a last resort.

### 3. CARBON MONOXIDE POISONING

- Keep fresh air circulating regardless of the ambient weather conditions.
- Ventilate the work area thoroughly if exhaust fumes are noticed.

## **EMERGENCIES QUICK REFERENCE**

### **PORTLAND HARBOR SUPERFUND SITE (CONTINUED)**

#### **4. FALLING OVERBOARD**

- Alert vessel master that there a person overboard without losing site of the person overboard.
- If possible, position the overboard person between the boat and the wind by approaching the swimmer from downwind.
- Use lifeslings™, a roped buoy, swim platforms, ladders, and even brute strength to bring the person on board.
- Never have anyone go into the water as this will add another person to be rescued.
- Provide assistance to passenger overboard.
- If passenger cannot be retrieved immediately, maintain visual contact with the passenger overboard and have another passenger or the vessel master radio for help on VHS Channel 16 or call 911.

#### **5. DISCOVERING UNEXPLODED ORDINANCE (UXO)**

- Do not handle or move UXO once discovered.
- Isolate the UXO with a barrier (for example caution tape) to ensure that it is not jostled by another site staff member.
- Return to muster point and evacuate the vessel.
- Call for help using a VHS Channel 16 or 911 on a cellular phone and follow the instructions provided by public emergency services personnel.

#### **6. CONTACT WITH PRESERVATIVE WITH ACID OR BASE**

- Immediately flush area exposed area with deionized water in first aid kit.
- Return to muster point if on water.

#### **7. CRUSHING INJURY**

- Immobilize area by implementing 1<sup>st</sup> aid training.
- Contacting help:
  - On water: Call for help using a VHS Channel 16 or 911
  - On land (off Vigor property): On a cellular phone call 911.
  - On land (on Vigor property): Radio Vigor on Channel 1 or Call (503) 247-1799 ext. #1799.
- Return to muster point if on water.

**EMERGENCIES QUICK REFERENCE**  
**PORTLAND HARBOR SUPERFUND SITE (CONTINUED)**

**8. LARGE/DEEP LACERATION THAT IS LIFE THREATENING**

- Stop bleeding by implementing 1st aid training.
- Contacting help:
  - On water: Call for help using a VHS Channel 16 or 911
  - On land (off Vigor property): On a cellular phone call 911.
  - On land (on Vigor property): Radio Vigor on Channel 1 or Call (503) 247-1799 ext. #1799.
- Return to muster point if on water.

**HGL CONFINED SPACE PROCEDURE**

*This page was intentionally left blank*

	<b>H&amp;S Procedure 26</b>	
	Approved by:	Health and Safety Director
<b>Confined Space Entry</b>	Steve Davis CIH, CSP	Digitally signed by Steve Davis CIH, CSP Date: 2020.10.08 13:04:17 -04'00'
	Publication Date: March 2011	
	Revision No.: 07	
	Revision Date: October 2020	
		Review Date: October 2021

## 1.0 PURPOSE

The purpose of this procedure is to ensure work in confined spaces is executed safely. Confined spaces often present physical and atmospheric hazards that can be avoided if they are recognized and addressed prior to entering these spaces to perform work. HGL's processes are also intended to comply with the OSHA General Industry Confined Space Standard, 29 CFR 1910.146 and the OSHA regulation that addresses confined spaces in the construction industry, 29 CFR 1926 Subpart AA. If HGL employees or subcontractors are engaged in both construction and industrial confined space entry, the work must comply with the construction safety standard because the standard is the more protective of the two.

## 2.0 SCOPE AND APPLICATION

This procedure applies to any work which exposes HGL employees, HGL temporary employees or subcontractors to confined space hazards. It also applies to situations where personnel or subcontractors may work around confined spaces, e.g., there are posting and signage requirements for confined spaces even if no one will enter identified confined spaces.

This procedure applies to entering, attending entries, and supervising entry into confined spaces. Examples of such work may include sampling or inspections in vaults, sewers, pits, tanks, crawl spaces, attics, and boilers. HGL subcontractors that perform this work must have their own processes that meet or exceed these requirements and the applicable regulations.

## 3.0 GENERAL REQUIREMENTS

- Evaluate confined spaces that HGL personnel or subcontractors will enter and determine which of the following classifications is applicable and ensure that the appropriate hazard controls are implemented.
  - Non-permit required,
  - Permit-required,
  - Hazards eliminated, or
  - Alternate procedures.
- Document confined space evaluations. The Confined Space Pre-Entry Inspection Checklist can be used to document the evaluation. Non-permit-required spaces pose little hazard and can be entered with minimal hazard controls. Permit-required spaces may pose significant hazards and entry will require full compliance with OSHA's permit-required confined space standards. Hazards-eliminated spaces pose no atmospheric hazard and

## Confined Space Entry

H&S Procedure No.: 26

Publication Date: March 2011

Revision No.: 07

Revision Date: October 2020

Review Date: October 2021

physical hazards have been controlled using engineering controls. Entry into hazards-eliminated spaces can be conducted as for a non-permit-required space. Alternate procedures spaces pose no physical hazard and the atmosphere can be maintained in a safe status using forced air ventilation. Entry requires continuous forced air ventilation and air monitoring but does not require many of the controls specified for fully regulated permit-required spaces.

- Identify confined spaces that are under HGL control with signage. For permit required confined spaces the signs should read, “DANGER – PERMIT REQUIRED CONFINED SPACE, DO NOT ENTER.” For non-permit required spaces the sign should read, “CAUTION - NON-PERMIT REQUIRED CONFINED SPACE, KEEP OUT UNLESS AUTHORIZED.”
- Have this document available at the jobsite for review by all employees that will be entering confined spaces.
- Train staff that will participate in confined space entry in the applicable hazards and hazard controls. The training should include the kinds of spaces workers may be in, what the hazards could be, how those hazards will be made safe or monitored, potential emergencies, and emergency plans including how workers will be rescued if necessary. Training is required for all confined space entry, including entry into non-permit spaces, and must include available information regarding classification of the confined space(s) to be entered and air monitoring results.
- Take effective measures to prevent unauthorized personnel from entering confined spaces.
- Include a discussion of any confined spaces at a jobsite (including the known hazards) in the site safety briefing and daily tail gate briefings when work is scheduled to be performed in or around the confined spaces. This discussion must include subcontractor personnel who will work in or near the confined spaces.
- Assess and control any hazards caused by tasks to be conducted in or near confined spaces such as welding, grinding, painting, etc. These hazards may include noise, airborne exposures to toxic vapors or particulates, oxygen deficiency, and others.
- Complete a confined space entry permit and receive all approvals prior to entering permit-required spaces.
- Limit all entry into permit-required confined spaces to those situations when it is the only feasible means of completing the tasks.
- Conduct continuous atmospheric monitoring during entries in permit-required spaces and during entries using alternate procedures to verify absence of a hazardous atmosphere.
- Conduct continuous monitoring and have an early warning alarm system for engulfment hazards, in confined spaces such as storm sewers.

<b>Confined Space Entry</b>	H&S Procedure No.: 26
	Publication Date: March 2011
	Revision No.: 07
	Revision Date: October 2020
	Review Date: October 2021

- Ensure that an effective communication process is established to allow the attendant to notify entrants in a permit-required space to evacuate or entrants to notify the attendant of problems. This process must be effective in the presence of interferences such as noise created by work inside the space or obstructions to line-of-sight.
- Before entry, prepare and discuss the plan for emergency self-rescue from permit-required confined spaces and/or for emergency rescue procedures with equipment and trained personnel, if required. If relying on local emergency services for emergency rescue, arrangements with the responders must be coordinated in advance so that they know to give HGL notice if they will be unable to respond (because they are responding to another emergency, attending department-wide training, etc.). Note: Outside emergency services must have the capability to reach the victim(s) within a time frame that is appropriate for the permit space hazard(s) identified.

#### 4.0 DEFINITIONS

**Acceptable Entry Conditions** – The conditions that must exist in a permit space to allow entry and to ensure that HGL or subcontractor employees involved with a permit-required confined space entry can safely enter and work within the space.

**Alternate Procedures**- Procedures that can be used if the only hazard posed by the permit space is an actual or potential hazardous atmosphere.

**Attendant** – Is the employee authorized and assigned to observe the Entrant during entry into a permit-required confined space. All Attendants must receive an appropriate level of confined space entry training and show competence in carrying out an Attendant’s responsibilities. No confined space entry will be undertaken without the presence of an Attendant. The Attendant can also serve as the entry supervisor.

**Authorized Entrant** – Means an employee who is authorized by the entry supervisor to enter a permit space. The Entrant must alert the attendant if a dangerous situation develops.

**Blanking or Blinding** – Means the absolute closure of a pipe, line, or duct by the fastening of a solid plate (such as a blind flange, spectacle blind, or a skillet blind) that completely covers the bore and that can withstand the maximum pressure of the pipe, line, or duct with no leakage beyond the plate.

**Competent Person** – A trained individual who is capable of identifying existing and predictable hazards in the surroundings or working conditions which are unsanitary, hazardous, or dangerous to employees, and who has the authorization to take prompt corrective measures to eliminate them. Each employer at a worksite must ensure that a competent person identifies all confined spaces in which one or more of the employees it directs may work, and identifies each space that is a permit space, through consideration and evaluation of the elements of that space, including testing as

<b>Confined Space Entry</b>	H&S Procedure No.: 26
	Publication Date: March 2011
	Revision No.: 07
	Revision Date: October 2020
	Review Date: October 2021

necessary. The competent person may also serve as entry supervisor, during confined space entries, if appropriately qualified.

**Confined Space** – A space that is large enough and so configured that an employee can bodily enter (entire body or a portion of the body, e.g. head, arms and upper torso) and do assigned work, has limited or restricted means for entry or exit, and is not designed for continuous employee occupancy.

Examples of confined spaces include, but are not limited to, the following:

- boilers
- storm drains
- tunnels
- sewers
- bunkers
- pipelines
- sumps
- utility/transformer vaults
- wells
- pumping stations
- sewage digesters
- smokestacks
- vats
- ductwork
- tanks
- reaction or process vessels

**Types of Confined Spaces**

**Non-Permit-Required Confined Space** – A confined space that does not contain or, with respect to atmospheric hazards, have the potential to contain any hazard that can cause death or serious physical harm.

**Permit-Required Confined Space (or “Permit Space”)** – A confined space that has any one of the following characteristics:

- Contains or has the potential to contain a hazardous atmosphere,
- Contains a material with the potential for engulfment of an Entrant,
- Has an internal shape such that an Entrant could be trapped or asphyxiated by inwardly converging walls, or a floor that slopes downward and tapers to a smaller cross section or Contains any other recognized serious safety and health hazard (such as moving machinery or the potential for the release of thermal energy).

<b>Confined Space Entry</b>	H&S Procedure No.: 26
	Publication Date: March 2011
	Revision No.: 07
	Revision Date: October 2020
	Review Date: October 2021

Entry into a permit-required confined space requires use of trained personnel, following written practices and procedures, use of an entry permit system, and arrangement of rescue services described in this written program.

***Permit Space, hazard eliminated-*** A permit required confined space can be temporarily reclassified as a non-permit confined space if the space poses no actual or potential hazardous atmosphere, and all other hazards within the space are eliminated without entry into the space. Note that there is a difference in the meanings of controlled and eliminated. Control of atmospheric hazards through forced air ventilation does not constitute elimination of the hazards.

Entry into a permit space, hazard eliminated, does not require use of barriers, permit system, or rescue and emergency service measures (example, no tripod and full body harness). Self-rescue from the confined space is the means of exit. For purposes of this written program, only the host employer/owner of the confined space can classify and document these spaces as such.

Hazard eliminated means that all serious safety and health hazards have been controlled using physical controls not including personal protective equipment (PPE) or respiratory protection. Note: This classification is typically a temporary designation as the engineering controls that eliminated the hazards may be removed after the work in the space has been completed.

***Permit Space, alternate procedures-*** Alternate procedures can be used to enter a permit required confined space if there are no physical hazards or the physical hazards in the space are eliminated or isolated through engineering controls and the atmosphere can be kept safe through continuous forced air ventilation. Entry under these conditions requires continuous air monitoring with a monitor that will alarm if unsafe atmospheric conditions develop but does not require entry permits, provisions for emergency rescue, or most of the formal requirements for permit-required confined space entry. The evaluation and air monitoring must be documented. HGL’s confined space entry permit form can be used for documentation.

***Controlling Contractor*** – The employer that has overall responsibility for construction at the worksite. **Note:** If the controlling contractor owns or manages the property, then it is both a controlling employer and a host employer. Controlling contractors and host employers must discuss spaces on the site and the hazards with entry employers and each other before and after entry.

***Double Block and Bleed*** – The closure of a line, duct, or pipe by closing and locking or tagging two in-line valves and by opening and locking or tagging a drain or vent valve in the line between the two closed valves.

<b>Confined Space Entry</b>	H&S Procedure No.: 26
	Publication Date: March 2011
	Revision No.: 07
	Revision Date: October 2020
	Review Date: October 2021

**Early-Warning System** – The monitoring method used to alert authorized entrants and attendants that an engulfment hazard may be developing. Examples of early-warning systems include but are not limited to: alarms activated by remote sensors, and lookouts with equipment for immediately communicating with the authorized entrants and attendants.

**Emergency** – Means any occurrence (including any failure of power, hazard control or monitoring equipment) or event, internal or external, to the permit space that could endanger entrants.

**Engulfment** – Means the surrounding and effective capture of a person by a liquid or finely divided (flowable) solid substance that can be aspirated to cause death by filling or plugging the respiratory system or that can exert enough force on the body to cause death by strangulation, constriction, crushing, or suffocation.

**Entry** – The act by which a person intentionally passes through an opening into a permit required confined space. Entry includes ensuing work activities in that space and occurs when any part of the entrant’s body breaks the plane of an opening into the space, regardless of whether there is an intent to fully enter the space.

**Entry employer** – The employer who directs workers to enter a space.

**Entry Permit (Permit)** – The written or printed document that is provided by the employer (see Appendix C for HGL form) to allow and control entry into a permit space and that contains the following information:

- The permit space to be entered,
- The purpose of the entry,
- Authorized entrants, attendants, and entry supervisors,
- Hazards of the permit space to be entered and measures used to isolate the permit space and to eliminate or control permit space hazards,
- Acceptable entry conditions, and results of initial and periodic tests, and
- Equipment, such as personal protective equipment, monitoring equipment, communications equipment, alarm systems, and rescue equipment.

**Entry Rescue** – Entry rescue requires entry by a fully trained and equipped confined space emergency responder. The attendant should not perform entry rescue unless there is a replacement attendant immediately available.

**Entry Supervisor** – The person responsible for determining whether acceptable entry conditions are present at a permit space where entry is planned, for authorizing entry and overseeing entry operations, and for terminating entry as required by this section. The entry supervisor must remain

<b>Confined Space Entry</b>	H&S Procedure No.: 26
	Publication Date: March 2011
	Revision No.: 07
	Revision Date: October 2020
	Review Date: October 2021

at the jobsite throughout the entire entry operation. **Note:** An entry supervisor also may serve as an attendant or as an authorized entrant, if that person is trained and equipped as required by this standard for each role he or she fills. Also, the duties of entry supervisor may be passed from one individual to another during an entry operation.

**Fall Hazards** – Any conditions creating a potential fall of 6 feet or more.

**Hazardous Atmosphere** – An atmosphere that may expose workers to the risk of death, incapacitation, and impairment to self-rescue, injury, or acute illness from one or more of the following causes:

- The atmospheric oxygen concentration is below 19.5 percent (“oxygen deficient atmosphere”) or above 23.5 percent (“oxygen enriched atmosphere”). Any atmosphere with less than 19.5 percent oxygen will not be entered without the use of an approved supplied air system.

**Note:** The oxygen level in a confined space can decrease because of work in progress, such as welding, cutting, or brazing. It can also be decreased by certain chemical reactions (rusting) or through bacterial action (fermentation). The oxygen level also may be low if another gas, such as carbon dioxide or nitrogen, displaces the oxygen in the space. An oxygen-rich atmosphere (above 23.5 percent) will cause combustible materials to burn violently when ignited and should be avoided.

- Flammable gas or vapor is more than 10 percent of its lower explosive limit (LEL)/lower flammable limit (LFL).
- Airborne combustible dust is at a concentration that meets or exceeds the LEL.

**Note:** This concentration may be approximated as a condition in which the dust obscures vision at a distance of 5 feet (1.52 meters) or less.

- Toxic substances at atmospheric concentrations that could result in employee exposures greater than 1/2 a published exposure limit. Those substances that can cause death, incapacitation, impairment of the ability to self-rescue, injury, or acute illness due to their health effects must be given higher priority than substances that pose chronic hazards. Other OSHA standards and protective requirements may also apply to airborne exposures. Some sources of toxic substances are as follows:
  - Material previously stored in the space: Contents can be absorbed into the walls and gradually vaporize after the contents have been removed. Removing contents and residue may release gases, vapors, or dusts into the space.
  - Work tasks in a confined space: Examples include welding, cutting, brazing, painting, scraping, sanding, degreasing, etc. Various processes generate toxic substances that may accumulate in the confined space.

<b>Confined Space Entry</b>	H&S Procedure No.: 26
	Publication Date: March 2011
	Revision No.: 07
	Revision Date: October 2020
	Review Date: October 2021

- Areas next to the confined space: Toxics produced by work outside of a confined space, such as a nearby welding operation, can enter and accumulate in the confined space.

**Host Employer** – The employer that owns or manages the property where the work is taking place. The host employer must identify and provide any information regarding permit space hazards and entry operations. Controlling contractors and host employers must discuss spaces on the site and their hazards with entry employers and each other before and after entry. The host employer should identify the designated rescue method and/or service during the pre-entry inspection.

**Hot Work** – Is defined as operations such as riveting, welding, cutting, burning, and heating that can provide a source of ignition and/or cause or have the potential to cause a hazardous atmosphere. If hot work is required in a confined space, a hot work permit must be completed.

**Isolation** – The process by which a permit space is removed from service and completely protected against the release of energy and material into the space. Techniques include blanking or blinding; misaligning or removing sections of lines, pipes, or ducts; a double block and bleed system; lockout or tagout of all sources of energy; or blocking or disconnecting all mechanical linkages. Simply locking or tagging out a piping system, is not appropriate for fluid isolation purposes and would not qualify a space as non-permit, since it does not eliminate the hazard.

**Limited or Restricted Means for Entry or Exit** – Means a condition that has a potential to impede an employee’s movement into or out of a confined space. Such conditions include, but are not limited to, trip hazards, poor illumination, slippery floors, inclining surfaces and ladders. Examples of where restricted exist may occur are: tanks, vessels, silos, storage bins, vaults and pits.

**Lockout** – Means the placement of a lockout device on an energy isolating device, in accordance with an established procedure, ensuring that the energy isolating device and the equipment being controlled cannot be operated until the lockout device is removed.

**Lower Flammable Limit or Lower Explosive Limit** – Means the minimum concentration of a substance in air needed for an ignition source to cause a flame or explosion.

**Monitor or Monitoring** – Means the process used to identify and evaluate the hazards after an authorized entrant enters the space. This is a process of checking for changes that are performed in a continuous manner after the completion of the initial testing or evaluation of that space.

**Non-entry Rescue** – Occurs when a rescue service, usually the attendant, retrieves employees in a permit space without entering the permit space using a retrieval system (see below).

**Prohibited Condition** – Any condition in a permit space that is not allowed by the permit during the period when entry is authorized.

<b>Confined Space Entry</b>	H&S Procedure No.: 26
	Publication Date: March 2011
	Revision No.: 07
	Revision Date: October 2020
	Review Date: October 2021

**Reduced Visibility** – Is defined as conditions where direct communications with others is not possible or visibility is limited to less than 5 feet due to darkness or other causes.

**Rescue Service** – The personnel designated to rescue HGL or subcontractor employees from permit spaces.

**Retrieval System** – The equipment, including a retrieval line, chest or full-body harness, wristlets, if appropriate, and a lifting device or anchor, used for non-entry rescue of persons from permit spaces.

**Self-Rescue** – Means that entrants into a confined space can easily exit the space by walking out or climbing a readily accessible ladder. This method of rescue may be appropriate for non-permit confined spaces and Alternate Procedures spaces as the hazards posed by these spaces are minimal or are controlled by ventilation.

**Test or testing** – Means the process by which the hazards that may confront entrants of a permit space are identified and evaluated. Testing includes specifying the tests that are to be performed in the permit space.

**Ventilation** – Means controlling a hazardous atmosphere using continuous forced-air mechanical systems that meet the requirements of §1926.57—Ventilation. As noted in the standard, using ventilation to preclude the possibility of a hazardous atmosphere is considered control of the atmospheric hazard and is not considered elimination, therefore the ventilated space would still be considered a Permit Confined Space, however alternate entry procedures may be used if conditions as defined in Alternate Procedures are met.

## 5.0 PROCEDURE

A confined space is a space that is large enough and so configured that an employee can bodily enter (entire body or a portion of the body), has limited or restricted means for entry or exit, and is not designed for continuous employee occupancy. Examples of confined spaces include tanks, boilers, etc. Because confined spaces can pose physical and atmospheric hazards, confined space entry is regulated by OSHA, and in some cases, requires completion of a confined space entry permit, and implementation of multiple hazard controls. A permit-required confined space is one that: contains or has a potential to contain a hazardous atmosphere, contains a material that may engulf an entrant, has an internal configuration that might trap or asphyxiate an entrant, or contains any other recognized serious safety or health hazard. There are three categories of permit-required spaces and corresponding processes for hazard control defined by OSHA: fully regulated – all of the requirements for permit-required entry apply; “hazard eliminated” – temporarily reclassified as a non-permit confined space if the space poses no actual or potential hazardous atmosphere; and all other hazards within the space are eliminated by engineering controls; and “alternate procedures” – no physical hazards are present and atmospheric hazards can be controlled by continuous forced air ventilation.

<b>Confined Space Entry</b>	H&S Procedure No.: 26
	Publication Date: March 2011
	Revision No.: 07
	Revision Date: October 2020
	Review Date: October 2021

A “hazard-eliminated” space can be treated as a non-permit space if the requisite requirements continue to be met. The decision process, monitoring results, and steps taken to eliminate hazards must all be documented, and the documentation must be retained. HGL must still ensure that entries are made safely and that entries are terminated if uncontrolled hazards are encountered.

“Alternate procedures” for permit required spaces does not require a permit system, or provisions for emergency rescue. Self-rescue from the confined space is allowed, but provisions such as harnesses and lanyards are recommended. Forced air ventilation and air monitoring must begin before entry and continue during entries. Air monitoring must be conducted continuously during entry and instruments must be equipped with alarm(s) that will alert entrants to unsafe conditions or the air monitoring instrument must be continuously monitored by an entrant or supervisor. The determination that a space meets the required criteria and the air monitoring results must be documented, and this documentation must be retained. This documentation must contain the date, the location of the space, and the signature of the person compiling the documentation. HGL’s pre-entry checklist can be used to document the initial evaluation and HGL’s confined space entry permit form can be used to document air monitoring results during the entry. Note: much of the information called out on the permit form will not be relevant to this type of entry.

**5.1 NOTIFICATION**

The Project Manager must contact Corporate Health and Safety before initiating any project with new confined space entry tasks, whether it be by HGL or subcontractors.

Notification may be email or by telephone. This notification will include the following:

- Project name, location, and Project Manager
- Anticipated confined space entry tasks
- Names of the proposed members of the confined space entry team(s), and, in the case of HGL serving as “host employer,” the name of the subcontractor making entry.

**5.2 PRE-ENTRY INSPECTION**

The Project Manager, Site Safety and Health Officer and/or Entry Supervisor must conduct a pre-entry site inspection. The inspection must be documented (see Pre-Entry Inspection Checklist in Appendix A), and should identify at least the following:

- Entryway or utility accessibility and condition.
- Photographs.
- Current or past contents of pipes, sumps, or tanks.
- Air testing results.

<b>Confined Space Entry</b>	H&S Procedure No.: 26
	Publication Date: March 2011
	Revision No.: 07
	Revision Date: October 2020
	Review Date: October 2021

- Any structural modifications or additions required to make a safe entry.
- Any fall hazards or ladder use that may be present during entry.
- The possible effect of adverse weather.
- The locations of entry, exit, and ports for mechanical venting.
- Lockout/tagout; blanking, blocking, and bleeding; or isolation requirements.
- The types of safety and environmental monitoring equipment required to make a safe entry.
- The location and path to a secondary means of egress if available.

During the pre-entry inspection, the atmosphere of a confined space should be tested, if possible, using equipment of sufficient sensitivity and specificity to identify and evaluate any hazardous atmospheres that may exist or arise, so that appropriate entry procedures can be developed, and acceptable entry conditions identified

### **5.3 POST-INSPECTION**

Once the pre-entry inspection checklist is completed (see Appendix A), the Project Manager, Site Safety and Health Officer and/or the Entry Supervisor and Corporate Health and Safety Director will review this data and determine acceptable entry conditions. The Corporate Health and Safety Director will review the information and will guide an evaluation of the space (if not already classified). The entry will be planned as permit-required, hazard-eliminated, or alternate procedures. If the entry will be a permit-required entry performed or supervised by HGL employees, a confined space entry permit must be completed using the form in Appendix C. The entry permit will be used to authorize entry into a permit-required confined space and must be posted outside the permit space prior to entry.

### **5.4 VERIFICATION TESTING**

The atmosphere of a permit space that may contain a hazardous atmosphere must be tested, by the Entry Supervisor before entry, for the contaminants identified during the pre-entry inspection using equipment specified in the permit. Initial measurement of values for each atmospheric parameter must be made for at least the minimum response time of the test instrument specified by the manufacturer, including procedures to identify stratified atmospheres.

Evaluation and interpretation of this data (i.e., are atmospheric contaminant concentrations within the range of acceptable entry conditions) will be done by the Entry Supervisor. For all HGL or contractor permit-required confined space entries, there will be continuous atmospheric monitoring for the duration of the entry, if there is a potential for a hazardous atmosphere to develop.

<b>Confined Space Entry</b>	H&S Procedure No.: 26
	Publication Date: March 2011
	Revision No.: 07
	Revision Date: October 2020
	Review Date: October 2021

Results of testing (i.e., actual concentration, etc.) must be recorded on the permit in the space provided next to the stipulated acceptable entry condition and, if applicable, in the project field manual.

## 5.5 PERMIT COMPLETION

The HGL Confined Space Entry Permit (permit) consists of a list of engineering controls, safety equipment, personal protective equipment, respiratory protection, and rescue service arrangements that may be appropriate for any given confined space. Based on information obtained from the pre-entry inspection and documented on the Pre-Entry Inspection Checklist, each individually listed permit condition will be identified as necessary for the entry or not. The following permit conditions are required for all HGL or subcontractor permit-required entries:

- Effective communication between the attendant and entrants,
- Lockout/tagout, unless not applicable (i.e., no hazardous energy or any potentially moving equipment is present),
- Lines broken or capped, unless not applicable (i.e., no lines discharge into the space),
- Ventilation, unless mechanical ventilation is not necessary or would not be effective,
- Secured area,
- Air monitoring,
- Full body harness,
- Emergency retrieval and/or lifeline and/or fall protection,
- Fire extinguisher/first aid kit,
- Safety glasses and/or goggles,
- Hard hat (unless hard hats will increase hazards), and
- Emergency procedures.

Any member of the HGL confined space entry team may fill out the HGL permit. The Entry Supervisor is responsible for verifying that the information on the permit is complete and correct, all permit conditions have been met, and all equipment, including personal protective equipment, is in working order and being properly used. If all conditions are met, the Entry Supervisor reviews the permit with the authorized Entrant(s) and Attendant, signs it, and posts it at the entrance to the confined space.

## 5.6 ENTRY

Whenever possible, permit required confined space entry should be horizontal with the Entrant wearing a full body harness attached to a retrieval line. For vertical openings, entry may be made by a ladder inserted into the confined space or by lowering the Entrant into the space using a man-

<b>Confined Space Entry</b>	H&S Procedure No.: 26
	Publication Date: March 2011
	Revision No.: 07
	Revision Date: October 2020
	Review Date: October 2021

rated winch. During any vertical entry, fall protection shall be provided for the Entrant and Attendant and must consist of a full body harness, a shock-absorbing fall lanyard, or an American National Standards Institute (ANSI) certified retractable lifeline/emergency retrieval winch combination, or equivalent.

*A mechanical retrieval system must be available to retrieve employees from vertical entry confined spaces more than 5 feet deep.*

If the Entrant will be stopping at several different heights for more than a few minutes (e.g., to do an inspection of the walls), a boatswain’s chair will be used when the opening to the space has a diameter larger than 24 inches. Use of a boatswain’s chair will be in accordance with OSHA 29 CFR 1910.28 (k), 1926.104, and 1926.451 (l).

**5.7 ENTRY TERMINATION**

The Entry Supervisor will cancel the entry permit when the following conditions are met:

- The entry operations covered by the permit have been completed.
- A prohibited condition that is not allowed under the entry permit arises in or near the permit space.

If the Entry Supervisor cancels the permit due to a prohibited condition, all personnel must evacuate the confined space. Prior to reentering the confined space, a new Permit must be completed.

**5.8 EMERGENCY RESPONSE AND RESCUE**

Prior to entering a permit required confined space, arrangements must be made to respond to credible emergencies. HGL will implement procedures for facilitating self-rescue or ensure the capability for rescue from outside confined spaces, for providing necessary emergency services to rescued employees, and for preventing unauthorized personnel from attempting a rescue.

HGL has not trained or authorized a standing HGL “in-house” rescue team in lieu of notifying and/or staging an “external” trained and equipped rescue team at confined space entry projects. *Permit-required entries will not be allowed into confined spaces with atmospheres exceeding concentrations known or suspected to be IDLH unless a trained and equipped and authorized rescue entrant or rescue team, approved by Corporate Health and Safety, is staged on site prior to entry.*

For the purposes of this written program and the above policies, one of the following rescue arrangements must be made by the Site Safety and Health Officer or Entry Supervisor, prior to permit-required confined space entry:

## Confined Space Entry

H&S Procedure No.: 26

Publication Date: March 2011

Revision No.: 07

Revision Date: October 2020

Review Date: October 2021

- Self-rescue is appropriate as the primary rescue provision under the following conditions:
  - The only hazard posed by the space is an actual or potential hazardous atmosphere,
  - The atmosphere in the space can be made safe by forced air ventilation (alternative procedures),
  - The atmosphere in the space is tested prior to entry and monitored continuously during entry,
  - There is a safe and unimpeded pathway to exit. If there is any doubt about the ability to self-rescue full-body harnesses and lanyards should be used, and
  - There is a system in place to monitor entrants.
- A rescue team can be notified at the time of entry and be available to respond if called if:
  - Entrants will not be wearing supplied air respirators,
  - Entrants are not expected to be exposed to IDLH or other imminently hazardous conditions, and Entrants can be expected to “self-rescue” or be “non-entry rescued” under normal circumstances,
  - The entry is a straight horizontal or vertical,
  - A trained and authorized Rescue Entrant, in addition to the Attendant, is staged at the entry,
  - No other need for a standby rescue team exists.
- A fully equipped and trained rescue team must be notified and staged on-site at the time of entry if:
  - Entrants will be wearing supplied air respirators,
  - Entrants are expected to be exposed to IDLH conditions, and/or
  - Entrants would be expected to have difficulty in being “non-entry rescued” under normal circumstances,
  - There are other OSHA standards for specific tasks, such as welding, with specific requirements for rescue, and/or
  - Any other need for an on-site rescue team exists.

If off-site third-party rescue personnel are to be used, arrangements must be completed with rescue and emergency services prior to the confined space entry. The “host employer”/confined space owner should identify the designated rescue service during the pre-entry inspection. The service should be contacted by the Entry Supervisor, and determination of interest to serve as the rescue team, availability, response time, equipment, familiarity with the site, and responder training must

<b>Confined Space Entry</b>	H&S Procedure No.: 26
	Publication Date: March 2011
	Revision No.: 07
	Revision Date: October 2020
	Review Date: October 2021

be documented. NOT ALL BASE AND LOCAL FIRE DEPARTMENTS ARE QUALIFIED TO SERVE AS CONFINED SPACE RESCUE TEAMS.

For each permit required confined space entry, an Emergency Response Form (see Appendix B) shall be completed and approved by the Entry Supervisor. The approved Emergency Response Form must be posted with the entry permit near the opening of the confined space. Emergency escape routes and directions to the nearest hospital (attach maps) shall be developed and attached to the Emergency Response Form (see Appendix B).

### **5.9 SUBCONTRACTOR AND MULTI-EMPLOYER WORKSITES**

The client, representatives of the client, or a subcontractor may be required to enter a confined space with HGL employees. OSHA requires the coordination of entry operations when employees of more than one employer are working simultaneously as authorized entrants in a confined space. Planning the task and making these arrangements in advance could prevent the purchase or rental of redundant equipment and the assignment of extra employees to the project.

OSHA identifies the employer who controls the confined space as the “host employer,” and all other employers who could enter the space as a contractor or “guest employer.” HGL is usually a “guest employer” in relation to its clients. HGL is always a “host employer” to HGL-hired subcontractors.

As a “guest employer,” HGL will:

- Provide a copy of this written confined space entry program to the “host employer” to allow for coordination of efforts,
- Provide documentation of HGL or subcontractor employees’ confined space entry training,
- Obtain any available information regarding permit space hazards and entry operations from the “host employer,”
- Independently assess the classification of a confined space using observation, instrumentation, and direct communication with the client and document such information on a Pre-Entry Inspection Checklist (see Appendix A), and
- Communicate to the “host employer” any hazards confronted or created during the entry.

Should a “host employer” require HGL and subcontractor employees to follow the host employer’s written confined space entry program the HGL Entry Supervisor will notify HGL’s Corporate Health and Safety Director before coordinating operations with the “host employer.”

As a “controlling contractor,” HGL will:

<b>Confined Space Entry</b>	H&S Procedure No.: 26
	Publication Date: March 2011
	Revision No.: 07
	Revision Date: October 2020
	Review Date: October 2021

- Discuss spaces on the site and their hazards with entry employers and each other before and after entry.
- Make sure employers outside a space know not to create hazards in the space, and that entry employers working in a space at the same time do not create hazards for one another's workers.

As a “host employer,” HGL will:

- Obtain a copy of the subcontractor’s written confined space entry program,
- Discuss any barriers, precautions or procedures that have been set up for protection in or near permit spaces,
- Obtain documentation of subcontractor employees’ confined space entry training,
- Provide to the subcontractor any available information regarding permit space hazards and entry operations from the client/owner of the confined space,
- Independently assess the classification of a confined space using observation, instrumentation, and direct communication with the client/owner and document such information on a Pre-Entry Inspection Checklist (see Appendix A), and
- Debrief the subcontractor and communicate to the “host employer” any hazards confronted or created during the entry.

#### **5.10 TRAINING REQUIREMENTS**

- All employees who participate or support confined space entry must receive training in their specific roles in confined space entry, the rules and regulations, kinds of spaces workers may be in, what the hazards could be, how those hazards will be made safe or monitored, how workers will self-rescue or be rescued if anything goes wrong, company policy, recognizing warnings and identification signs, procedures that address employees of other companies who may enter and work in permit-required confined spaces, and this procedure. This basic training requirement applies regardless of the type of confined space (non-permit, permit-required, hazard eliminated, or alternative process) to be entered. Retraining must also be provided for authorized and affected employees when there is a change that presents a new hazard.
- Entrants, Supervisors, and Attendants will be trained in:
  - Their roles and responsibilities.
  - The hazards that may be faced during entry, including information on the mode, signs or symptoms, and consequences of the exposure.
  - The communication method to alert entrants of the need to evacuate the space.

<b>Confined Space Entry</b>	H&S Procedure No.: 26
	Publication Date: March 2011
	Revision No.: 07
	Revision Date: October 2020
	Review Date: October 2021

- The monitoring methods that will be used to evaluate activities inside and outside the space to determine if it is safe for entrants to remain in the space.
- The need to verify that appropriate entries have been made on the entry permit, all tests conducted, and that all procedures and equipment specified by the permit are in place before endorsing the permit and allowing entry to begin.
- The method of performing non-entry rescue or summoning rescue services.

## **6.0 RESPONSIBILITIES**

Corporate officers, managers, and project-level staff should all be role models for safety. Other responsibilities are summarized below.

### **6.1 PRESIDENT, CHIEF OPERATING OFFICER, DIVISIONAL VICE PRESIDENTS**

- Provide adequate resources to enable safe work. Maintain a general awareness of procedural requirements.

### **6.2 CORPORATE HEALTH AND SAFETY DIRECTOR**

The Corporate Health & Safety Director will be consulted before initiating any new task with confined space entry exposures. The Corporate Health & Safety Director will assist the supervisors in meeting their responsibilities under this section. This assistance will include providing technical guidance in identifying confined spaces, reviewing project confined space entry and procedures, and assisting in developing and facilitating training.

- Approve this program and subsequent revisions.
- Provide support and assistance in the implementation of this program.
- Review the confined space entry task(s) and provide constructive input on confined space hazard recognition and control.
- Review Pre-Entry Inspection Checklists and provide guidance regarding hazards and completion of confined space entry permits.
- Confirm and document certification in the HGL Training and certification database that the employees have completed the necessary confined space training for their roles.

### **6.3 OFFICE MANAGERS**

- Maintain a general awareness of the applicable portions of these requirements.
- Maintain an awareness of the confined spaces on supervised work and ensure that adequate controls are in place.

<b>Confined Space Entry</b>	H&S Procedure No.: 26
	Publication Date: March 2011
	Revision No.: 07
	Revision Date: October 2020
	Review Date: October 2021

#### **6.4 OFFICE HEALTH AND SAFETY COORDINATORS**

- Maintain a general awareness of the applicable portions of these requirements.
- Maintain an awareness of confined spaces on work managed by the office.
- Verify that confined space hazards are controlled.

#### **6.5 SUPERVISORS AND PROJECT MANAGERS**

- Ensure that confined spaces are identified and everyone working onsite is aware of locations and hazards. Coordinate entry operations with subcontractors and ensure that entry is performed in compliance with OSHA’s Confined Space Standards and this procedure.
- Contact Corporate Health and Safety to discuss plans for entry.
- Ensure that personnel authorized to be involved in confined space entry work are properly trained and collect certifications.
- Ensure that there is a trained competent and responsible entry supervisor/attendant for each confined space entry project or task.
- Procure appropriate equipment for confined space entry project tasks.
- Coordinate the confined space entry with those of the owner or contractor and make the subcontractor aware of the elements that make the space in question a permit space. Also, apprise subcontractors of any procedures that HGL and/or the host employer/owner of the space have implemented for the protection of employees of HGL or its subcontractor.
- Ensure that all involved adhere to approved procedures.
- Keep records of pre-entry check lists and permits.
- Debrief the subcontractor after the entry

#### **6.6 ENTRY SUPERVISOR/ SITE SAFETY OFFICER/COMPETENT PERSON**

- Ensure that conditions in permit-required confined spaces have been tested to determine if acceptable entry conditions exist before entry begins,
- Verify that the information on the Pre-Entry Inspection Checklist (see Appendix A) accurately reflects the conditions and hazards of the confined space,
- Verify that the completed entry permits (see Appendix C) reflects the availability and proper working condition of the equipment to be used for atmospheric monitoring, entry, and remote emergency retrieval before authorizing or allowing entry,

## Confined Space Entry

H&S Procedure No.: 26

Publication Date: March 2011

Revision No.: 07

Revision Date: October 2020

Review Date: October 2021

- Verify that the necessary procedures, practices, and equipment for safe entry are present and in effect before allowing entry.
- Verify that qualified rescue services are available and that the means for summoning them are operable.
- Oversee the initial air monitoring to determine if an acceptable entry condition is present.
- Verify that all Entrants and Attendants have received appropriate training, and medical and respiratory protection clearances (if respirators will be worn) before initiating an entry.
- Verify, at least once each hour, that the entry operations remain consistent with the terms of the entry permit and that acceptable entry conditions are present.
- Cancel the entry authorization and end the entry when acceptable entry conditions are not present.
- Take the necessary measures for concluding an entry operation including canceling the permit and replacing the cover or otherwise restricting access to the confined space. Take the appropriate measures to prevent individuals who the company has not authorized for entry from lingering in or near an active confined space entry.
- Arrange for all required field and safety equipment before initiating entry.
- Inspect all equipment before entry and ensure that the environmental monitors have been properly calibrated, passed a function check, and operate correctly.
- Ensure that the permit-required confined space is tested or monitored continuously to determine if acceptable entry conditions are being maintained during entry operations.
- Reevaluate the space in the presence of any Entrant, or his/her representative, who requests that the space be reevaluated if they have reason to believe the evaluation may not have been adequate.
- Provide each Entrant with monitoring results immediately.
- Ensure that at least one Entry Supervisor/Attendant is outside the confined space for the duration of the entry and that there is effective communication between the entrants and attendant.
- Identify all HGL or subcontractor staff that have roles in the confined space entry and discuss their roles with them.
- Prevent unauthorized personnel from attempting a rescue.
- Prepare, use, and cancel entry permits.
- Conclude the entry and close the entry permit after operations have been completed.

<b>Confined Space Entry</b>	H&S Procedure No.: 26
	Publication Date: March 2011
	Revision No.: 07
	Revision Date: October 2020
	Review Date: October 2021

- Have a discussion with entry employer, controlling employer and host employer after the entry to review how the entry proceeded and provide any information regarding permit space hazards or lessons learned during the entry operation.
- Ensure that confined space entry permits are retained as required by this procedure.

## 6.7 ATTENDANT

The Attendant continuously maintains an accurate count of persons in the permit-required confined space. The Attendant is only assigned to one confined space entrance at a time, even if there is an emergency.

The Attendant shall:

- Recognize potential hazardous energy, chemical, physical, electrical, or mechanical confined space hazards, as well as the signs, symptoms, and consequences of exposure to these hazards, and report any unusual circumstance to the Entry Supervisor,
- Monitor activities inside and outside the confined space and judge if it is safe for the Entrants to remain in the space, and
- Monitor the air quality inside the confined space.
- Communicate – The Attendant shall:
  - Keep in contact with Entrants during entry, and
  - Order Entrants to evacuate the permit space immediately when:
    - The Attendant observes an activity or condition outside the acceptable entry conditions for that confined space,
    - The Attendant detects a situation outside the confined space that could endanger the Entrants,
    - The Attendant detects an uncontrolled hazard within the confined space, or
    - An emergency in a nearby confined space may distract the Attendant from his/her responsibilities.
- Rescue – The Attendant shall:
  - Call 911 or contact the appropriate emergency response team,
  - Never enter the confined space to attempt a rescue of Entrants unless replaced by a standby attendant,
  - Properly use any remote rescue equipment provided and perform any other assigned rescue and emergency duties, and
  - Warn or stop unauthorized Entrants.

## 6.8 EMPLOYEES

- Participate in confined space training, as needed.
- Follow the confined space entry procedures.
- Alert supervisor if proper equipment is not available or there are uncontrolled hazards.

## 7.0 RECORDS

Collect and maintain documentation generated as a result of this program in accordance with Document Control requirements of the HGL Corporate Quality Assurance Manual.

Entry permits, records of monitoring results, determinations regarding confined space classification, and related documents will be retained in project records. Records of task or site-specific training will be retained in project documentation. Records of formal training such as classroom training for confined space entrants, attendants, and supervisors will also be kept in HGL's corporate training data base.

The training records will include the following information:

- The dates of the training sessions.
- The contents or a summary of the training sessions.
- The names and qualifications of persons conducting the training.
- The names of persons attending the training sessions.

**EMERGENCY RESPONSE PLAN  
SWAN ISLAND BASIN PROJECT AREA  
PORTLAND HARBOR SUPERFUND SITE  
PORTLAND, MULTNOMAH COUNTY, OREGON**

## **1.0 INTRODUCTION**

This Emergency Response Plan (ERP) describes the specific measures to be carried out in the event of an injury to personnel, damage to property, or spills of materials during work activities at the Swan Island Basin (SIB) Project Area located at the Portland Harbor Superfund Site in Portland, Multnomah County, Oregon. The overall site location is shown on Figure 1-1. The SIB Project Area is between approximately River Mile 8.1 and River Mile 9.2 on the northeast side of the Willamette River and includes all riverbanks from top of the bank to the river. For a detailed site description and history of the site, refer to the Field Sampling Plan (HydroGeoLogic, Inc. [HGL], 2021a).

### **1.1 PURPOSE AND SCOPE**

This ERP provides a description of the site-specific actions necessary in the event of personnel injury, property damage, or spills of materials during the performance of the Remedial Design (RD) work which constitutes an emergency or may present an immediate threat to public health or welfare or the environment. This plan is to be used in conjunction with HGL's Health and Safety Plan (HASP) for work at the SIB Project Area. Procedures for emergency medical treatment and first aid are specified in the HASP. This plan:

- Identifies the types of emergencies that may be encountered during the project work and typical responses,
- Lists important points of contact (POCs) along with their notification and reporting procedures, and
- Describes the approach to inspections and data recording.

### **1.2 PLAN REVISION AND AMENDMENT**

This ERP will be maintained and reviewed annually and will be updated and/or amended as described herein. The emergency POC telephone numbers will be reviewed and updated semiannually and/or when a change in operations or management occurs. The plan will be reviewed and amended immediately if the following occur:

- The list of emergency equipment, supplies, and/or materials required to stop and/or control a spill or release are altered or updated;
- The emergency POCs change;
- The plan fails to contain, control, or clean up a spill or release of hazardous materials; or
- The plan fails to address personnel injuries or property damage.

*This page was intentionally left blank.*

## **2.0 FORMS OF EMERGENCIES EVALUATED**

The various types of emergencies covered in this plan generally fall into two broad categories: those associated with human activities and those related to natural events.

### **2.1 HUMAN-INDUCED EMERGENCIES**

#### **2.1.1 Spills**

Spills, leaks, and releases associated with the RD field investigation are described in Section 4 of this ERP and discussed in Section 3 of the Spill Prevention, Control, and Countermeasures Plan (SPCCP) included as Appendix A. The potential sources of contaminants anticipated to be encountered during the RD field investigation include petroleum products (e.g., fuel, oil, and grease) associated with sample collection equipment and vehicles, sample preservatives, and investigation derived wastes such as drilling mud and detergent/water from decontamination activities. The multistep process for controlling and reporting on spills is presented in Section 5 of the SPCCP.

#### **2.1.2 Fires and Explosions**

Except for small fires that can be managed with handheld equipment such as fire extinguishers, the priority during emergencies is to evacuate project personnel, followed by notifying trained emergency responders to contain the fire. Fire extinguishers will be maintained on site as described in the activity hazard analysis General Site Work located in the sitewide HASP (HGL, 2021b). The field team leader (FTL)/site safety and health officer (SSHO) will follow the incident reporting requirements outlined in this document and the SPCCP if field team members, including subcontractors, are injured or property damage to field equipment occurs.

Potential fires and explosions may occur during the project activities on land at the temporary field office (Building #10 of the Vigor facility), the riverbank/upland area, a vessel, or an on-water platform. For emergencies occurring on land, field team members and subcontractors should muster at the upland position (Swan Island Boat Ramp) specified in the HASP if fire or explosions threatens work activities being conducted inside the field office or within the riverbank/upland area. If a staff member observes a hazard that public emergency services should handle, they will withdraw from the area and contact public emergency services immediately.

Field team members working on vessels or on-water platforms will wear U.S. Coast Guard-approved personal flotation devices (PFDs) as described in the sitewide HASP (HGL, 2021b). Field team members should evacuate to an adjacent vessel or platform in the event of fire, or explosion if it is safe to do so, and the fire is too large to fight using handheld equipment. Personnel will maintain as much distance as possible from the emergency site to avoid open flames and impacts from shrapnel from explosions, and then evacuate to the nearest safe shoreline area or back to the Swan Island Boat Ramp until personnel numbers and condition have been assessed.

If additional vessels or on-water platforms are not present in the work area, or if the escape path to them includes encountering additional hazards, then the field team members should abandon the vessel as a last resort and swim to the nearest shore. The areas around running engines/

propellers and any visible floating petroleum that has the potential to catch fire shall be avoided. Upon reaching the shore, personnel should assist coworkers out of the water and assemble to evaluate the situation, especially with respect to burns or injuries. The group should mobilize back to the primary muster location (Swan Island Boat Ramp) and then contact public emergency services if they have not already been notified of the event.

### **2.1.3 Boating-Related Incidents**

Five types of general boating-related incidents that could happen during on-water work of the RD field investigation are presented below.

#### **Collisions**

Shipping traffic, industrial transportation, and recreational usage occur on the Willamette River. In addition, upstream flooding events may wash wood/vegetation and other floating debris into the river. This traffic, along with floating debris, can create collision hazards with vessels. The potential for collisions on the water can be reduced by:

- Following the accepted rules of navigation and general boating safety.
- Using a spotter to assist with identifying other vessels and floating debris.
- Maintaining a safe speed, especially when traffic is heavy, or visibility is reduced due to fog or early/late day low light conditions.
- Not operating the vessel when fatigued or under conditions that may impair reaction times.
- Paying special attention to navigational aids.

#### **Running Aground**

This type of hazard includes grounding the vessel on the river bottom or other underwater structure when operating on the river. The following will reduce the chances of running aground:

- Know your environment and the waterways you travel in.
- Use a spotter when the boat is in motion and/or operating in shallow waters or areas with known underwater snags.
- Be aware that the location of shallow submerged objects will change as water levels change.
- Bring appropriate charts and onboard electronic equipment such as sonar to determine the exact position and water depth.
- If the boat is not grounded too severely, the operator may simply be able to reverse off from where it is grounded by putting the engine into reverse, tilting the engine slightly upward (for an outboard or an inboard/outboard), and then shifting some weight away from where the boat is grounded. Otherwise, the field team members may attempt to physically push the vessel off the obstruction using poles or similar equipment or by contacting another vessel for assistance.

### **Fire Aboard**

Proper fueling techniques and materials storage, as well as following standard boating safety guidelines, will help prevent the likelihood of fires aboard a vessel. The following approach will be used for small fires that do not require abandoning the vessel:

- Stop the vessel immediately if in transit.
- Position the boat so that the fire is downwind of the field team members.
- Shut off the fuel supply if the fire is close to an engine and it is safe to do so.
- Use a fire extinguisher to battle small flames, aiming at the base and moving it in a sweeping motion.
- Call for help using a marine radio (VHF channel 16, the distress, safety, and calling frequency) or cellular phone and follow the instructions provided by public emergency services personnel.

### **Capsizing and Falling Overboard**

Collisions with other vessels or floating debris, heavy wave action, sharp turns, swinging heavy equipment, and misplaced steps on wet and slick decks can contribute to capsizing and overboard events. Overboard victims face several dangers, including panic, injury during the fall, and hypothermia. For those aboard the boat, quick thinking and coordinated action are essential to an effective rescue.

- Alert vessel master that there is a person overboard without losing sight of the person overboard.
- Persons onboard must always wear PFDs when performing on-water work, as specified in the sitewide HASP.
- Do not exceed the weight limit of the vessel and be mindful of changes in its center of gravity when stowing equipment or heavy loads.
- Do not allow passengers to sit anywhere not designed for seating when the vessel is in transit.
- Avoid boating in rough weather or adverse conditions.
- Reduce speed appropriately when making turns.

In an overboard situation:

- Alert vessel master that there is a person overboard without losing sight of the person overboard.
- Stop the vessel immediately if in transit.
- Position the overboard person between the boat and the wind by approaching the overboard person from downwind.

- Use a roped buoy, swim platforms, ladders, and even brute strength to bring the person on board.
- Never have anyone go into the water as this will add another person to be rescued.

Additional details regarding the overboard scenario are presented in the activity hazard analysis Working Near Open Water located in the sitewide HASP (HGL, 2021b), and will be presented by the subcontractors responsible for providing boating services.

### **Carbon Monoxide Poisoning**

Carbon monoxide is produced anytime a fuel source is burned, including on a boat in the form of engines, heaters, and generators. Here are a few tips to keep carbon monoxide safely away from boat passengers:

- Keep fresh air circulating regardless of the ambient weather conditions.
- Ventilate the work area thoroughly if exhaust fumes are noticed.
- Be aware of the location of engine and/or generator exhaust outlets.
- Avoid working in the vicinity of idling engines and generators.

See the sitewide HASP and its related subcontractor-specific boating safety plans for detailed information on treatment and evacuation of personnel in the event of an injury or person-in-the-water (overboard) situation (HGL, 2021b).

## **2.2 NATURALLY-CAUSED EMERGENCIES**

### **2.2.1 Flooding and Swift Water Events**

Floods are the most frequent and widespread of natural disasters caused by weather. They may occur following heavy rains, when ocean waves (tsunami) crash on the shore, snow melts rapidly, or in conjunction with dams or levees failing. Floods can happen in a matter of minutes or over a long period of time, lasting days, weeks, or even months. Their effect on Willamette River conditions can impact the RD field investigation.

The FTL and/or SSHO will check and be aware of the following each day prior to commencing on-water or on-bank activities associated with the Willamette River:

- Physical river conditions including elevation/stage,
- Water temperature,
- Regional (upstream) rainfall amounts within the past 48 hours,
- Anticipated rainfall intensity and amount, and
- Upstream dam release schedule and flow values.

These conditions and data can be obtained from the following sources:

Observation	Source	Website
River Conditions	U.S. Geological Survey Gage #14211720, Willamette River, Portland, OR	<a href="https://waterdata.usgs.gov/usa/nwis/uv?site_no=14211720">https://waterdata.usgs.gov/usa/nwis/uv?site_no=14211720</a>
Previous Rainfall Amount and Intensity	National Oceanic and Atmospheric Administration (NOAA)/National Weather Service data at Portland International Airport	<a href="https://w1.weather.gov/data/obhistory/KPDX.html">https://w1.weather.gov/data/obhistory/KPDX.html</a>
Forecasted Weather/Precipitation	<ul style="list-style-type: none"> <li>• NOAA/National Weather Service Data for Portland</li> <li>• Other publicly available online source</li> </ul>	<a href="https://forecast.weather.gov/MapClick.php?textField1=45.59&amp;textField2=-122.59">https://forecast.weather.gov/MapClick.php?textField1=45.59&amp;textField2=-122.59</a>
Upstream Dam Releases	U.S. Army Corps of Engineers, Portland District Water Management	<a href="https://www.nwd-wc.usace.army.mil/nwp/wm/teacups.html">https://www.nwd-wc.usace.army.mil/nwp/wm/teacups.html</a>

Being aware of and avoiding non-normal river conditions will be the primary means of preventing water-related emergencies. On-water work and possibly on-bank activities (such as riverbank slope inspections) will be rescheduled when recent storm events cause water currents to increase, contribute significant amounts of floating debris to the river, or similar extreme river conditions are present or anticipated to occur during the work period. The riverbank and associated slopes will be visually inspected by the FTL and/or SSHO after the river returns to normal water elevation and flow patterns. These conditions will be discussed with the project team and a decision will be made whether to continue or delay on-bank work activities.

### 2.2.2 Seismic Events

Portland, Oregon, is in the Cascadia Fault subduction zone, an area of low to moderate seismic and volcanic activity. Hazards within the project area related to seismic events would be related primarily to falling and collapsing items that lead to covering or crushing personnel or equipment. These may include buildings, trees, riverbank riprap/soil, or retaining walls/piers in the industrialized section of the project area. Bank collapse, liquefaction of soil/sediments, or waves in the river because of the seismic event are possible secondary hazards.

#### **On-Water Response**

On-water and dive work should be stopped immediately in the event of a seismic event, and the work platforms or vessels shall navigate away from the shore or land-connected structures and toward the center of the river channel to avoid falling trees, structures, and destabilized riverbank soils. It is preferred that vessels return to the Swan Island Boat Ramp rather than disembarking at the nearest shore as soils may be unstable and because the boat ramp infrastructure is better equipped for responding to emergencies. To avoid dangerous and damaging waves associated with the seismic events, personnel should relocate from the boat ramp to higher ground and then follow the muster protocol described in the “Off-Water Response” section below.

### **Off-Water Response**

If a seismic event occurs during RD investigation work along the riverbank or upland area, the field team members should move away from the riverbank edge, buildings, trees, and steep slopes as much as possible. Personnel should follow the safest and shortest route to the muster spot after ground shaking has stopped. Roll call of the RD field personnel will be taken once everyone has relocated to the muster location (Swan Island Boat Ramp Parking Area). Damaged or collapsed transportation and communication networks may create areas of isolation throughout Portland. In this case, field team members may be required to walk to the nearest police/fire station or Basic Earthquake Emergency Communications Node (BEECN) to receive assistance. The nearest fire station (Portland Fire and Rescue Station 22 – Overlook/Swan Island) is located at 4515 North Maryland Avenue, approximately 1.6 miles East of the Swan Island Boat Ramp. The nearest BEECNs are located at:

- University of Portland Public Safety Office located in Haggerty Hall at 5415 N. Warren Street near the intersection of N. Portsmouth Avenue and N. Warren Street approximately 1.5 miles northwest of the Swan Island Boat Ramp.
- Arbor Lodge Park at the northeast corner of N. Dekum Street and N. Greely Avenue approximately 1.0 mile northeast of the Swan Island Boat Ramp.

A visual assessment of the project area will be made following a seismic event to determine the impact to completion of the RD field activities, including the potential for aftershocks or future impacts such as delayed collapse of weakened structures. The U.S. Environmental Protection Agency (EPA), HGL with its subcontractors, and the SIB RD Group will each assign representatives to conduct the visual assessment together.

### **2.2.3 Riverbank/Slope Structural Failure**

The project manager (PM), SSHO, or on-site staff, along with the project geotechnical engineer, will follow the process outlined below if a significant failure of the riverbank occurs within the project work limits:

- Examine the SIB to document current conditions.
- Photograph observed bank failure, estimate the volume of material dislodged during the failure, and evaluate stability.
- Identify and contact the property owner to coordinate response actions.
- With permission of property owner, barricade the failure area from access while the failure is under evaluation.
- Develop a plan to address the failure area and provide it to EPA.
- With permission of property owner, stabilize and monitor the area, as necessary.

### 3.0 EMERGENCY POINTS OF CONTACT AND PROCEDURES FOR NOTIFICATION AND REPORTING

#### 3.1 ON-SITE RESPONSE TEAM

Field team members initially responding to an emergency should immediately contact the RD field investigation FTL following a spill or safety incident, if the FTL was not already present in the immediate vicinity. The FTL will act as the primary POC during emergencies and coordinate the appropriate response. The SSHO will assume this role if the FTL is not present on site at the time of the event. In the case of on-water accidents the vessel captain will initially act as the POC until the vessel returns to the boat ramp and the FTL/SSHO is apprised of the situation. The FTL will assess the emergency, spill, or release and then direct the confinement, containment, and control measures until relieved by local responding emergency personnel, if applicable. Once the emergency has been abated, the FTL will begin the process of communicating details of the event to regulatory agencies and the project team.

#### 3.2 EMERGENCY CONTACTS

A general list of off-site POCs for emergencies is presented in the table below. Further detailed POCs specific to spills and bodily injury are included in the SPCCP and sitewide HASP, respectively.

Contact/Agency	Office Phone Number	Emergency Phone Number
<b>Emergencies</b>		
<i>On Water Emergency:</i> U.S. Coast Guard – Marine Safety Unit Portland	Not Applicable	Call Channel 16 on VHS Radio
<i>Land Emergency (On Vigor LLC Property):</i> Vigor Emergency Staff	503-247-1799 ext. #1799	Call Channel 1 on VHS Radio
<i>Land Emergency (Off Vigor Property):</i> 911 Bureau of Emergency Communications, City of Portland	Not Applicable	911

<b>Exterior Agencies</b>		
Elisabeth Novak, Project Coordinator, EPA	503-326-3277	503-351-4445
National Response Center	800-424-8802	800-424 8802
Michael Heffner, State Emergency Response Commission	503-934-8030	Not Applicable
Emergency Response System, Oregon Department of Environmental Quality	Not Applicable	800-452-0311

### **3.3 NOTIFICATION PROCEDURES**

In the event of an emergency, the FTL (or a designated appointee) will conduct an initial evaluation of the scenario. Personnel safety and protection of life and limb take precedence over environmental protection. After initiating first aid, a decision will be made on whether to involve public emergency response services. After the emergency situation has been resolved, the EPA Remedial Project Manager (RPM) will be notified and provided the following information:

1. Reporter's name and contact information;
2. Location, date, time, and duration of incident/release;
3. Description and timeline of the incident/release;
4. Severity of incident (threat to persons, property, or the environment) and potential threat to first responders, if any;
5. Estimated dollar amount of property damage, if known; and
6. Name and telephone number of contact person for further information.

The EPA RPM will be provided with the following additional detail if the emergency involves the release of a hazardous substance:

1. Chemical name or identity of the released substance(s) (Note: chemicals on-site and in the staging area will be restricted to only those required for RD efforts.);
2. Estimate of the quantity of the substance(s) released and description of the media into which the release occurred;
3. Associated health risks and medical attention necessary for exposed individuals; and
4. Actions implemented to date, such as containment and/or evacuation.

### **3.4 REPORTING PROCESS**

The following will be provided to the EPA RPM in association with the occurrence of an emergency event:

- A report will be submitted, within 14 calendar days of the start of the incident, that outlines the event and actions taken or planned by or on behalf of the project team.
- A full report detailing measures taken in relation to the incident will be submitted within 30 days of the event's conclusion.

## **4.0 SPILL RESPONSE**

In the case of a spill or release associated with the RD field investigation, the SPCCP (Appendix A) describes the response procedures to be followed, as well as the notification and reporting processes. Specifically, detailed guidance related to spill prevention, control, and response is presented in Section 5 of the SPCCP. The EPA RPM will act as the primary POC for distributing emergency-related information to the public, with support from HGL and the SIB RD Group, as required.

*This page was intentionally left blank.*

## **5.0 INSPECTIONS AND RECORDS**

### **5.1 INSPECTIONS**

Routine inspections will be conducted monthly during field efforts and will include, at a minimum, a visual inspection of the hazardous materials containers at the on-site office and equipment staging area, if present, and the adjacent areas for signs of a spill or leak. The SSHO will conduct and record these inspections in a logbook. See Section 5 of the SPCCP for additional detail regarding equipment inspections.

### **5.2 RECORDS**

Spills will be documented on the Spill Plan Inspection Form (Attachment 1) and must be entered into the Spill Log (Attachment 2). Additional pages may be included with the Spill Plan Inspection Form as needed to describe the event in greater detail. Examples of additional information may include:

- Known or possible causes of the spill or release;
- Areas affected;
- Effectiveness of the cleanup; and
- A review of the cleanup subcontractor, if necessary, and the procedures used.

## Spill Plan Inspection Form

### Swan Island Basin Project Area, Portland Harbor Superfund Site

#### **Lids and Labels -**

- Have lids and caps been returned to their proper place? Yes \_\_\_ No \_\_\_
- Are labels present and legible on containers? Yes \_\_\_ No \_\_\_

#### **Evidence of Spills -**

- Is there an indication that a spill might have occurred? Yes \_\_\_ No \_\_\_
- If so, was the spill properly cleaned? Yes \_\_\_ No \_\_\_
- Was the Spill Log completed for that incident? Yes \_\_\_ No \_\_\_
- Were kit materials used, and if so, restocked? Yes \_\_\_ No \_\_\_

#### **New Hazardous Materials -**

- Have new chemical products been purchased? Yes \_\_\_ No \_\_\_
- Is a safety data sheet for the new product available on site? Yes \_\_\_ No \_\_\_
- Is the container properly labeled? Yes \_\_\_ No \_\_\_
- Is the new product stored and handled properly? Yes \_\_\_ No \_\_\_

#### **Spill Kits -**

- Have items been used from the spill kit? Yes \_\_\_ No \_\_\_
- If items are missing, is there an associated entry in the Spill Log? Yes \_\_\_ No \_\_\_
- Are there items missing from the spill kit that are currently on order? Yes \_\_\_ No \_\_\_
- Is the spill kit stored at its designated location? Yes \_\_\_ No \_\_\_
- Is there a sufficient supply of daily cleanup materials? Yes \_\_\_ No \_\_\_

#### **Storm Drains in the On-Site Office and Equipment Staging Area -**

- Is there a buildup of sediment in the drain traps? Yes \_\_\_ No \_\_\_
- Is there evidence of drain clogging? Yes \_\_\_ No \_\_\_
- Are the drain filters intact? Yes \_\_\_ No \_\_\_
- Should the drain filters be replaced? Yes \_\_\_ No \_\_\_
- Have the drain filters been replaced? Yes \_\_\_ No \_\_\_

#### **Items Fixed -**

- Have previously documented deficiencies been fixed or made acceptable? Yes \_\_\_ No \_\_\_

**SPILL PREVENTION, CONTROL, AND COUNTERMEASURES PLAN**  
**SWAN ISLAND BASIN PROJECT AREA**  
**PORTLAND HARBOR SUPERFUND SITE**  
**PORTLAND, MULTNOMAH COUNTY, OREGON**

**1.0 INTRODUCTION**

This Spill Prevention, Control, and Countermeasures Plan (SPCCP) describes the specific measures to be carried out in the event of an accidental spill or release of hazardous materials during Pre-remedial Design Investigation (PDI) work activities at the Swan Island Basin (SIB) Project Area portion of the Portland Harbor Superfund Site (PHSS), located on the Willamette River near Portland, Oregon. For a detailed site description and history of the site, refer to the Field Sampling Plan (HydroGeoLogic, Inc. [HGL], 2021a).

Personnel conducting work activities at the project site will be familiar with this SPCCP and will review the actions that would be required should a spill occur in their respective area.

**1.1 PURPOSE AND SCOPE**

The actions to be taken in the event of a spill or release during SIB field investigation activities are described in this plan, which provides site-specific guidelines regarding responsible leadership for implementing effective countermeasures during a spill or release to help minimize or eliminate damage to property and the environment. This plan (1) identifies potential spill sources and associated work activities; (2) establishes guidelines for the prevention and control of spills associated with the project activities; (3) establishes roles, responsibilities, procedures, and training guidelines for response personnel; and (4) describes notification and reporting requirements with respect to unintentional spills and releases. The plan has been prepared in accordance with 40 CFR Part 110 (requirements for spill reporting) and Part 112 (requirements to prepare and implement an SPCCP).

**1.2 PLAN REVISION AND AMENDMENT**

This SPCCP will be maintained and reviewed annually and will be updated and/or amended in parallel with changes or updates to the Emergency Response Plan.

*This page was intentionally left blank.*

## **2.0 PROJECT AREA DESCRIPTION**

### **2.1 LOCATION AND HISTORY**

PHSS is in Portland, Oregon, on the Lower Willamette River immediately downstream of the urban downtown area from river mile (RM) 1.9 upstream to RM 11.8. The study area is located within SIB, which is on the northeastern side of the Lower Willamette River in PHSS between RM 8.1 and RM 9.2. Contamination in river sediments is associated with decades of industrial use along the Willamette River. In December 2000, PHSS was added to the U.S. Environmental Protection Agency's (EPA's) National Priorities List, and a Record of Decision was prepared in 2017 (EPA, 2017).

### **2.2 CONTAMINANTS OF CONCERN**

The contaminants of concern (COC) driving the cleanup in the project area are the following:

- Polychlorinated biphenyls;
- Dioxins and furans;
- Polycyclic aromatic hydrocarbons; and
- Pesticides DDT, DDD, and DDE (EPA, 2017; EPA and WC Group, 2019).

### **2.3 PROPOSED FIELD ACTIVITIES**

The field investigation is targeted for the third quarter of 2021 and is expected to last 2 to 6 weeks. Activities to be conducted in support of the Remedial Design (RD) are described in the FSP (HGL, 2021a) and will include:

- Bathymetric surveys mapping riverbed features that will require boats to be used on the water.
- Sediment and porewater sampling that will require the use of on-water barges, support boats, and possibly drilling equipment.
- Barge-mounted or land-based drilling activities that will require using a drill rig or direct push probe unit along with support vehicles.
- Visual inspections of marine structures using a three-member dive team that will require using a support vessel.
- General project support during site visits, inspections, sampling, and other activities that will require parking vehicles at the support facility/field trailer.

*This page was intentionally left blank.*

### 3.0 WORK ACTIVITIES AND POTENTIAL SOURCES OF SPILLS

The potential sources of hazardous materials anticipated to be encountered during the RD field investigation are summarized in the following table.

Activity	Potential Source	Contaminants
<ul style="list-style-type: none"> <li>• Bathymetric Surveys</li> <li>• Dive Inspections</li> <li>• Sediment Sampling</li> </ul>	<ul style="list-style-type: none"> <li>• Boat/On-Water Vessels</li> <li>• Support Vehicles</li> </ul>	Fuel, oil, and grease
<ul style="list-style-type: none"> <li>• Soil, Sediment, and Porewater Sampling</li> </ul>	<ul style="list-style-type: none"> <li>• Drill Rig</li> <li>• Direct Push Probe Unit</li> <li>• Support Vehicles</li> </ul>	<ul style="list-style-type: none"> <li>• Diesel, unleaded fuel, oil, and grease</li> <li>• Investigation-derived Waste from sampling activities (sample preservatives and detergents from decontamination activities)</li> <li>• Drill cuttings/mud slurry</li> </ul>
<ul style="list-style-type: none"> <li>• Site Visits</li> <li>• Riverbank Inspections</li> <li>• General Support</li> </ul>	Support Vehicles	Fuel, oil, and grease

The U.S. Occupational Safety and Health Administration (OSHA) Hazardous Communications Program requires that safety data sheets (SDSs) be available to personnel when work is performed at the site. The SDSs include information such as the properties of each chemical; the physical, health, and environmental health hazards; personal protective equipment (PPE) to use when handling the chemical; and safety precautions for handling, storing, and transporting the chemical. The SDSs for the contaminants hazardous materials that are anticipated to be used or encountered during the RD field activities are included in the sitewide Health and Safety Plan (HGL, 2021b), of which a hard copy will be present on site during the work activities.

*This page was intentionally left blank.*

## **4.0 REPORTING SPILLS**

### **4.1 SPILL INFORMATION**

Spills in reportable quantities (see Section 4.2.1) of the hazardous materials listed in Section 3 are unlikely during the RD field investigation. However, RD field personnel will be instructed on the requirements and procedures for spill prevention, control, and reporting as part of the general health and safety orientation for site work. The basic information to have in hand for reporting spills includes:

1. Reporter's name, company, and contact information;
2. Location, date, time, and duration of incident/release;
3. Chemical name or identity of the released substance(s);
4. Estimate of the quantity of the substance(s) released and description of the media into which the release occurred;
5. Description and timeline of the incident/release;
6. Severity of the incident (threat to persons, property, or the environment) and potential threat to first responders, if any;
7. Associated health risks and medical attention necessary for exposed individuals;
8. Actions implemented to date, such as containment and/or evacuation; and
9. Name and telephone number of contact person for further information.

### **4.2 NOTIFICATION AND REPORTING**

#### **4.2.1 State of Oregon Notification**

Certain scenarios require immediate notification to the Oregon Department of Environmental Quality (ODEQ) according to Oregon Administrative Rules Database Chapter 340 Division 142, *Oil and Hazardous Materials Emergency Response Requirements*. Reportable spills as defined by ODEQ include:

- Any amount of oil released to waters of the state;
- Oil spills on land more than one barrel (42 gallons); and/or
- Hazardous materials that are equal to, or greater than, the quantity listed in 40 CFR Part 302 (List of Hazardous Substances and Reportable Quantities), and amendments adopted before July 1, 2002.

Verbal notification of the spill will be provided to the Oregon Emergency Response System at 800-452-0311. Written notification of the release and subsequent cleanup will be provided within 30 calendar days to ODEQ on the Spill/Release Report form located on the ODEQ website at <https://www.oregon.gov/deq/Hazards-and-Cleanup/env-cleanup/Pages/How-To-Report-A-Spill.aspx>.

#### **4.2.2 National Response Center**

The National Response Center (NRC) is the sole federal point of contact when reportable oil and chemical releases occur and must be contacted within 24 hours of the incident. This contact can be made via telephone at 800-424-8802. The NRC duty officer will guide the caller through a detailed series of questions based on the Standard Report Form to gather as much information as possible concerning the spill or release. Alternately, the contact can be made through email at [NRC@uscg.mil](mailto:NRC@uscg.mil).

Contacting NRC fulfills the requirement to report releases of hazardous substances under the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) and several other federal regulatory programs. If direct reporting to NRC is not possible at the time of or immediately following the incident, reports may be made to the designated EPA on-scene coordinator for the geographic area where the release occurred. However, those reports must subsequently be relayed to NRC as soon as practicable.

#### **4.2.3 State Emergency Response Commission**

As required by the Emergency Planning and Notification regulation, the State Emergency Response Commission (SERC) must be notified when a facility accidentally releases one of the following types of chemicals into the environment in an amount greater than or equal to the reportable quantity:

- List of Extremely Hazardous Substances (40 CFR part 355); and
- CERCLA hazardous substances (40 CFR part 302).

The point of contact for SERC is:

Michael Heffner, SERC Coordinator  
Oregon State Police; Office of the State Fire Marshal  
3565 Trelstad Ave. SE  
Salem, OR 97317-9614  
Phone: 503-934-8030  
Email: [michael.heffner@state.or.us](mailto:michael.heffner@state.or.us)

#### **4.2.4 Project Team Notification and Reporting**

In addition to notifying the appropriate regulatory agencies, the SIB project team will be notified in the following manner:

- Field team members initially responding to the event should immediately contact the field team leader (FTL) following a spill if the FTL was not in the immediate vicinity of the spill. The FTL shall immediately notify the appropriate spill reporting agencies, followed by notification to the EPA project coordinator.
- The FTL shall then notify the HGL corporate health and safety coordinator along with the SIB project manager (PM). The PM shall initiate communication with the SIB RD

Group through Group Project Coordinator Philip Spadaro with The Intelligence Group, LLC (TIG).

<b>Point of Contact/</b>

*This page was intentionally left blank.*

## **5.0 SPILL PREVENTION, CONTROL, AND RESPONSE**

### **5.1 SPILL PREVENTION**

#### **5.1.1 Training**

The minimum training requirements for on-site personnel designated to handle oil and/or hazardous materials or respond to spills will include OSHA Hazardous Waste Operations and Emergency Response 40-hour safety and health training, a current 8-hour OSHA Refresher certificate, and documented training in respirator use. Spill awareness, prevention, and response procedures will be discussed as part of the initial site safety orientation to be conducted at the start of the field activities and if/when new personnel join the field team. Concepts of spill prevention, control, and response will be added to the rotation of topics to be discussed as part of the daily safety tailgate meeting to maintain awareness and knowledge. Subcontractors will provide spill response training for their own members in accordance with state and federal regulations.

#### **5.1.2 Inspections**

Incoming vehicles and equipment (including delivery trucks and employee and subcontractor vehicles) will be checked for leaking oil and fluids when they are first mobilized to the project and daily during regular use. Vehicles or equipment that are visibly leaking will not be allowed on site until repairs are made to address the issue. Visual inspections for leaks under and around powered equipment will be part of the FTL's daily site inspection and documented in the Daily Quality Control Report.

#### **5.1.3 Fueling**

Fueling of vehicles and equipment will be performed off site to the extent possible. For instances where fueling occurs at the project site:

- Specific areas, located away from drainage courses and stormwater inlets, will be designated for use when it is impractical to send vehicles or equipment off site for refueling. The areas will be protected from stormwater runoff and runoff.
- “Topping off” fuel tanks will be discouraged.
- A means of secondary containment, such as a drain pan, will be used when fueling to catch spills/leaks.
- A spill kit will be available immediately adjacent to the fueling operation.

#### **5.1.4 Regular Maintenance and Cleaning Equipment**

Regular maintenance and cleaning of powered (fuel-driven) equipment should be performed off site. If emergency maintenance is required to move or prepare a piece of equipment to be relocated off site for extensive service or repair, then drip pans, plastic sheeting, or other means to prevent/contain spills should be taken prior to performing the work.

### **5.1.5 Biodegradable Hydraulic Fluids and Oils**

The use of biodegradable or plant-based petroleum products is encouraged on this project, particularly when used in proximity to water bodies, to lessen the environmental impact of spills or fluid releases. Current fluids and oils in equipment should be converted to biodegradable alternatives wherever possible.

## **5.2 CONTROL**

### **5.2.1 Guidelines for Containers**

- Close and seal containers when not in use.
- Label containers to show the contents and capacity.
- Maintain containers in good condition during normal use. Transfer materials to new containers if containers are leaking or visibly damaged. Immediately clean spills on the exterior of the container.
- Store substances per the manufacturer's directions in containers that are in good condition and compatible with the materials.
- Allow sufficient spacing between containers for ease of access, periodic inspections, and release response.
- Use grounding procedures when storing and dispensing flammable materials from drums or totes to prevent static sparks.
- Keep portable containers (with capacity of less than 5 gallons) for flammable/combustible liquids (such as gasoline cans) in a flammable storage cabinet when not in use.
- Remove markers and labels from clean, empty, hazardous substance containers (drums), and mark the container with the word "empty."
- Provide at least 4 inches of headspace in drums to allow for expansion of the stored material.

### **5.2.2 Spill Kits**

Spill response equipment will be provided and maintained in areas where spills are likely to occur. The equipment will meet the following guidelines:

- Stock spill cleanup kits and response equipment that are compatible with the substances used or stored on site;
- Locate spill kits in areas where spills are likely to occur;
- Stock spill kits to manage the worst-case anticipated release (corresponding to the volume of the largest container or sum of containers); and
- Periodically inspect spill kits and other emergency response equipment to ensure they are complete, and that the equipment is in proper working condition.

Subcontractors will be responsible for supplying appropriately sized spill kits containing materials specific to their operations and instructions for their use. Each on-water vessel will have at least one spill kit on board.

### **5.2.3 Containment Areas**

- Containment areas shall be constructed with leak-resistant materials or provided with a similar liner and have a storage volume equal to or greater than 110 percent of the largest individual container or tank located inside the containment area.
- Containment areas shall be included as part of the FTL's daily inspection of site conditions.
- Rainwater/precipitation shall not be allowed to accumulate in containment areas or secondary containment features.
- Store non-bulk chemicals within appropriate secondary containment if a potential exists for release to the environment.
- Inspect secondary containment periodically and identify, clean, and remove spills from the secondary containment feature.
- Fire extinguisher(s) shall be available near areas in which flammable or combustible materials are stored.

### **5.2.4 Good Housekeeping**

- Use proper signage to identify hazardous substance or waste storage, collection, and disposal areas.
- Close hazardous substance containers when not in use.
- Regularly inspect, clean and repair containers. Do not use damaged containers including lids.
- Use a funnel or spigot when transferring chemicals from larger to smaller containers to prevent spills and use drip pans or other collection devices to contain drips or leaks.
- Immediately clean and properly manage small spills or leaks per the material SDS.
- Inspect equipment and hazardous substance storage areas to ensure that leaks or spills are not occurring.
- Keep work and storage areas clean and in good general condition. Maintain clearance and open walkways around stored materials, containers, and equipment.

## **5.3 SPILL CONTROL AND RESPONSE**

The FTL of the RD field investigation activities shall be primarily responsible for implementation of this SPCCP in the field.

### 5.3.1 General Spill Response Procedures

Response actions associated with spills and releases will vary in relation to the range of materials and variety of activities planned for the RD field investigation, along with the scale and variable severity of the hazards presented in the event of a spill. General procedures for addressing spills are outlined in the following sections. Subcontractors and vessel captains will be responsible for the initial response to on-water spills and emergencies with HGL personnel providing additional support regarding containment and the reporting process.

#### Step One: Communicate the Hazard

- If the nature of a spill is not known, the FTL must radio the Coast Guard on Channel 16 (on water spills) or call 911 (on land spills, off Vigor LLC property) or radio Vigor emergency response staff on Channel 1/call 503-247-1799 and evacuate the area of the spill. The field team members will not attempt to clean up spills that may contain unknown chemicals.
- Immediately notify others working in the area and the FTL of the hazard. Evacuate the area if the situation warrants it.
- Follow the established emergency procedures to call for help and/or radio Channels 1 or 16 or call 911 for large spills, hazardous materials, or in the event of injured personnel. Inform the dispatcher of the type of material that was spilled and the quantity so that first responders will be ready to address the situation. Be prepared to provide SDS information to fire department, emergency medical technician, hospital, or physician.
- Remove injured or contaminated personnel from the immediate area if the situation is immediately dangerous to life and health if they can be reached and withdrawn from the area without endangering additional personnel in the process. First aid and/or decontamination procedures will be implemented, as appropriate.

#### Step Two: Control the Spill

- The sooner a spill is contained, the smaller the area that will need to be cleaned.
- The FTL, SSHO, and/or vessel captain will evaluate the scale of the spill and chemical/physical properties of the spilled material to determine whether it can be managed by on-site personnel or requires addressing from public emergency agencies.
- When a spill is managed by on-site personnel, they should immediately don appropriate PPE for the chemical and the nature of the hazard including respirators, if necessary. The appropriate PPE for this activity will be based upon the guidelines in the SDSs, which will be co-located with the chemicals being stored and/or in the possession of the field team members whenever field activities utilizing these compounds are occurring.
- Implement readily available actions (such as closing a valve or righting a container that has tipped over) to stop the spill or minimize the chances of it becoming worse if this does not introduce risk to that acting person's health.

- Shut down potential sources of heat or ignition if possible and appropriate for the type of spilled material. Increase ventilation to the area if that will safely disperse fumes and aid in drying liquids.

### **Step Three: Contain the Hazard**

- Once the immediate situation has been addressed, take steps to keep the spill from spreading to other areas or contaminating adjacent surfaces. This usually involves confining the spilled material to a small area by using some type of absorbent material or neutralizer.
- Prevent the spill from spreading to floor drains, stormwater inlets, or other places that may allow the material to flow into environmentally sensitive areas.
- Practice and be knowledgeable of a variety of spill confinement techniques and equipment including absorbent mats, booms, dikes, and related materials, as well as possessing a working knowledge of common patch and repair tactics such as pre-measured epoxy sticks, clay-based patches, tourniquets, and pipe wraps.

### **Step Four: Evaluate and Implement Cleanup**

- The FTL will assess the spill/release and then direct the confinement, containment, and control measures until relieved by local responding emergency personnel, if necessary.
- Collect the material used to contain or neutralize the spill and dispose of it in the specified manner.
- Implement personnel and equipment decontamination procedures, if necessary.

### **Step Five: Notification and Reporting**

- Initiate the notification process for regulatory agencies and the project team.
- Begin gathering information and data regarding the spill and cleanup process and start the reporting process.

## **5.3.2 Spill Response for Petroleum and Floating Liquids**

### **5.3.2.1 Responses to Minor Spills**

Minor spills typically involve small quantities of oil, fuel, paint, etc., which can be controlled by the first responder at the discovery of the spill. Minor spills have 1) volume of less than 42 gallons, 2) do not contact stormwater drains or other means of conveyance, 3) do not enter bodies of water, and 4) do not contain hazardous materials or reportable quantities as described in Code of Federal Regulations 40 CFR Part 302. Minor spills of any volume that occur over water must be reported. On-water minor spills will be contained and removed by appropriately trained personnel using spill kits and other tools (i.e., floating oil boom) available aboard the vessel.

The PM will be notified of spills less than 42 gallons on land and will begin the process of communicating details of the event to the SIB RD Group, adjacent property owners/managers, and EPA. Notification to regulatory agencies of minor spills is not required unless the spill enters a

water body. The response procedures presented in Section 5.3.1 will be followed for spills on land with the addition of:

- Containerizing the underlying material in a 55-gallon drum (or similar sized container included as part of the spill kit) along with contaminated cleanup materials for proper disposal.
- Collecting a sample of the drummed materials for characterization and disposal.
- Collecting a sample of the soil, gravel, subgrade, etc. beneath the spill zone to document that the spilled material has been adequately removed.

### **5.3.2.2 Responses to Major Spills**

Major spills are those that are too large in scale or intensity to be addressed by available personnel using materials present on site (i.e., spill kits). In addition, these releases may pose a safety or health hazard or contact and enter a body of water.

The primary approach for responding to major oil/petroleum spills will be mechanical containment, recovery, and cleanup. Typical equipment will include booms, barriers, and skimmers, as well as sorbent materials placed and managed to block the spread of material, concentrated into one area, and removed for disposal. A release of any amount of oil/petroleum into a water body or volume greater than 42 gallons on land will initiate the notification process (regulatory agencies and the project team) described in Section 4.2.

### **5.3.3 Non-Petroleum Substances Response**

Non-petroleum types of materials present during the RD field investigation that might be subject to spills include soil cuttings/drilling mud, sample preservatives, and investigation-derived waste. Except for soil cuttings/drilling mud, these materials are not anticipated to be on site in quantities large enough to create a major spill scenario. The approach to evaluating, responding to, and cleaning up these types of materials is expected to be the same as that described previously for petroleum-based materials. Minor spills will be reported to the FTL and documented in the Daily Quality Control Report.

### **RESPONSE TO EPA COMMENTS**

*This page was intentionally left blank.*

APPENDIX E  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
The following are U.S. Environmental Protection Agency's (EPA's) comments on the Draft Pre-Design Investigation Work Plan Revision 4 (PDI Work Plan), prepared by HydroGeoLogic, Inc. (HGL) on behalf of the Swan Island Basin Remedial Design Group and dated June 2021. The PDI Work Plan is a deliverable prepared for the SIB RD Group under the Administrative					
1a	1001	Sufficiency Assessment Report Data Gaps	The PDI Work Plan does not clearly establish that the data gaps identified in the SIB Project Area Draft Sufficiency Assessment Report Revision 4 (SAR) (HGL 2021) will be filled as part of the PDI. A summary of the data gaps should be provided in the PDI Work Plan along with a plan to fill those data gaps. EPA recommends including a crosswalk table to track data needs.	The PDI Work Plan will be amended to clearly establish the data gaps identified in the SAR will be addressed as part of the PDI. A summary of the data gaps identified together with a plan to address these data gaps will be provided in the PDI Work Plan. A crosswalk table will be created to track data needs.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
1b	1002	Sufficiency Assessment Report Data Gaps	Additionally, clarify if any of the evaluations planned for the PDI are intended to generate inputs for the SEDCAM modeling discussed in the SAR. Additional comments regarding the proposed SEDCAM model will be provided with EPA's comments on the SAR.	The PDI Work Plan will be amended to clarify which PDI data will be used to generate inputs for the SEDCAM model. The specific information and a brief summary of how it will be used will be included as text in appropriate sections, including Sections 4.1 and 4.9.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
2a	1003	SMA Delineation	Sediment management area (SMA) refinement needs to consider both surface and subsurface sediment exceedances of all remedial action levels (RALs) applicable outside of the navigation channel and principal threat waste (PTW) thresholds (see Remedial Design [RD] Principle #1 in Section 1.4 of EPA's Remedial Design Guidelines and Considerations [RDGC]).	The text will be amended to include discussion of subsurface RAL and PTW exceedances that fall outside of the areal extent of the SMA, if any, including justification for how they should impact the SMA refinement.	
2b	1004	SMA Delineation	The intent of the recommendations in the RDGC is to provide a nominal 150-foot grid resulting in a maximum distance of 150 feet between sample locations to delineate an SMA boundary. Note, it is expected that additional samples at higher density may be needed to sufficiently plan for the RD. Adjust the text and proposed sample locations to illustrate that no samples are further than 150 feet apart or provide rationale for why certain proposed sample locations should be spaced farther apart. Note that SMA boundaries will be considered undelineated until they are bounded by samples with no RAL and/or PTW threshold exceedances within a 150-foot grid.	The text in the and applicable supporting documents will be amended to note that sample locations shall not be further than 150' apart. This sample spacing guidance applies specifically to the SMA boundaries with more flexibility for sample spacing within the interior of the SMA. Where proposed sample locations are >150' apart, written rationale will be provided to justify these proposed sample locations.	The response is acceptable pending EPA's review of the revised PDI Work Plan. As indicated in EPA's comments on the Draft SAR, areas under docks and other structures must be characterized as part of remedial design and physical and chemical characterization should be noted as a data gap that should be addressed during the PDI.
3	1005	Sediment Sampling	Upon reviewing planned core depths relative to existing subsurface data and RAL/PTW exceedances EPA believes that the target depth of the proposed subsurface sediment samples should be extended to 15-feet (ft) below mudline (bml) or refusal in most locations. Additionally, 20 feet bml may be required in some locations, particularly those adjacent to historical sample locations with concentrations exceeding RALs at depths greater than 15 feet. EPA recommends collecting additional archive samples from deeper intervals than the depths proposed in this PDI Work Plan to be analyzed pending characterization of the shallower intervals to avoid unnecessary design schedule delay. This will reduce the potential for data gaps related to unbound depth of contamination (DOC) and lateral extent of contamination. If only subsurface contamination exceeds RALs and/or PTW thresholds and the expected remedial technology application is capping, full delineation of DOC may not be necessary (see RD Principle #4 in Section 1.4 of the RDGC [EPA 2021]). However, characterization of subsurface sediment contamination will be required to sufficiently characterize material to be left in place to support cap design evaluations (see RDGC Table 5-2) or to demonstrate the stability of the buried contamination. If DOC is not fully delineated, EPA will require additional sampling to delineate DOC in dredging areas and areas with non-aqueous phase liquid (NAPL) impacts.	The expected remedial technology within the SMA is predominantly dredge and capping or just capping. In light of this likely technology application, EPA further affirmed (8/19/21) that DOC need not be defined in every core, but data should be collected to define DOC for SIB and to support dredge design where dredging is the anticipated remedial technology. The revised PDI Work Plan will clearly show what is known about DOC for PTW and RAL exceedance. Cores will be judgmentally located to fill data gaps in DOC and extended to 15 or 20 ft bml in areas where necessary and appropriate with selected archiving of samples for analysis. Some 150'-spaced core locations that are not needed for SMA refinement may be omitted to support these deeper core sampling locations with justification for the larger spacing.	The response is mostly acceptable; however, note that presumptive capping remedies are highly dependent on future land use in the SIB Project Area but EPA understands that the PDI work will result in additional information regarding future FMD depth requirements. The proposed core locations that exceed 150 foot by 150 foot spacing in the revised PDI Work Plan will be reviewed for potential data gaps. EPA also requests that a proposed analytical schedule for triggering archive samples is provided in the revised . Lastly, if porewater sample collection is not proposed for a supplemental PDI there may be data gaps such that additional sediment core collection is warranted in areas where the 150 foot by 150 foot spacing is exceeded to generate adequate data for cap design.

APPENDIX E (Continued from Previous Page)  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA's Draft Final PDI Work Plan Comments on February 1, 2022	SIB Response on February 17, 2022	EPA's Draft Final PDI Work Plan Comments on April 5, 2022	SIB Response on May 10, 2022
Settlement Agreement and Order on Consent (ASAOC), CERCLA Docket No. 10-2021-001, executed between EPA and the SIB RD Grot						
1a	1001	Sufficiency Assessment Report Data Gaps	<p>Additional information summarizing data gaps identified in the SAR was not provided in the text. Additionally, a crosswalk table of data gaps identified in the SAR was not included nor was that information added to existing tables. Revise the PDI Work Plan to include additional information summarizing data gaps identified in the SAR and a crosswalk table of data collection and SAR-identified data gaps or add information about SAR-identified data gaps to Table 4-1.</p> <p>As a specific example, the SAR identified a VOC groundwater plume associated with End of Swan Island Lagoon (ESCI #3901) as "C(u) Sources not sufficiently controlled because RPCs are present in site media &gt;CUL and/or RAL and there is a direct pathway." As indicated in the SAR, this site is not currently in the DEQ source control program. The plume has the potential to discharge into the project area at concentrations above CULs. The lack of porewater data should be identified as a data gap and sampling incorporated into the future porewater sampling program in order to determine (as indicated in the ASAOC SOW) whether cleanup can go forward and, if or how this source should be integrated into the in-water design.</p> <p>Further, neither Section 4.1 nor Section 4.9 include any discussion of how the PDI data will be used in the SEDCAM modeling. Although the PDI sediment core data may not directly be used for the SEDCAM modeling, the hydrodynamic and sediment transport modeling presumably will be used to develop inputs for SEDCAM. Therefore, at a minimum, revise Section 4.9 to discuss how these models will be used to support the SEDCAM model.</p>	<p>PDI WP Table 4-1 was reorganized and modified to include the data gaps identified in the SAR and to note that those are SAR-identified data gaps.</p> <p>Comment reference to Section 4.9 in the PDI Work Plan is incorrect. Section 4.11.7 Recontamination Potential Evaluation describes how hydrodynamic and sediment transport modeling results will be used to develop SEDCAM inputs as follows:</p> <p>"Recontamination potential evaluations in this section include analysis of sediment movements which when combined with contaminant concentrations from areas of sediment origin, provide input of contaminants from different sources for use in the SEDCAM modeling described in SAR Section 8.6." [Note that this text is not shown in RLISO because it was included as written in the December 2021 submittal.]</p> <p>"[Bullet Point] Generate sediment deposition footprint from simulated outfalls and rates of sediment deposition to be used as input to SEDCAM modeling for recontamination potential evaluation."</p> <p>Section 4.11.7 was amended to describe how the hydrodynamic and sediment transport modeling will be used to develop inputs for SEDCAM as follows:</p> <p>"The hydrodynamic and sediment transport modeling results will be used to develop inputs for SEDCAM. SEDCAM will be applied to multiple locations spatially distributed within the SIB Project Area, and the hydrodynamic and sediment transport modeling results will inform key parameter values at each SEDCAM location. Those parameters will include local sediment deposition rates, scour rates, mixing depth, and COC loading."</p>		
1b	1002	Sufficiency Assessment Report Data Gaps				
2a	1003	SMA Delineation				
2b	1004	SMA Delineation	<p>EPA notes the following potential data gaps:</p> <ul style="list-style-type: none"> <li>Figure 3-2a indicates a historical RAL exceedance for surface sediment sample S220 (PCBs and PeCDD) in cell C25 along the SMA boundary however no new surface sample is proposed in cell B25 to delineate the extent of the SMA boundary. A subsurface sample is proposed in cell B25 and a surface sample should be added to this location or a rationale provided for not further characterizing contamination at depth.</li> <li>Cell B8 has 2 surface samples; 1 has a PCB exceedance. A subsurface sample should be added to cell B8 to delineate contamination vertically or a rationale provided for not further characterizing contamination at depth.</li> <li>Cell B10 contains Post ROD sample A1 which has no exceedances. However, the post ROD sample directly adjacent A2 (cell C10) has above RAL surface concentrations not delineated by depth. A subsurface sample should be added in either C10 or B10 between A1 and A2 to delineate the contamination horizontally and vertically.</li> <li>A subsurface sample is planned for B19. Include a surface sample to delineate the SMA horizontally.</li> <li>PDI Sample B303, located on the boundary of the SMA in grid cell C-28, exceeded PCB and dioxin/furan RALs. Sample G411 was collected from grid cell B-28 (the adjacent grid cell to the north) in 2004, and this sample was not analyzed for dioxins/furans. The Revised PDI Work Plan does not identify this data gap, which has the potential to leave the SMA undelineated adjacent to a riverbank.</li> <li>Add step out subsurface sediment samples adjacent to cells BH and BI (IH and II) and archive in the event that samples from cells BH and BI have RAL or PTW threshold exceedances.</li> </ul> <p>Note that areas under docks and other structures may require additional characterization as part of RD and physical and chemical characterization in those areas should be noted as a data gap in the PDI Work Plan.</p>	<ul style="list-style-type: none"> <li>The surface core interval for cell B25 has been changed from archive to part of the Phase I analysis set</li> <li>Added new core location to cell B8</li> <li>Added new core location to cell B10</li> <li>This cell is reasonably well-covered by historical data, and may not constitute a data gap after planned Phase I analyses. A core surface-sediment interval will be archived in cell B19, and we recommend reviewing data gaps after Phase I to determine whether to analyze this sample.</li> <li>The surface core interval for cell C28 has been changed from archive to part of the Phase I analysis set. The core surface-sediment interval in cell B28 will be archived and reviewed for potential further analysis after Phase I results are received.</li> <li>Added new core locations to cells H0 and I0. These cores will be archived and reviewed for potential analysis in the event cells H1 and I1 have RAL or PTW threshold exceedances.</li> <li>Table 4-1 in the PDI was modified to include physical and chemical characterization in areas under docks and other structures as a data gap in the PDI Work Plan.</li> </ul>	<p>EPA notes that surface sediment samples have been added to the Phase I analysis set in cells B24 and C25. However, no surface sediment sample is currently proposed in the Phase I analysis set in cell B25.</p> <p>Also, there is no surface core sample from cell C28 in the Phase I analysis set identified in FSP Figure 4-3 or FSP Table 4-2. Clarify whether the SIB Group intends to include a surface sediment sample from cell B25 and C28 in the Phase I analysis set and revise the PDI WP accordingly.</p> <p>Additionally, EPA notes the following potential data gaps in vertical delineation of PTW exceedances the SIB Group may choose to address:</p> <ul style="list-style-type: none"> <li>At Cell R6 to bound subsurface PTW contamination at core PSY43.</li> <li>Downstream of Cell N1 (similar to the samples at H0 and I0) to bound PTW Exceedances at PSY34. If collected, this should be a 20-foot sediment core because PSY34 has total PCB PTW threshold and RAL exceedances from 4 to 8 and 8 to 10.8 feet bml, respectively.</li> </ul>	<p>Figures, tables, and text will be updated to confirm that cells B25 and C28 will be sampled as part of Phase I activities.</p> <p>A 10-foot core will be added to cell R6, and a 20-foot core will be added to cell N0. The PDI WP will be updated to reflect these additions.</p> <p>Changes to PDI WP include Tables 3-2 and 4-1 and text Sections 3.1.1, 3.1.2, and 4.1. Changes to FSP include Figures 4-3 and 4-4; FSP Tables 2-1, 4-1, and 4-3, and FSP text in Sections 4.2, 4.2.2, 4.2.3, and 4.2.3.1.</p>
3	1005	Sediment Sampling	<p>EPA appreciates that the text indicates SIB Group will consult with EPA regarding archive sample analysis. Revise the PDI Work Plan to include the proposed analytical schedule for archived samples for EPA review relative to the overall schedule for design. Sediment characterization data gaps will be reevaluated once the PDI data is collected and added to the CSM.</p> <p>Additionally, the Revised PDI Work Plan contains inconsistent information regarding the approach to delineating the depth of contamination (DOC) within the SMA. The FSP (Appendix A) identifies 8 locations that will be advanced to 20 feet below the sediment surface, but these eight deep locations are not discussed in Section 4.1 or Table 4-1. Revise the PDI Work Plan to correct discrepancies regarding the plan for delineating DOC in the project area.</p> <p>Figures 3-3a and 3-3b map subsurface sample locations where DOC was not delineated. These locations are generally located at the head of SIB to the east of Outfall S1, or adjacent to the drydocks at the mouth of SIB. The Revised PDI Work Plan only proposes DOC cores at the head of SIB (generally to the east of Outfall S1). EPA recommends that DOC cores also be advanced adjacent to the drydocks at the mouth of SIB or a rationale be provided for why additional cores are not necessary. Revise the rationale to support selecting sample locations to inform DOC.</p>	<p>Added text to Section 3.1.1 describing analytical schedule and timeframe for conferring with EPA regarding analysis of archived material.</p> <p>Added text regarding depth of contamination data gap locations (8 grid cells) to PDI Section 4.1</p>	<p>The text in Section 4.1 has been revised to identify the locations where 20-foot sediment cores will be collected but does not include the rationale. Revise this section to include the rationale for collecting DOC sediment cores from these locations (i.e., existing data show DOC greater than 10 feet bml). Additionally, EPA recommends that the sediment core in cell J8 be changed to a 20-foot vibracore because sample WLCPSK091-Z has a total PCBs PTW threshold exceedance from 6.8 to 10.8 feet bml.</p>	<p>The core collected from cell J8 will be revised to be a 20-foot core. The PDI WP will be updated to reflect this change.</p> <p>The PDI WP will be updated to provide a description of rationale used in selecting 20-foot core locations as follows:</p> <p>"20-foot core locations are selected to target areas with PTW exceedances that are unbounded in depth near or exceeding 10 feet below mudline, and to a lesser extent areas with unbounded RAL exceedances. Locations were further selected to target areas where the expected remedial technologies are most uncertain, starting near Berth 305 and continuing to the Head of SIB. Eight 20-foot cores will be collected in and near this area, from grid cell columns 18 to 35. A ninth 20-foot core will be collected in the Dry Dock Basin near an unbounded PCB PTW exceedance in grid cell J8, and a tenth 20-foot core will be collected in grid cell N0 just outside the Swan Island Sediment Decision Unit near an unbounded PCB PTW exceedance in grid cell N1."</p>

APPENDIX E  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
4a	1006	Riverbanks	The analytical approach provided for evaluating the historical riverbank samples should be consistent with the Portland Harbor Superfund Site (PHSS) Record of Decision (ROD) (EPA 2017) requirements and EPA's RDGC Appendix D (EPA 2021). The lateral extent of contaminant concentrations exceeding the criteria listed in ROD Table 17 (for riverbank soil) and Table 21 for these historical samples should be evaluated. If historical samples were not analyzed consistent with the ROD and RDGC Appendix D requirements, the evaluation should identify the data gaps.	The text in this section will be revised to include the following: "The historical riverbank sample results were evaluated in Section 6 and Appendix E of the SAR. ROD cleanup level (CUL) and remedial action level (RAL) exceedances were identified. Because the lateral extents of the exceedances were not defined and / or all ROD contaminants of concern (COCs) were not analyzed, these conditions were identified as data gaps for the PDI and additional characterization proposed."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
4b	1007	Riverbanks	The riverbank sampling plan should be included in the PDI Work Plan. The text indicates that 150 transects will be, "targeted for visual inspection and possible sample collection." The riverbank sampling plan should include the data quality objectives, planned sampling locations, and sampling methods (including contingency plans).	The riverbank sampling will be conducted in two phases. The first phase of the proposed riverbank characterization will be a visual assessment of the riverbank to evaluate erodibility and bank condition. The first phase is necessary to identify sample locations. After the visual inspection, HGL will evaluate bank stability using the BANCs model and prepare a riverbank sampling plan as an addendum to the PDI Work Plan with the data quality objectives and proposed sampling locations and analyses. The riverbank sampling plan will be provided to EPA for review and approval prior to sampling. Sampling methods are described in Section 4.3 of the Field Sampling Plan. The will be revised to clarify the two phased approach and specify the preparation of the riverbank soil sampling plan for EPA review and approval prior to conducting the second phase sampling.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
5	1008	Data Sources	Data used in remedial design (RD) deliverables should come from the Portland Harbor Environmental Data Portal. Verify that the sediment data included in the PDIWP was from the datasets provided at the following links or currently in review by EPA (See below). The text data not included in the approved or in review data sets should either be removed or be clearly distinguishable on all figures and tables.	Interpolations and statistics will be revised to be based only on EPA-approved data or data currently in review by EPA. Report interpolations, figures, and tables will be revised to remove data that are not approved by EPA. Report text will be updated to list the EPA-approved data sources as the basis of RD deliverables.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
5a	1009	Data Sources	RI/FS data (Remedial Investigation Database and Feasibility Study Database): <a href="http://ph-public-data.com/document/CDMSmith2018/">http://ph-public-data.com/document/CDMSmith2018/</a>	Please see Response to Comment #1008.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
5b	1010	Data Sources	Pre-RD Investigation and Baseline Sampling data: <a href="http://ph-public-data.com/document/PHRD_2019">http://ph-public-data.com/document/PHRD_2019</a>	Please see Response to Comment #1008.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
5c	1011	Data Sources	Pacific Groundwater Group, 2019. Surface and Subsurface Sediment Field Sampling and Data Report, Swan Island Lagoon, Portland Harbor Superfund Site. Prepared for Daimler Trucks North America LLC (DTNA). Data in review by EPA	Please see Response to Comment #1008.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
5d	1012	Data Sources	Pacific Groundwater Group, 2019. Surface and Subsurface Sediment Field Sampling and Data Report, Swan Island Lagoon, Portland Harbor Superfund Site. Prepared for de maximis, inc. Data in review by EPA	Please see Response to Comment #1008.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
6	1013	Habitat Conditions Data Collections	EPA appreciates the initiative to collect these data. EPA recommends habitat data be collected to inform the Habitat Equivalency Analysis (HEA) based approach, which enables quantification of pre- and post-remedial habitat conditions to determine potential mitigation requirements, as described in Specific Comments on Section 3.11.	The data collection to characterize habitat conditions will be utilized to inform a HEA-based approach that will enable quantification of pre- and post-remedial habitat conditions to determine potential mitigation requirements, if any, as described in Section 3.11 The HEA-based approach is commonly utilized to determine and quantify - where possible - unavoidable impacts by the required remediation. This approach will be supplemented as needed based upon through ongoing technical discussions with EPA technical team members.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
7	1014	Seepage and Porewater Data	Empirical methods to measure groundwater seepage should be considered in the current PDI Work Plan or the text should be revised to clarify when such empirical measurements are expected to be completed for cap design (e.g., a subsequent stage of the PDI or the supplemental PDI). Comparative measurements of temperature and specific conductance in sediment porewater and overlying surface water can identify general locations of upwelling but do not provide a quantitative measure of the upwelling rates which can be of the most benefit to this sensitive modeling parameter. Similarly, porewater concentrations for ROD Table 17 contaminants will also be required for cap design so the text should clarify when porewater chemistry data is expected to be collected.	The text will be modified to clarify that the porewater evaluation will be completed in two phases. The first phase, as currently proposed, focuses on mapping the locations where upward migration of porewater is currently occurring in SIB sediments. The text will be amended to describe the second phase of porewater characterization for cap evaluation. The second phase will include empirical methods to measure groundwater seepage and porewater sampling to characterize porewater chemistry. The results of the first phase are needed to determine the locations and quantities of samples and groundwater seepage measurements. The text will be modified to state that HGL will prepare and submit a Phase 2 sampling and field measurement plan to EPA for review and approval prior to advancing the second phase of the study.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
8	1015	Cap Design Data Needs	Data and engineering study needs to support cap design are incomplete. Engineering described in the PDI Work Plan to inform cap design are limited to cap physical stability. Clarify how the sampling proposed in the PDI Work Plan is expected to inform chemical isolation layer design requirements for the cap. The PDI Work Plan should more clearly identify data gaps relevant to inform cap design, a cap treatability study (noted in Worksheets #14 and #16 of the QAPP), and any other engineering evaluations needed to support RD. These data gaps should include sampling for site-specific porewater concentrations and groundwater seepage rates in areas where porewater upwelling is measured and/or caps may be required.	Text revisions to the porewater study will also address this comment (see response to previous comment). Specifically, the second phase of the porewater study will include collecting and analyzing porewater samples and making field measurements of groundwater seepage. The design analyses to support cap design and evaluate cap stability are not part of the PDI, but instead will be conducted either as part of the Basis of Design report or first design submittal. The discussion of the porewater study will be amended to explicitly identify the data needs for the anticipated cap design and evaluation, and show how the proposed data collection addresses those data needs. Regarding the cap treatability study, that study has not yet been designed, and it is not proposed as part of the PDI. The cap treatability study will be designed and implemented on a parallel track with the PDI, and it will go through separate EPA review and approval.	The response is acceptable pending EPA's review of the revised PDI Work Plan.

APPENDIX E (Continued from Previous Page)  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA's Draft Final PDI Work Plan Comments on February 1, 2022	SIB Response on February 17, 2022	EPA's Draft Final PDI Work Plan Comments on April 5, 2022	SIB Response on May 10, 2022
4a	1006	Riverbanks				
4b	1007	Riverbanks				
5	1008	Data Sources	Section 3.1 indicates that the RD will not rely on the data set from the 2015 Kleinfelder investigation, which has not been approved by EPA, but may consider it a qualitative reference within the SIB project area. Revise the text to clearly identify when and how unapproved data are used qualitatively.	There are no plans at this time to use non-approved EPA data qualitatively. Removed text from Section 3.1 stating KFR may be used qualitatively. Revised statement, after deletion, reads, "EPA has not accepted the data set from the Kleinfelder investigation in 2015 and the RD will not rely on that data."		
5a	1009	Data Sources				
5b	1010	Data Sources				
5c	1011	Data Sources				
5d	1012	Data Sources				
6	1013	Habitat Conditions Data Collections				
7	1014	Seepage and Porewater Data	The text mentions future groundwater seepage and porewater chemistry sampling but does not clearly state that sampling will be included in Phase 2 as is indicated in several SIB Group responses. Revise the text to include an explicit discussion of the sampling planned for Phase 2.  Additionally, porewater chemistry should be noted as a data gap in Table 4-1 and FSP Table 2-1, and the anticipated time at which that data gap will be filled should be noted (e.g., Phase 2 PDI).	Text was added to clearly state that sampling will be included in Phase 2: "The survey described above is the first phase of a two-phase approach to characterizing porewater chemistry and groundwater upwelling rates. Porewater sampling and analysis will be included in Phase 2 to characterize porewater chemistry. After the results of the Phase 1 porewater upwelling mapping effort are completed, HGL will use those results to prepare a sampling and analysis plan for characterizing porewater chemistry and migration rates in the areas where groundwater seepage occurs. That future porewater sampling and analysis plan will be provided to EPA for review as an addendum to the PDI Work Plan and FSP."  The second to last paragraph of Section 4.2 was revised to read, "The upwelling survey results will be overlaid on proposed cap areas and used to identify future collection stations for quantitative measurements of seepage rates in proposed cap areas for cap modeling. Seepage rate data collection methods and locations will be described in a future porewater sampling and analysis plan that will be provided to EPA for review as an addendum to the PDI Work Plan and FSP."		
8	1015	Cap Design Data Needs	Revise the text related to the cap treatability study to describe the plan indicated in SIB Group's response. Worksheets #14 and #16 of the QAPP have not been revised and still show that the treatability study was supposed to be submitted to EPA on October 27, 2021.	Worksheets #14 and #16 of the QAPP were revised to show that work plan development for the treatability study will be initiated in 2022 and the first draft of the treatability study work plan will be submitted to EPA October 24, 2022 to allow consideration of Phase 1 Porewater Study results in developing that work plan. Subsequent schedule milestone dates for the cap treatability study were also updated. Text in Section 4.2 of the PDI was revised to include a brief description of the vision for the cap treatability study as follows: "A cap treatability study is tentatively planned as a component of the design and evaluation of sediment capping within the SIB Project Area. That cap treatability study is not included as part of the current PDI Work Plan. It will be developed on a parallel track with the PDI and documented in a draft Cap Treatability Study Work Plan that will be submitted to EPA for review tentatively October 2022 to allow consideration of the Phase 1 porewater survey results in developing that work plan. Preliminary concepts for the cap treatability study envision laboratory tests designed to compare alternatives for cap composition, chemical treatment amendments, and thickness."		

APPENDIX E  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
9	1016	Enhanced Natural Recovery	The ROD technology application decision tree identifies ENR as the selected technology for areas within the project area that are outside of the sediment management area (SMA). The PDI Work Plan should acknowledge this requirement more clearly and describe what data collection and evaluations will be used to identify areas where MNR may be an effective remedial technology versus areas where ENR would be necessary to achieve CULs. Data gaps relevant to this evaluation should be identified to ensure that the necessary information will be collected as part of the PDI.	The applicable sections of all documents will be amended to specifically clarify which areas will be potentially subject to MNR and ENR. The revised text will include specific data collection locations and parameters. The text will also include evaluations based upon this data to reflect the selection of the appropriate technology based upon demonstrated compliance with applicable CULs. Specifically, HGL anticipates that there will be few if any areas where MNR would be an effective substitute for ENR. Data collection and analysis efforts relevant to the consideration of MNR include the shoreline reconnaissance for riverbank evaluation, the habitat survey, and the hydrodynamic and sediment dynamic analysis within the project area.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
10	1017	Data Quality Objectives	EPA recommends revising the document to follow EPA's 7 step DQO process for each media (EPA, 240/B-06/001, 2006).	The appropriate documents will be amended to reflect compliance with EPA's 7-step DQO process for each sampled media. While this comment was listed as item#10 in the General Comments of the PDI Work Plan, specific amendments that addresses this comment will be found in the QAPP, the FSP and all other documents where data collection and analyses will be performed.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
11	2001	SRASP			
12	2002	Recontamination Evaluation			
Specific Comments on Preliminary Design Investigation Work Plan					
1	1018	Section 1.3 Conceptual Remedial Design Elements, page 1-4	EPA has the following comments on this section and the text should be revised accordingly:		The response is acceptable pending EPA's review of the revised PDI Work Plan.
1a	1019	Section 1.3 Conceptual Remedial Design Elements, page 1-4	Revise the text in this section and subsequently as appropriate to indicate that confirmation of future land uses is a necessary component of data to be collected for each technology and its application.	Section 1.3 of the PDI Work Plan lists and describes elements that provide the basis for the Conceptual Remedial Design. The text of this section will be amended in the PDI Work Plan and all other appropriate documents as applicable to state "that future land uses are a necessary component when collecting data for the evaluation of the application of each technology."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
1b	1020	Section 1.3 Conceptual Remedial Design Elements, page 1-4	The description of the remediation technology application process in each subsection should be revised for consistency with the remedy selection criteria shown in the ROD technology application decision tree (PDI Work Plan Figure 1-3) and the design requirements described in ROD Section 14.2.9. Application of dredging and capping are based on the locations of RAL and PTW exceedances relative to river regions (i.e., shallow, intermediate, etc.).	Section 1.3 of the PDI Work Plan lists and describes elements that provide the basis for the Conceptual Remedial Design. The text in this section will state "the application of the remediation technology process will demonstrate compliance with the EPA ROD technology application decision tree and the design requirements found in ROD Section 14.2.9. The application of the specific remedial actions of dredging and capping are/will be based on the locations of RAL and PTW exceedances relative to river regions."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
2	1021	Section 1.3.1 Sediment Dredging via Future Maintenance Dredging in the Navigation Channel, page 1-5	This section states that "the entirety of the SIB Project Area is located outside the Federal Navigation Channel and is therefore not subject to the specified future maintenance dredging depths associated with it." This section should be updated to include a discussion of the 50-foot Navigation Channel offset as discussed in Section 5.3.3 of the RDGC, and that the western portion of the site adjacent to the navigation channel is subject to coordination with EPA and USACE to ensure slopes and depths in this area are suitably compatible.	Section 1.3.1 will be amended to include language that addresses the 50' Federal Navigational Channel offset as referenced in Section 5.3.3 of the RDGC. It is acknowledged that the western portion of the SIB site is subject to coordination with USEPA and USACE to ensure that the slopes and depths are suitably compatible. Note that the western portion of the site adjacent to the navigation channel is anticipated to be remediated using ENR, so the remedy is unlikely to result in significant changes in slope or depth in this part of the project area. The text in section 1.3.1 will note the requirement to coordinate with EPA and USACE to ensure slopes and depths in this area are suitably compatible.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
3	1022	Section 1.6 Important Definitions, page 1-9	EPA has the following comments on this section and the text should be revised accordingly:		The response is acceptable pending EPA's review of the revised PDI Work Plan.
3a	1023	Section 1.6 Important Definitions, page 1-9	Cleanup Levels (CULs) – Revise the text to state, "For riverbank soil or sediment, when risk based CULs were less than background concentrations for a given contaminant, background concentrations were selected as the CUL (emphasis added)".	The text will be revised to state, "For riverbank soil or sediment, when risk based CULs were less than background concentrations for a given contaminant, background concentrations were selected as the CUL."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
3b	1024	Section 1.6 Important Definitions, page 1-9	Recontamination Potential Chemicals (RPCs) – The stated approach for identifying RPCs is screening existing surface sediment data against CULs. While the surface sediment screening process/approach may be utilized, it does not remove the need to screen data from all media (e.g., surface sediment, subsurface sediment, groundwater, stormwater, and riverbanks) against ROD criteria to identify sources that may pose a recontamination threat. EPA requests that the identification of RPCs be based on an assessment of all available sediment, riverbank, groundwater, and stormwater data screened against the applicable ROD Table 17 CULs as modified by the 2019 ESD and the 2020 Errata #2 memorandum, and ROD Table 21 RALs and PTW thresholds. The PDI approach should be revised as needed based on review of data from all media.	The stated approach to identifying RPCs will be revised to include the results of the data review from all media from the SAR. The screening of available data for stormwater, groundwater, and riverbank data against applicable ROD Table 17 CULs, as modified by the 2019 ESD and 2020 Errata #2 was performed in Section 6 and Appendix E of the SAR. The following COCs exceeded ROD CULs in riverbank soil: Arsenic, cadmium, copper, lead, mercury, zinc, PCBs, PAHs, and dieldrin. The following COCs exceeded ROD CULs in groundwater: Arsenic, copper, and PAHs. The following COCs exceeded ROD CULs in stormwater: Arsenic, copper, zinc, BEHP, PCBs, cPAHs, and dioxins and furans. All of these COCs were retained as RPCs in surface sediment, except cadmium, copper, lead, zinc, DDX, and total chlordane.	The response is acceptable pending EPA's review of the revised PDI Work Plan. Note that proposing a reduced list of RPCs does not eliminate the requirement that all ROD Tables 17 and 21 contaminants be considered in remedial design. Robust rationale based on analytical results and the CSM must be provided if Table 17 and/or Table 21 contaminants are proposed to be excluded from analysis during remedial design.

APPENDIX E (Continued from Previous Page)  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA's Draft Final PDI Work Plan Comments on February 1, 2022	SIB Response on February 17, 2022	EPA's Draft Final PDI Work Plan Comments on April 5, 2022	SIB Response on May 10, 2022
9	1016	Enhanced Natural Recovery	Data gaps related to the ENR evaluation have not been clearly identified in the PDI Work Plan. Furthermore, the text added to Section 1.3.5 should be expanded to clarify what criteria will be considered when evaluating areas for ENR. Revise the text and data gap tables to include this information.	Table 4-1 in the was modified to identify data gaps related to ENR. The following text was added to Section 1.3.5:  "Criteria that will be used to specify locations for ENR are summarized as follows:  • Located outside the SMA but within the project area; • COC concentrations in surface sediments exceed CULs but are less than RALs; and • Sediment deposition occurs at too slow a rate for MNR to be protective. Threshold rate will be determined as part of the sediment transport modeling analysis."		
10	1017	Data Quality Objectives	EPA has the following comments on the DQO-related revisions and the text should be revised accordingly:  a. Revise QAPP Section 11.3.2, page 26 to remove dive crew size. HASP elements of dive crew size will be separately reviewed for any safety deficiencies by EPA. b. Revise each section of 11.3 to include specific standards for each media, e.g. for bathymetry, citing the Hydrographic Surveying Engineering Manual (EM) 1110-2-1003, USACE 2013. c. Revise the DQO to explicitly note where in the WP text details on the number of samples and locations to meet each portion of the objective are found. d. The DQO should more specifically discuss how each piece of collected data will be used as well as error tolerances.	Text was revised as follows:  a. QAPP Section 11.3.2, page 26 was revised to remove dive crew size. b. Section 11.3 was modified to include a table documenting the 7-step DQO process for each of the applicable surveys the table includes reference to specific, applicable standards for each survey. c. The new DQO table in Section 11.3 notes where details are found in the PDI Work Plan text regarding the number of samples and locations to meet each portion of the objective. d. The new DQO table in Section 11.3 describes how each piece of collected data will be used as well as error tolerances.		
11	2001	SRASP	In the event that a discrepancy exists between the Revised PDI Work Plan and the SRASP, note that the SRASP will be used.	Comment noted and agreed.		
12	2002	Recontamination Evaluation	EPA would like to reiterate the following comment, which was also included in EPA's December 17, 2021 comments on the SAR.  All recontamination potential evaluations "should clearly discuss the magnitude of exceedances of screening criteria as the basis for the relative significance of recontamination pathways. EPA recommends further interpreting any CUL exceedances in the context of RDGC, Appendix C Table 3: RAO Monitoring. The table shows how EPA will assess progress toward achieving RAOs using pathway-specific PRGs and spatial scales during long-term monitoring. This information should be used to determine whether ongoing sources that exceed CULs have the potential to impede or delay attainment of RAOs. Note that RAL and PTW threshold exceedances are evaluated on a discrete basis."	Comment noted. No revisions to the PDI Work Plan were made.		
1	1018	Section 1.3 Conceptual Remedial Design Elements, page 1-4				
1a	1019	Section 1.3 Conceptual Remedial Design Elements, page 1-4				
1b	1020	Section 1.3 Conceptual Remedial Design Elements, page 1-4				
2	1021	Section 1.3.1 Sediment Dredging via Future Maintenance Dredging in the Navigation Channel, page 1-5				
3	1022	Section 1.6 Important Definitions, page 1-9				
3a	1023	Section 1.6 Important Definitions, page 1-9				
3b	1024	Section 1.6 Important Definitions, page 1-9	The text was not revised as indicated in SIB Group's response. Update the text to state that RPCs will be based on an assessment of all available sediment, riverbank, groundwater, and stormwater data screened against the applicable ROD Table 17 CULs as modified by the 2019 ESD and the 2020 Errata #2 memorandum, and ROD Table 21 RALs and PTW thresholds.	The text in Section 1.6 pertaining to RPCs was updated to state "RPCs will be based on an assessment of all available sediment, riverbank, groundwater, and stormwater data screened against the applicable ROD Table 17 CULs as modified by the 2019 ESD and the 2020 Errata #2 memorandum, and ROD Table 21 RALs and PTW thresholds."		

APPENDIX E  
EPA Review of Draft Pre-Design Investigation Work Plan  
Response to Comments Matrix  
May 10, 2022

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
3c	1025	Section 1.6 Important Definitions, page 1-9	Remedial Action Levels (RALs) – Revise text to clarify that the Site-wide RALs in ROD Table 21 apply to the SIB Project Area. Because the Project Area is not in the navigation channel, the Navigation Channel RALs do not apply to SIB SMAs.	The text will be revised to state, "The Site-wide RALs in ROD Table 21 apply to the SIB Project Area."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
4	1026	Section 2 Existing Conditions Overview, page 2-1	EPA has the following comments on this section and the text should be revised accordingly:		The response is acceptable pending EPA's review of the revised PDI Work Plan.
4a	1027	Section 2 Existing Conditions Overview, page 2-1	Per EPA's RDGC Section 4.1, the CSM update should include "contaminant characteristics including the nature and extent of contamination for COCs [contaminants of concern] for all relevant media, sources of contamination, and migration pathways" (EPA 2021). Add a summary of these missing CSM elements or a reference to the SAR.	The Existing Conditions section will be amended to state that for all relevant media, it includes the nature and extent of COC contamination, contamination sources, and migration pathways. A summary of all CSM elements will be included in the applicable documents.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
4b	1028	Section 2 Existing Conditions Overview, page 2-1	EPA recommends adding background information about the Willamette River such as the tribal and ecological history and use. The text should acknowledge that the Willamette River is critical habitat for fish, wildlife, aquatic and terrestrial plants, and birds, and supports several endangered salmon runs as stated in ROD Section 1. Revise the text to refer to the archaeological survey conducted during the RI/FS and highlight any areas of interest in SIB.	The Existing Conditions sections of the PDI Work Plan will be amended to include applicable and relevant background information about the Willamette River including tribal and ecological history and use. The text will state "The Willamette River is critical habitat for fish, wildlife, aquatic and terrestrial plants and birds and supports several endangered salmon runs as stated in the ROD. The archaeological survey conducted during the RI/FS will also be utilized to highlight any areas of interest in the SIB."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
5	1029	Section 2.2 Swan Island Basin Conceptual Site Model, page 2-3	The CSM highlights the quiescent and low energy nature of the lagoon and only discusses vessel traffic in the context of navigational depth requirements. The CSM should also discuss the impacts of vessel traffic on riverbed scour and bank erosion and identify that while the majority of the lagoon is privately owned, there is public access via a beach and boat ramp at the head of the lagoon.	The following two sentences will be added to appropriate locations within the CSM discussion in Section 2.2: "While the lagoon riverbed/banks are typically more stable than those in the main river, vessel traffic in the lagoon may cause mobilization of sediment and potentially erosion in riverbank locations not protected by structure or armoring." and "The majority of the lagoon is privately owned, however there is public access via a beach and boat ramp at the head of the lagoon."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
6	1030	Section 2.2.1 Quiescent Backwater Conditions are Prevalent Withing SIB, page 2-4	EPA has the following comments on this section and the text should be revised accordingly:	Please see responses to Comments #1031 and 1032.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
6a	1031	Section 2.2.1 Quiescent Backwater Conditions are Prevalent Withing SIB, page 2-4	Revise the text to provide a reference for the statement that flow velocities do not exceed 0.1 feet per second and describe the conditions under which the flow velocities exceed 0.1 feet per second and the associated velocities.	Section 2.2.1 will be updated to read "During peak flow conditions in the river, as well as during periods of low flow that result in maximum tidal exchange, current velocities within the SIB interior are typically less than 0.1 feet per second. Current velocities are larger in the mouth of the SIB between the navigation channel and the shipyard, reaching up to roughly 1 foot per second, and can exceed 1 foot per second in the main channel (Coast & Harbor Engineering 2013)."	The response is acceptable pending EPA's review of the revised PDI Work Plan. EPA requests that the cited reference be provided with the revised PDI Work Plan.
6b	1032	Section 2.2.1 Quiescent Backwater Conditions are Prevalent Withing SIB, page 2-4	Provide the technical rationale for the assertion that, "the interior of the SIB remains quiescent and does not convey flood flows in contrast to the main river." Clarify which parts of the Project Area this statement applies to (i.e., inner cove versus the transition zone).	This sentence in Section 2.2.1 will be updated to read "...the SIB does not convey flood flows moving in the main river, because it is a backwater channel. Even during large flood events, the interior of the SIB remains quiescent, with river flow-induced current velocities less than 0.1 feet per second (Coast & Harbor Engineering 2013)."	The response is acceptable pending EPA's review of the revised PDI Work Plan. EPA requests that the cited reference be provided with the revised PDI Work Plan.
7	1033	Section 2.2.2 Sediment Deposition and Scour are Limited by Low Energy Hydrodynamics, page 2-4	Provide a reference or the technical rationale for the statements that deposition is low, and scour is negligible in the Project Area. In addition, discuss deposition and scour due to anthropogenic forces (e.g., propwash from vessel traffic).	Section 2.2.2 will be re-named "Natural River Sediment Deposition and River-Induced Scour are Limited by Low Energy Hydrodynamics in the SIB Interior", and will be updated to read "Quiescent river flow conditions in the SIB interior result in low sediment deposition rates (neutral, between -2.5 to +2.5 centimeters per year), as demonstrated by comparison of hydrographic surveys from both 2002 to 2009 and from 2009 to 2018 (AECOM and Geosyntec 2019). Riverbed scour due to river currents alone is likely negligible, based on observed small current velocities and modeled currents less than 0.1 feet per second (Coast & Harbor Engineering 2013)." The PDI proposes new hydrodynamics analysis to evaluate the anthropogenic effects of vessel traffic on sediment dynamics because that information was identified as a data gap. NOTE: reference to be added is <i>AECOM and Geosyntec, 2019. PDI Evaluation Report, Portland Harbor Pre-Remedial Design Investigation and Baseline Sampling, Portland Harbor Superfund Site, Portland, Oregon.</i>	The response is acceptable pending EPA's review of the revised PDI Work Plan.
8	1034	Section 2.2.4 Stormwater Outfalls are the Primary Connected Pathway from Upland Sources to SIB Sediments, page 2-4	Provide robust rationale for the assertion that stormwater outfalls are the "primary connected pathway" or revise the section name.	Section 2.2.4 of the PDI Work Plan will be amended to add a robust rationale for the statement noted in the comment. The rationale for focusing on the connected stormwater pathway between upland sources and SIB sediments is based on the CSM published in the ROD and the relative magnitude of the transport capacity for each of the potential transport pathways. The analysis of sources and source control included in the SAR included an evaluation of recontamination pathways, and that evaluation concluded that the stormwater pathway was a primary connected pathway for transporting chemicals from upland sources to SIB sediments. The amended text in Section 2.2.4 will draw on the SAR evaluation. Additionally, the revised text will clarify that this statement applies to future recontamination, and that the relative importance of contaminant transport pathways under past conditions was likely different.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
9	1035	Section 2.2.5 Dredging History Informs Interpretation and Application of Sediment Characterization Data, pages 2-4 through 2-5	Clarify whether there was a lack of records for any period in the provided dredging history. Note whether any years where dredging was not noted are due to a lack of data or whether records confirmed no dredging occurred.	This text of this section will be updated to include a discussion of known periods where dredging did not occur versus periods with historical data gaps. The text will be revised to state: "Records for the shipyard from 1981 to present are well researched and documented in LWG work. However, specific dredging information is not available prior to the 1970s for the SIB and may not be complete for non-shipyard facilities."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
10	1036	Section 3 Data Gaps Analysis, pages 3-1 through 3-8	EPA has the following comments on this section and the text should be revised accordingly:		

APPENDIX E (Continued from Previous Page)  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA's Draft Final PDI Work Plan Comments on February 1, 2022	SIB Response on February 17, 2022	EPA's Draft Final PDI Work Plan Comments on April 5, 2022	SIB Response on May 10, 2022

5	1029	Section 2.2 Swan Island Basin Conceptual Site Model, page 2-3				
6	1030	Section 2.2.1 Quiescent Backwater Conditions are Prevalent Withing SIB, page 2-4				
6a	1031	Section 2.2.1 Quiescent Backwater Conditions are Prevalent Withing SIB, page 2-4	A reference for the statement that flow velocities do not exceed 0.1 feet per second was provided in the SIB response, but the cited reference was not provided with the revised PDI Work Plan. Provide the cited reference with the revised PDI Work Plan for EPA review.	HGL will transmit an electronic copy of the cited reference to EPA as part of the submittal of the revised PDI scheduled for March 16, 2022.		
6b	1032	Section 2.2.1 Quiescent Backwater Conditions are Prevalent Withing SIB, page 2-4				
7	1033	Section 2.2.2 Sediment Deposition and Scour are Limited by Low Energy Hydrodynamics, page 2-4				
8	1034	Section 2.2.4 Stormwater Outfalls are the Primary Connected Pathway from Upland Sources to SIB Sediments, page 2-4				
9	1035	Section 2.2.5 Dredging History Informs Interpretation and Application of Sediment Characterization Data, pages 2-4 through 2-5	The text of this section was not updated to include a discussion of known periods where dredging did not occur versus periods with historical data gaps. Revise the text as indicated in the SIB Group response.	Added text stating: "Records for the shipyard from 1981 to present are well researched and documented in LWG work. However, specific dredging information is not available prior to the 1970s for the SIB and may not be complete for non-shipyard facilities."		
10	1036	Section 3 Data Gaps Analysis, pages 3-1 through 3-8				

APPENDIX E  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
10a	1037	Section 3 Data Gaps Analysis, pages 3-1 through 3-8	Discuss how the identified data gaps and proposed data collection relate to RD. For example, clarify what RD need(s) the flood impact modeling will serve. Additionally, discuss how the PDI sampling will fill all data gaps associated with the assigned remedial technologies or discuss future plans to fill any remaining data gaps. For example, clarify whether the PDI data will satisfy data needs to evaluate monitored natural recovery (MNR) in the SIB Project Area.	The text in this section will be amended to provide a clear, direct connection between data collection and the technical information required to support the evaluation with the appropriate level of remedy that follows the RDGC. Examples of amended text will include a thorough discussion of the applicability and necessity of flood impact modeling will have on a particular evaluated and selected remedial strategy. HGL will include a crosswalk table to clarify the connection between data collection and addressing data gaps.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
10b	1038	Section 3 Data Gaps Analysis, pages 3-1 through 3-8	The data gaps analysis appears to only consider the spatial density of samples and does not discuss whether every sample has results for relevant Table 17 and/or Table 21 contaminants. Include a discussion of any contaminant-specific data gaps in the text.	Section 3 will be revised to include discussion of Table 17 and/or Table 21 COCs and contaminant-specific data gaps. Discussions will be added such as, "TBT is not analyzed in samples near y. TBT will be analyzed in proposed sample x to fill this data gap."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
11	1039	Section 3.1 Surface/Subsurface Sediment Contaminant Concentrations, pages 3-1 through 3-2	EPA has the following comments on this section and the text should be revised accordingly:		
11a	1040	Section 3.1 Surface/Subsurface Sediment Contaminant Concentrations, pages 3-1 through 3-2	The first line of this section states that "Surface sediment RAL exceedances define SMAs in PHSS." This statement is incorrect and must be revised to include both surface and subsurface exceedances. See General Comment regarding SMA Delineation.	The text of this section will be updated to state: "Surface and subsurface sediment RAL and PTW exceedances define SMAs in PHSS." Further discussion on the role of specific subsurface exceedances and their specific impacts will be included.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
11b	1041	Section 3.1 Surface/Subsurface Sediment Contaminant Concentrations, pages 3-1 through 3-2	One of the goals listed in this PDI is to delineate the extent of PTW. Locations with PTW exceedances should be highlighted on PDI Work Plan Figure 3 series and Appendix A Figure 4 series and differentiate RAL from PTW exceedances. The sampling plan should clearly illustrate an approach to delineating these locations vertically and horizontally.	The Figure 3 series and Appendix A Figure 4 series will be updated to highlight PTW exceedances. The sampling plan will be amended to include discussion of how PTW areas will be delineated vertically and horizontally, as described in Response to Comments #1023, 1024, and 1025.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
12	1042	Section 3.1.1 Surface Sediment Contaminant Concentrations, page 3-2	EPA has the following comments on this section and the text should be revised accordingly:		
12a	1043	Section 3.1.1 Surface Sediment Contaminant Concentrations, page 3-2	This section discusses the data density of surface sediment locations and "step out" data referenced to Figure 3-2. This section should be revised after removal or differentiation and qualification of locations on Figure 3-2 that are not part of the approved database. See General Comment regarding Data Sources.	The discussion of step-out sediment locations will be updated by removing or delineating and qualifying non-EPA approved data sources.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
12b	1044	Section 3.1.1 Surface Sediment Contaminant Concentrations, page 3-2	Remove qualitative descriptors like "modest" and "high degree" of coverage and replacing them with a discussion of percentages of areas where samples are not in conformance with the 150-foot sample to sample distance.	The text of this section will be updated with the specific percentage of grid cells that are not currently in conformance with the 150-foot sample to sample distance, and the terms "modest" and "high degree" will be removed.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
12c	1045	Section 3.1.1 Surface Sediment Contaminant Concentrations, page 3-2	Clarify what is meant by "step out" in the context of the sampling plan. There are no surface grabs indicated on the figures that are listed as step out locations.	Figure 3-2 will be updated to highlight the step out locations referenced in this section. "Step out locations" are defined in Section 3.1.1, but the text may be updated for clarity.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
13	1046	Section 3.1.2 Subsurface Sediment Contaminant Concentrations, page 3-3	This section states that "Conceptually, core locations are identified in each grid cell lacking existing subsurface data by randomly generating x, y coordinates for core collection within each cell." SIB RD Group should provide a rationale for why this approach has been selected and how randomly generated locations will achieve the goals of this PDI or RD plans. EPA generally considers targeted, rather than randomized, sample locations the most appropriate for RD-level SMA delineation.	The text of this section will be revised to locate samples with nominal 150-foot spacing using a 150-foot grid with tolerance for existing sample spacing, vessel accuracy, obstructions, and refusal found due to field conditions. Locations will be judgmentally chosen and where adjustments are made, explanations of locations will be provided.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
14	1047	Section 3.3 Stormwater Discharge, page 3-4	EPA has the following comments on this section and the text should be revised accordingly:		
14a	1048	Section 3.3 Stormwater Discharge, page 3-4	Revise the text in PDI Work Plan Section 3.3 to clarify which outfalls are planned to be sampled as part of the PDI. The following text implies that sampling will occur at private outfall basins: "the collection of additional source control data within city of Portland outfall basins M-1, M-2, M-3, S-1, and S-2, and select private outfall basins..." However, Section 4.3 and Figure 4-2 only describe PDI sampling for the City of Portland outfalls. Appendix A  Section 4.5 also indicates that private outfalls will be sampled, and that text should be revised as needed to clarify which private outfalls will be sampled or the process for determining which outfalls will be sampled.	The purpose of Section 3.3 of the PDI Work Plan is to provide an overview of the data gaps related to the stormwater discharge pathway. Pursuant to the August 19 call with EPA, HGL will be preparing a separate PDI Work Plan or FSP addendum for the proposed scope of work for stormwater sampling to include a visual inspection of all active private and public outfalls, with special emphasis on those private outfall discharges with surface water CUL exceedances (10x order of magnitude) and/or are adjacent to RAL or PTW thresholds in the riverbank or adjacent sediment.  Section 4.3 will be updated to identify the private stormwater systems to be sampled including, the USCG MSU, ATT Leasing, Port of Portland Dredge Base, North Basin Watumull LLC outfall, Daimler Trucks North America Corp 5 Wind Tunnel property, and Port of Portland N Lagoon Avenue property. Figure 4-2 of the PDI Work Plan shows the City and private outfalls to be sampled. This initial list of private outfalls to be sampled will be confirmed or modified based on the results of the proposed field reconnaissance and visual inspection of private outfalls.	EPA understands that the proposed scope of work has been refined and provided in the Draft Stormwater and Riverbank Assessment and Sampling Plan based, in part, on the results of the reconnaissance performed on September 22, 2021. EPA appreciates prioritizing sampling stormwater outfalls adjacent to CUL, RAL, or PTW exceedances in sediment. EPA does not recommend a bright line prioritization based on exceedances 10 times the magnitude of the surface water CUL in stormwater; rather, EPA recommends evaluating the frequency and magnitude of CUL exceedances, stormwater discharge volumes, and current and past facility uses when selecting sampling locations. EPA anticipates providing any additional comments on the revised PDI Work Plan or Draft Stormwater and Riverbank Assessment and Sampling Plan as appropriate.

APPENDIX E (Continued from Previous Page)  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA's Draft Final PDI Work Plan Comments on February 1, 2022	SIB Response on February 17, 2022	EPA's Draft Final PDI Work Plan Comments on April 5, 2022	SIB Response on May 10, 2022
10a	1037	Section 3 Data Gaps Analysis, pages 3-1 through 3-8	<p>A discussion of applicability and necessity of flood impact modeling on a selected remedial strategy was not included. A crosswalk table of data collection and data gaps was not included nor was information about SAR identified data gaps added to existing tables. Revise the PDI Work Plan to include a discussion of applicability and necessity of flood impact modeling on a selected remedial strategy, a crosswalk table of data collection and data gaps, and/or add information about SAR identified data gaps in existing tables. See also comment reference No. 1001.</p> <p>Additionally, revisions to text in Section 3.1.1 (Surface Sediment Contaminant Concentrations) discuss sediment cores and should be moved to Section 3.1.2 (Subsurface Sediment Contaminant Concentrations).</p>	<p>The first sentence in Section 3.10 was modified to read, "Flood impact evaluation is necessary to confirm that a selected remedial strategy does not result in exacerbated flooding in the surrounding area during heavy rain events." Table 4-1 was modified to attribute SAR-identified data gaps. Flood impact modeling of a selected remedial strategy will be performed as part of the Basis of Design Report and/or RD Work Plan once a remedial strategy has been selected.</p> <p>Revisions to text in Section 3.1.1 (Surface Sediment Contaminant Concentrations) that discuss sediment cores were not moved per the comment. While this discussion refers to cores, the focus of the discussion is that surface sediment information will be obtained by using the top interval of cores for specified locations, and for all cores the top interval will be archived, and if necessary, used to address surface sediment data gaps. This discussion is located in the correct place and was not moved to Section 3.1.2.</p>		
10b	1038	Section 3 Data Gaps Analysis, pages 3-1 through 3-8	Note that data gaps related to Table 17 contaminants must be addressed during RD. It is acceptable to defer that sampling until the remedial technologies have been selected.	Comment noted. Existing discussion in Section 3.1.1 states that the proposed sampling plan and possibly archived samples from the top interval of cores may be used to address COC-specific data gaps. No revisions to the PDI Work Plan were made.		
11	1039	Section 3.1 Surface/Subsurface Sediment Contaminant Concentrations, pages 3-1 through 3-2				
11a	1040	Section 3.1 Surface/Subsurface Sediment Contaminant Concentrations, pages 3-1 through 3-2				
11b	1041	Section 3.1 Surface/Subsurface Sediment Contaminant Concentrations, pages 3-1 through 3-2	Figure 3-3b shows the locations for PTW threshold exceedances, but Appendix A Figure 4 series does not contain similar information. Revise Appendix A Figure 4 series to include the locations for PTW threshold exceedances.	Appendix A Figure 4 series was revised to include the locations for PTW threshold exceedances on FSP Figures 4-2 and 4-4.		
12	1042	Section 3.1.1 Surface Sediment Contaminant Concentrations, page 3-2				
12a	1043	Section 3.1.1 Surface Sediment Contaminant Concentrations, page 3-2				
12b	1044	Section 3.1.1 Surface Sediment Contaminant Concentrations, page 3-2				
12c	1045	Section 3.1.1 Surface Sediment Contaminant Concentrations, page 3-2				
13	1046	Section 3.1.2 Subsurface Sediment Contaminant Concentrations, page 3-3	Sections 3.1.1 and 3.1.2 of the Revised PDI Work Plan state that target coordinates will be randomly generated within each grid cell and then manually adjusted to better meet the 150-foot spacing criteria and that final coordinates will be reported after the fieldwork is complete. However, there is no information about who will be responsible for manually adjusting locations, when the locations will be adjusted (i.e., prior to going into the field, or in the field), and what rationale will be used to inform decision making. As a result of randomization and manual adjustment the distance between proposed samples often exceeds the nominal 150 feet guidance. For example, the subsurface samples in B33 & B34 are approximately 220 feet apart and samples along the SMA boundary C33 and B34 are 250 feet. Additionally, other samples including D25 and E25 are approximately 240 feet apart, D15 & D16 (250 feet), B18 & C18 (200 feet) and various other samples within the design footprint. Revise the PDI Work Plan to provide target sample coordinates and clearly demonstrate that these targeted sampling locations achieve the spatial coverage requirements provided in the RDGC.	Sample locations have been modified to reduce gaps between samples, addressing most gaps greater than 150 ft. All gaps identified by EPA in comment #1046 have been addressed. Remaining gaps larger than 150 feet are not expected to impact remedial design or significantly limit characterization of contamination left in place.		
14	1047	Section 3.3 Stormwater Discharge, page 3-4				
14a	1048	Section 3.3 Stormwater Discharge, page 3-4				

APPENDIX E  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
14b	1049	Section 3.3 Stormwater Discharge, page 3-4	Revise the last sentence in the section to clarify that uplands source control is DEQ's jurisdiction with coordination and input from EPA on upland contamination which may impact the river. Information on upland source control strategy and DEQ and EPA roles in source control is provided in the Portland Harbor Joint Source Control Strategy (JSCS) (DEQ and EPA 2005).	The last sentence of this section will be updated to be consistent with EPA's clarification in this comment: "Uplands source control is ODEQ's jurisdiction with coordination and input from EPA on upland contamination which may impact the river."	The response is mostly acceptable. EPA requests that the text additionally clarify that the EPA is lead for source control at the Navy Reserve and the US Coast Guard sites.
15	1050	Section 3.7 Shoreline and Overwater Structures and Activities, Pages 3-5 through 3-6	SAR Section 7.4 identifies a need for field reconnaissance to assess "coatings/preservatives used on water structures to evaluate the potential significance the piling coatings or treatment processes could have on recontamination potential." Revise the text to discuss this data gap and provide a plan to fill it.	Revise text to state: "Leaching or abrasion of the in-water structures are potential pathways for associated contaminants to reach nearby sediment. There has not been a comprehensive survey of in-water structures or debris in the SIB Project Area, and there is no facility-specific information regarding the presence or absence of contaminants on these structures. A screening level visual inspection of readily accessible in water structures will be conducted as part of shoreline and overwater structures data collection activities. To the extent that wooden and painted steel structures will remain in place as part of the remedy, they may need to be assessed during the RD."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
16	1051	Section 3.11 Habitat Conditions, page 3-7	Revise the third sentence of the first paragraph to replace "RD" with "RA."	This typographical error will be corrected to read RA.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
17	1052	Section 3.11 Habitat Conditions, page 3-7	The definition of shallow water used by the National Marine Fisheries Service (NMFS) is pertinent to the evaluation of potential impacts on ecological resources, specifically impacts on species listed under the Endangered Species Act. NMFS defines shallow water as 0 to -15 feet Columbia River Datum (CRD). Revise the first sentence of the second paragraph to indicate that habitat conditions characterization data collected for shallow water would include the area from 0 to -15 feet CRD.	The first sentence of the of the 2nd paragraph of Section 3.11 will be amended to state "habitat conditions characterization data collected for shallow water will include the area from 0 to -15' CRD which is the NMFS definition of shallow water for the CRD."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
18	1053	Section 3.11 Habitat Conditions, pages 3-7 through 3-8	EPA appreciates the initiative to collect these data. EPA recommends coordination with NMFS as soon as possible to confirm the appropriate habitat conditions data are collected. Habitat conditions characterization data should include evaluation of the active channel margin (ACM), which NMFS defines as the area between ordinary high water and ordinary low water. Revise the text to clarify that the survey will include areas down to -15 feet CRD rather than "e.g., depth down to 2 meters." The characterization should also include the riparian area (above ordinary high water) as well as deep water (below ordinary low water) portions of the project area. In addition to the habitat data described in this section of the PDI Work Plan, EPA recommends habitat data be collected to inform the HEA-based approach, which enables quantification of pre- and post-remedial habitat conditions to determine potential mitigation requirements. Habitat data should be collected along transects at a spacing appropriate to fully describe habitat conditions for input into the HEA. Data should include representative photos at a frequency necessary to capture the habitat conditions along each transect. To inform the HEA, habitat data should include the acreages and conditions of each habitat area where remedial activities will occur, including the following: photos on a transect spacing and photo frequency above and below water that will capture all habitat types and variations in quality for items a-e:	The purpose of the proposed habitat data collection is to provide a preliminary basis for assessing the need, extent, and nature of compensatory mitigation that may be required for impacts to Waters of the United States regulated under Sections 404 and 401 of the Clean Water Act. HEA is commonly used as a basis for evaluating habitat function loss and replacement under the Natural Resources Damages Assessment (NRDA) process. HGL does not anticipate using HEA as part of this analysis because addressing NRDA is not within the scope of work for the RD. The USACE has jurisdiction over Section 404, and EPA has delegated Section 401 authority to Oregon DEQ. HGL requests that EPA broker any coordination with NMFS to discuss habitat characterization requirements necessary to inform a habitat impact assessment under CWA requirements, and HGL requests that such coordination also include USACE and ODEQ regulatory representatives. NMFS would be involved in the impact and mitigation discussion through Endangered Species Act Section 7 consultation initiated by the USACE under Section 404 of the Clean Water Act. HEA may be selected as an analytical tool to inform the impact assessment, but that decision should be made in coordination with the appropriate agencies with regulatory jurisdiction.	Under CERCLA, EPA does not obtain a CWA Section 404 permit from the USACE, but instead has authority to direct the evaluation of habitat impacts to meet the substantive requirements of CWA Section 404. Similarly, USACE does not have a role in consultation with NMFS for implementation of the CERCLA remedy relative to ESA. EPA has initiated programmatic consultation with NMFS for the site-wide cleanup and will direct the project area-specific evaluations under ESA and CWA 404. HEA is the tool that will be used to evaluate habitat pre-and post-remediation for the purposes of complying with CWA Section 404 and, in coordination with NMFS, in compliance with ESA. Therefore, performing parties will need to collect appropriate data to inform the HEA, as described in the EPA comment. EPA, as the decision maker, will ensure implementation of all reasonable NMFS requirements.
18a	1054	Section 3.11 Habitat Conditions, pages 3-7 through 3-8	Riparian habitat conditions (above ordinary high water and less than 400 feet from the ACM): vegetation, substrate, location with respect to historical floodplain, slope, presence of buildings, structures, and riprap	HGL will amend section 3.11 to include photos on a 150 ft transect spacing along the shoreline to inform the characterization of habitat conditions within the target shoreline zone.	The response is acceptable pending EPA's review of the revised PDI Work Plan; however, EPA recommends that conditions between the 150 foot transects that are not represented by the predetermined transect locations be noted to limit potential data gaps. EPA recommends that habitat data adequate to inform the HEA be collected following established procedures for physical habitat characterization. EPA suggests consideration of methods presented in Chapter 8 of the National Rivers and Streams Assessment Field Operations Manual - Non-Wadeable (EPA 2017).

APPENDIX E (Continued from Previous Page)  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA's Draft Final PDI Work Plan Comments on February 1, 2022	SIB Response on February 17, 2022	EPA's Draft Final PDI Work Plan Comments on April 5, 2022	SIB Response on May 10, 2022
14b	1049	Section 3.3 Stormwater Discharge, page 3-4	<p>This section states that ROD Table 17 COCs were detected in stormwater and stormwater solids in public and select private outfall basins at concentrations that exceed surface water and/or sediment CULs and/or RALs. This should be qualified with the understanding that source control measures, including removal of stormwater solids with concentrations above RALs, have been implemented since RAL exceedances were detected, and these data are not representative of current conditions.</p> <p>Revise the text to clarify that source control measures have been implemented in some or all cases, and the PDI stormwater sampling will serve to provide updated analytical data representative of current conditions.</p> <p>The last sentence in this section could lead to misinterpretation that the two sites owned by the U.S. Government (U.S. Navy and Marine Reserve Center [Environmental Cleanup Site Information (ECSI) 5109] and adjacent U.S. Coast Guard Marine Safety Unit [ECSI 1338]) are not subject to source control requirements. Revise this sentence to identify EPA as the regulatory authority for source control at the Navy and USCG sites.</p>	<p>The following text has been added to the first paragraph of Section 3.3: ROD Table 17 COCs...before and, in some locations, after best management practices and/or source control measures were implemented, including the removal of solids with ROD Table 17 COCs and/or RALs. As a result, this data may not be representative of current conditions."</p> <p>The text in the second paragraph of Section 3.3 has been updated to indicate that additional stormwater and solids data will provide updated analytical data representative of current conditions. The revised sentence reads, "For the reasons above, the collection of additional stormwater and solids data within city of Portland outfall basins M-1, M-2, M-3, S-1, and S-2, and select private outfall basins, is necessary, to provide updated analytical data representative of current conditions, determine source control sufficiency to complete the SAR and for modeling to assess recontamination potential for SIB (HGL, 2021)."</p> <p>The last sentence of the second paragraph of Section 3.3 has been revised to identify EPA as the regulatory authority for source control at the U.S. Navy and U.S. Coast Guard sites.</p>	<p>EPA appreciates the revisions to Section 3.3 and requests clarification regarding which specific outfalls and/or manholes had RAL exceedances after BMPs were implemented. Revise the text to indicate which locations had RAL exceedances after BMPs were implemented or delete the text.</p>	<p>This sentence will be deleted. While several locations had CUL exceedances after BMPs were implemented (OFM-1, OFM-2, OFS-2 [manhole AAP953], USGG MSU, and SIUF OU3 [Port of Portland N. Lagoon Avenue property] ), the detected post-BMP concentrations, where available, did not exceed the RALs.</p>
15	1050	Section 3.7 Shoreline and Overwater Structures and Activities, Pages 3-5 through 3-6				
16	1051	Section 3.11 Habitat Conditions, page 3-7				
17	1052	Section 3.11 Habitat Conditions, page 3-7				
18	1053	Section 3.11 Habitat Conditions, pages 3-7 through 3-8	<p>Note that under CERCLA, EPA does not obtain a CWA Section 404 permit from the USACE, but instead has authority to direct the evaluation of habitat impacts to meet the substantive requirements of CWA Section 404. Similarly, USACE does not have a role in consultation with NMFS for implementation of the CERCLA remedy relative to ESA. EPA has initiated programmatic consultation with NMFS for the site-wide cleanup and will direct the project area-specific evaluations under ESA and CWA 404. HEA is the tool that will be used to evaluate habitat pre-and post- remediation for the purposes of complying with CWA Section 404 and, in coordination with NMFS, in compliance with ESA. Therefore, performing parties will need to collect appropriate data to inform the HEA, as described in the EPA comment. EPA, as the decision maker, will ensure implementation of all reasonable NMFS requirements. Similarly, EPA has not delegated its authority under CWA Section 401 to DEQ for CERCLA cleanups in which EPA is lead. EPA will seek input from DEQ in its decision making in implementing CWA. Revise the document as appropriate.</p>	<p>The first paragraph of Section 3.11 was revised to read, "EPA has authority to direct the evaluation of habitat impacts to meet the substantive requirements of Clean Water Act (CWA) Section 404. EPA has initiated programmatic consultation with National Marine Fisheries Service (NMFS) for the site-wide cleanup and will direct the project area-specific evaluations under the Endangered Species Act and CWA Section 404. Habitat Equivalency Analysis (HEA) is the tool that EPA will use to evaluate habitat pre-and post-remediation for the purposes of complying with CWA Section 404 and in coordination with NMFS, in compliance with the Endangered Species Act. The purpose of the habitat conditions characterization would be to collect the data needed to inform an HEA-based approach to comparing pre- and post-remediation habitat conditions. EPA, as the decision maker, will ensure implementation of all reasonable NMFS requirements. Similarly, EPA will determine how CWA requirements will be implemented with input from ODEQ."</p> <p>The second paragraph of Section 3.11 was revised to define the habitat data collection study area to include the shoreline within the SIB project area and the vertical extent including the riparian area extending down to -15 ft Columbia River Datum. Additionally, each of the five vertical extent zones were identified, defined, and discussed (e.g., riparian area, active channel margin, shallow water, deep water, and off channel areas).</p> <p>The last paragraph of Section 3.11 was revised to read, "There are no precursors to the habitat characterization work, but it would be most efficient to coordinate the work with any riverbank evaluation survey efforts. The riverbank survey, overwater and shoreline structure surveys, bathymetry surveys, and surface sediment sampling would all be potential sources of data to support completion of the habitat characterization."</p>	<p>EPA is currently in coordination with NMFS to verify the requirements for habitat data collection, including data needs and methods for habitat surveys, that will be used to inform the HEA and for compliance with ESA and CWA. No changes to the habitat data collection are requested.</p>	<p>Noted; HGL will consult with EPA RPM prior to mobilizing for habitat data collection to confirm if additional guidance has been provided at that time.</p>
18a	1054	Section 3.11 Habitat Conditions, pages 3-7 through 3-8				

APPENDIX E  
EPA Review of Draft Pre-Design Investigation Work Plan  
Response to Comments Matrix  
May 10, 2022

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
18b	1055	Section 3.11 Habitat Conditions, pages 3-7 through 3-8	ACM conditions: slope, vegetation, substrate, presence of riprap, sheetpile/seawall, pilings, suspended structures over channel margins (e.g., docks), and floating structures (e.g., docks)	HGL will amend section 3.11 to include photos on a 150 ft transect spacing along the shoreline to inform the characterization of habitat conditions within the target shoreline zone.	The response is acceptable pending EPA's review of the revised PDI Work Plan; however, EPA recommends that conditions between the 150 foot transects that are not represented by the predetermined transect locations be noted to limit potential data gaps. EPA recommends that habitat data adequate to inform the HEA be collected following established procedures for physical habitat characterization. EPA suggests consideration of methods presented in Chapter 8 of the National Rivers and Streams Assessment Field Operations Manual - Non-Wadeable (EPA 2017).
18c	1056	Section 3.11 Habitat Conditions, pages 3-7 through 3-8	Shallow water conditions: depth, substrate, presence of riprap, sheetpile/seawall, pilings, and suspended and floating structures	HGL will amend section 3.11 to include photos on a 150 ft transect spacing along the shoreline to inform the characterization of habitat conditions within the target shoreline zone.	The response is acceptable pending EPA's review of the revised PDI Work Plan; however, EPA recommends that conditions between the 150 foot transects that are not represented by the predetermined transect locations be noted to limit potential data gaps. EPA recommends that habitat data adequate to inform the HEA be collected following established procedures for physical habitat characterization. EPA suggests consideration of methods presented in Chapter 8 of the National Rivers and Streams Assessment Field Operations Manual - Non-Wadeable (EPA 2017).
18d	1057	Section 3.11 Habitat Conditions, pages 3-7 through 3-8	Deep water conditions: depth, substrate, presence of riprap, sheetpile/seawall, pilings, and suspended and floating structures	HGL will amend section 3.11 to include photos on a 150 ft transect spacing along the shoreline to inform the characterization of habitat conditions within the target shoreline zone.	The response is acceptable pending EPA's review of the revised PDI Work Plan; however, EPA recommends that conditions between the 150 foot transects that are not represented by the predetermined transect locations be noted to limit potential data gaps. EPA recommends that habitat data adequate to inform the HEA be collected following established procedures for physical habitat characterization. EPA suggests consideration of methods presented in Chapter 8 of the National Rivers and Streams Assessment Field Operations Manual - Non-Wadeable (EPA 2017).
18e	1058	Section 3.11 Habitat Conditions, pages 3-7 through 3-8	Off-channel (if present): tributary water temperature and position relative to main channel substrate)	HGL will amend section 3.11 to include photos on a 150 ft transect spacing along the shoreline to inform the characterization of habitat conditions within the target shoreline zone.	The response is acceptable pending EPA's review of the revised PDI Work Plan; however, EPA recommends that conditions between the 150 foot transects that are not represented by the predetermined transect locations be noted to limit potential data gaps. EPA recommends that habitat data adequate to inform the HEA be collected following established procedures for physical habitat characterization. EPA suggests consideration of methods presented in Chapter 8 of the National Rivers and Streams Assessment Field Operations Manual - Non-Wadeable (EPA 2017).
19	1059	Section 4.1 Surface/Subsurface Sediment Contaminant Concentrations, page 4-1	The text states, "COCs may be analyzed using archived material, as needed, to characterize the "leave surface" or fill data gaps identified during the RD." Revise the text to expand the discussion of what conditions would trigger analysis of archived material.	The text will be expanded to discuss what conditions would trigger analysis of archived material, such as a finding of anomalously high concentration.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
20	1060	Section 4.2 Porewater Upwelling Location Survey, page 4-2	EPA has the following comments on this section and the text should be revised accordingly:		
20a	1061	Section 4.2 Porewater Upwelling Location Survey, page 4-2	The text indicates that the transects shown on Figure 4-1 may be deviated from as needed. Revise the text to specify under what conditions these deviations may be warranted and discuss the distance or radius within which a station may be relocated. Any deviations from the PDI Work Plan must be reported to EPA via field change request forms for review and approval prior to implementing the proposed change.	The text will be revised to read: "Measurements may deviate from the proposed transect lines if a strong contrast in surface water and porewater conductivity measurements is recorded in one area along a transect to delineate the extent of that contrast on and around the transect line area and to quantify variability within the potential upwelling zone. The stronger the difference in measurements, the more measurements will be collected in that area to map the extent of the upwelling zone(s). These additional stations will be within 50 feet of the previous station. In addition, deviations from proposed station locations may occur if the substrate is too hard to manually drive the Trident Probe into the sediment or vessels or other over-water features are present during the survey."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
20b	1062	Section 4.2 Porewater Upwelling Location Survey, page 4-2	Add 2 or 3 transects towards the mouth of the Swan Island Basin in the Dry Dock Basin and Berth 312 area or provide a justification for not including any porewater upwelling transects in this area. Revise Figure 4-1 accordingly.	Figure 4-1 has been updated with three transects in the Dry Dock Basin based on accessible locations.	The response is acceptable pending EPA's review of the revised PDI Work Plan.

APPENDIX E (Continued from Previous Page)  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA's Draft Final PDI Work Plan Comments on February 1, 2022	SIB Response on February 17, 2022	EPA's Draft Final PDI Work Plan Comments on April 5, 2022	SIB Response on May 10, 2022
18b	1055	Section 3.11 Habitat Conditions, pages 3-7 through 3-8	The PDI Work Plan text was revised to include mention of transects spaced 150 feet apart along the riverbank. There is no description of data collection within the active channel margin (ACM). Revise the text to provide details regarding the collection of HEA-based data for the ACM.	The following text was added to Section 3.11:  " • Active channel margin (ACM) – the area between ordinary high water and ordinary low water."  "Data needs to characterize the ACM are depth, substrate, presence of riprap, sheetpile/seawall, pilings, and suspended and floating structures."		
18c	1056	Section 3.11 Habitat Conditions, pages 3-7 through 3-8	There is no description of data collection within the shallow water areas. Revise the text to provide details regarding the collection of HEA-based data for the shallow water areas.	The following text was added to Section 3.11:  " • Shallow water – the area between 0 and -15 ft Columbia River Datum."  "Data needs to characterize the shallow water area are depth, substrate, presence of riprap, sheetpile/seawall, pilings, and suspended and floating structures."		
18d	1057	Section 3.11 Habitat Conditions, pages 3-7 through 3-8	There is no description of data collection within the deep-water areas. Revise the text to provide details regarding the collection of HEA-based data for the deep-water areas.	The following text was added to Section 3.11:  " • Deep water – the area deeper than -15 ft Columbia River Datum."  "Data needs to characterize the deep water area are depth, substrate, presence of riprap, sheetpile/seawall, pilings, and suspended and floating structures."		
18e	1058	Section 3.11 Habitat Conditions, pages 3-7 through 3-8	There is no description of data collection within the off-channel areas, if present. Revise the text to provide details regarding the collection of HEA-based data for the off-channel areas, if present.	The following text was added to Section 3.11:  " • Off-channel areas - tributaries to the main waterway."  "Data needs to characterize the off-channel areas include are tributary water temperature and position relative to main channel substrate."		
19	1059	Section 4.1 Surface/Subsurface Sediment Contaminant Concentrations, page 4-1				
20	1060	Section 4.2 Porewater Upwelling Location Survey, page 4-2				
20a	1061	Section 4.2 Porewater Upwelling Location Survey, page 4-2				
20b	1062	Section 4.2 Porewater Upwelling Location Survey, page 4-2				

APPENDIX E  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
20c	1063	Section 4.2 Porewater Upwelling Location Survey, page 4-2	The timing of the investigation should be planned during the time of the year when the river surface elevations are dropping, has less tidal fluctuations, and seasonal groundwater levels are elevated. The text indicates that regional groundwater elevations were used to determine the period of greatest potential upwelling. The optimal period of upwelling should be determined based on historical river stage and groundwater data as localized to the project area as possible. This period should be clearly identified in the PDI Work Plan for EPA review and approval before starting the survey.	Section 4.2 will be revised to read: "The timing of the investigation will be planned during the time of the year when the river level is dropping, has less tidal fluctuations, and seasonal groundwater levels are elevated. Based on a review of available data documenting 2002 through 2007 groundwater elevations at former monitoring wells at the Portland Shipyard and Willamette River gage data (Morrison Street Bridge Station), the river drops in February, March, June, and July and groundwater elevations at the Shipyard were highest in February. As a result, the upwelling survey is proposed for February and March 2022 during neap tide windows when there is the least amount of difference between high and low water."	The response is mostly acceptable pending EPA's review of the revised PDI Work Plan. EPA requests that the revised PDI Work Plan also indicate how tidal fluctuations will be accounted for during the porewater upwelling investigation.
20d	1064	Section 4.2 Porewater Upwelling Location Survey, page 4-2	Revise the text to discuss the allowable range of distances between transects and number of stations for each transect shown on Figure 4-1.	The text will be revised to read: "Proposed station distances will vary with distance from the shoreline and have been adjusted for the presence of permanent or semi-permanent structures (Figure 4-1). The proposed survey assumes station distances of 50 feet near the shore and 100 feet away from the shore. Specifically, the proposed survey assumes fifteen 800-foot-wide transects across SIB (with up to 10 stations each where no permanent structures are present) and two 400-foot-wide transects at the head of SIB (8 stations) for a total of up to 158 stations."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
20e	1065	Section 4.2 Porewater Upwelling Location Survey, page 4-2	Revise the text with the expected temperature differentials needed to detect upwelling between surface water and groundwater.	The text will be revised to read: "The detection of upwelling zones between surface water and groundwater will be based primarily on measurements of conductivity with conductivity measurement contrasts with a cutoff of 930 microSiemens per centimeter. The second method will use a combined Z-score of 0.95 for temperature and conductivity contrasts (Coastal Monitoring Associates, 2020). Data Report [for] Trident Probe Transition Zone Water Screening [for] Tube Forgings of America, Inc. / Front Avenue LLCs, 4950, 5034, and 5200 NW Front Avenue, Portland, OR. July."	The response is acceptable pending EPA's review of the revised PDI Work Plan. EPA requests that the cited reference be provided with the revised PDI Work Plan.
20f	1066	Section 4.2 Porewater Upwelling Location Survey, page 4-2	Revise the text to clearly state the uses of the data being collected. EPA's recommendation is that this data is only suitable to locate quantitative seepage rate collection stations for use in cap modeling.	HGL agrees with EPA regarding the data uses. The text will be revised to read: "The upwelling survey results will be overlaid on proposed cap areas and possibly used to identify future collection stations for quantitative measurements of seepage rates and pore water concentrations in proposed cap areas as part of remedial design for cap modeling."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
20g	1067	Section 4.2 Porewater Upwelling Location Survey, page 4-2	EPA recommends revising the text to follow EPA's 7 step DQO process EPA, 2006 EPA/240/B-06/001)	HGL concurs with EPA's recommendation. The text will be revised to apply the following seven steps to the discussion for both the Phase 1 survey (proposed in Draft PDI Work Plan) and the second phase sampling and field measurement effort that will be amended to this discussion in response to other EPA comments. Step 1. State the problem: How will upwelling impact a future remedial cap? Step 2. Identify the Goal of the Study. State how environmental data will be used in meeting objectives and solving the problem, identify study questions, define alternative outcomes. Map upwelling zones for cap design and modeling. Step 3. Identify data inputs needed to answer the question. Define extent of areas, future seepage rates once areas defined. Step 4. Define the boundaries of the study. Step 5. Develop the analytic approach. Step 6. Specify performance or acceptance criteria. Step 7. Develop the plan for developing the data.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
21	1068	Section 4.3 Stormwater Outfall and Conveyance System Sampling, page 4-3	EPA has the following comments on this section and the text should be revised accordingly:		
21a	1069	Section 4.3 Stormwater Outfall and Conveyance System Sampling, page 4-3	Clarify the approach for determining whether private outfalls will be sampled and the process that will be used to sample those outfalls. The text is unclear how the private outfall inventory will be used to determine which private outfalls will be sampled. The specific sampling locations and methods for private outfall sampling should be described in the PDI Work Plan or future supplemental s to allow for EPA review at least 4 weeks before conducting sampling.	Please see response to Comment #1070.	See response to comment #1070.

APPENDIX E (Continued from Previous Page)  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA's Draft Final PDI Work Plan Comments on February 1, 2022	SIB Response on February 17, 2022	EPA's Draft Final PDI Work Plan Comments on April 5, 2022	SIB Response on May 10, 2022
20c	1063	Section 4.2 Porewater Upwelling Location Survey, page 4-2	EPA has the following comments, and the text should be revised accordingly:  i. Text in PDI Work Plan Section 4.2 and FSP Section 5.5 states that the upwelling survey will be conducted in February and March 2022 based on an evaluation of groundwater elevation data from former monitoring wells at the Portland Shipyard and Willamette River gauge data (Morrison Street Bridge station). This information needs to be presented as a figure showing changes in river stage and groundwater elevations with time for EPA's review and concurrence of the period of highest upwelling.  ii. EPA notes that the February/March time period is different from the July/August time period identified in the response to this comment. Resolve the inconsistency between the timeframe suggested in SIB Group's response and PDI Work Plan to ensure that the DQO of measurement during the time period of greatest upwelling is demonstrated to EPA and revise the text as appropriate.	i. Figure 4-1b has been generated showing the available groundwater elevation data from the shipyard in the 2000s overlaid on the Willamette River gauge data for the Morrison Street Bridge station. Seasonal groundwater elevation data is available for monitoring wells between 2001 and 2007. Groundwater elevations were higher than river elevations during different seasons, with some plotting consistently close to river elevations, reflecting high connectivity with the river. Some groundwater elevations were relatively static and consistently above river elevations. In addition to the elevation differences between groundwater and river stage, temperature differences between groundwater and surface water enhance the ability of the Trident Probe to detect locations where groundwater upwelling occurs. Temperature differences are stronger earlier in the year versus later in the year in this region according to the professional experience of the consultant operating the Trident probe. Currently, Willamette River discharge and gauge height are very low (below 25th percentile), therefore low river conditions are present. In addition, river temperatures are currently 6-7 degrees Celsius, and will provide a strong contrast with groundwater temperatures (estimated to be between 13 and 15 degrees Celsius). ii. The previous inconsistency in the proposed timeframe for the upwelling survey has been resolved and the text revised.	i. Revise Section 4.2 based on EPA's March 2, 2022 conditional approval of the porewater upwelling survey. As written, Section 4.2 does not discuss the data limitations nor the need for a potential summer upwelling survey. Add text to acknowledge these limitations and the potential summer upwelling survey. Additionally, Section 4.2 states that in late February 2022 groundwater temperatures are "estimated to be between 12 and 15 degrees Celsius." Include a reference or data source for this estimate of groundwater temperature. Revise FSP Section 5.5 to be consistent with PDI WP Section 4.2.  ii. The response and revisions to the PDI WP are acceptable.	i. The following text will be added to Section 4.2: Limitations of the upwelling study are related to the screening-level nature of the measurements, and the limited temporal coverage of the data. While conductivity and temperature provide a good indicator of potential upwelling zones, they can be influenced by processes other than groundwater upwelling and thus need to be considered as a screening level indicator of potential upwelling zones only, and not a quantitative measure of upwelling rates. Quantification of upwelling rates generally requires different methodologies that are most effectively applied after the potential upwelling zones have been identified. The screening survey will be conducted during conditions that are present in February – March 2022 and are thus primarily indicative of that time period. As discussed above, the period is expected to be a favorable time to detect upwelling using conductivity and temperature. However, the actual conditions that are present during the measurement period may vary from what is expected. In addition, seasonal and other temporal variations in river levels and groundwater levels may influence the nature and extent of upwelling zones. To the extent that uncertainty remains in identification of potential upwelling zones following the winter measurement event, some level of verification during the summer period may be considered. The source for estimated groundwater temperatures in late February 2022 was groundwater temperatures measured in groundwater monitoring wells at the Front Avenue Property in the RM9W Project Area (DEQ ECSI 1239) on February 28, 2018 (Bridgewater, 2020 – Interim Report for Source Control Evaluation: Updated Final Groundwater Monitoring Well Installation and Development, 2017 – 2018 Sampling and Analyses, and Proposed Transition Zone Water Sampling and Analyses. Revised August 13). This citation will be added within the parenthetical in Section 4.2: (estimated to be between 12 and 15 degrees Celsius (Bridgewater, 2020)) and to Section 730 References. FSP Section 5.5 will be revised concurrently with revisions in Section 4.2.
20d	1064	Section 4.2 Porewater Upwelling Location Survey, page 4-2				
20e	1065	Section 4.2 Porewater Upwelling Location Survey, page 4-2	The actual added text deviates from what was indicated in the SIB response. Revise the text to be consistent with SIB Group's response. Additionally, EPA requests that the cited reference be provided with the revised PDI Work Plan.	The text has been revised consistent with the SIB Group's September 2021 response, and reads, "The detection of upwelling zones between surface water and groundwater will be based primarily on measurements of conductivity, with conductivity measurement contrasts with a cutoff of 930 microSiemens per centimeter, and; the second method will use a combined Z-score of 0.95 for temperature and conductivity contrasts (Coastal Monitoring Associates, 2020)." The cited reference will be provided as part of the transmittal of the revised PDI Work Plan scheduled for March 16, 2022.		
20f	1066	Section 4.2 Porewater Upwelling Location Survey, page 4-2				
20g	1067	Section 4.2 Porewater Upwelling Location Survey, page 4-2

21a	1069	Section 4.3 Stormwater Outfall and Conveyance System Sampling, page 4-3				

APPENDIX E  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
21b	1070	Section 4.3 Stormwater Outfall and Conveyance System Sampling, page 43	The invert elevations at the proposed sampling locations should be identified to support planning and determining whether backflow will be present in stormwater pipes during selected storms. If alternative sampling locations are selected, those locations should be representative of basin discharges.	HGL will remove the entire stormwater SOW from PDI Work Plan and inserting it into an addendum per EPA's suggestion. PDI Work Plan Addendum would include a visual survey of public and private outfalls including upland conveyance systems that discharge to the outfalls. The FSP Addendum would propose sampling all public outfall systems (M1, M2, M3, S1 and S2) since previous stormwater data, CUL level exceedances (10x) are dated, and Sedcam modeling requires more recent data for RPCs. Include a table with manhole locations, pipe sizes and invert elevations, and proposed types of monitoring. Sampling to include grab solids samples prior to sediment trap installation, flow meter installation and modeling, and HVS stormwater sampling. Phase IIb - Propose to sample private systems where stormwater concentrations > 10x CULs or no data available, and discharges are adjacent to CUL, RAL or PTW exceedances in sediment. Instrumentation if private systems will include autosamplers with flow meters. Solids grab samples in system and/or build smaller sediment traps for private pipes to OFs.  The text in this section will be revised as follows: Table X summarizes proposed sample locations in the City's conveyance system and invert elevations to evaluate whether backflow will be present in the conveyance system during selected storms, along with alternative locations in the event that backflow may be anticipated."	See EPA's response in the 9/22/21 EPA Response to Comments Matrix – Early Feedback on Stormwater and Riverbank Responses document.  9/22/21 Comment: Section 3 of the SRASP summarizes proposed sample locations. The five municipal outfall basins are proposed for sampling because of their sizes, age and magnitude of previous concentrations, and large discharge volumes relative to the sizes of private systems that discharge to SIB. In addition, more recent data are needed from the larger city outfall basins for input parameters to the Sedcam recontamination evaluation model. Sampling of seven private outfall basins that directly discharge to SIB are proposed based on historical data, if available, the magnitude and frequency of CUL detections, current and former site operations, and/or presence of CUL or RAL exceedances in the adjacent riverbank or sediment.  EPA appreciates prioritizing sampling stormwater outfalls adjacent to CUL, RAL or PTW exceedances in sediment. EPA does not recommend a bright line prioritization based on a >10X CUL exceedance in stormwater; rather, EPA recommends evaluating the frequency and magnitude of CUL exceedances, stormwater discharge volumes, and current and past facility uses when selecting sampling locations. EPA understands the proposed scope of work will be refined and provided to EPA in a separate PDI Work Plan or FSP addendum based, in part, on the results of the reconnaissance work. EPA anticipates providing additional comments on the PDI Work Plan or FSP addendum, as appropriate.
21c	1071	Section 4.3 Stormwater Outfall and Conveyance System Sampling, page 43	The HVS sampling methodology using the Gravity Marine PR2900 system is a timeweighted sampling method and not flow-weighted sampling. Revise the text accordingly.	Please see response to 21b. The text will be revised as follows: "The HVS sampling methodology using the Gravity Marine PR2900 system is a time-weighted sampling method that targets sampling during the highest flow periods of a sampling event."	EPA understands the proposed scope of work will be refined and provided to EPA in a separate PDI Work Plan or FSP addendum based, in part, on the results of the reconnaissance work. EPA anticipates providing additional comments on the PDI Work Plan or FSP addendum, as appropriate.  The response is mostly acceptable. EPA requests that the text additionally clarify that the method is a time-weighted composite sampling method.
21d	1072	Section 4.3 Stormwater Outfall and Conveyance System Sampling, page 43	The rationale for collecting manual grab solids samples should be clarified in the PDI Work Plan. The data use described in Section 4.3 is to "inform the relative RPC load coming from each major sub-basin." Because sediment traps capture time-integrated sediment that is transported through the conveyance system, sediment trap solids data provide stronger assessment of loading than manual grab samples of deposited sediments.	Include in PDI Work Plan or FSP Addendum for Stormwater Evaluation. The text will be revised in one of these forthcoming documents as follows: "The rationale for collecting manual grab samples from laterals in sub-basins of each City outfall basin, prior to sediment trap deployment, is to collect any materials present in the line in the unlikely event that no solids are collected in the sediment traps. These solids will be archived (frozen) for potential future analyses."	The response is acceptable pending EPA's review of the Draft Stormwater and Riverbank Assessment and Sampling Plan.
21e	1073	Section 4.3 Stormwater Outfall and Conveyance System Sampling, page 43	Provide the rationale for the proposed grab sample at manhole AAQ011. It is unclear what RD data purpose sampling at the upgradient part of the drainage basin serves. See also the Editorial Comment on Section 4.3.	Include in PDI Work Plan of FSP Addendum for Stormwater Evaluation. The text will be revised as follows: "This location is proposed for solids grab sampling in the stormwater system to determine if polychlorinated biphenyls (PCBs) are being tracked from the adjacent property at 3205 N Webster Street and migrating to Swan Island Basin via City outfall M-3 discharges. This site is a former Oregon DEQ cleanup site that formerly dismantled transformers where PCBs were detected in soil. The site was paved and issued a no further action determination in 1992. However, PCBs were detected in solids around this site and along N. Emerson Street to the north in 2013."	The response is acceptable pending EPA's review of the Draft Stormwater and Riverbank Assessment and Sampling Plan.
22	1074	Section 4.4 Riverbank Characterization, page 4-4	EPA has the following comments on this section and the text should be revised accordingly:		

APPENDIX E (Continued from Previous Page)

22	1074	Section 4.4 Riverbank Characterization, page 4-4				

APPENDIX E  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
22a	1075	Section 4.4 Riverbank Characterization, page 4-4	This section discusses review of historical data. If historical soil data has been collected on the riverbank, these locations should be added to the PDI figures. Additionally, an assessment of the extent of ROD Table 17 (riverbank soil/sediment) and Table 21 contaminants or gaps in the data sets should be included in a series of figures. This data should be included in either this PDI Work Plan or in final PDI data evaluation.	This section will be revised as follows: "The screening of available riverbank data against ROD CULs is summarized in Section 6.1.3 and presented in Section 2 of Appendix E and Tables E.1 through E.4 of the SAR. "	The response is acceptable pending EPA's review of the revised PDI Work Plan.
22b	1076	Section 4.4 Riverbank Characterization, page 4-4	EPA recommends that Incremental Sampling Methodology (ISM) be considered in the forthcoming riverbank sampling work plan for the sandy beach located at the head of the lagoon where public access is provided via a public boat ramp. If ISM is used, the SAP/QAPP development is to follow the Interstate Technology & Regulatory Council's (ITRC) guidance document, Incremental Sampling Methodology. Technical and Regulatory Guidance (ITRC 2012).	HGL agrees that proposed methods should include Incremental Sampling Methodology and will update the PDI Work Plan and FSP text accordingly. The text will be revised as follows: "Incremental Sampling Methodology (ISM) will be followed for sampling the sandy beach at the City's "End of the Swan Island Lagoon" property as follows: Thirty 2-ounce aliquots will be collected from 30 randomly distributed locations and composited into one composite decision unit (DU) sample for ISM processing and analyses in the analytical laboratory."	The response is acceptable pending EPA's review of the revised PDI Work Plan. Note that 30-aliquots per DU may not be enough depending on the size of the DU. Further, EPA would like to clarify that the ITRC guidance was updated in 2020 and should be referred to: <a href="https://ism-2.itrcweb.org/">https://ism-2.itrcweb.org/</a>
23	1077	Section 4.5 Bathymetric and Topographic Surveys, page 4-5	EPA has the following comments on this section and the text should be revised accordingly:	Please see response to Comments #1078, #1079, and #1080.	
23a	1078	Section 4.5 Bathymetric and Topographic Surveys, page 4-5	A topographic/bathymetric survey work and quality control plan needs to be submitted. Contents of the plan should include a general discussion of the work to be performed, target river stage, survey timeframe, information on the specific equipment and software to be used, key personnel involved, and discussions about datums, survey control/frequency of monument checks, lead line, velocity and bar check measurements, data acquisition, and data processing. The FSP must also include details appropriate for the bathymetry equipment being used to show how it is compliant with the minimum standards outlined in the U.S. Army Corps of Engineers (USACE) Engineering Manual (EM) 1110-2-1003, Hydrographic Surveying, dated November 30, 2013 See Appendix A of the Pre-RD Group's Bathymetry Survey Field Sampling Plan for an example (AECOM and Geosyntec 2018), available on the Portland Harbor Environmental Data Portal: <a href="http://ph-publicdata.com/document/AECOM2020/">http://ph-publicdata.com/document/AECOM2020/</a>	A bathymetric survey work plan and quality control plan will be submitted as part of the Final FSP (Appendix A to the Final PDIWP) and will be referenced in Section 4.5 of the Final PDIWP. To clarify, this will not include topographic data collection because no topography data collection is proposed in the PDI (as noted in Section 4.5) due to availability of suitable existing data. Since we are inserting a large work plan after it is developed (significant input from a subcontractor), we cannot quote the text we will insert at this time.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
23b	1079	Section 4.5 Bathymetric and Topographic Surveys, page 4-5	The text states that, "Reasonable approximations will be made in areas where data collection is not feasible (e.g., under vessels)." Revise the text to explicitly state the manner in which such approximations will be made and clarify what efforts will be made around berthing schedules to access areas under vessels.	Section 4.5 will be revised to state "Reasonable bottom elevation approximations will be made in areas where data collection is not feasible (e.g., under permanently moored vessels or large pile-restrained floats), such as filling data gaps using interpolation based on observed slopes, or filling with previous data if analysis shows recent changes are minimal. Side-scan sonar and sub-bottom profiling being performed at different times may also be used to help address bottom elevation data gaps to the extent feasible."	The response is acceptable pending EPA's review of the revised PDI Work Plan. Note that areas characterized with this approach may still present a data gap which would need to be filled later in remedial design.
23c	1080	Section 4.5 Bathymetric and Topographic Surveys, page 4-5	Provide an FSP following EPA's 7 step DQO process for LiDAR and bathymetry data collection as an attachment to the final PDI Work Plan for EPA review.	A bathymetric survey work plan and quality control plan will be submitted as part of the Final FSP (Appendix A to the Final PDIWP), including a summary of the 7 steps for systematic planning using the data quality objectives (DQO) process, and will be referenced in Section 4.5 of the Final PDIWP. No topography data collection is proposed in the PDI (Mobile Terrestrial LiDAR is proposed only to assist in structures/debris detection). Since we are inserting a large work plan after it is developed (significant input from a subcontractor), we cannot quote the text we will insert at this time.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
24	1081	Section 4.6 Geotechnical Sampling, 3rd bullet, page 4-6	EPA has the following comments on this section and the text should be revised accordingly:	Please see response to Comments #1082 and #1083.	
24a	1082	Section 4.6 Geotechnical Sampling, 3rd bullet, page 4-6	Clarify whether the organic content of the soils will be measured as part of the laboratory test program.	The sub-list under the 3rd bullet on page 4-6 will be updated to include: "Organic Content (ASTM, 2020e1)"	The response is acceptable pending EPA's review of the revised PDI Work Plan.

APPENDIX E (Continued from Previous Page)  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA's Draft Final PDI Work Plan Comments on February 1, 2022	SIB Response on February 17, 2022	EPA's Draft Final PDI Work Plan Comments on April 5, 2022	SIB Response on May 10, 2022
22a	1075	Section 4.4 Riverbank Characterization, page 4-4	<p>Some description of available riverbank data was added to Section 4.4. The level of detail provided is acceptable at this time; however, EPA expects a comprehensive presentation and evaluation of historical riverbank data to be included with the Phase 2 riverbank FSP.</p> <p>The bullets in Section 4.4, page 4-8 do not include the scenario when ROD Table 21 contaminants exceed the PTW thresholds. The fourth bullet states that remedial technologies to address contaminated riverbank soils with RAL exceedances may include bank stabilization, removal of contaminated soils, and/or capping. Bank stabilization, in and of itself, is not a remedial technology identified in the ROD. EPA understands that riverbanks may be stabilized as a result of removal and/or capping. Revise the first sentence in the fourth bullet to read: "If ROD Table 21 focused COC concentrations exceed the RALs or ROD Table 21 contaminant concentrations exceed the PTW thresholds..." Revise the bullet list summary to address the requirements of EPA's conditional approval of the SRASP and to differentiate actions shown in the second and third bullets.</p> <p>Additionally, revise this section to include the missing footnote 6 and to reference the decision process indicated in RDGC Appendix D Section 4.1.2 in addition to referencing the ROD.</p> <p>Finally, it is not clear why the SIB Group response references Section 6.1.3. There is no Section 6.1.3.</p>	<p>A comprehensive presentation and evaluation of the historical riverbank data will be included in the Phase 2 riverbank FSP.</p> <p>The second and third bullets were edited to highlight the evaluation of erodibility included in the BANCS model.</p> <p>The fourth bullet in Section 4.4, page 4-8 has been revised as follows: "If ROD Table 21 focused COC concentrations exceed the RALs but not the ROD Table 21 COC concentrations PTW thresholds, the vertical and lateral extent of the exceedances will be delineated, a BANCS analysis (or equivalent erodibility evaluation) will be performed to identify erodible and non-erodible conditions, as noted above, and the RD for the riverbank will be designed in accordance with the requirements of the ROD. Remedial technologies to address contaminated riverbank soils may include removal of contaminated soils and/or capping of contaminated soils, supplemented with bank stabilization to resist erosion (e.g., from stormwater runoff, tidal fluctuations, and propeller wash)."</p> <p>A new fifth bullet was added to the list to address the scenario when ROD Table 21 contaminants exceed the PTW thresholds. The new fifth bullet reads, "If ROD Table 21 COC concentrations exceed the PTW thresholds, the vertical and lateral extent of the exceedances will be delineated, a BANCS analysis (or equivalent erodibility evaluation) will be performed to identify erodible and non-erodible conditions, as noted above, and the RD for the riverbank will be designed in accordance with the requirements of the ROD. Remedial technologies to address contaminated riverbank soils may include removal of contaminated soils and/or capping of contaminated soils, supplemented with bank stabilization to resist erosion (e.g., from stormwater runoff, tidal fluctuations, and propeller wash)."</p> <p>Missing footnote 6 was corrected to be footnote 5 and added to the text with the definition of RAO 9 for riverbanks, and a reference to the decision process indicated in RDGC Appendix D Section 4.1.2.</p> <p>The SIB Group comment response reference to Section 6.1.3 (Riverbanks Adjacent to the SIB Project Area), refers to Section 6.1.3 in the Sufficiency Assessment Report.</p>

APPENDIX E  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
24b	1083	Section 4.6 Geotechnical Sampling, 3rd bullet, page 4-6	Add Specific Gravity – ASTM D854 to be consistent with Field Sampling Plan (FSP) Table 4-1.	The sub-list under the 3rd bullet on page 4-6 will be updated to include: "Specific Gravity (ASTM, 2014)"	The response is acceptable pending EPA's review of the revised PDI Work Plan.
25	1084	Section 4.6 Geotechnical Sampling, 2nd paragraph, page 4-6	Verify that the example for "other applicable guidance documents" is Ohio Department of Transportation versus Oregon Department of Transportation.	The second paragraph of page 4-6 will be updated to: "...as well as other applicable guidance documents (e.g., Oregon Department of Transportation, Federal Highway Administration)."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
26	1085	Section 4.8 Existing Utilities and Debris Identification Surveys, pages 4-7 through 4-8	The text indicates the use of multi-beam and Table 3-5 describes the use of Mobil Terrestrial LiDAR scans. Clarify whether side-scan sonar is being proposed in areas where multibeam may not work and specify what conditions would call for side-scan sonar. See also General Comment regarding 7 step DQO preparation.	Section 4.8 will be revised to include "Side-scan sonar is being proposed as a supplement to multibeam along the entire shoreline in areas where required due to the presence of higher-elevation marine debris (e.g., broken timber piles) or other obstacles preventing safe vessel access and data capture in the multi-beam survey."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
27	1086	Section 4.9 Hydrodynamics and Sediment Dynamics Measurements, page 4-8	Provide the rationale supporting the proposed locations for the bottom-deployed Acoustic Doppler Current Profilers (ADCPs).	Section 4.9 will be revised to include "The outer bottom-deployed ADCP location was chosen to characterize currents closer to the entrance where river flows enter SIB and recirculate (Coast & Harbor Engineering 2013). The inner bottom-deployed ADCP location was chosen to characterize currents in the more quiescent area within the SIB where velocities are typically less than 0.1 feet per second (Coast & Harbor Engineering 2013). At both locations, consideration was made to avoid potential conflicts with vessel traffic, as well as bottom slope to ensure instrument package stability during the deployment."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
28	1087	Section 4.10 Habitat Conditions Survey, page 4-9	EPA has the following comments on this section and the text should be revised accordingly:		
28a	1088	Section 4.10 Habitat Conditions Survey, page 4-9	Revise this section consistent with EPA comments on Section 3.11 to provide more detail on the habitat conditions data to be collected.	This section will be amended accordingly to provide a clearer and detailed description of habitat conditions to be collected for use in evaluating and selecting the appropriate level of remedy. See response to comment 3.11 and note the need to coordinate with NMFS, USACE, and ODEQ regarding applicability of Clean Water Act Sections 404 and 401 and Endangered Species Act. The purpose of the habitat evaluation is to support the analysis of impacts to Waters of the United States and the determination of whether compensatory mitigation is required under Section 404. The habitat assessment is not related to NRDA.	The response is not acceptable. See EPA response to #1053.
28b	1089	Section 4.10 Habitat Conditions Survey, page 4-9	Provide additional detail for the statement that, "data collection will be conducted in accordance with applicable state and federal guidelines." Discuss which state and federal guidelines are applicable.	Section 4.10 of the PDI Work Plan, Habitat Conditions Survey, will be amended to state "data collection for the survey of habitat conditions will follow all applicable federal and state rules and guidelines. The specific rules and guidelines are typically found within the appropriate federal 404 and 401 permits as well as the applicable Nationwide General Permit for this specific activity. Since this work will be conducted pursuant to CERCLA, it is anticipated that a Permit Equivalent will be issued by the EPA Project Manager that incorporates the regulatory conditions that will guide this work."	The SIB Group will need to collect appropriate data to inform the HEA, as described in the above EPA comment (reference #1053). The PDI Work Plan should describe the methodology for performing the habitat conditions survey
29	1090	Section 4.11.3 Facility Future Use and RA Impact Evaluation, pages 4-10 through 4-11	Revise the text to note that future use evaluations should include an estimate of the structures' remaining design life per ROD Figure 28 Footnote No. 2.	Section 4.11.3 language will be updated to include "Functional structures determination will be performed, including an estimate of the structures' remaining service life."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
30	1091	Section 4.11.5 Dredging Study, page 4-11	Clarify the goals of the geotechnical evaluation bullet on the dredging study. Include any portions of that study (i.e., internal dredge side slopes, slope stability and structural offsets, additional finite element modeling) or any other geotechnical assessments that will be needed to evaluate the dredge design. This section should also identify evaluations for any underground utilities or pipelines that may be in the project area.	The bullet "Geotechnical evaluation;" will be updated to read "Geotechnical evaluation, for the purposes of evaluating potential dredging production rates, slope stability, side slope design, structural offsets, dewatering, and disposal considerations;"	The response is acceptable pending EPA's review of the revised PDI Work Plan.
31	1092	Section 4.11.6 Constructability Assessment, Page 4-12	EPA recommends that the constructability assessment be conducted in coordination with the dredging study and consider all dredging technologies (i.e., mechanical, hydraulic, land-based, and water-based). Additionally, this section should identify any construction monitoring anticipated for seawalls or other structures that may be required as a result of dredging.	Section 4.11.6 will be updated to include "The constructability assessment will be conducted in coordination with the dredging study." and "The constructability assessment will also include a discussion on potential construction monitoring suitable to protect existing functional structures."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
32	1093	Section 4.11.7 Recontamination Potential Evaluation, pages 4-12 through 4-15	EPA has the following comments on this section and the text should be revised accordingly:		

APPENDIX E (Continued from Previous Page)  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA's Draft Final PDI Work Plan Comments on February 1, 2022	SIB Response on February 17, 2022	EPA's Draft Final PDI Work Plan Comments on April 5, 2022	SIB Response on May 10, 2022
24b	1083	Section 4.6 Geotechnical Sampling, 3rd bullet, page 4-6				
25	1084	Section 4.6 Geotechnical Sampling, 2nd paragraph, page 4-6				
26	1085	Section 4.8 Existing Utilities and Debris Identification Surveys, pages 4-7 through 4-8				
27	1086	Section 4.9 Hydrodynamics and Sediment Dynamics Measurements, page 4-8				
28	1087	Section 4.10 Habitat Conditions Survey, page 4-9				
28a	1088	Section 4.10 Habitat Conditions Survey, page 4-9	The SIB Group needs to collect appropriate data to inform the HEA, as described in the above EPA comment (reference #1053). The PDI Work Plan should describe the methodology for performing the habitat conditions survey. See also the comment above regarding EPA's authority under CWA 401 during CERCLA cleanup. Also revise Section 10 of the FSP to be consistent with these comments by removing reference to any required permit from USACE for a SLOPES STU variance. EPA decides on the substantive compliance for ARARs listed in Table 25 of the ROD.	See response to comment reference #1053. Section 4.10 of the was amended to include a description of methodology for conducting the habitat conditions survey based on the methods presented in Chapter 8 of the National Rivers and Streams Assessment Field Operations Manual - Non-Wadeable (EPA 2017).Section 10 of the FSP was revised to remove reference to any required permit from USACE for a SLOPES STU variance.		
28b	1089	Section 4.10 Habitat Conditions Survey, page 4-9	The revised PDI Work Plan text indicates a misunderstanding of the purpose, objectives, and use of the habitat conditions data. As described in the EPA comments and responses on Section 3.11, these data are needed to inform the HEA-based approach. The new text referring to federal and state rules and guidelines within the 404 and 401 permits and a nationwide general permit is generally true relative to using nationwide permits as a guide for performing party substantive permit compliance; however, these should not be used to the exclusion of project specific substantive permit compliance examples. Revise the text to note that these federal and state permits do not limit EPA's interpretation of substantive permit requirements and that future deliverables will incorporate Portland Harbor-specific examples as provided in the forthcoming Programmatic Biological Opinion. Reference to a permit equivalent is incorrect and should be deleted. EPA comments on Section 3.11 provide guidance and suggested methodology for the collection of habitat conditions data and should be incorporated into the PDI Work Plan.	Text in Section 4.10 was revised to note that CWA Section 404 and 401 permits do not limit EPA's interpretation of substantive permit requirements and that future deliverables will incorporate Portland Harbor-specific examples as provided in the forthcoming Programmatic Biological Opinion. Reference to a permit equivalent was deleted from Section 4.10. Section 4.10 was amended to describe habitat conditions data collection based on methods described in Chapter 8 of the National Rivers and Streams Assessment Field Operations Manual - Non-Wadeable (EPA 2017).		
29	1090	Section 4.11.3 Facility Future Use and RA Impact Evaluation, pages 4-10 through 4-11				
30	1091	Section 4.11.5 Dredging Study, page 4-11				
31	1092	Section 4.11.6 Constructability Assessment, Page 4-12				
32	1093	Section 4.11.7 Recontamination Potential Evaluation, pages 4-12 through 4-15				

APPENDIX E  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
32a	1094	Section 4.11.7 Recontamination Potential Evaluation, pages 4-12 through 4-15	The text proposes seven recontamination potential analyses. Discuss the RD use these evaluations will serve. For example, clarify whether they are intended to provide a combined contaminant loading estimate for use in the proposed SEDCAM model, i.e., the input of contaminant concentrations in freshly deposited sediment as stated in SAR Section 8.6.	The following will be added to the introduction of Section 4.11.7: "Recontamination potential evaluations in this Section include analysis of sediment movements which, when combined with contaminant concentrations from areas of sediment origin, provide input of contaminants from different sources for use in the SEDCAM modeling described in SAR Section 8.6."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
32b	1095	Section 4.11.7 Recontamination Potential Evaluation, pages 4-12 through 4-15	SAR Section 7.1 states that upstream sediments exceeding CULs could be a source of recontamination; therefore, additional characterization of upstream sediment transport and deposition is needed. The PDI Work Plan proposes sediment sampling in the SIB (Section 4.1) but does not address how sediment data from upstream of the SIB Project Area will be incorporated in the river sediment transport recontamination potential analysis discussed in PDI Work Plan Section 4.11.7. Discuss how upstream sediment data will be incorporated into the modeling analysis (i.e., as a boundary condition or through sediment tracking analysis with sources released from upstream).	The following will be added to the river sediment transport section of Section 4.11.7: "Upstream river sediments will be incorporated into the modeling through sediment tracking analysis with multi-fraction sediment sources within the river upstream of the SIB."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
33	1096	Section 4.11.7 Recontamination Potential Evaluation, Upland Pathways – Direct Discharges (Outfalls) Recontamination Potential, page 4-13	EPA has the following comments on this section and the text should be revised accordingly:		
33a	1097	Section 4.11.7 Recontamination Potential Evaluation, Upland Pathways – Direct Discharges (Outfalls) Recontamination Potential, page 4-13	Discuss the proposed sediment-concentration budget and clarify whether this methodology only applies to direct discharges from outfalls or if it also applies to other potential recontamination pathways.	The term sediment-concentration budget refers to contributing sediment transport inputs from outfalls to the SEDCAM modeling, which also applies to other pathways. The bullet "Evaluation for recontamination potential based on sediment-concentration budget." will be revised to read "Generate sediment deposition footprint from simulated outfalls, and rates of sediment deposition, to be used as input to SEDCAM modeling for recontamination potential evaluation."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
33b	1098	Section 4.11.7 Recontamination Potential Evaluation, Upland Pathways – Direct Discharges (Outfalls) Recontamination Potential, page 4-13	Clarify if outfall discharges will also have a contaminant concentration evaluation similar to overwater sources pathways.	Section 4.11.7 will be updated to include a bullet stating: "Sediment footprints from simulated outfall discharges will be assigned contaminant concentrations based on contaminant concentrations measured during stormwater sampling."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
34	1099	Section 4.11.7 Recontamination Potential Evaluation, Upland Pathways – Overwater Sources (Particulates) Recontamination Potential, page 4-13	Explain what data will be used to characterize over-water discharged particulates and what methodology will be used to simulate their deposition.	Section 4.11.7 will be updated to read: "Data used to characterize over-water contributions will include any available measured concentrations within discharged particulates or estimates based on desktop study, and particulate physical properties relevant to in-water transport (density, diameter, shape). Transport and deposition will be simulated using hydrodynamic modeling combined with particle tracking (Lagrangian) transport simulations."	The response is mostly acceptable pending EPA's review of the revised PDI Work Plan. Include the historical data and/or discuss the desktop studies that that will be used to characterize contaminant concentrations. If insufficient data are available it may be considered a data gap which must be filled to complete the remedial design.
35	1100	Section 4.11.7 Recontamination Potential Evaluation, Resuspension/Scour Pathways – Sediment Releases During Dredging bullet, page 4-15	Resuspension evaluation should compare expected impacts from both hydraulic and mechanical dredging to assist with equipment selection. EPA recommends conducting this in coordination with the dredging study.	A bullet will be added to this section stating "Evaluate releases from both hydraulic and mechanical dredging, in coordination with the Dredging Study."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
36	1101	Section 4.11.8 Cap Stability Evaluations, Cap Stability Evaluation (Erosion) - Anthropogenic Conditions Post-Remedial Action, page 4-16	The text proposes to evaluate impacts on cap stability from anthropogenic conditions and lays out tasks focused on bottom velocities. Revise the text to include wave impacts due to maximum wake generated by expected vessel traffic.	A bullet will be added to this section stating "Evaluate post-remedial action maximum expected vessel-generated waves."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
37	1102	Section 4.11.8 Cap Stability Evaluations, Geotechnical Cap Stability page 4-17	The stability of the cap against the bearing capacity failure mode and filter design should be evaluated in addition to the slope stability failure mode.	Section 4.11.8 will be updated to include "Bearing capacity failure and filter design will be evaluated in general accordance with EPA's <i>Assessment and Remediation of Contaminated Sediments (ARCS) Program Guidance for In-Situ Subaqueous Capping of Contaminated Sediments (EPA 1998)</i> "	The response is acceptable pending EPA's review of the revised PDI Work Plan.
38	1103	Section 4.11.9 Green Remediation Practice Evaluation, page 4-17	EPA has the following comments on this section and the text should be revised accordingly:		

APPENDIX E (Continued from Previous Page)  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA's Draft Final PDI Work Plan Comments on February 1, 2022	SIB Response on February 17, 2022	EPA's Draft Final PDI Work Plan Comments on April 5, 2022	SIB Response on May 10, 2022
32a	1094	Section 4.11.7 Recontamination Potential Evaluation, pages 4-12 through 4-15				
32b	1095	Section 4.11.7 Recontamination Potential Evaluation, pages 4-12 through 4-15				
33	1096	Section 4.11.7 Recontamination Potential Evaluation, Upland Pathways – Direct Discharges (Outfalls) Recontamination Potential, page 4-13				
33a	1097	Section 4.11.7 Recontamination Potential Evaluation, Upland Pathways – Direct Discharges (Outfalls) Recontamination Potential, page 4-13				
33b	1098	Section 4.11.7 Recontamination Potential Evaluation, Upland Pathways – Direct Discharges (Outfalls) Recontamination Potential, page 4-13				
34	1099	Section 4.11.7 Recontamination Potential Evaluation, Upland Pathways – Overwater Sources (Particulates) Recontamination Potential, page 4-13	Revise the text to include the historical data and/or discuss the desktop studies that will be used to characterize contaminant concentrations. Revise the text to discuss where collection of under pier cores would be a preferable line of evidence. If insufficient data are available, it will likely be considered a data gap which must be filled to complete the remedial design, such as with under pier core samples which would be a direct measure of recent and historical overwater discharge.	Data sources for analysis of future recontamination potential from overwater sources are under evaluation. The SIB Group requests approval of the PDIWP with the commitment that further coordination with EPA will be performed regarding the appropriate data source(s) prior to commencing the overwater sources portion of the recontamination analysis. The SIB Group does not believe surface sediment samples are a reliable data source for evaluation of overwater sources likely to be present in the future, due to low sedimentation rates in SIB and mixing from multiple pathways. We expect we will need to consider multiple lines of evidence to establish an appropriate range of COC loading values from overwater activities. We anticipate uncertainty in characterizing loading from overwater sources. Sensitivity analysis and intelligent scenario development are key components to how we plan to handle that uncertainty.	Response acceptable based on the SIB Group's commitment that further coordination with EPA will be performed regarding the appropriate data source(s) prior to commencing the overwater sources portion of the recontamination analysis.	Noted; HGL is committed to coordinating with EPA regarding the appropriate data source(s) prior to commencing the overwater sources portion of the recontamination analysis.
35	1100	Section 4.11.7 Recontamination Potential Evaluation, Resuspension/Scour Pathways – Sediment Releases During Dredging bullet, page 4-15				
36	1101	Section 4.11.8 Cap Stability Evaluations, Cap Stability Evaluation (Erosion) - Anthropogenic Conditions Post-Remedial Action, page 4-16				
37	1102	Section 4.11.8 Cap Stability Evaluations, Geotechnical Cap Stability page 4-17				
38	1103	Section 4.11.9 Green Remediation Practice Evaluation, page 4-17				

APPENDIX E  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
38a	1104	Section 4.11.9 Green Remediation Practice Evaluation, page 4-17	This section should make it clear that the intention of the regional and national EPA guidance is to reduce impacts from design investigations as well as construction, e.g., use of alternative fuels in vehicles used for sampling work and construction activities. At a minimum, the following Green Remediation resources should be considered: i. Consideration of Greener Cleanup Activities in the Superfund Cleanup Process ( <a href="https://semspub.epa.gov/work/HQ/100000160.pdf">https://semspub.epa.gov/work/HQ/100000160.pdf</a> ) ii. Green Remediation Best Management Practices: Site Investigation and Environmental Monitoring ( <a href="https://clu.in.org/greenremediation/docs/GR_Fact_Sheet_SI&amp;EM.pdf">https://clu.in.org/greenremediation/docs/GR_Fact_Sheet_SI&amp;EM.pdf</a> ) iii. Green Remediation Best Management Practices: Clean Fuel & Emission Technologies for Site Cleanup ( <a href="https://clu.in.org/greenremediation/docs/Clean_FuelEmis_GR_fact_sheet_8-31-10.pdf">https://clu.in.org/greenremediation/docs/Clean_FuelEmis_GR_fact_sheet_8-31-10.pdf</a> ) iv. Green Remediation Best Management Practices: Integrating Renewable Energy into Site Cleanup ( <a href="https://clu.in.org/greenremediation/docs/integrating_re_into_site_cleanup_factsheet.pdf">https://clu.in.org/greenremediation/docs/integrating_re_into_site_cleanup_factsheet.pdf</a> ) v. Green Remediation Best Management Practices: Materials and Waste Management ( <a href="https://clu.in.org/greenremediation/docs/GR%20BMP%20fact%20sheet_materials&amp;waste.pdf">https://clu.in.org/greenremediation/docs/GR%20BMP%20fact%20sheet_materials&amp;waste.pdf</a> ) vi. Green Remediation Focus ( <a href="https://clu-in.org/greenremediation/dco">https://clu-in.org/greenremediation/dco</a> )	HGL will consider the Green Remediation resources identified in the comment when planning and implementing the PDI. The text has been revised to include the following statement: "Per discussion with EPA on August 19, 2021, the Green Remediation Practice Evaluation will not need to include design investigations, and the Green Remediation Plan will be developed after the Pre-Design Investigation. The design team is committed to using Best Management Practices during the design investigations to minimize their environmental footprint to the extent feasible."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
38b	1105	Section 4.11.9 Green Remediation Practice Evaluation, page 4-17	For the Pre-Design Investigation Report, the Green Remediation Plan should include best management practices that will be implemented during this phase of the project.	See response to Comment #1104.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
38c	1106	Section 4.11.9 Green Remediation Practice Evaluation, page 4-17	Consistent with the Region 10 policy noted above, in either this section or the next iteration of this document (i.e., the Green Remediation Plan) explain how baseline versus reductions in energy and water usage, particulate emissions, waste generation and handling, and other improvements will be tracked and reported during pre-design investigation activities, remedial design, and construction.	Section 4.11.9 will be updated to include "The Green Remediation Plan will include a discussion on how baseline versus reductions in energy and water usage, particulate emissions, waste generation and handling, and other improvements will be tracked and reported during construction."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
38d	1107	Section 4.11.9 Green Remediation Practice Evaluation, page 4-17	While EPA Region 10's Clean and Green Policy is cited, the specific aspects of the regional guidance are not explicitly discussed, e.g., Environmental Management System (EMS) aspects, buying office paper with recycled content, using recycled toner cartridges, etc. Include in the text how this regional guidance was considered.	Section 4.11.9 will be updated to generally describe what regional guidance included in EPA Region 10's Clean and Green Policy will be included in the Green Remediation Practice Evaluation.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
38e	1108	Section 4.11.9 Green Remediation Practice Evaluation, page 4-17	Revise the text to specify when the Green Remediation Plan will be drafted during the design process for EPA review to ensure elements that apply to RD data gathering activities are applied in a timely fashion.	Section 4.11.9 will be updated to include "The Green Remediation Plan will be drafted for EPA review following the pre-design investigation."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
38f	1109	Section 4.11.9 Green Remediation Practice Evaluation, page 4-17	Revise the text to specify when the Green Remediation Plan will be drafted during the design process for EPA review to ensure elements that apply to RD data gathering activities are applied in a timely fashion.	Section 4.11.9 will be updated to include "The Green Remediation Practice Evaluation will address ROD requirements related to construction, such as minimizing transportation of materials and using rail rather than truck transport to the extent practicable."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
39	1110	Section 4.11.10 Flood Impact Evaluation, page 4-18	EPA has the following comments on this section and the text should be revised accordingly:		
39a	1111	Section 4.11.10 Flood Impact Evaluation, page 4-18	The flood impact evaluation does not require 3D modeling. Delete term "3D" from text in parentheses in the first paragraph of section.	"3D" will be removed from the text in parentheses in the first paragraph of Section 4.11.10.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
39b	1112	Section 4.11.10 Flood Impact Evaluation, page 4-18	Revise the text to include a discussion of climate change impacts as another factor to be assessed in the flood impact evaluation. Per the ROD, "uncertainties associated with potential climate change will be incorporated into the flood rise evaluation" (EPA 2017).	A third bullet will be added to Section 4.11.10: "Uncertainties associated with potential climate change effects on future hydrologic conditions affecting the flood rise evaluation will be incorporated into the modeling as a sensitivity analysis."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
40	1113	Section 5.0 PDI Management Plan, page 5-1	The following sentence should be appended to note that field work protocols will conform to state and national COVID-19 guidelines: "At all times, this work will adhere to industry prescribed health and safety practices in the field and in the water."	Section 5.0 will be amended as follows "At all times, this work will adhere to industry prescribed H&S practices in the field and in the water. This also includes any current national, state or local COVID-19 guidelines."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
41	1114	Section 6 Deliverables/Schedule, page 6-1	Include a table that summarizes the proposed schedule for PDI sampling. The table would provide a quick reference to confirm that sampling is planned for the optimum time (e.g., stormwater/outfall sampling and porewater upwelling surveys), as well as confirm that sampling is appropriately staged so as not to interfere with the other sampling efforts (e.g., geotechnical sampling and sediment sampling for chemistry and other parameters). EPA understands that a detailed field schedule is not possible at this time but expects that one will be provided in the final PDI Work Plan prior to mobilization.	Table 6-1, listing the field tasks, will be added to the document. The new table is provided in the Attachments to this RTC document. The following text will be added to Section 6.1: "The proposed schedule for the work is shown in Table 6-1."	The response is acceptable pending EPA's review of the revised PDI Work Plan. The schedule was not appended to the RTC.

APPENDIX E (Continued from Previous Page)  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA's Draft Final PDI Work Plan Comments on February 1, 2022	SIB Response on February 17, 2022	EPA's Draft Final PDI Work Plan Comments on April 5, 2022	SIB Response on May 10, 2022
38a	1104	Section 4.11.9 Green Remediation Practice Evaluation, page 4-17

40	1113	Section 5.0 PDI Management Plan, page 5-1				
41	1114	Section 6 Deliverables/Schedule, page 6-1	Table 6-1 indicates that the bathymetry and topography surveys were completed from 11/1/2021 to 12/1/2021. Revise the dates to reflect the correct period in 2022 when these survey activities are planned.	Table 6-1 will be updated to reflect the most recent project schedule.		

APPENDIX E  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
42	1115	Section 7.1 Positioning, Horizontal, and Vertical Control, page 7-1	State the frequency at which the onboard fathometer will be checked with physical (i.e., lead line, pole) checks. Describe how any offsets of a certain value or greater will be accounted for with relevant software.	Gravity Marine will provide the frequency of checks and offsets. A bar check will be conducted daily prior to sampling. This will be done by lowering a metal plate at a known distance below the sonar and recording the value. The depth will be analyzed for accuracy based on the draft of the sonar below the waterline. Draft values will be input into the survey navigation software HYPACK. This allows for static offsets to be applied to real time depth data and corrected for accurate depth readings. Any adjustments in the draft value will be measured and input directly in the hardware configuration of the HYPACK survey software prior to sampling.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
43	1116	Section 7.2.1 Positioning at Sediment Sample Stations, page 7-1	Revise the text to note the fixed survey benchmark being selected. The FSP should describe which monuments will be used and when the position check(s) will be performed. The FSP should verify that these monuments are adequate for the survey to be performed. Provide a table showing primary and secondary monuments and include the monument name, coordinates, and elevation. To relate this project to previously collected data, the monuments should consist of the previously established monuments, to the extent possible. If any of the previous monuments will not be used, justification for using different monuments should be provided. A primary monument should be shot at the beginning and end of the survey, at a minimum. If a monument is not easily accessible during surveying, a new monument should be established as close as possible to the original monument and any deviations should be noted in the final report. Provide all monument elevations in NAVD88 and provide a conversion factor value for any monument elevations that are converted from a different reference elevation. The location of the established monuments to be used for position checks should be shown on a figure.	GNSS checks will be performed with the vessel, and will record horizontal but not vertical data. Section 7.3.1 will be updated with a full description of the positioning procedures, provided by Gravity Marine.  Alternatively, HGL could use the same SOP used by Gravity Marine in other Portland Harbor PDI work because it is accepted by EPA at other sites and significantly easier to perform. Gravity Marine can also follow procedures written in-text currently, if requested. Above text assumes change, need updated comment response if the existing procedures are kept.  HGL will work with EPA to determine the preferred SOP.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
44	1117	Table 3-3 Data Gap Analysis – Geotechnical Site Characterization	The list of engineering analyses under the “Site Specific Geotechnical Design Parameters” data requirement item should also include an evaluation of bearing capacity mode of failure for the cap.	Table 3-3 will be updated to include "Evaluation of the cap bearing capacity failure mode."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
45	1118	Table 3-4 Data Gap Analysis – Shoreline and Overwater Structures	Revise the table to include the estimated remaining service life of shoreline and overwater structures as a data requirement.	Table 3-4 will be revised by adding the following: "- Data Requirement: Functional structures evaluation - Existing Data Summary: Some as-built design plans are available for various fixed structures within the shipyard, but no remaining service life information is available. - Data Gap to be Filled: Current condition assessments of shoreline and over-water structures, and structural evaluation to estimate remaining service life."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
46	1119	Table 3-6 Data Gap Analysis – Hydrodynamics and Sediment Dynamics	A 3D hydrodynamic and sediment transport model is proposed to fill a data gap for currents and water levels. However, being a freshwater tidal system (i.e., lacking salinity and/or thermal stratification) a 2D model will be adequate. Review and revise the proposed modeling approach, as needed. EPA recommends collecting data when water levels are low.	The referenced bullet will be revised to state “Numerical modeling results will be generated using a river-wide 2D hydrodynamic model, with local 3D hydrodynamic modeling performed on a limited basis as needed.”	The response is acceptable pending EPA's review of the revised PDI Work Plan.
47	1120	Table 3-6 Data Gap Analysis – Hydrodynamics and Sediment Dynamics	EPA has the following comments on this section and the text should be revised accordingly:		
47a	1121	Table 3-6 Data Gap Analysis – Hydrodynamics and Sediment Dynamics	The table should be expanded to include data on climate change (as relates to anticipate associated with potential climate change will be incorporated into the flood rise evaluation and cap design elements”. See RDGC Section 5.2.12 for additional guidance (EPA 2021).	A row called "Climate change" will be added to the table, with a summary of relevant existing data/literature, and data gaps to be filled by literature review and research during the PDI.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
47b	1122	Table 3-6 Data Gap Analysis – Hydrodynamics and Sediment Dynamics	Conceptual fluid design modeling of propeller wash is proposed. The table should be expanded to include EPA guidance (Palermo et al., 1998, RDGC) on incorporating propeller wash impacts on cap design.	On the Propeller wash row, the <i>Existing Data Summary</i> column will be updated to include a third bullet “EPA guidance (Palermo et al., 1998, RDGC) on incorporating propeller wash impacts on cap design.” NOTE: the cited bullet should have read “Computational Fluid Dynamics (CFD) modeling of propeller wash based on vessel traffic evaluation.”	The response is acceptable pending EPA's review of the revised PDI Work Plan.
48	1123	Figure 1-2 Technology Assignments, Selected Remedy	Section 1.1 indicates that Figure 1-2 shows the Project Area technology assignments as depicted in the ROD. However, Figure 1-2 does not match the technology assignments indicated on Figure 31d of the ROD; namely, Figure 1-2 does not show capping as the assigned technology under Pier A. Revise the figure to address the discrepancy.	Figure 1-2 will be revised to show capping as the assigned technology under Pier A.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
49	1124	Figures 3 Series	EPA has the following comments on this section and the text should be revised accordingly:		
49a	1125	Figures 3 Series	Different symbols should be used to differentiate sampling events.	The Figure 3 series will be updated to use different symbols to differentiate sampling events. Due to the large number of investigations that comprise the EPA RI/FS data in SIB, the RI/FS data will use a single symbol whereas post-ROD events will have unique symbols	The response is acceptable pending EPA's review of the revised PDI Work Plan.

**APPENDIX E**  
**EPA Review of Draft Pre-Design Investigation Work Plan**  
**Response to Comments Matrix**  
**May 10, 2022**

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
49b	1126	Figures 3 Series	The current scale of the figures is too large and lacks data required for EPA or stakeholders to perform a timely review. EPA recommends having an overview figure and then zooming in to locations such that sample ID's can be added to proposed and historical cores.	The noted figures will be zoomed in and sample IDs added.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
49c	1127	Figures 3 Series	Evaluation of bathymetric data should be included to support sampling decisions. Add contours to the figures and, if needed, the scales should be adjusted.	Bathymetry contours will be added to support sampling decisions.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
49d	1128	Figures 3 Series	Revise the figures to depict the location, name, and contaminant identified. For additional clarity, include the concentration of the contaminant, depth interval, and indication if that location is vertically delineated with two consecutive 1-foot sampling intervals below applicable RAL or PTW thresholds (see Section 5.1.2 of the RDGC).	Figures and tables will support vertical delineation of RAL or PTW discussion, providing location, name, and contaminant identified, including depth and indication if that location is vertically delineated with two consecutive 1-foot sampling intervals below RAL or PTW or justification why that information is not needed.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
49e	1129	Figures 3 Series	Add the demarcation of the shallow zone, intermediate zone, approximate top of bank, and approximate future maintenance dredge areas on all figures.	The Figure 3 series will be updated to delineate shallow zone, intermediate zone, approximate top of bank, and approximate future maintenance dredge areas.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
50	1130	Figures 3-2 and 3-3	As discussed in the Approved Sample Databases general comment, only samples from approved data sets should be provided on the data gaps assessment figures. Remove or differentiate all non-approved surface and subsurface locations.	Figures 3-2 and 3-3 will be revised to differentiate non-approved data.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
51	1131	Figures 4-3 and 4-5	Ensure that the bathymetry FSP, once submitted, indicates the target overlap of bathymetry and LiDAR surveys to meet DQOs along with river elevation ranges necessary to achieve each survey successfully.	A bathymetric survey work plan and quality control plan will be submitted as part of the Final FSP (Appendix A to the Final PDIWP) and will be referenced in Section 4.5 of the Final PDIWP, including a summary of the 7 steps for systematic planning using the data quality objectives (DQO) process. No topography data collection is proposed in the PDI (as noted in Section 4.5) due to availability of suitable existing data. The bathymetric survey work plan will indicate target elevations to ensure adequate overlap with the existing topographic survey data. Since we are inserting a large work plan after it is developed (significant input from a subcontractor), we cannot quote the text we will insert at this time.	The response is acceptable pending EPA's review of the revised PDI Work Plan.

APPENDIX E (Continued from Previous Page)  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA's Draft Final PDI Work Plan Comments on February 1, 2022	SIB Response on February 17, 2022	EPA's Draft Final PDI Work Plan Comments on April 5, 2022	SIB Response on May 10, 2022
49b	1126	Figures 3 Series				
49c	1127	Figures 3 Series				
49d	1128	Figures 3 Series				
49e	1129	Figures 3 Series	Figures 3-1a through 3-1d illustrate revised Portland Harbor Site regions, including a smaller future maintenance dredge area compared to what was presented in the ROD. The Revised PDI Work Plan should discuss these changes, including sources of information, how these changes may affect the application of remedial technologies, and whether these revised areas have been accepted by EPA for use in the RD.	Discussion was added to PDI Work Plan Section 3.1 regarding updates to approximate future maintenance dredge areas compared to what was presented in the ROD. New text reads:  "Note that future maintenance dredge (FMD) areas portrayed on Figures 3-1a to 3-1d differ from what was shown in the ROD, and EPA has not yet accepted these areas for use in the RD. Section 2.2.6 of this PDI Work Plan identifies current and future navigation depth requirements for the SIB Project Area as a data gap. The approximate FMD areas shown in Figures 3-1a to 3-1d are preliminary and based on preliminary information provided by a subset of the shoreline property users. The FMD areas that will be used to inform the RD will be mapped based on the results of the proposed facility owner/operator interviews, which will include a survey of waterway users (see Section 4.11.2 of this PDI Work Plan). Any revisions to the map of FMD areas will be reported to EPA in the PDI Evaluation Report and subject to EPA review and acceptance prior to using them to inform technology applications and RD development."  The bullet list in Section 4.11.2 (Facility Owner/Operator Interviews) was amended to include this new bullet point: "Determine the current and future navigation depth requirements for the SIB Project Area."		
50	1130	Figures 3-2 and 3-3				
51	1131	Figures 4-3 and 4-5				
52	2003	Section 6.2 Engineering Study Elements of the PDI, page 6-2	Revise the text to clarify that this is not a fully inclusive list of all engineering evaluations required for RD or revise the list to include all engineering evaluations in the RDGC (EPA 2021).	Text in Section 6.2 was revised to by adding, "This is not a fully inclusive list of all engineering evaluations required for RD. Additional engineering evaluations will be identified and documented in the Basis of Design Report, the RD Work Plan, and subsequent design submittals."		
53	2004	Figure 3-2 and 3-3 Series	EPA has the following comments on these figures and the figures should be revised accordingly:	Noted.		
53a	2005		The grid cell identification letters and numbers are missing from these figures, making them difficult to cross reference with FSP Tables and Figures that identify proposed sample locations. Revise the figures to include the grid cell identification letters and numbers.	Figures 3-2 and 3-3 series were modified to add the grid cell identification letters and numbers.		
53b	2006		The circles surrounding the sample location symbols make the figure difficult to review. Revise the figures to more clearly identify CUL, RAL, and PTW threshold exceedances by changing the color of the sample location symbol itself.	A new surface-sediment CUL-exceedance figure, now Figure 3-2a, has been added to the PDI. Figure symbols on Figures 3-2 and 3-3 series were revised to more clearly identify CUL, RAL, and PTW threshold exceedances.		
53c	2007		It is unclear why the sample location symbols differentiate "Post-ROD" and "PDI" sample locations. Revise the figures or clarify in the text the difference between "Post-ROD" and "PDI" sample locations.	The legend of the Figures 3-2 and 3-3 series for historical sample points have been renamed to "RI/FS", "PDI", and "Other Studies" to resolve the ambiguity between "PDI" and "Post-ROD" studies.		
53d	2008		Include a figure that shows locations with surface or subsurface RAL and/or PTW threshold exceedances.	We believe these data are already presented fully on the Figures 3-2 and 3-3 series, and with the ROD SMA boundary shown on those figures.		

APPENDIX E  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
54	2009	Table 4-2 Summary of Stormwater System Sampling Activities and Locations			
<b>Editorial Comments on PDI Work Plan</b>					
1	1132	Section 1.6 Important Definitions, Contaminants of Concern (COCs), page 1-9	The second sentence in the subsection appears to contain a typographical error: "DDX.1." Revise as needed.	DDX.1 will be revised to read, "DDx" as listed in Tables 21 and 17.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
2	1133	Section 2.2.5 Dredging History Informs Interpretation and Application of Sediment Characterization Data, page 2-4	This section lists the maintenance dredge events and references figures from the 2004 Programmatic Work Plan. EPA recommends adding boundaries of the historic dredge areas to a figure in the PDI Work Plan or in the data evaluation report to provide additional context for data comparison and relationship to the conceptual site model (CSM).	The boundaries of the five listed maintenance dredge events will be included in a new figure in the data evaluation report, and the report text will reference the figure in discussing data comparison and the CSM.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
3	1134	Section 3.1.2 Subsurface Sediment Contaminant Concentrations, 2nd paragraph, page 3-3	The last sentence of this paragraph is repeated. Remove one of the duplicate sentences.	The duplicate sentence will be removed.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
4	1135	Section 3.3 Stormwater Discharge, page 3-4	The following text appears to have a typographical error: "CLs and/or RALs". Revise to state, "CULs and/or RALs".	The text will be revised to state "CULs and/or RALs."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
5	1136	Section 4.3 Stormwater Outfall and Conveyance System Sampling, page 4, bullet 3	The text in bullet three indicates that a grab solids sample will be collected from AAQ011, whereas Figure 2 indicates the sample will be collected at AAQ012. Revise as needed so that text and figures are consistent.	Additional details on this comment will be included in the new, separate PDI Work Plan addendum for stormwater evaluation. Figure 2 will be revised to indicate that the sample will be collected at AAQ011.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
6	1137	Section 7 References, pages 7-1 through 7-1	Add the following citations to the reference section:		
6a	1138	Section 7 References, pages 7-1 through 7-1	PGG (Pacific Groundwater Group). 2019a. Surface and Subsurface Sediment Field Sampling and Data Report, Swan Island Lagoon, Portland Harbor Superfund Site. Prepared for Daimler Trucks North America LLC.	This citation will be added to the section references and cited within the text.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
6b	1139	Section 7 References, pages 7-1 through 7-1	PGG. 2019b. Surface and Subsurface Sediment Field Sampling and Data Report, Swan Island Lagoon, Portland Harbor Superfund Site. Prepared for de maximis, inc.	This citation will be added to the section references and cited within the text.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
7	1140	Figure 3-3	Revise the legend to clarify which locations represent surface samples, subsurface samples, or both.	This figure will be updated to include only subsurface sample locations, or to clearly delineate whether a sample location is surface, subsurface, or both.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
8	1141	References	DEQ and EPA. 2005. <i>Portland Harbor Joint Source Control Strategy</i> . EPA. 2017. <i>Record of Decision, Portland Harbor Superfund Site, Portland, Oregon</i> . APPENDIX E (Continued from Previous Page)  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA's Draft Final PDI Work Plan Comments on February 1, 2022	SIB Response on February 17, 2022	EPA's Draft Final PDI Work Plan Comments on April 5, 2022	SIB Response on May 10, 2022
54	2009	Table 4-2 Summary of Stormwater System Sampling Activities and Locations	Table 4-2 should be updated to be consistent with the text in FSP Section 4.5.1 that states, "The whole water sample will be analyzed for ROD Table 17 COCs, except the PCBs, OCPs, and dioxins and furans. If there is a sufficient volume of stormwater solids available in the carboy after the removal of the whole water sample, those solids will be separated by centrifuge in the laboratory and analyzed for ROD Table 17 COCs, except the PCBs, OCPs, and dioxins and furans".	Table 4-2 was updated to be consistent with FSP Section 4.5.1 text noted in the comment. Specifically, the collection method for stormwater samples was revised to read "HVS (Whole Water Carboy)" where applicable.		
1	1132	Section 1.6 Important Definitions, Contaminants of Concern (COCs), page 1-9	The typographical error remains in the text. Revise as needed.	The typographical error was corrected from DDx.1 to DDx.		
2	1133	Section 2.2.5 Dredging History Informs Interpretation and Application of Sediment Characterization Data, page 2-4				
3	1134	Section 3.1.2 Subsurface Sediment Contaminant Concentrations, 2nd paragraph, page 3-3				
4	1135	Section 3.3 Stormwater Discharge, page 3-4				
5	1136	Section 4.3 Stormwater Outfall and Conveyance System Sampling, page 4-4, bullet 3				
6	1137	Section 7 References, pages 7-1 through 7-1				
6a	1138	Section 7 References, pages 7-1 through 7-1	The citation was not added to the reference section. Revise as needed.	Citation added to the reference section		
6b	1139	Section 7 References, pages 7-1 through 7-1	The citation was not added to the reference section. Revise as needed.	Citation added to the reference section		
7	1140	Figure 3-3				
8	1141	References				
9	2010	Formatting	Revise the document with bookmarks for all section headers, automated 508 tagging and other EPA document formatting expectations.	The document has been formatted to comply with 508 requirements.	The PDI Work Plan Revision 2 did not meet the 508 tagging requirements for accessibility (pursuant to Section 5.4 of the SIB Group's statement of work). Guidance on preparing a 508 compliant document is attached.	The main body of the document and tables will be revised according to the 508 compliance document and guidance received from EPA (4/12/2022). The Excel tables of the document were causing the remaining 508 errors. The Excel tables were converted to Word to eliminate the errors. HGL does not plan to revise the figures and appendices.
10	2011	Formatting	When preparing future response to comments, indicate new section header numbers if the section header number has been changed for ease of EPA review.	Any revised section numbers have been identified within individual comment responses.		
11	2012	Formatting	The subsections under Section 2.2 are numbered as 2.1.1 to 2.1.6. They should be corrected to 2.2.1 to 2.2.6.	Section 2.1 and 2.2 were properly tagged and the 2.1.1 to 2.1.6 were auto-corrected to 2.2.1 to 2.2.6.		

**APPENDIX E**  
**EPA Review of Draft Pre-Design Investigation Work Plan**  
**Response to Comments Matrix**  
**May 10, 2022**

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
12	2013	Table 4-1 Summary of Sample Activities, Numbers, and Analyses			
N/A	2014	QAPP Worksheet 15			
N/A	2015	QAPP Worksheet 20			
<b>General Comments on the Field Sampling Plan</b>					
Following are EPA's comments on the HydroGeoLogic, Inc. Field Sampling Plan (FSP), Appendix A of the Draft Pre-Design Investigation Work Plan, prepared by HydroGeoLogic, Inc. on behalf of the Swan Island Basin Remedial Design Group and dated June 2021.					
1	1142	Phase 2 Analysis of Archived Subsurface and Surface Intervals	Tables 4-2 and 4-3 indicate samples will be archived for Phase 2 and that the FSP will provide more detail. Discussion of Phase 2 analysis is missing from the FSP and must be added. The FSP should include details such as when archived samples will be analyzed and how to analyze those samples. Additionally, EPA recommends review of adjacent historical sample locations to determine subsurface intervals for Phase 1 sample analysis. As noted in PDI Work Plan General Comment on Sediment Sampling, historical locations were found to have concentrations above RALs at depths greater than 15 feet.	Tables and text will be revised for consistency with the PDI Work Plan (as above).	The response is acceptable pending EPA's review of the revised PDI Work Plan.
2	1143	Riverbank Sample Locations	Chemical characterization of riverbank soils should be conducted throughout the bank between mean low water (MLW) and the top of the bank, as described in Section 2.2.1 of RDGC Appendix D. The proposed sampling locations do not provide coverage of the MLW zone of the riverbank and samples should be added to capture that part of the riverbank.	As discussed during the August 19m 2021 call with EPA, HGL will remove the riverbank sampling scope of work from the PDI Work Plan and move it to a separate addendum with phased scope of work to follow EPA's Riverbank Guidance. The PDI Work Plan Addendum / Phase Ia - Visual survey of bank will be to define geomorphic features, material types and collect input parameters for BANCs evaluation of erodibility / stability.  Note that this change will also require an FSP Addendum/Phase II. HGL will proposed sample collections at the top, face, and mean low water (toe) along each transect where BANCs determines bank is unstable. HGL will present a contingency plan if material cannot be sampled at a location. HGL will also include number and type of analyses in this FSP vs QAPP in PDI Work Plan.	The response is partially acceptable pending EPA's review of the Draft Stormwater and Riverbank Assessment and Sampling Plan. EPA notes that riverbank soil sampling needs to be performed to determine whether in-water SMAs are contiguous with contaminated riverbank soil exceeding RALs/PTW, not just in erodible areas. Initial sampling in erodible areas may be acceptable if followed by supplemental riverbank soil sampling in non-erodible areas that are potentially contiguous with in-water SMAs.
3	2014				
<b>Specific Comments on the Field Sampling Plan</b>					
Following are EPA's comments on the HydroGeoLogic, Inc. Field Sampling Plan (FSP), Appendix A of the Draft Pre-Design Investigation Work Plan, prepared by HydroGeoLogic, Inc. on behalf of the Swan Island Basin Remedial Design Group and dated June 2021.					
1a	1144	Section 1.3 Purpose and Objectives, No. 2, page 1-4	Revise to clarify what "three applications" the text is referring to.	The text in Section 1.3 will be revised to remove the phrase "three applications", and instead to simply list the applications as follows "...needs are sufficient to support the ASAOC applications required for Sediment Management Area...".	The response is acceptable pending EPA's review of the revised PDI Work Plan.
1b	1145	Section 1.3 Purpose and Objectives, No. 2, page 1-4	Revise the following text for clarity: "Ensure that the data and analysis needs are sufficient to support..." It is not clear how a data/analysis need would support RD. Data and analysis support RD after data and analysis needs (data gaps) are filled.	The text in Section 1.3 will be revised to remove the words "data and" to indicate that just the analysis needs (data gaps) are necessary to support RD.	The response is acceptable pending EPA's review of the revised PDI Work Plan.

APPENDIX E (Continued from Previous Page)  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA's Draft Final PDI Work Plan Comments on February 1, 2022	SIB Response on February 17, 2022	EPA's Draft Final PDI Work Plan Comments on April 5, 2022	SIB Response on May 10, 2022
12	2013	Table 4-1 Summary of Sample Activities, Numbers, and Analyses	Table 4-1 still shows that data collection for subsurface sediment sampling includes 174 cores and total 870 samples, which are from the previous draft PDI Work Plan. They should be updated to 181 cores and 905 samples to be consistent with Section 4.1. Similarly, the stormwater sample numbers in Table 4-1 should be updated from 11 to 12 to be consistent with Section 4.3.	Table 4-1 was updated to include the revised subsurface sediment core and total sample number to be consistent with Section 4.1. Table 4-1 was updated to include revised stormwater sample numbers to be consistent with Section 4.3.	Table 4-1 has been revised to be consistent with PDI WP Section 4.1. However, QAPP Worksheet #20 has not been updated to reflect the correct number of samples and field QC samples. Revise QAPP Worksheet #20 to reflect the final sample counts.	QAPP Worksheet #20 will be updated to be consistent with Table 4-1 (of Appendix A - Field Sampling Plan) to include the correct number of samples and field QC samples for each media. FSP Table 4-1 and QAPP Worksheet #20 will be updated to reflect changes in sediment sample numbers in response to Comment # 2b. Additional changes to FSP Table 4-1 were made to update Analyses column from "SIB RPCs" to "All surface water COCs (ROD Table 17)" and to provide further clarification/delineation between public/private stormwater activities.
N/A	2014	QAPP Worksheet 15				Introductory text: Added text to clarify distinction between focused COCs, RPCs, and ROD Table 17 COCs for all media rather than just aqueous matrix. Worksheet 15.4A: Clarified Focused COC RAL column for aroclors to refer to Total PCBs RAL. Worksheet 15.8A: Added aldrin and lindane - ROD Table 17 COCs, inadvertently omitted in previous submission.
N/A	2015	QAPP Worksheet 20				Surface Sediment Samples: Removed excess EB samples that are accounted for in the subsurface sediment core samples. Added note to Sediment Core Samples row label "(includes surface interval at selected locations)" to clarify change. Surface and Shallow Core Riverbank Samples: Added PAH analysis as it was inadvertently omitted in previous submission. Stormwater: In-Line Solids and Manual Grab Sediment Samples: Reduced excess EBs inadvertently included for locations with dedicated samplers. Added footnote #7 to clarify change.
1	1142	Phase 2 Analysis of Archived Subsurface and Surface Intervals				
2	1143	Riverbank Sample Locations				
3	2014		In cases where sample volume is limited and select COCs must be prioritized for analysis, EPA recommends analyzing for metals if sufficient volume remains after analyzing for focused COCs.	In Section 4.5.7.4, "with metals analysis completed on any remaining solid or liquid" was added to the end of the first sentence.		
1a	1144	Section 1.3 Purpose and Objectives, No. 2, page 1-4				
1b	1145	Section 1.3 Purpose and Objectives, No. 2, page 1-4				

APPENDIX E  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
2	1146	Section 4.2 Sediment Sampling, page 4-2	All ROD Table 21 contaminants should be analyzed, per Section 5.1.2 of EPA's RDGC (EPA 2021) unless a CSM based technical rationale can be provided to limit analysis. EPA acknowledges that the data density and results for chlorobenzene and naphthalene are likely sufficient to support such rationale. Revise the text to provide an explicit explanation that references the data.	This section will be amended to include an explicit technical rationale for any ROD Table 21 COCs not analyzed.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
3	1147	Section 4.2.2.2 Surface Sample Collection and Compositing, page 4-5	The text states that "After sealing the sample containers, the container threads will be thoroughly wiped down before storing on ice in a sampler cooler. This will prevent leakage and potential cross-contamination." The order of operations in the first sentence is incorrect and should be corrected. Also, if potential cross-contamination is to be avoided between sample containers stored in a cooler on ice, each jar should be placed in a sealed plastic bag and wrapped in bubble wrap. Revise the text accordingly.	The text in Section 4.0 will be revised to list the sample containment operations in the correct order and will include wrapping each jar in bubble wrap and sealing in a plastic bag as added precautions.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
4	1148	Section 4.2.4 Sediment Erodibility (SedFlume) Sample Collection, page 4-10	Revise the text to describe the rationale behind the specific locations proposed to be sampled and the number of cores to be characterized for erodibility. Based on experience at other sites, 30 cores over the 117 acre SIB project area is a relatively high density of cores. It is not clear if this density of cores is warranted. Discuss whether there are large variations in sedimentation rates, fines content, energy regimes, consolidation effects, etc. that can affect erodibility in the SIB Project Area.	The following text will be included in Section 4.2.4: "The SedFlume sampling program was designed based on review of previous sampling that was performed in Portland Harbor (Sea Engineering 2006). The previous programs included two samples in the SIB: one sample near the SIB entrance, and one sample in the SIB central interior. Analysis of those testing results indicates significant differences in sediment erodibility properties, including erosion rates and fines content. Therefore, a robust sampling program was determined to be warranted in order to capture these significant differences in sediment erodibility."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
5	1149	Section 4.2.2.1.1 Power-Grab Sampling, page 4-3	EPA has the following comments on this section and the text should be revised accordingly:		
5a	1150	Section 4.2.2.1.1 Power-Grab Sampling, page 4-3	Clarify that power grab samples will be a 3-point composite sample like the manual grab locations. The section does state that a minimum of 3 samples will be collected but does not specify if these locations will be composited.	The text will be revised to clarify: "Power grab samples will consist of a 3-point composite sample like manual grab locations."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
5b	1151	Section 4.2.2.1.1 Power-Grab Sampling, page 4-3	The text indicates that if field conditions preclude the field staff from collecting proposed target samples, then the location will be adjusted or abandoned. Revise the text to clarify that adjustment of sample locations outside of the 25-foot radius or abandonment of a sampling location must be documented in a field change request and approved by EPA.	Revisions will clarify adjustment outside the 25-foot tolerance or abandonment decisions. The following text will be included in Section 4.2.3.1.1: "If an adjusted sample location falls outside of a 25-foot radius of the planned sample location, or if a sample location is abandoned, the location will be documented in a field change request for EPA approval." Also note that FSP text in Section 8.1.1 Field Decisions and Documentation will be amended to clearly describe the process for making and documenting field changes with EPA approval. That process will require (1) verbal communication with EPA to initially discuss the situation and possible solutions, and (2) written documentation of the change.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
6	1152	Section 4.2.3.1.1 Core Acceptance Criteria and Contingency Plans, pages 4-6 through 4-7	EPA has the following comments on this section and the text should be revised accordingly:		
6a	1153	Section 4.2.3.1.1 Core Acceptance Criteria and Contingency Plans, pages 4-6 through 4-7	The target recovery should be 80 percent, which is consistent with other sites in Portland Harbor. Revise the text as needed.	The following text will be revised in Section 4.2.3.1.1: "The target core recovery is 80 percent."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
6b	1154	Section 4.2.3.1.1 Core Acceptance Criteria and Contingency Plans, pages 4-6 through 4-7	Revise the text to note that, if 80 percent recovery is not achieved, SIB RD Group's representative should contact EPA to discuss potential deviations prior to abandoning a location.	The following text will be included in Section 4.2.3.1.1: "If the target 80-percent recovery is not achieved, SIB RD Group's representative will contact EPA to discuss the potential deviations prior to abandoning the location." Also note that FSP text in Section 8.1.1 Field Decisions and Documentation will be amended to clearly describe the process for making and documenting field changes with EPA approval. That process will require (1) verbal communication with EPA to initially discuss the situation and possible solutions, and (2) written documentation of the change. Also note that FSP text in Section 8.1.1 Field Decisions and Documentation will be amended to clearly describe the process for making and documenting field changes with EPA approval. That process will require (1) verbal communication with EPA to initially discuss the situation and possible solutions, and (2) written documentation of the change.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
6c	1155	Section 4.2.3.1.1 Core Acceptance Criteria and Contingency Plans, pages 4-6 through 4-7	Revise the text to state that the sample attempts should be made within a 25-foot radius of the target location and that deviations outside this area will require approval by EPA.	Section 4.2.3.1.1 of the FSP will be updated to include: "Sample attempts will be made within the 25-foot radius tolerance. For deviations outside the 25-foot tolerance, EPA will be notified by a method accessible to the field crew while on site (e.g., mobile phone followed up with an email). If EPA is not available, field sampling will proceed and deviations from the FSP will be documented in the field logbook." This text will also be included in the PDI. Also note that FSP text in Section 8.1.1 Field Decisions and Documentation will be amended to clearly describe the process for making and documenting field changes with EPA approval. That process will require (1) verbal communication with EPA to initially discuss the situation and possible solutions, and (2) written documentation of the change.	The response is acceptable pending EPA's review of the revised PDI Work Plan.

APPENDIX E (Continued from Previous Page)  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA's Draft Final PDI Work Plan Comments on February 1, 2022	SIB Response on February 17, 2022	EPA's Draft Final PDI Work Plan Comments on April 5, 2022	SIB Response on May 10, 2022
2	1146	Section 4.2 Sediment Sampling, page 4-2	Similar to the rationale provided for chlorobenzene, revise the text to include a robust technical rationale for omitting naphthalene from the analyte list.	Footnote in FSP Section 4.2 was modified to include the statement, "Naphthalene will be analyzed along with other PAHs." Deleted the statement from the footnote in FSP Section 4.2 that indicated naphthalene will be excluded.		
3	1147	Section 4.2.2.2 Surface Sample Collection and Compositing, page 4-5				
4	1148	Section 4.2.4 Sediment Erodibility (SedFlume) Sample Collection, page 4-10				
5	1149	Section 4.2.2.1.1 Power-Grab Sampling, page 4-3				
5a	1150	Section 4.2.2.1.1 Power-Grab Sampling, page 4-3				
5b	1151	Section 4.2.2.1.1 Power-Grab Sampling, page 4-3	Revise this section to reference FSP Section 8.1.1.	Added text to Section 4.2.2.1.1 (Power Grab Sampling) that refers to FSP Section 8.1.1, "Section 8.1.1 of this FSP describes the procedure for requesting EPA approval."		
6	1152	Section 4.2.3.1.1 Core Acceptance Criteria and Contingency Plans, pages 4-6 through 4-7				
6a	1153	Section 4.2.3.1.1 Core Acceptance Criteria and Contingency Plans, pages 4-6 through 4-7				
6b	1154	Section 4.2.3.1.1 Core Acceptance Criteria and Contingency Plans, pages 4-6 through 4-7				
6c	1155	Section 4.2.3.1.1 Core Acceptance Criteria and Contingency Plans, pages 4-6 through 4-7				

APPENDIX E  
EPA Review of Draft Pre-Design Investigation Work Plan  
Response to Comments Matrix  
May 10, 2022

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
6d	1156	Section 4.2.3.1.1 Core Acceptance Criteria and Contingency Plans, pages 4-6 through 4-7	Clarify what is meant by "within +/- 2 ft of target" with regards to penetration depth. The text seems to imply that cores with 8 to 12 feet of penetration bml will be accepted, but it is not clear how the first core acceptance criteria (overlying water is present and the surface is intact) would be met if there is an extra 2 feet of sediment in the 10-foot core tube.	Revisions will clarify that the core tube length is 15 ft per Section 4.2.3.3 that describes Vibracore Sampling using a "15-ft long, 4-inch outer diameter" core tube.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
7	1157	Section 4.2.3.2 Direct-Push Sampling, page 4-9	Clarify whether direct-push sampling will achieve the data quality objectives for RD. At least a 5-foot sample is needed to apply the ROD technology application decision tree, and the PDI Work Plan estimates that a 10-foot core would be needed to vertically delineate impacts. Describe what measures will be taken if direct-push samples are unable to vertically delineate the depth of contamination.	Revisions will clarify: "Direct-Push borings reach target depth of 10 ft using <i>successive</i> 4-ft long core tubes and the acceptance criteria listed in Section 4.2.3.1.1." Please also see Response to Comments #1023, 1024, 1025 for DOC and vertical SMA delineation approach for subsurface core sampling.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
8	1158	Section 4.2.5 Dredge Elutriate Testing, pages 4-10 through 4-11	EPA has the following comments on this section and the text should be revised accordingly:		
8a	1159	Section 4.2.5 Dredge Elutriate Testing, pages 4-10 through 4-11	It is unclear why dredge elutriate testing (DRET) samples will be collected in accordance with Standard Operating Procedure (SOP) A-4 Storm Drain Sampling (Appendix A). Using a grab sample pole fitted with a sample cup or stainless beaker may not provide adequate sediment volume for the required testing and also limits DRET sample collection to surface sediment. This is also inconsistent with Section 4.2.5.3 text which states that: "A second Vibracore will be collected at select locations to perform bulk sediment testing including: waste characterization, DRET, and bench tests for stabilization and handling to support RD." The Vibracore samples should be used for bulk sediment waste characterization and DRET samples instead of the sampling methodology described in SOP A-4.	The referenced SOP is incorrect. The correct SOP is SOP 403.08 Sediment Sampling. Text will be revised to correct this.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
8b	1160	Section 4.2.5 Dredge Elutriate Testing, pages 4-10 through 4-11	Revise the text to clarify how and when the sediment samples for disposal characterization and DRET testing will be collected and analyzed, including details on sample depths, proposed locations, compositing, analysis methods, etc. Locations with highest historical COC concentrations should be targeted for the disposal characterization bulk samples.	Additional detail on collection of sediment samples proposed for disposal characterization and DRET testing will be provided. "Investigation Derived Waste (IDW) will be properly characterized and disposed of by NRC-US ecology who has been performing this task for other RD areas under agreement with Gravity Marine." All data regarding highest concentration areas will be provided to NRC-US ecology for waste segregation and proper disposal, as needed. 2018 sampling efforts followed similar protocols in the highest concentration areas of SIB and none of the IDW generated during the 2018 sample effort was characterized as hazardous waste.	EPA appreciates the additional information regarding IDW disposal. EPA clarifies that the original comment was focused on elutriate testing and dredge material characterization for disposal during remedial action and requests additional detail on the approach for collecting and analyzing samples for elutriate testing and dredge material characterization.
8c	1161	Section 4.2.5 Dredge Elutriate Testing, pages 4-10 through 4-11	Discuss the basis for determining compliance with disposal facility acceptance criteria and confirm that the proposed analytical methods will adequately meet data gaps related to dredged material disposal.	See response to Comment #1160. Disposal facility compliance will be fully met with additional screening by NRC-US ecology if a data gap is identified. In 2018 sampling from the highest SIB concentration areas, further analyses were not needed.	See EPA response to #1160.
8d	1162	Section 4.2.5 Dredge Elutriate Testing, pages 4-10 through 4-11	Specify the ambient water quality criteria to be used for evaluating DRET results and the conventional parameters that will be tested in addition to bulk chemistry. Also indicate the proposed location and volume of surface water sample collection for the DRET slurries.	The ambient water quality criteria for evaluating DRET testing will be the EPA's National Recommended Water Quality Criteria, with the standard being the lower of the aquatic life and the human health-consumption of organism criteria for freshwater systems.  Surface water samples for the DRET slurries will be collocated with the DRET sediment sampling locations. The surface water samples will be composited to provide a single bulk water sample for DRET slurry and treatability testing. Target sample volume will be specified in the revised FSP.	EPA appreciates the response. In addition on comparing DRET results to the EPA National Recommended Water Quality Criteria, where those criteria do not have values, use the following criteria:  • Oregon Administrative Rule (OAR) 340-041-8033 Table 30: Aquatic Life Water Quality Criteria for Toxic Pollutants  • Oak Ridge National Laboratory Toxicological Benchmarks for Screening Potential Contaminants of Concern for Effects on Aquatic Biota: 1996  EPA requests that DRET results be compared to both chronic and acute criteria.
8e	1163	Section 4.2.5 Dredge Elutriate Testing, pages 4-10 through 4-11	Section 4.2.5.2 references Table 2-2 as showing surface water cleanup levels (CULs). Table 2-2 only shows sediment/riverbank soil CULs. DRET samples should be analyzed for all contaminants with surface water and sediment/riverbank soil CULs per ROD Table 17.	Text will be revised to include analysis of contaminants with surface water or sediment/riverbank CULs in ROD Table 17.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
8f	1164	Section 4.2.5 Dredge Elutriate Testing, pages 4-10 through 4-11	In addition to the TCLP chemical analysis, Resource Conservation and Recovery Act (RCRA) waste characteristics of ignitability and corrosivity, and any listed waste, should also be analyzed for the disposal characterization bulk sediment samples. As stated in Remedial Investigation Section 3.2.3.1.1, ship building and repair activities in the area could have led to volatile organic compound (VOC) contamination; generator knowledge should be considered to determine whether F002 waste characterization should be conducted.	These analyses will be added to the analyses proposed for waste characterization and disposal. Text will be revised to state, "Investigation Derived Waste (IDW) will be properly characterized and disposed of by NRC-US ecology who has been performing this task for other RD areas under agreement with Gravity Marine."	EPA appreciates the response and the addition of the analyses. Note, consistent with EPA response to #1160, EPA clarifies that the original comment was focused on dredge material characterization for disposal during remedial action, and not on disposal of IDW.

APPENDIX E (Continued from Previous Page)  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA's Draft Final PDI Work Plan Comments on February 1, 2022	SIB Response on February 17, 2022	EPA's Draft Final PDI Work Plan Comments on April 5, 2022	SIB Response on May 10, 2022
6d	1156	Section 4.2.3.1.1 Core Acceptance Criteria and Contingency Plans, pages 4-6 through 4-7	The text was not revised as indicated by SIB Group's response. Revise the text to clarify that a 15-foot core tube will be used.	Section 4.2.3.1.1 (Core Acceptance Criteria and Contingency Plans) does not specify core length but specifies 80% recovery as a criterion for acceptance. Core length is specified in Section 4.2.3.1 (Sediment Core Collection) of the FSP indicating that 15-foot core tubes will be used. We believe this is the appropriate location for this information, rather than 4.2.3.1.1 (Core Acceptance Criteria and Contingency Plans). This response supercedes the previous response on this comment thread by making the requested revision to the appropriate section.		
7	1157	Section 4.2.3.2 Direct-Push Sampling, page 4-9				
8	1158	Section 4.2.5 Dredge Elutriate Testing, pages 4-10 through 4-11				
8a	1159	Section 4.2.5 Dredge Elutriate Testing, pages 4-10 through 4-11				
8b	1160	Section 4.2.5 Dredge Elutriate Testing, pages 4-10 through 4-11	EPA appreciates the additional information regarding IDW disposal. EPA clarifies that the original comment was focused on elutriate testing and dredge material characterization for disposal during remedial action. Revise this section to define the locations for DRET, provide additional detail on the approach for collecting and analyzing samples for elutriate testing and dredge material characterization, and clarify what water quality criteria will be used to evaluate the results.  Revise Section 4.1 of the PDI Work Plan to be consistent with this section of the FSP.	Added locations of DRET samples to FSP and PDI (grid cells F14, D5, and C20). Added text explaining that the DRET COCs will be tested for all ROD Table 17 Surface Water COCs. Approach for collecting and analyzing samples appears well-described in Sections 4.2.5.1 and 4.2.5.2, and the cited SOP 403.08. Updated text of both FSP and PDI to be consistent.		
8c	1161	Section 4.2.5 Dredge Elutriate Testing, pages 4-10 through 4-11				
8d	1162	Section 4.2.5 Dredge Elutriate Testing, pages 4-10 through 4-11		Comment resolved in FSP Section 4.2.5.2		
8e	1163	Section 4.2.5 Dredge Elutriate Testing, pages 4-10 through 4-11				
8f	1164	Section 4.2.5 Dredge Elutriate Testing, pages 4-10 through 4-11	EPA appreciates the response and the addition of the analyses. Note, consistent with EPA response to #1160, EPA clarifies that the original comment was focused on dredge material characterization for disposal during remedial action, and not on disposal of IDW. Revise the text to include RCRA waste characteristics of ignitability and corrosivity, and add that any listed waste, should also be analyzed for the disposal characterization bulk sediment samples.	Requested text added to the second bullet of Section 4.2.5.1. Revised sentence reads, "Samples of the bulk sediment, as collected and after amendment, will be tested as specified in the Resource Conservation and Recovery Act by the toxicity characteristic leaching procedure and for ignitability, corrosivity, and listed waste to characterize dredged sediments for disposal."		

APPENDIX E  
EPA Review of Draft Pre-Design Investigation Work Plan  
Response to Comments Matrix  
May 10, 2022

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
8g	1165	Section 4.2.5 Dredge Elutriate Testing, pages 4-10 through 4-11	Clarify when and how dewatering and stabilizing amendments will be tested if the applicable disposal suitability and water quality criteria are not met.	If disposal suitability and water quality criteria are not met, then bench-scale testing of amendments will be performed to assess effectiveness at meeting applicable disposal and discharge criteria and support remedial design. Additional detail on bench-scale testing methods and potential amendments will be provided in the revised text.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
8h	1166	Section 4.2.5 Dredge Elutriate Testing, pages 4-10 through 4-11	Provide a description of bench tests for dredged material stabilization and handling of wastes to support remedial design.	Bench-scale testing will include water clarification testing as part of the DRET, paint filter testing to support disposal characterization, slump testing to assess sediment behavior during handling, and testing of different admixtures of sediment and amendments. Additional detail on bench-scale testing methods will be provided in the revised text.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
9	1167	Section 4.3.2 Riverbank Soil Characterization, pages 4-12 through 4-13	EPA has the following comments on this section and the text should be revised accordingly:		
9a	1168	Section 4.3.2 Riverbank Soil Characterization, pages 4-12 through 4-13	A formal plan for riverbank sampling should be provided. This section states that up to 150 samples may be collected (1 from each transect) but does not indicate a planned location. EPA disagrees with a random approach to riverbank characterization to be determined in the field. A plan should be provided that outlines how SIB RD Group riverbank soils throughout the riverbank between the top of bank and MLW will be characterized. See FSP General Comment on Riverbank Sample Locations.	The riverbank characterization will be completed in two phases. The first phase includes a reconnaissance of the entire riverbank within the SIB project area and completion of a bank stability analysis using the BANCS model. The first phase of the proposed riverbank characterization is to visually assess the riverbank for BANCS evaluation and material types. After this visual inspection, HGL will provide a riverbank sampling plan as a Field Sampling Plan Addendum with the data quality objectives and proposed sampling locations. The first phase reconnaissance would be performed at same time as first phase of stormwater evaluation (anticipated for fall 2021). See response to Comment #1146. Sampling methods are described in Section 4.3 of the Field Sampling Plan.	The response is acceptable pending EPA's review of the Draft Stormwater and Riverbank Assessment and Sampling Plan.
9b	1169	Section 4.3.2 Riverbank Soil Characterization, pages 4-12 through 4-13:	EPA expects characterization of riverbank soils for all contaminants listed in RDGC Appendix D Table 1 unless a technical rationale based on the project area CSM can be provided to support the exclusion of certain contaminants listed on Table 1 of the guidance. Revise all applicable sections of the PDI Work Plan and FSP accordingly.	The SAR included a detailed analysis and screening process to identify RPCs. The text will be modified to incorporate the results of that SAR analysis. The RPC screening analysis considered source areas, source control measures, and transport pathways to determine that certain chemicals identified in RDGC Appendix D Table 1 do not pose a risk of recontamination.	See EPA's response in the 9/22/21 EPA Response to Comments Matrix – Early Feedback on Stormwater and Riverbank Responses document.  EPA 9/22/21 comment: The RPC screening analysis of existing surface sediment data is not adequate for determining the analytical suite for sampling of other media such as riverbank soil. EPA expects characterization of riverbank soils for all contaminants listed in the RDGC Appendix D Table 1, unless an evaluation of upland/riverbank sources clearly demonstrates lack of sources of particular contaminants on specific riverbanks that justifies their exclusion from the analytical suite. EPA recommends that during this phase of PDI riverbank characterization all contaminants listed on Table 1 of Appendix D in the RDGC be analyzed.
9c	1170	Section 4.3.2 Riverbank Soil Characterization, pages 4-12 through 4-13:	The text states that, if riprap or other surface obstructions are present at a target riverbank soil sample location, the location will be relocated within 50 feet of the target location. Revise the text to clarify that, if such relocation is not possible, sample abandonment will need approval from EPA through a field change request.	See response to Comment #1168. Completion of the riverbank characterization in two phases should eliminate this situation by ensuring that selected sampling location are all feasible for sample collection. EPA will have the opportunity to review and approve the proposed sample collection locations as part of the PDI addendum that proposes the second phase of the riverbank characterization that will include riverbank soil sample collection.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
10	1171	Section 4.4.2 Exploratory Borings, pages 4-13 through 4-14	EPA has the following comments on this section and the text should be revised accordingly:		
10a	1172	Section 4.4.2 Exploratory Borings, pages 4-13 through 4-14	Explain how mudline elevation at the in-water boring locations will be determined.	Paragraph 1 on page 4-14 will be updated with the following text: "...and in-water borings will be advanced to a termination depth of approximately 50 ft below the mudline. Prior to drilling a weighted line will be used to determine the depth of the mudline relative to the deck of the drill ship. Following drilling the mudline elevation will be estimated based on bathymetric survey data, GPS location data, and the water level at the time of drilling."	EPA appreciates the response and requests use of a lead line and/or fathometer.
10b	1173	Section 4.4.2 Exploratory Borings, pages 4-13 through 4-14	Cite applicable ASTM standard for standard penetration testing.	The following sentence will be added to FSP Section 4.4.2: "Standard penetration tests will be conducted in accordance to ASTM D1586 (ASTM, 2018), with consideration given to ASTM 1587 and 3550."  The following citation will be added to the reference section: <i>ASTM, 2018. D1586, Standard Test Method for Standard Penetration Test (SPT) and Split-Barrel Sampling of Soils, ASTM International, West Conshohocken, PA, at URL www.astm.org.</i>	The response is acceptable pending EPA's review of the revised PDI Work Plan.
10c	1174	Section 4.4.2 Exploratory Borings, pages 4-13 through 4-14	Standard penetration test blow counts should also be logged by the field engineer or geologist in addition to the parameters listed.	Section 4.4.2 will be updated to include "Standard penetration test (SPT) blow counts will be logged in accordance with ASTM D1586."	The response is acceptable pending EPA's review of the revised PDI Work Plan.

APPENDIX E (Continued from Previous Page)  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA's Draft Final PDI Work Plan Comments on February 1, 2022	SIB Response on February 17, 2022	EPA's Draft Final PDI Work Plan Comments on April 5, 2022	SIB Response on May 10, 2022
8g	1165	Section 4.2.5 Dredge Elutriate Testing, pages 4-10 through 4-11	Revise the text to include additional detail on bench-scale testing methods and potential amendments.	Elutriate testing is proposed only to develop information for water quality during dredging. Upland disposal is required by the ROD, so elutriate testing to support in-water disposal is not proposed. No bench scale testing is proposed. This response supercedes previous responses on this comment thread based on the determination that bench scale testing is not needed to support upland disposal.		
8h	1166	Section 4.2.5 Dredge Elutriate Testing, pages 4-10 through 4-11	Revise the text to include additional detail on bench-scale testing methods and potential amendments.	Elutriate testing is proposed only to develop information for water quality during dredging. No bench scale testing is proposed. This response supercedes previous responses on this comment thread based on the determination that bench scale testing is not needed to support upland disposal.		
9	1167	Section 4.3.2 Riverbank Soil Characterization, pages 4-12 through 4-13				
9a	1168	Section 4.3.2 Riverbank Soil Characterization, pages 4-12 through 4-13				
9b	1169	Section 4.3.2 Riverbank Soil Characterization, pages 4-12 through 4-13:	All RDGC Appendix D Table 1 contaminants are included for analysis in the QAPP Tables 19 and 30.1, except chlorobenzene. Chlorobenzene analysis by EPA method 8260 should be added to the riverbank soil analytical schedule unless its omission can be justified with robust technical rationale based on the project area-CSM provided in the forthcoming Phase 2 riverbank field sampling plan.	Chlorobenzene was not detected in surface or subsurface sediment samples from the SIB Project Area. Development of the Phase 2 riverbank field sampling plan will include an evaluation of existing EPA approved soil data for riverbanks, and Chlorobenzene analysis by EPA method 8260 will be evaluated for possible inclusion in the riverbank analytical schedule in the Phase 2 riverbank field sampling plan.		
9c	1170	Section 4.3.2 Riverbank Soil Characterization, pages 4-12 through 4-13:				
10	1171	Section 4.4.2 Exploratory Borings, pages 4-13 through 4-14				
10a	1172	Section 4.4.2 Exploratory Borings, pages 4-13 through 4-14				
10b	1173	Section 4.4.2 Exploratory Borings, pages 4-13 through 4-14				
10c	1174	Section 4.4.2 Exploratory Borings, pages 4-13 through 4-14				

APPENDIX E  
EPA Review of Draft Pre-Design Investigation Work Plan  
Response to Comments Matrix  
May 10, 2022

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
10d	1175	Section 4.4.2 Exploratory Borings, pages 4-13 through 4-14	Explain how the cone penetration testing results will be used to derive engineering properties for geotechnical analyses.	The following text will be added to Section 4.4.3, immediately after paragraph 1: "Existing semi-empirical correlations will be used to estimate geotechnical parameters from the CPT sampling results (cone tip resistance, qc, and "sleeve friction", fs) including but not limited to over consolidation ratio, undrained shear strength, relative density, 1-D compressibility, and Young's and shear moduli."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
11	1176	Section 4.5 Stormwater and Stormwater Solids Sampling, pages 4-15 through 4-21	EPA has the following comments on this section and the text should be revised accordingly:		
11a	1177	Section 4.5 Stormwater and Stormwater Solids Sampling, pages 4-15 through 4-21	Provide the analytical suite for each of the planned sampling methodologies. If the analytes are tabulated elsewhere, provide a reference to that information in Appendix A Section 4.5. EPA recommends that stormwater outfall samples be analyzed for all ROD Table 17 contaminants with surface water CULs, not just recontamination potential chemicals (RPCs).	The purpose of the stormwater sampling focuses on supporting the evaluation of potential recontamination of SIB sediments after implementation of the remedy. The SAR included a screening process to define the RPCs, and the purpose of that analysis was to determine which chemicals have the potential to recontaminate SIB sediments based on source control anticipated future sources, and the connection of transport pathways between those sources and SIB sediments. HGL believes it is appropriate and compliant with applicable guidance and requirements (specifically, instructions for completing the source control sufficiency assessment) to focus on RPCs for the purpose of this study.	See EPA's response in the 9/22/21 EPA Response to Comments Matrix – Early Feedback on Stormwater and Riverbank Responses document.  9/22/21 comment: EPA recommends that stormwater samples are analyzed for all ROD Table 17 contaminants with surface water CULs, unless an evaluation of existing stormwater data and outfall-specific sediment evaluations demonstrate that a particular contaminant is not a concern in stormwater. Limiting the analysis of stormwater samples to RPCs is not recommended for the following reasons: -The CSM describes localized settling of contaminants near outfalls and some of the COCs were screened out in the RPC analysis based on SWACs of the entire lagoon, which doesn't take localized inputs into account; - The RPC approach does not address evaluation of surface water remedial action objectives (i.e., RAOs 3 and 7)
11b	1178	Section 4.5 Stormwater and Stormwater Solids Sampling, pages 4-15 through 4-21	Discuss the proposed investigation of private outfalls. PDI Work Plan Section 3.3 states that, "The status of discharges from some of the private outfalls is unknown and will need to be evaluated as part of the PDI to provide information necessary to complete the SAR." Note which private outfalls are planned to be inspected and the rationale for selecting those outfalls. Clarify what information will be collected as part of this investigation and provide the proposed schedule.	Please see response to Comment #1070.	See EPA's response in the 9/22/21 EPA Response to Comments Matrix – Early Feedback on Stormwater and Riverbank Responses document.
11c	1179	Section 4.5 Stormwater and Stormwater Solids Sampling, pages 4-15 through 4-21	Clarify the sampling locations, media, and approach for the manual grab sample at the public outfalls discharge point (Item 3 on page 4-15).	Please see response to Comment #1072.	The response is acceptable pending EPA's review of the Draft Stormwater and Riverbank Assessment and Sampling Plan. Note that the response to Comment #1072 does not address Comment #1179.
12	1180	Section 4.5.2.1.3 Particulate Phase Concentration, page 4-19	The final bullet suggests that the RPC concentration is in "picograms to proton masses, which is the same as µg/kg". It is not clear from the equation provided where the proton mass unit comes from or how that is equivalent to micrograms per kilogram (µg/kg). Revise the text to clarify.	The text will be revised as follows: "The proton mass is the total particulate phase mass collected from the high vortex sampling during HVS for stormwater and calculated by the analytical laboratory. The proton mass of particles = 1.67E-12 picograms and 1 kg = 1.0E+15 pg. and 1.0E+9 micrograms, which is the same as microgram per kilogram, a more typical measurement of sediment concentrations."	EPA appreciates the response, but it is still not clear to EPA where the value for proton mass of particles of 1.67E-12 pg. is derived or how it is used for this calculation. EPA requests that the text be revised to clarify.
13	1181	Section 4.5.3 Automatic Stormwater Sampling Methodology for Private Outfall, page 4-19	EPA has the following comments on this section and the text should be revised accordingly:		
13a	1182	Section 4.5.3 Automatic Stormwater Sampling Methodology for Private Outfall, page 4-19	Revise the text to clarify that the sampling storm event criteria are as follows: i. Antecedent dry period of at least 24 hours (as defined by less than 0.1 inches over the previous 24 hours ii. Minimum predicted rainfall volume of greater than 0.2 inches per event iii. Expected duration of storm event of at least 3 hours	The text in Section 4.5.3 will be revised as follows: "Stormwater sampling criteria will be consistent with Appendix D of the 2005 ODEQ and EPA Joint Source Control Strategy Guidance: i. Antecedent dry period of at least 24 hours (as defined by less than 0.1 inch over the previous 24 hours ii. Minimum predicted rainfall volume of greater than 0.2 inch per event iii. Expected duration of storm event of at least 3 hours."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
13b	1183	Section 4.5.3 Automatic Stormwater Sampling Methodology for Private Outfall, page 4-19	Provide additional information on how the autosamplers will be used to collect samples. It is not clear if the samples will be grab samples or composite, whether the samplers will be programmed to automatically collect samples at a given flow volume/time or if they will be manually actuated, and if there are specific SOPs for the use of autosamplers.	The text in Section 4.5.3 will be revised as follows: "Autosamplers (e.g., Teledyne ISCO 6712C portable samplers with flow meters) will be used to collect samples from small private conveyance systems to assess whether COCs in stormwater are controlled prior to RA. The samplers will be automatically programmed to collect samples to evaluate COC concentrations discharging to SIB and the need for source control measures. Proposed private facility locations were selected based on the location of discharges relative to SMAs, ROD CUL/RAL exceedances, and/or lack of data adjacent to SMAs." Follow up and provide SOPs for autosamplers included in FSP or reference to LWG FSP.	See EPA's response in the 9/22/21 EPA Response to Comments Matrix – Early Feedback on Stormwater and Riverbank Responses document.  9/22/21 Comment: The samples will be grab samples collected during precipitation events required in the 2005 ODEQ-EPA JSCS Guidance.
14	1184	Section 4.5.4 Manual Grab Stormwater Solids Sampling Methodology, page 4-19	Provide additional information explaining what Teledyne ISCO portable samples are, what types of samples they are intended to collect, and how these data compare to HVS data.	See the response to Comment #1183.	The response is acceptable pending EPA's review of the Draft Stormwater and Riverbank Assessment and Sampling Plan.

 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA's Draft Final PDI Work Plan Comments on February 1, 2022	SIB Response on February 17, 2022	EPA's Draft Final PDI Work Plan Comments on April 5, 2022	SIB Response on May 10, 2022
10d	1175	Section 4.4.2 Exploratory Borings, pages 4-13 through 4-14				
11	1176	Section 4.5 Stormwater and Stormwater Solids Sampling, pages 4-15 through 4-21				
11a	1177	Section 4.5 Stormwater and Stormwater Solids Sampling, pages 4-15 through 4-21				
11b	1178	Section 4.5 Stormwater and Stormwater Solids Sampling, pages 4-15 through 4-21				
11c	1179	Section 4.5 Stormwater and Stormwater Solids Sampling, pages 4-15 through 4-21				
12	1180	Section 4.5.2.1.3 Particulate Phase Concentration, page 4-19				
13	1181	Section 4.5.3 Automatic Stormwater Sampling Methodology for Private Outfall, page 4-19				
13a	1182	Section 4.5.3 Automatic Stormwater Sampling Methodology for Private Outfall, page 4-19				
13b	1183	Section 4.5.3 Automatic Stormwater Sampling Methodology for Private Outfall, page 4-19				
14	1184	Section 4.5.4 Manual Grab Stormwater Solids Sampling Methodology, page 4-19	The text in the first paragraph of section 4.5.3 indicates that time-weighted composite samples will be collected and the text in the third paragraph of section 4.5.3 indicates that flow-weighted composite samples will be collected. Revise the text to clarify whether time-weighted or flow-weighted composites will be collected and how this best services the relevant DQO.	Reference to "flow-weighted" sample was deleted from the third paragraph and replaced with "time-weighted".		

APPENDIX E  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
15	1185	Section 4.5.4 Manual Grab Stormwater Solids Sampling Methodology, page 4-19 and Section 4.5.5 In-Line Sediment Trap Sampling Methodology, page 4-20	Insufficient information is provided to justify sieving the solids and only analyzing the fraction that is less than 2 mm. The size class of solids that is mobile is dependent on site-specific hydraulic conditions, and the assumption that materials greater than 2 millimeters (mm) in diameter are not mobile is not supported by data or site-specific analysis. In-line sediment traps are specifically intended to capture mobile solids, so sieving and only analyzing the fraction that is less than 2 mm is not appropriate. All solids collected should be analyzed.	The last paragraph for each section (Sections 4.5.4 and 4.5.5) will be revised as follows: "The entire sediment trap solids samples will be analyzed."	The response is acceptable pending EPA's review of the Draft Stormwater and Riverbank Assessment and Sampling Plan.
16	1186	Section 4.5.5 In-Line Sediment Trap Sampling Methodology, page 4-20	Clarify the proposed timing for deployment of in-line sediment traps and collection of samples. The timelines described in Section 4.5.5 are not consistent with the timelines proposed in Section 4.3 of the PDI Work Plan.	If access to City conveyance system is granted by the end of September 2021, in-line sediment traps will be deployed in October 2021 before the anticipated first flush event, bottles removed and replaced at the end of January, April and June 2022 for compositing and analyses representing wet season accumulation. The bottles deployed in June 2022 will be deployed until October 2022 before the wet season first flush event and analyses will represent dry weather accumulation. These details will be addressed in the Stormwater addendum.	The response is acceptable pending EPA's review of the Draft Stormwater and Riverbank Assessment and Sampling Plan.
17	1187	Section 4.5.6.3 In-Line Sediment Trap Sampling, page 4-21	Note that all Table 21 contaminants are used to define SMAs (not just focused COCs) and, as such, EPA recommends that analysis of all Table 21 contaminants be prioritized.	The purpose of the stormwater solids sampling focuses on supporting the evaluation of potential recontamination of SIB sediments after implementation of the remedy. The SAR included a screening process to define the RPCs, and the purpose of that analysis was to determine which chemicals have the potential to recontaminate SIB sediments based on source control, anticipated future sources, and the connection of transport pathways between those sources and SIB sediments. HGL believes it is appropriate and compliant with applicable guidance and requirements to focus on RPCs for the purpose of this study.	See EPA's response in the 9/22/21 EPA Response to Comments Matrix – Early Feedback on Stormwater and Riverbank Responses document.  9/22/21 Comment: EPA expects the analyte list for in-line sediment traps to include Table 17 COCs unless an evaluation of upland sources clearly demonstrates lack of sources of particular contaminants to the stormwater conveyance system. EPA understands that sample volume may necessarily limit the analyses that can be conducted and recommends in this circumstance that the Table 21 contaminants are prioritized for analysis.
18	1188	Section 4.9.1 Hand Sampling Tools, page 4-26	EPA recommends that it be noted in the field logbook when field equipment are decontaminated; and subsequent sample locations in which that equipment was used should be noted in the field logbook for tracking purposes.	HGL will revise Section 4.9.2 Hand Sampling Tools, page 4-26 to include the following statement "Field equipment decontamination dates and times will be noted in the logbook."	The response is acceptable pending EPA's review of the revised PDI Work Plan. In addition, EPA notes that if scrubbing and rinsing with Alconox is insufficient to remove visually observable tar/oil-related contamination on sampling equipment, the equipment needs to be scrubbed and rinsed using a solvent rinse until all visual signs of contamination are absent. EPA recommends that if NAPL is encountered and a solvent rinse is conducted, a field equipment wipe blank be collected after decontaminating the equipment and noted in the field logbook for tracking purposes. The wipe blank can be archived frozen for future analysis if cross contamination is suspected.
19	1189	Section 4.9.2 Drilling Equipment, page 4-26	Discuss how drilling equipment will be decontaminated if oily/tar residue is present, similar to the discussion of hand sampling tools. See also Specific Comment on Section 4.9.1 regarding field equipment.	Section 4.9.2 Drilling Equipment will be revised with the addition of a new sub-bullet: "If drilling equipment is contaminated with oily/tar that can not be decontaminated with an Alconox™ detergent rinse, a concentrated Alconox™ rinse will be attempted. If that approach is still unsuccessful, then a fast evaporating distillate of petroleum (such as toluene or xylene) will be used to remove the oily/tar residue. This distillate of petroleum product will not include use of oily paint thinners. Following removal of the oily/tar residue, the equipment will be rinsed with Alconox™ and distilled water to ensure the removal of the petroleum distillate."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
20	1190	Section 5.1 Bathymetry and Topography and Section 5.2 Detection of Existing Buried Utilities and Debris, page 5-1	FSP Sections 5.1 and 5.2 present general guidelines to complete a geophysical survey to identify potential debris as well as coverage, depth, and thickness of sediment types present within the SIB Project Area. However, the text does not provide a work plan for conducting a geophysical survey.  EPA is amenable to the approach to allow the SIB RD Group to work with potential geophysical subcontractors to develop a scope of work to conduct the geophysical survey, as EPA recognizes that preliminary work to determine and resolve several issues related to geophysical surveying prior to designing work such as soil/sediment/water sub-bottom survey, magnetometer survey and side scan sonar, multi-beam bathymetric survey for infrastructure identification, etc. needs to occur. However, EPA expects a geophysical survey work plan that follows EPA's 7 step DQO process to be provided for agency review. EPA requests 45 days of review time for this work plan prior to the scheduled work.	A geophysical survey work plan and quality control plan will be submitted as part of the Final FSP (Appendix A to the Final PDIWP), with the FSP updated to include a summary of the 7 steps for systematic planning using the data quality objectives (DQO) process. Since we are inserting a large work plan after it is developed (significant input from a subcontractor), we cannot quote the text we will insert at this time.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
21	1191	Section 5.3.2 Dive Inspection of In-Water Structures, pages 5-2 through 5-3	Dive inspections should include in-water sheet pile bulkheads and not be limited to over-water structures. Dive inspections should not be limited to a maximum of three over-water or in-water structures if additional inspections can be performed to determine a structure's functional use and its estimated remaining design life.	Section 5.3.2 will be revised to read "Selected in-water and over-water structures will be inspected by a dive team. The structures selected for a dive inspection will be based on the results of the screening-level inspections and preliminary analysis of the impacts of the RA on the structures. An existing structure that exhibits noticeable above-water deterioration that reduces the design capacity and is also negatively impacted by the proposed RA will receive priority for a dive inspection."	EPA recommends top to bottom inspection of structures anticipated to be impacted by remedial action to ensure structure failure is not likely to occur given assumed setbacks (e.g., above water abutment conditions may not necessarily represent underwater conditions).

APPENDIX E (Continued from Previous Page)  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA's Draft Final PDI Work Plan Comments on February 1, 2022	SIB Response on February 17, 2022	EPA's Draft Final PDI Work Plan Comments on April 5, 2022	SIB Response on May 10, 2022
15	1185	Section 4.5.4 Manual Grab Stormwater Solids Sampling Methodology, page 4-19 and Section 4.5.5 In-Line Sediment Trap Sampling Methodology, page 4-20				
16	1186	Section 4.5.5 In-Line Sediment Trap Sampling Methodology, page 4-20				
17	1187	Section 4.5.6.3 In-Line Sediment Trap Sampling, page 4-21				
18	1188	Section 4.9.1 Hand Sampling Tools, page 4-26				
19	1189	Section 4.9.2 Drilling Equipment, page 4-26				
20	1190	Section 5.1 Bathymetry and Topography and Section 5.2 Detection of Existing Buried Utilities and Debris, page 5-1				
21	1191	Section 5.3.2 Dive Inspection of In-Water Structures, pages 5-2 through 5-3	Revise the text to include top to bottom inspection of structures anticipated to be impacted by remedial action to ensure structure failure is not likely to occur given assumed setbacks (e.g., above water abutment conditions may not necessarily represent underwater conditions).	The first paragraph of Section 5.3.2 is revised to read, "Selected in-water and overwater structures will be inspected by a dive team. The structures selected for a dive inspection will be based on the results of the screening-level inspections and preliminary analysis of the impacts of the Remedial Action on the structures. For structures anticipated to be impacted by the Remedial Action, a top to bottom inspection will be conducted."		

APPENDIX E  
EPA Review of Draft Pre-Design Investigation Work Plan  
Response to Comments Matrix  
May 10, 2022

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
22	1192	Section 5.4.1 Current Velocities and Water Levels, page 5-5	The rationale behind the proposed longitudinal and lateral ADCP transects within the SIB project area is not clear. The two longitudinal transects will very likely not show any meaningful trends in currents since the dominant flow direction is oriented in the same direction as the proposed transects. The lateral transects will also not show significant variations in currents due to the relatively small tidal prism of the SIB. Consider eliminating the two longitudinal transects and reduce the number of lateral transects or provide the rationale supporting the selection of transects.	Section 5.4.1 will be updated to include "Lateral transect locations were chosen to measure alongshore currents, and eddying effects, while avoiding active vessel mooring locations. Longitudinal transects were included to capture cross-basin currents which likely occur in some locations due to eddying effects. It is understood that currents are likely quite small within the interior of the basin and demonstrating this is an important element of validating the SIB conceptual site model."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
23	1193	Section 5.4.3 Suspended Sediments, page 5-6	Revise the text to specify how suspended sediment concentrations will be measured. Based on PDI Work Plan Section 4.9, it seems that turbidity will be measured, with presumably a turbidity- total suspended solids (TSS) correlation to be developed and used to convert the continuous turbidity measurements to continuous estimates of TSS. However, turbidity measurements are typically made at a single point in the vertical (in the water column) and therefore cannot be used to characterize the depth-average TSS or the depth integrated suspended sediment flux. Revise the text to clarify the analytical methods proposed (measure turbidity, or acoustic backscatter using the ADCP), the depth intervals proposed to be sampled, and the procedures to be used to estimate TSS time-series.	Section 5.4.3 will be updated to include "A logging Conductivity, Temperature, and Depth (CTD) Sonde equipped with a turbidity sensor will be mounted on the ADCP platforms and oriented such that the sensor portion or the CTD is near the level of the first ADCP data bin or at least near the same distance from the bottom as the ADCP head. The CTD will collect sensor data concurrently with the sampling period of the ADCP. A third CTD will be used to collect water quality profiles that include optical turbidity for at least three (3) ensembles during the current profiling at each bottom mount for through column correlation with backscatter data. CTD profiles will be collected concurrently with water samples. The purpose will be to collect data throughout the water column to provide a vertical variation profile to supplement the near-bottom optical backscatter point sensor (OBS)/turbidity measurements. Note: Due to equipment shortages and availability, an infrared turbidity OBS sensor may be used in place of an optical turbidity CTD.  To assist with data correlation and quality checks, approximately 500 ml to 1,000 ml of water will be collected for laboratory analysis of turbidity and TSS based on the laboratory's requirements. A maximum analysis of up to 10 water samples will be collected following the first deployment of the ADCP platforms, and up to 10 water samples will be collected following the second deployment. A water grab sampler will be used to collect a water sample within the first sample bin (estimated to be approximately 1-meter from bottom) near both ADCP stations during an ensemble recording event. Turbidity from these samples will be recorded on the boat upon recovery using a handheld turbidity meter then processed for transport to a laboratory for testing (turbidity and TSS only). Additional water samples shall be taken at random locations along the proposed ADCP transects following a CTD profile at the close of the transect at an area and depth indicating varying back-scatterance on the ADCP real-time display. Water samples will be analyzed by a contract laboratory for Total Suspended Solids, by EPA Method 160.2. AND SSC analytical method, ASTM D 3977-97, Standard Test Method for Determining Sediment Concentration in Water Samples (ASTM, 1999). Results of laboratory analysis and details of the sample collection will be provided with the report. Laboratory water samples will be collected concurrent to the first deployment and service deployment event only.  Prior to deployment, turbidity sensors will be pre-calibrated using a nominal range concentration turbidity standard for the site. Pre-calibration of the turbidity sensors will be standardized using a 2-point calibration with distilled water and a (TBD) high concentration turbidity standard to set the internal offset and scale of the OBS or alternate turbidity sensor. During the TSS calibration, short-term averages (as provided by logger) will be recorded with the OBS/turbidity sensor in a thoroughly mixed container of site sediment collected within the sediment traps, or those collected using a small grab sampler (back-up) and distilled water. Three to five sediment concentrations, ranging from 1-40g/l will be used to develop a calibration curve. This calibration will likely be represented by a non-linear 2nd or 3rd order polynomial curve with a specific calibration for each sensor. During post processing, the stored data logger values (in NTU, counts or millivolts) will be processed with the developed calibration equations to produce SSC values for each averaged field measurement."	ADCPs typically do not include measurements immediately above the instrument head (the blanking distance for the instrument); therefore, the position of the turbidity sensor should be set such that it is within the first ADCP bin (from bottom) rather than at the level of the ADCP head. Similarly, water samples for TSS/SSC measurements should be collected at the same level as the turbidity measurement and not too far (laterally) from the instrument location.  Additionally, the concentration ranges of 1-40 g/L for the instrument TSS calibration seem too high. Ambient TSS values in the SIB are unlikely to be that high; review and revise the TSS concentration range to be consistent with the ambient TSS range. In addition to the TSS-turbidity curve developed from the laboratory calibration, TSS from the in situ turbidity data can be compared to the TSS measured in water samples as an additional check and validation of the performance of the TSS-turbidity relationship.
24	1194	Section 5.5 Porewater Upwelling Location Survey, page 5-6	EPA has the following comments on this section and the text should be revised accordingly:		
24a	1195	Section 5.5 Porewater Upwelling Location Survey, page 5-6	The period of greatest upwelling identified in this section is July and August which is different from the June and July timeframe identified in PDI Work Plan Section 4.2. Revise the text to address Specific Comment on PDI Work Plan Section 4.2 and resolve the inconsistency between the timeframe suggested in the PDI Work Plan and FSP to ensure that the DQO is met of measurement during the time period of greatest upwelling is met.	The timing of the investigation will be planned during the time of the year when the river surface elevations are dropping, has less tidal fluctuations, and seasonal groundwater levels are elevated. Based on a review of available, historical, 2002 through 2007 groundwater elevations from former monitoring wells at the Portland Shipyard and Willamette River gage data (Morrison Street Bridge station), the river drops in February, March, June and July and groundwater elevations at the Shipyard were highest in February. As a result, the upwelling survey is proposed for February – March 2022.	Please provide response.

APPENDIX E (Continued from Previous Page)  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA's Draft Final PDI Work Plan Comments on February 1, 2022	SIB Response on February 17, 2022	EPA's Draft Final PDI Work Plan Comments on April 5, 2022	SIB Response on May 10, 2022
22	1192	Section 5.4.1 Current Velocities and Water Levels, page 5-5				
23	1193	Section 5.4.3 Suspended Sediments, page 5-6				
24	1194	Section 5.5 Porewater Upwelling Location Survey, page 5-6				
24a	1195	Section 5.5 Porewater Upwelling Location Survey, page 5-6	See EPA response to comment on Section 4.2 Porewater Upwelling Location Survey (comment reference no. 1063).	See HGLs' response to comment reference no. 1063. Text in FSP Section 5.5 was revised to provide additional information about Trident probe measurements, including data collection rate of 15 stations per day, timing of survey period coinciding with neap tide conditions to minimize tidal fluctuations, and subsurface probe depth of 18 inches.		

APPENDIX E  
EPA Review of Draft Pre-Design Investigation Work Plan  
Response to Comments Matrix  
May 10, 2022

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
24b	1196	Section 5.5 Porewater Upwelling Location Survey, page 5-6	The text indicates that a Trident Probe will be used to measure temperature and specific conductance contrast between sediment porewater and overlying surface water. Trident probes can be used to collect porewater samples for chemical analysis and this data is needed for cap design. The PDI Work Plan could be revised to include collection of porewater samples for chemical analysis of ROD Table 17 contaminants. Alternatively, other means of collecting porewater samples should be proposed.	The text will be revised as follows: "The need for porewater analyses will be assessed after the delineation of upwelling zones and may occur as part of remedial design for cap design."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
24c	1197	Section 5.5 Porewater Upwelling Location Survey, page 5-6	Provide a SOP for the Trident Probe sampling with the revised PDI Work Plan for EPA review.	The SOP for the Trident Probe has been added to Appendix A of the FSP.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
24d	1198	Section 5.5 Porewater Upwelling Location Survey, page 5-6	FSP Section 5.5 and Figure 5-5 should be revised consistent with EPA comments on PDI Work Plan Section 4.2.	FSP Section 5.5 and Figure 5-5 will be revised consistent with EPA comments on PDI Work Plan Section 4.2. The text will be revised to read: "Proposed station distances will vary with distance from the shoreline and have been adjusted for the presence of permanent or semi-permanent structures (Figure 5-5). The proposed survey assumes station distances of 50 feet near the shore and 100 feet away from the shore. Specifically, the proposed survey assumes fifteen 800-foot-wide transects across SIB (with up to 10 stations each where no permanent structures are present) and two 400-foot-wide transects at the head of SIB (8 stations) for a total of up to 158 stations."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
25	1199	Section 8.1.1 Field Decisions and Documentation, page 8-1	The following text should be removed: "If the EPA contact or designee cannot be reached in a reasonable time frame, minor modifications to the plan may be made without EPA approval." EPA expects field sampling to be conducted according to an approved WP and FSP. Any deviations from these documents must be reported to EPA via field change requests for review and approval prior to implementing the proposed change. EPA will make every effort to provide prompt communication regarding field deviations.	The following text from Section 8.1.1 Field Decisions and Documentation (page 8-1) has been removed: "If the EPA contact or designee cannot be reached in a reasonable time frame, minor modifications to the plan may be made without EPA approval."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
26	1200	Section 9.5 Laboratory Selection, page 9-3	Add a bullet noting that laboratories with detection limits below Table 17 CULs and/or Table 21 RALs will be selected to the greatest extent practicable.	A bullet has been added to Section 9.5 Laboratory Selection, page 9-3, noting that "laboratories with detection limits below Table 17 CULs and/or Table 21 RALs will be selected to the greatest extent practicable".	The response is acceptable pending EPA's review of the revised PDI Work Plan.
27	1201	Table 2-2 Cleanup Levels for Sediment and Riverbank Soil	Correct the CUL for TCDD to 0.0002 µg/kg.	The CUL for TCDD has been changed to 0.0002 µg/kg on Table 2-2 Cleanup Levels for Sediment and Riverbank Soil.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
28	1202		EPA has the following comments on this section and the text should be revised accordingly:		
28a	1203	Table 4-1 Summary of Sample Activities, Numbers, and Analyses	EPA recommends removing the ASTM reference number in Table 4-1 and instead state ASTM standard number.	Table 4-1 will be updated by removing reference numbers and only stating ASTM standard numbers (e.g. D2216).	The response is acceptable pending EPA's review of the revised PDI Work Plan.
28b	1204	Table 4-1 Summary of Sample Activities, Numbers, and Analyses	ASTM Standards listed for "Sieve and Hydrometer analysis" are incorrect. Verify and cite the applicable ASTM Standards.	The ASTM standard for sieve analysis will be corrected to D6913. The ASTM standard for hydrometer analysis will be corrected to D7928.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
29	1205	Table 4-2	Clarify the significance of the sample nomenclature. It is not clear why all but 2 samples end in "Y".	The "Y" at the end of all but two of the location IDs in Table 4-2 will be removed.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
30	1206	Table 4-2 and Table 4-3	The footnotes states, "The other half and remaining undivided cores will be archived for Phase 2. See FSP for more details." Phase 2 is not mentioned anywhere else in the PDI Work Plan or FSP. Revise this reference and include in the text details regarding Phase 2.	Reference to Phase 2 will be removed from Tables 4-2 and 4-3. The footnote will be revised to state "The other half and remaining undivided cores will be archived for future use."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
31	1207	All FSP Figures	Remove the "Confidential" stamps from the figures.	Figures will be updated to remove 'Confidential' stamps.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
32	1208	Figures 4-3 and 4-4	EPA has the following comments on this section and the text should be revised accordingly:		

APPENDIX E (Continued from Previous Page)

 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA's Draft Final PDI Work Plan Comments on February 1, 2022	SIB Response on February 17, 2022	EPA's Draft Final PDI Work Plan Comments on April 5, 2022	SIB Response on May 10, 2022
24b	1196	Section 5.5 Porewater Upwelling Location Survey, page 5-6				
24c	1197	Section 5.5 Porewater Upwelling Location Survey, page 5-6	Revise the FSP to provide the frequency at which Trident probe measurements will be recorded and clarify whether that frequency will account for daily tidal fluctuations	<p>The following text has been added to the second paragraph of Section 5.5: "The Trident probe measurements are planned to be collected at a rate of 15 stations per day. The Trident probe records temperature and specific conductance measurements every 5 seconds; the reported measurements are the average over a 30-second interval."</p> <p>The following text has been added to the fourth paragraph of Section 5.5: "The survey period was selected to correspond as closely as possible to neap tide conditions when tidal fluctuations are relatively small (~2 ft). The subsurface probe depth was also selected to be at 18 inches, deep enough to be minimally affected by tidal fluctuations."</p>		
24d	1198	Section 5.5 Porewater Upwelling Location Survey, page 5-6				
25	1199	Section 8.1.1 Field Decisions and Documentation, page 8-1

APPENDIX E  
EPA Review of Draft Pre-Design Investigation Work Plan  
Response to Comments Matrix  
May 10, 2022

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
32a	1209	Figures 4-3 and 4-4	As discussed in PDI Work Plan General Comment on Data Sources, only samples from approved data sets should be provided on the data gaps assessment figures. Remove or differentiate all non-approved surface and subsurface locations.	Figures 4-3 and 4-4 will be updated by differentiating non-EPA approved data sources.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
32b	1210	Figures 4-3 and 4-4	The figure legend states that dark green shading means "SMA sample". Define and explain that term in the text.	The legend entry 'SMA Sample' on Figures 4-3 and 4-4 will be changed to "Grid Cell Without Existing Data within SMA". The legend entry "SMA Boundary Sample" will be changed to "Grid Cell Without Existing Data on Border of SMA".	The response is acceptable pending EPA's review of the revised PDI Work Plan.
33	1211	Figure 4-6 Proposed Riverbank Characterization Transects	Add the MLW elevation contour to Figure 4-6 and adjust the sampling transects to include sampling throughout the riverbank between top of bank and MLW.	Figure 4-6 has been updated with the MLW elevation.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
34	1212	Appendix A Standard Operating Procedures, SOP 403.07 Geologic Borehole Logging, Attachment 2, Unified Soil Classification System Table	Verify the correctness of the equation for the Coefficient of Curvature (Cc) and revise if needed.	The existing Attachment 2 of SOP 403.07 will be updated: the equation for Coefficient of Curvature (Cc) will be revised to: " $Cc=(D30)^2 / (D10 \times D60)$ ". A new version of the Standard Operating Procedure (SOP) for Borehole Logging for geotechnical logging, SOP R-4, will be included in the Final FSP for use during logging of geotechnical borings.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
35	1213	Appendix C Waste Management Plan, General Comment:	EPA recommends estimating the quantity of investigation derived waste (IDW) that will be generated because handling/disposal of 55-gallon drums of waste may not be economical. One may consolidate multiple drums into a roll-off bin, then conduct composite sampling. This method proves to be more cost-effective if about 10 or more drums are expected to be generated.	The quantity of generated waste will be estimated and the most cost efficient method for containment will be determined. Appendix C will be updated accordingly. Section 2 of the appendix has been revised as follows: "Additionally, the quantity of general waste will be estimated and the most cost efficient method for containment will be determined."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
36	1214	Appendix C Section 3.0 General Waste Management, 3rd paragraph, page C-7	Plan states that phosphate-free detergent bearing liquid wastes will be sampled/analyzed for site contaminants of concern, then discharged to sanitary sewer system if 'the permit' allows. One would need to coordinate such discharges with the local sewer agency. Revise the text to state who that would be. As a recommendation, one might consider other disposal means or consolidating the liquid waste because the cost of the chemical analysis may be higher than alternative disposal methods. Also, there can be weather-dependent factors for City of Portland publicly owned treatment works discharge limitations that may prevent its use.	Costs for analyses and transport/disposal will be compared to determine the most cost efficient method and the plan will be updated accordingly. The following text update will be made after first sentence: "... will be sampled for site contaminants of concern." New proposed text: "If discharge to a sanitary sewer system is identified as the most cost effective method, the appropriate representative at the sewer system authority will be identified and permission to discharge requested."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
37	1215	Appendix C Section 3.1 Containers and Accumulation, page C-8	EPA has the following comments on this section and the text should be revised accordingly:		
37a	1216	Appendix C Section 3.1 Containers and Accumulation, page C-8	The text states that, "The waste accumulation area is identified as the staging area at the Fred Divine Dock ..." Provide a figure showing this location and determine if accidental waste releases in this area could result in releases to the environment. Also, provide a brief description of the construction of the "secondary containment system" area. Consider, among other factors, if accumulation of rainwater in the containment area could be an issue.	A figure identifying the Fred Divine Dock property lines, drainages, buildings, and secondary containment will be provided. The text will be revised after second sentence: "Figure __ denotes the location of the proposed waste accumulation area." A new sentence will be added to the end of the paragraph as follows: "Also, the waste accumulation area will be constructed with a secondary containment system consisting of a plastic lined area with 2x4s or waddles and/or a pre-constructed system."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
37b	1217	Appendix C Section 3.1 Containers and Accumulation, page C-8	The text states that, "The field crew can use this area to process ..." Revise the text to clarify if this area "will" be used (or not).	The text in Appendix C Section 3.1, 2nd paragraph will be edited as follows "The field crew will use the waste accumulation area to process..... "	The response is acceptable pending EPA's review of the revised PDI Work Plan.
38	1218	Appendix C Section 3.4.5 Nonhazardous Waste Manifest, C-14	It is not typical/required to use a manifest for non-hazardous waste, although records of the quantity and disposal location for the non-hazardous IDW shipments are necessary and required.	The "Nonhazardous Waste Manifest" in Appendix C Section 3.4.5, first sentence and bullets will be revised as follows: "Each load.....be shipped using a Nonhazardous Waste Record. At a minimum, the record will include the required fields, "quantity of waste" and "disposal location".	The response is acceptable pending EPA's review of the revised PDI Work Plan.
39	1219	Appendix C Section 4.0 Documentation, page C-17	EPA has the following comments on this section and the text should be revised accordingly:		
39a	1220	Appendix C Section 4.0 Documentation, page C-17	The text states that "The locations and quantities of soil reused at the site ..." There appears to be no plan to reuse IDW at the site. Clarify whether there is a plan to reuse IDW. If not, remove this sentence.	No IDW will be reused at the site. The sentence beginning with "The locations and quantities of soil reused at the site..." will be removed from Appendix C Section 4.0	The response is acceptable pending EPA's review of the revised PDI Work Plan.
39b	1221	Appendix C Section 4.0 Documentation, page C-17	Provide a copy of all documentation declared in this section to EPA.	The text at the end of Appendix C, Section 4.0 be amended as follows: "Copies of all documentation will be provided to EPA."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
40	2015	Appendix C Section 3.4.1 CERCLA OSR Confirmation, page C-12			

APPENDIX E (Continued from Previous Page)  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA's Draft Final PDI Work Plan Comments on February 1, 2022	SIB Response on February 17, 2022	EPA's Draft Final PDI Work Plan Comments on April 5, 2022	SIB Response on May 10, 2022
32a	1209	Figures 4-3 and 4-4	The figures do not differentiate between EPA approved and non-approved data sources. Clarify whether the non-approved data was removed or revise the figures to indicate which data are not approved.	Non-approved data is not included/shown on figures. A note was added to the figure legends to indicate that only EPA-approved data are shown and list the data sources.		
32b	1210	Figures 4-3 and 4-4				
33	1211	Figure 4-6 Proposed Riverbank Characterization Transects				
34	1212	Appendix A Standard Operating Procedures, SOP 403.07 Geologic Borehole Logging, Attachment 2, Unified Soil Classification System Table				
35	1213	Appendix C Waste Management Plan, General Comment:				
36	1214	Appendix C Section 3.0 General Waste Management, 3rd paragraph, page C-7				
37	1215	Appendix C Section 3.1 Containers and Accumulation, page C-8				
37a	1216	Appendix C Section 3.1 Containers and Accumulation, page C-8				
37b	1217	Appendix C Section 3.1 Containers and Accumulation, page C-8				
38	1218	Appendix C Section 3.4.5 Nonhazardous Waste Manifest, C-14				
39	1219	Appendix C Section 4.0 Documentation, page C-17				
39a	1220	Appendix C Section 4.0 Documentation, page C-17				
39b	1221	Appendix C Section 4.0 Documentation, page C-17				
40	2015	Appendix C Section 3.4.1 CERCLA OSR Confirmation, page C-12	Delete "and submit to the RPM for review, approval, and signature as generator of the waste" from the last sentence of this section. EPA is not the waste generator at the SIB Project Area and the EPA RPM does not need to review, approve, or sign the waste manifest or other support documentation. However, the EPA Region 10 Off-Site Contact must provide an acceptability determination of the receiving facility for any waste, including IDW, to be sent off-site. The EPA RPM should be copied on correspondence with the EPA Region 10 Off-Site Contact.	The requested text was removed. Communication requirements noted for EPA Region 10 Off-Site Contact and EPA RPM.		

APPENDIX E  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
<b>Editorial Comments on the Field Sampling Plan</b>					
1	1222	Section 4.5.4 Manual Grab Stormwater Solids Sampling Methodology, page 4-19	The text states that, "Standing water in the manhole sump, if present, may be pumped off to simplify solids sample collection." For clarity, revise the text to state that standing water will be pumped off.	The text has been revised to indicate that standing water will be pumped off. The following statement has replaced the former sentence "If standing water is present in the manhole sump, it will be pumped off to simplify solids sample collection."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
2	1223	Figure 4-1	The outfall symbols are difficult to distinguish from "Surface Sample Locations (Existing)" symbols. EPA recommends using a different symbol/shape/color for outfalls on the figures.	Figure symbology will be updated accordingly.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
3	1224	Figure 4-3	The color scheme on this figure is difficult to read. Suggest reducing opacity of the following grid colors Existing Surface Sample, SMA Sample, and SMA Boundary Sample. The colors used for Proposed Surface Core Sample Location and Surface Sample Location (Existing) are too similar, which is confusing because purple means both "existing" and "proposed". Revise all other figures with similar color schemes.	The color scheme of Figure 4-3, and other figures with similar color scheme, will be modified to provide more clarity.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
<b>General Comments on Appendix B, the Quality Assurance Project Plan</b>					
Following are EPA's comments on the HydroGeoLogic, Inc. Quality Assurance Project Plan (QAPP), Appendix B of the Draft Pre-Design Investigation Work Plan, prepared by HydroGeoLogic, Inc. on behalf of the Swan Island Basin Remedial Design Group and dated June 2021.					
1	1225	General	The QAPP was reviewed versus the requirements in EPA Requirements for Quality Assurance Project Plan: EPA QA/R-5, March 2001, Reissued May 2006; Guidance for Quality Assurance Project Plans: EPA QA/G-5, December 2002, and the Uniform Federal Policy Quality Assurance Project Plan (UFP-QAPP) manual (EPA 2005) and optimized worksheets (March 2012). Some sections were missing or incomplete, including B10–Data Management [refer to the data management plan in the work plan]; C1–Assessment and Response Actions [missing discussions on the authority and independence of the individual(s) performing the assessments in relation to those being assessed]; and D2–Verification and Validation Methods [missing data validation procedures checklists to be used by the data validator]. Include or expand on these sections in the QAPP, as appropriate. The section on Non-Direct Measurements should identify existing data and data sources, for example, computer databases or literature files, or models that should be accessed and used.	B-10: The following reference to the data management plan has been added to the end of the introductory text for Worksheet #29: "Project documentation, including field data, laboratory data, and electronic files will be maintained in accordance with the project data management plan described in Section 9.0 of the FSP and the Programmatic Data Management Plan (EPA, 2020a)." C-1: The following introductory text has been added to Assessments table of Worksheets #31, #32, and #33: "The planned project assessment activities are described below. In addition to the planned activities listed below, all on-site workers will monitor project activities on an ongoing basis to ensure compliance with project plans, good work practices, and H&S requirements. If a non-conforming or unsafe condition is observed, all site workers have the authority to stop work until the condition is addressed." The following text has been added to the Assessment Response and CA table of Worksheets #31, #32, and #33: "The responsibilities for assessment response and implementing corrective action are described below. In all cases, corrective action will be monitored and assessed by different personnel than those tasked with implementing the corrective action. The project QA Officer, who is independent from the project management and execution team, will have the final authority to determine if corrective action has been satisfactorily implemented, except for H&S corrective action, which is under the final authority of the Corporate H&S Manager." D-2: Example data validation checklists have been provided by the validation subcontractor and have been added to the QAPP as Appendix B. Non-Direct Measurements: References to Section 2.0 of the SAR and Section 2.0 of the PDI Work Plan have been added to Worksheet #13. The referenced sections describe the database and existing site data that were used to develop project data needs and the CSMS.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
2	1226	General	The first references to analysis for total suspended solids (TSS) in the QAPP are in Worksheet #19, Sample Containers, Preservation, and Hold Times and Worksheet #23, Analytical SOP Reference Table. Include TSS in the other analytical worksheets or clarify why TSS analysis is not included on the other worksheets.	TSS is included as a project analysis with the geotechnical parameters listed in Worksheet #12.10; however, the acronym was not defined at this first reference. Worksheet #12.10 has been revised to include "(TSS)" at this first use of total suspended solids.	The response is acceptable pending EPA's review of the revised PDI Work Plan.

APPENDIX E  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
<b>Specific Comments on Appendix B, the Quality Assurance Project Plan</b>					
1	1227	QAPP Worksheet #1 and 2, Title and Approval Page, page 3	Revise the worksheet to include Oregon Department of Environmental Quality (ODEQ) and Yakama Nation as stakeholders on.	ODEQ and the Yakama Nation have been added as stakeholders in Item 7 of Worksheets #1 and #2 (p. 3).	The response is acceptable pending EPA's review of the revised PDI Work Plan.
2	1228	QAPP Worksheet #3 and #5 and Worksheet #9, pages 4 and 19	EPA has the following comments on this section and the text should be revised accordingly:		
2a	1229	QAPP Worksheet #3 and #5 and Worksheet #9, pages 4 and 19	DEQ personnel are listed in the distribution list as a settling party entity but should be listed as a Support Regulatory Agency. For clarification, the title for Wesley Thomas should be listed as Project Manager.	The table has been revised to list ODEQ personnel under the sub-heading of "Support Regulatory Agency". Wesley Thomas's title has been revised to "PM".	The response is acceptable pending EPA's review of the revised PDI Work Plan.
2b	1230	QAPP Worksheet #3 and #5 and Worksheet #9, pages 4 and 19	Yakama Nation Fisheries is erroneously listed as part of the Five Tribes; Yakama is spelled incorrectly (Yakama, not Yakima); and Laura Shira's email address is wrong; revise to: shil@yakamafish-nsn.gov.	Laura Shira's title has been revised to "Yakama Nation Representative" and the spelling of "Yakama" has been corrected in the corresponding Organization and Email Address fields of the table.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
3	1231	QAPP Worksheet #4, 7 and 8, Project Organization and QAPP Distribution, under EPA Regulatory Program, page 4	The QAPP approval page is unsigned. A signature is required for all versions of the QAPP submitted to document review and concurrence of the contents. Include the final signed QAPP approval page in the updated document. Include Josie Clark, EPA, as secondary RPM who can be contacted if Madi Novak is unavailable.	The signature blocks in this worksheet does not indicate approval but indicates that the listed personnel have read and agree to implement this QAPP as written. The final version of the QAPP will include a sign-off from all listed project personnel. Obtaining external signatures requires time and coordination with EPA and other parties, and the effects of this requirement must be accounted in the timeline for delivering the final PDI Work Plan. HGL proposes to complete the revised QAPP at least one week in advance of the final PDI submittal date to allow sufficient time to secure external signatures in time for the delivery date of November 12, 2021.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
4	1232	QAPP Worksheet #10, Conceptual Site Model, pages 20 through 24	Revise the worksheet to summarize or reference a description of the SIB Project Area CSM (in the SAR). As written, it focuses on the harbor wide CSM.	The opening paragraph of Worksheet #10 has been revised to include this text: "The comprehensive refined CSM for the SIB Project Area is presented in Section 2.2 of the PDI Workplan." The following text has been added to Section 10.2 of QAPP Worksheet #10: "The following sections provide an overview of the PHSS. The development history of the SIB Project Area is presented in Section 3.1.3 of the SAR. Site investigation activities at the SIB Project Area were generally conducted as a component of the PHSS-wide investigations described below. Field investigation activities specific to the SIB Project Area are discussed in Section 3.4 of the SAR." A reference to the SAR describing the dredging activities specific to the SIB Project Area has been added to Section 10.2.1 of QAPP Worksheet #10.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
5	1233	QAPP Worksheet #11, Project Data Quality Objectives, Develop the Analytical Approach, page 27	Include a reference to Worksheet #15 in Section 11.5 so the reader can find key analytical approach information such as analytical methods, detection limits, and project action limits (PALs).	The following text has been added at the end of the second paragraph of Section 11.5 of Worksheet #11: "The project analytical methods, including target analytes and the associated laboratory sensitivity limits and the project action limits (PALs), are presented in Worksheet #15."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
6	1234	QAPP Worksheet #11, Project Data Quality Objectives, Specify Performance or Acceptance Criteria, page 27	For projects that involve hypothesis testing (e.g., the presence or absence of contamination exceeding some threshold value) for decision-making, the QAPP needs to specify probability limits for decision errors. For estimations and other analytic approaches (e.g., estimating the volume of groundwater or soil potentially requiring remediation), the QAPP needs to state performance criteria (for new data being collected) or acceptance criteria (for existing data being considered for use). Based on the information presented on Worksheet #11, Section 11.6 (Specify Performance and Acceptance Criteria) and 11's reference to the details in analytical Worksheets #12, 15, 28 and 28, it seems that the estimation approach is planned. Specify whether the estimation approach is planned to be used in the updated QAPP.	The following text has been added to the final paragraph of Worksheet #11, Section 11.6: "The project DQOs have been developed to address an estimation problem and determining the probability limits on decision errors is not required."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
7	1235	QAPP Worksheet #12.1 through 12.9, Measurement Performance Criteria, Sensitivity rows, pages 39-60	The column titled "QC Sample or Measurement Performance Activity" shows the project quantitation limit (PQL) and the column titled "Measurement Performance Criteria" is listed as "Established at or above the low point of calibration curve". The associated footnote #4 says, "This method requirement will only be reviewed to complete definitive (Stage 4) data validation." Since achievement of the remedy will be based on evaluating the data against the selected action levels (e.g., cleanup levels [CULs]), the project's measurement performance criteria should be included on these worksheets. A reference can be made to Worksheet #15s for specific sensitivity requirements.	A row has been added to the MDL DQI for each method table in Worksheet #12 indicating that the Measurement Performance Criteria (MPC) includes performance relative to the associated analyte PALs. For example, text has been added to Worksheet 12.1a stating one of the MPCs for MDLs is: "MDL at or below the analyte-specific PALs listed in Worksheets #15.1, #15.2a and b, and #15.3a and b".  The footnote indicating that this is a Stage 4 QC element has been removed from "MDL" in the second column and added to "Conducted and updated at least annually" in the MPC column (column 3) in order to differentiate this analytical requirement from the project-specific MPC for comparison to PALs, which is applicable to all results regardless of validation level.  "Laboratory MDL determination" has been revised to "MDL" in column 2 of the MPC tables.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
8	1236	QAPP Worksheet #14/16, Project Task and Schedule, pages 64-69	A detailed schedule is included but it focuses on deliverables only and does not include key activities such as data collection and generation of field and analytical data; data assessments and reviews. Include this information in the schedule.	QAPP Worksheet #14/16 will be revised to include details for planned field work. The revised portion of the table showing the PDI Field Efforts will be provided in the revised document.	The response is acceptable pending EPA's review of the revised PDI Work Plan.

APPENDIX E  
EPA Review of Draft Pre-Design Investigation Work Plan  
Response to Comments Matrix  
May 10, 2022

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
9	1237	QAPP Worksheet #15.3B, PALs and Laboratory Specific MDLs/PQLs – PAHs in Water by 8270-SIM, page 75	Seven PAHs (benzo[a]anthracene, benzo[a]pyrene, benzo[b]fluoranthene, benzo[k]fluoranthene, chrysene, dibenz[a,h]anthracene, and indeno[1,2,3-cd]perylene) are focused contaminants of concern (COCs); have PHSS screening levels; they have surface water CULs that are below both ALS-Kelso laboratory method detection limits (MDLs) and PQLs. Note in the revised QAPP if these MDLs/PQLs will achieve the project-specific objectives or if method modifications or other approaches will be applied to improve analytical sensitivities or to evaluate the data. The laboratory should be contacted and the planned approach on achieving the project's quality objective should be included in this section of the QAPP to update the current language.	ALS-Kelso has an ultra-low modification to Method 8270D-SIM that can achieve a PQL of 3.4 ng/L for PAHs. The associated MDLs meet the CULs for all indicated PAHs except benzo[a]pyrene (MDL = 0.41 ng/L, CUL = 0.12 ng/L) and dibenz[a,h]anthracene (MDL = 0.45 ng/L, CUL = 0.12 ng/L). The modified method and the associated sensitivity limits have been incorporated into QAPP Worksheet #15.3b.  Analysis of organics in runoff water will be performed both on grab samples and on samples submitted on polyurethane foam (PUF) filters from metered high volume samplers, which will have improved sensitivity over the grab sample analyses currently presented in the QAPP. The sensitivity limits and associated method/laboratory information associated with analysis of organics on PUF filters will be added to the QAPP.  The following text has been added to the introductory section of Worksheet #15: "In some cases, the laboratory's MDL is greater than the matrix-specific CUL developed for a target analyte, which is indicated in the methods-specific tables by highlighting the affected CUL. In most cases where the laboratory limits do not meet the CULs, analytical method selected to support this project is the most sensitive method commercially available and the sensitivity limits provided by the laboratory are representative of the currently achievable analytical technical capabilities. In other cases, a less sensitive method (such as Method 8082A for PCBs as Aroclors) will be used in conjunction with a more sensitive method. The sensitivity performance for the affected analytes does not meet one of the measurement performance criteria for MDLs (see Worksheet #12) and is a limitation on data usability for comparison to CULs; however the site is fully characterized,  and the analytical results will be of sufficient sensitivity to support RD to address areas of known contamination and the evaluation of recontamination potential from runoff."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
10	1238	QAPP Worksheet #15.8A, PALs and Laboratory Specific MDLs/PQL-Organochlorine Pesticides in Soil/Sediment by Method 1699M, page 90	Dieldrin has a soil/sediment CUL that is below the ALS-Kelso laboratory MDL and PQL. Address as noted in QAPP specific comment number 5.	ALS-Kelso is in the process of updating its Method 1699M GC/MS/MS instruments and the new instrumentation is expected to show improved sensitivity performance. The new instruments are expected to be installed and ready to support analysis before the start of project sampling in January, contingent on supply chain impacts due to COVID. ALS will also explore improving the sensitivity performance of their current instrumentation, as the current MDL of 0.077 ug/kg is close to the CUL of 0.07 ug/kg. This information has been added as a footnote to Worksheet #15.8a. See also response to Comment #1237.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
11	1239	QAPP Worksheet #15.8B, PALs and Laboratory Specific MDLs/PQL-Organochlorine Pesticides in Water by Method 1699M, page 91	The DDX components are both COCs and recontaminant potential chemicals (RPCs); they have surface water CULs that are below the ALS-Kelso laboratory MDLs and PQLs. Address as noted in QAPP specific comment number 5.	The QAPP will be revised to indicate that aqueous OCP samples will be analyzed using HRGC/HRMS at the ALS-Burlington facility. See also response to Comment #1237.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
12	1240	QAPP Worksheet #15.9A, PALs and Laboratory Specific MDLs/PQL-PCDDs/PCDFs in Soil/Sediment by Method 1613B, page 92	Four dioxins listed, including 2,3,7,8-TCDD, 1,2,3,7,8-PeCDD, 2,3,4,7,8-PeCDF, and 1,2,3,4,7,8-HxCDF, are both COCs and RPCs and have soil/sediment CULs that are below the CFA laboratory MDLs. Address as noted in QAPP specific comment number 5.	CFA has provided EDLs that meet the CULs for all target PCDD/PCDF compounds and will report non-detected results as EDL U. These EDLs have been added to Worksheet #15.9a. CFA is in the process of integrating new standards into their calibration that will also lower the PQLs for both water and soil media and expects these lower calibrated ranges will be available before project sampling begins.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
13	1241	QAPP Worksheet #15.10A, PALs and Laboratory Specific MDLs/PQL-Metals in Soil/Sediment by Method 6020B, page 94	Arsenic has a soil/sediment CUL that is below the ARI laboratory MDL and PQL. Address as noted in QAPP specific comment number 5.	The laboratory MDL and PQL for sediments are both below the CUL of 3.0 mg/kg; however, the aqueous MDL and PQL are above the CUL of 0.018 ug/L. ARI has a Method 6020B modification that allows for a 2x or a 5x concentration of samples to improve sensitivity. However, performing this modification requires samples that do not have elevated mineral concentrations. ARI's experience with storm water samples indicates that it is unlikely that this modification will be available, but ARI will evaluate samples that are ND on a sample-specific basis to determine if concentrated analysis is practical. This information has been added as a footnote to QAPP Table 15.10b.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
14	1242	QAPP Worksheet #19 and 30.2, Project Laboratory Identification, page 109	Add the laboratories' certification expiration date.	Laboratory certification expiration dates have been added to Worksheet #19 and 30.2.	The response is acceptable pending EPA's review of the revised PDI Work Plan.

 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
15	1243	QAPP Worksheet #20, Field QC Summary, Introductory text, page 110	The fourth sentence says, "No sampling for volatile constituents is planned and TBs and ambient blanks are not required." Aqueous VOCs are indicated on other QAPP worksheets. For example, on Worksheet #15.1 (page 102), ethylbenzene is listed for surface water samples, and on Worksheet #19 and 30.1 (Continued) (page 104), DRET extracts are listed for VOC analysis. Worksheet #20 also lists VOC quality control trip and field blanks on page 111. Clarify or delete the statement quoted in this comment.	This statement has been deleted from the introductory text for Worksheet #20.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
16	1244	QAPP Worksheet #37, Data Usability Assessment, 2nd paragraph, page 153	Describe the circumstances under which data would be rejected and removed from the final data set; how limitations in the final data set will be documented and communicated to all end data users and stakeholders; and the data usability assessment process that will be used to confirm that the data are usable are adequate to make the site decisions.	The discussion in the second paragraph of Worksheet #37 has been expanded to include the following text: "Data that is rejected during the validation process in accordance with the data qualification conventions (Worksheet #36) will be evaluated against the project DQOs (Worksheet #11) by the HGL Chemistry QA Manager to determine if rejection is the appropriate final decision for the affected data. In addition, the HGL Chemistry QA Manager will evaluate DQI performance to determine whether any data points are of insufficient quality for the intended use, even if the affected results did not require rejection under the validation conventions." The fourth paragraph of Worksheet #37 has been revised to include the following text: "Project deliverables that present analytical data will include a section addressing data quality and any limitations or gaps in the data set that were identified during the data evaluation process and the potential impact on decision-making."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
17	1245	QAPP Appendix A.1, ALS Environmental-Kelso Laboratory Information, pdf page 697	This appendix contains an SOP titled, "Extraction Method for Organotins in Sediment, water and Tissue". This SOP, document ID EXT-OSWT, Rev 12.0, is not listed on Worksheet #23. Add this analytical SOP to Worksheet #23.	SOP EXT-OSWT has been added to the laboratory preparation methods listed in Worksheet #23.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
18	1246	QAPP Appendix A.1, ALS Environmental-Kelso Laboratory Information, pdf page 697	This appendix is missing SOP SVM-8270L, "Semi-Volatile Organic Compounds by GC/MS Low Level Procedure." This SOP is listed on Worksheet #23. Add this analytical SOP to Appendix A.1.	This analytical SOP has been added to Appendix A.1.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
19	1247	QAPP Appendix A.2, Analytical Resources, Inc. (ARI) Laboratory Information, pdf page 1179	The Analytical Resources, Inc. standard operating procedures (SOPs) listed in Worksheet #23 and the laboratory QA Manual are noted as confidential business information and are not included in this Appendix. The fly sheet notes that the documents are available on request from the ARI point of contact listed in Worksheet #3/5. At a minimum, include the title and signature pages of the SOPs in the appendix.	The title and signature pages of the ARI SOPs and laboratory QAM have been added to Appendix A.2; the appendix fly sheet has been revised to indicate the inclusion of this material.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
20	1248	QAPP Appendix A.3, Cape Fear Analytical Laboratory Information, pdf page 1181	This appendix is missing SOP CF-OA-E-001, "Dioxin/Furan/PCB Congener Sample Processing". The Cape Fear affiliated laboratory is GEL; their SOP GL-GC-E-127 titled, "Modified Elutriate Test" is also missing from this Appendix A.3. This SOP is listed on Worksheet #23. Add these analytical SOPs to Appendix A.3. The SOP cover and signature pages can be included for proprietary SOPs.	The requested SOPs will be added to Appendix A.3	The response is acceptable pending EPA's review of the revised PDI Work Plan.
21	1249	QAPP Appendix A.4, Northwest Testing, Inc. Laboratory Information, pdf page 1371	The Northwest Testing Inc. SOPs listed in Worksheet #23 and the laboratory QA Manual are noted as confidential business information and are not included in this Appendix. The fly sheet notes that the documents are available on request from the Northwest Testing point of contact listed in Worksheet #3/5. At a minimum include the title and signature pages of the SOPs in the appendix.	The title and signature pages of the Northwest Testing SOPs and laboratory QAM have been requested for addition to Appendix A.4; the appendix fly sheet has been revised to indicate the inclusion of this material.	The response is acceptable pending EPA's review of the revised PDI Work Plan.

APPENDIX E  
EPA Review of Draft Pre-Design Investigation Work Plan  
Response to Comments Matrix  
May 10, 2022

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
<b>General Comments on the Health and Safety Plan</b>					
Following are EPA's comments on the HydroGeoLogic, Inc. Health and Safety Plan (HASP), Appendix C of the Draft Pre-Design Investigation Work Plan, prepared by HydroGeoLogic, Inc. on behalf of the Swan Island Basin Remedial Design Group and dated June 2021.					
	1250	Introductory Comment	Note that EPA does not approve HASPs but reviews for completeness.		
1	1251	Wildfire Smoke	With more frequent wildfires in Oregon and the West, EPA recommends including a section with wildfire smoke safety protocol in the event of poor air quality from significant airborne PM2.5 or PM10. Procedures could be similar to those promulgated by Cal OSHA, which states that actions such as event delaying, location moving, or face mask/respirator wearing be instituted when certain air quality index (AQI) levels are reached. Also, consider adding wildfire smoke hazards to appropriate AHAs.	The following will be added to Contingency Plans: "Wildfire smoke safety protocol Smoke from wildfires contains chemicals, gases and fine particles that can harm health. The greatest hazard comes from breathing fine particles in the air, which can reduce lung function, worsen asthma and other existing heart and lung conditions, and cause coughing, wheezing and difficulty breathing. Protection from Wildfire Smoke will apply when the current Air Quality Index (AQI) for PM2.5 particulate is 151 or greater ("unhealthy") and when it is reasonably anticipated that employees may be exposed to wildfire smoke. • At the start of each shift and periodically thereafter, as needed, AQI forecasts and current AQI for PM2.5 will be checked at the following websites or using another effective method (telephone, email, text, etc.) from the agencies listed below: o The U.S. EPA AirNow o The U.S. Forest Service o The Interagency Wildland Fire Air Quality Response Program o The local air pollution control district o The local air quality management district If the current AQI is 151 or greater. The following controls will occur: • Implement a system for communicating wildfire smoke hazards • Train employees in the hazards of wildfire smoke and the administrative and personal protection measures. • Implement engineering controls, where feasible, to reduce employee exposure. Examples include providing enclosed structures or vehicles for employees to work in where the air is filtered. • Whenever engineering controls are not feasible or do not reduce employee exposures changes will be made to work procedures or schedules (delay) when practicable. Examples include changing the location where employees work or their work schedules. • Provide proper respiratory protection equipment, such as disposable filtering facepiece respirators (dust masks), other half facepiece respirators, or full facepiece respirators."	The response is acceptable pending EPA's review of the revised PDI Work Plan. Note that there is a new Oregon OSHA temporary rule on wildfire smoke that has been in effect since August 9, 2021.
2	1252	Incident Reporting	Include instructions for the employee reporting of injuries or incidents.	Bullet 8 of the General Site Rules will be revised to state: "Report incidents and significant near misses in accordance with HGL's H&S Procedure 09, Incident Reporting and Investigation."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
3	1253	Dive Plan	The HASP indicates that a dive plan will be submitted by the contractor. The dive plan must be submitted to EPA for review and approval at least 45 days prior to commencement of dive operations.	The text will be revised to state: "Hazards associated with diving in a river (to be addressed by subcontractor Dive Operations Plan. The subcontractor's plan will be submitted to EPA at a minimum 45 days before dive operations begin.)"	The response is acceptable pending EPA's review of the revised PDI Work Plan.
4	1254	Element Compliance	The HASP has been reviewed for compliance with Occupational Safety and Health Administration's (OSHA's) 29 Code of Federal Regulations (CFR) 1910.120(b)(1)(ii) requirements for elements of a HASP.	No response required.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
5	1255	COVID-19	Although COVID-19 protocol is discussed in Appendix G, additional mention and reference should be made elsewhere in the plan – e.g., Section 5.10 Biological Hazards, Section 7.1 Personal Protective Equipment, and/or JHAs. It is currently only referenced in the JHA for Working over Water from Boats and Docks.	Under Hazards of Concern, Other, the text on COVID-19 will be expanded to reference the AHA Coronavirus Practices to Prevent Exposure.  Under Additional Protective Equipment Requirements, Head & Eye, the text will be revised to include "Face masks are to be worn in accordance with the AHA Coronavirus Practices to Prevent Exposure".	The response is acceptable pending EPA's review of the revised PDI Work Plan.
6	1256	Rubber Work Boots	Revise the HASP to include a requirement for rubberized, steel-toed work boots or leather, steel-toed work boots with disposable covers to be worn when working with contaminated sediment, consistent with other Project Areas at PHSS. This requirement reduces the potential for migration of contaminants sediments off the Site.	On page 13 the text pertaining to Boots under Additional PPE Requirements will be revised to include the following:  Boots: Leather steel-toe or composite toe. Disposable covers are to be worn over the boots when working on contaminated sediment.  Rubber: on sediment sampling vessels, shallow water (if waders not required), and whenever working on contaminated sediment. Please see also response to comment #1265.	Revise the text to clarify that disposable covers should only be used for visitors, infrequent staff, etc. and rubber boots should be used for primary field staff.
7	1257	AED	An automated external defibrillator (AED) is required to be onsite, and on vessels and personnel trained in its use before work may start.	A bullet will be added to General Site Rules that states: "An automated external defibrillator (AED) is required to be on site and on vessels whenever work is being conducted. At least 2 personnel on site at any one time will have CPR/AED certification." In addition, Column 4 in the Personnel and Responsibilities Section will be changed from "First Aid" to "First Aid & CPR/AED" and an AED will be included in the list of emergency equipment under Contingency Plans.	The response is acceptable pending EPA's review of the revised PDI Work Plan.

APPENDIX E (Continued from Previous Page)  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA's Draft Final PDI Work Plan Comments on February 1, 2022	SIB Response on February 17, 2022	EPA's Draft Final PDI Work Plan Comments on April 5, 2022	SIB Response on May 10, 2022
	1250	Introductory Comment				
1	1251	Wildfire Smoke	Note that there is a new Oregon OSHA temporary rule on wildfire smoke that has been in effect since August 9, 2021.	The text in HASP Section 13 (Contingency Plans Summarized below:) was updated to be consistent with the regulations from the Oregon temporary rule on wildfires. The following text was added:  "• The SSO will notify field personnel when the ambient air concentration at the work location is at or above the following levels and when it drops below levels requiring protection: o 35.5 µg/m3 (AQI 101); o 150.5 µg/m3 (AQI 201); o 500.4 µg/m3 (AQI 501); and • The following exposure controls will be implemented: o AQI ≥ 101. Control by use of NIOSH-approved respirators that protect from PM2.5 particulates. o AQI ≥ 201. • When engineering and administrative controls cannot reduce hazardous levels, KN-95 or NIOSH approved respirators will be used. o AQI ≥ 501. Stop work until conditions approve. "		
2	1252	Incident Reporting				
3	1253	Dive Plan				
4	1254	Element Compliance				
5	1255	COVID-19	Additional mention and reference to COVID-19 should be made elsewhere in the plan (e.g., Section 5.10 Biological Hazards, Section 7.1 Personal Protective Equipment, and/or JHAs). It is currently only referenced in the JHA for Working over Water from Boats and Docks.	EPA rescinded this comment per email sent from Madi Novak to Shane Cherry dated Wed 2/23/2022: "As I indicated during the meeting, EPA reviewed the discussion of COVID safety practices in the HASP in light of your comments below. EPA rescinds the 2/1/22 responsiveness comment regarding the HASP."		
6	1256	Rubber Work Boots	Revise the text to clarify that disposable covers should only be used for visitors, infrequent staff, etc. and rubber boots should be used for primary field staff.	Text will be added indicating that disposable covers are to be worn only by visitors and infrequent staff and that rubber boots are required for primary field staff.		
7	1257	AED				

APPENDIX E  
EPA Review of Draft Pre-Design Investigation Work Plan  
Response to Comments Matrix  
May 10, 2022

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
8	1258	Medical Surveillance	Clearly indicate whether each of the proposed personnel is required to be in chemical/biological surveillance per 29 CFR 1910.120 based on their accumulated exposure days over the past year.	The following text will be added to the notes for the Personnel and Responsibilities table. "HGL personnel are in a medical surveillance program per 29 CFR 1910.120 regardless of their accumulated exposure days or their frequency of respirator use. If they are involved in hazard waste field-work, noise louder than 85 dBA, respirator use and potential over exposure to other materials as required by OSHA (lead, asbestos, etc.) they are in the annual/biennial medical surveillance program."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
<b>Specific Comments on the Health and Safety Plan</b>					
1	1259	Waste Characteristics, page 4	The statement that "wastes are not anticipated to be hazardous" is misleading. On page 2 it states that there are several chemical groups of interest related to historical releases in the area (e.g., PCBs, DDT, and PAHs), which are known to be hazardous to humans, regardless of their classification by Occupational Safety and Health Administration (OSHA) or its Hazardous Waste Operations and Emergency Response (HAZWOPER) standard. The Contaminants of Interest table beginning page 6 also details the presence of these specific chemicals.	The text under Waste Characterization has been revised according to the Contaminants of Interest list, as follows: Waste Characteristics: Check as many as applicable. ~ Corrosive ~ Flammable ~ Radioactive x Toxic x Volatile ~ Reactive ~ Inert Gas ~ Unknown x Carcinogenic ~ Other Specify: Wastes are not anticipated to be hazardous.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
2	1260	Work Zones, page 4	The text should state whether work zones will be modified based on sampling results or other means as described in Principle Disposal Methods and Practices for Investigation Derived Waste section directly below. Clarify whether work zone needs based on analytical sample data or other rationale.	The text under Work Zones will be revised to include the following statement "Analytical results from contaminant characterization will be used to adjust the need for Work Zones."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
3	1261	Contaminants of Interest, page 8	The ACGIH TLV and OSHA PEL stated for Aldrin appears to be incorrect and should be listed as 0.25 mg/m3 (skin) for both.	The 2021 ACGIH TLV for Aldrin of 0.05 mg/m3 (skin) is correct. The OSHA PEL for Aldrin is 0.25 mg/m3 (skin). The table has been noted to reflect the higher OSHA PEL as well as the TLV.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
4	1262	Stinging Insects, page 11	Instructions should be given for allergic persons to carry an Epi-pen or equivalent if physician directs and alert team to their allergy.	Bullet item 12 of the General Site Rules will be revised to include the following statement: "Field staff with severe allergic reactions to stinging insects shall alert the SSHO and other field staff during the daily Tailgate Safety Meeting and carry an Epi-pen (if prescribed by a physician) with them while on site."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
5	1263	General Site Rules, page 11	Heavy, sudden rains are a factor at the project location and precautions/planning elements should be included in this section. For example, raingear can be critical during overwater activities.	An additional bullet item will be added to the General Site Rules that states: "There is the potential for sudden, heavy rains at the site and field personnel should keep abreast of weather conditions, carry adequate raingear, and be aware of potential shelter locations if conditions should require suspension of activities."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
6	1264	Activity Hazard Analysis, page 12	Answers "Yes" to whether permit-required confined spaces will need to be entered. A confined space program should be referenced and attached that shows project compliance with OSHA's 29 CFR 1910.146 standard.  If confined spaces are to be entered, the subsequent question ("Does the project require specialized training or competent persons for excavations, fall protection, equipment operators, etc.?" ) on the same page should also state that confined space training is required.	The following revisions will be made to the text pertaining to confined space entry. Does the project have permit-required confined spaces that will need to be entered to accomplish the identified project tasks? x Yes ~ No If yes, attach HGL's H&S Procedure 26, Confined Space Entry (Attachment E) which complies with the OSHA General Industry Confined Space Standard, 29 CFR 1910.146 and the OSHA regulation that addresses confined spaces in the construction industry, 29 CFR 1926 Subpart AA. Confined space entry locations will be determined in the field.  The first sentence will be revised to state: "Specialized training will be required for confined space entry, boating, barge, and diving activities."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
7	1265	Additional Personal Protective Equipment Requirements, page 12	Safety glasses should be included as standard field equipment. Rubber safety-toe boots (or other material capable of being decontaminated) should be required for personnel working on sediment sampling vessels in addition to shallow water (if waders not required).	Under Head and Eye, the Other box will be checked and the following specification added: "Safety glasses are needed whenever there is a splash potential."  The requirement for rubber safety boots will be amended to state: "Rubber: on sediment sampling vessels, shallow water (if waders not required), and whenever working on contaminated sediment." See also see response to comment #1264.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
8	1266	Health and Safety Monitoring Equipment and Action Levels, Action Level Guidelines for Photoionization Detector, page 14	Provide the rationale for an action level of ">10 ppm above background in breathing zone".	The following text will be added to the action level guidelines for the Photoionization Detector: "Rationale for >10ppm action level is as follows: Eight of the 11 VOCs of concern have STELS and/or TLVs above 10 ppm. 1,2 dichloroethane has a TLV of 200 ppm and makes up 60% of the total vapor in air concentration."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
9	1267	Health and Safety Monitoring Equipment and Action Levels, Response for Combustible Gas Indicator, page 14	Response discusses use of a photoionization detector (PID) to monitor for VOCs. Is this verbiage in the correct row of the table? It appears instead to correspond to the PID row.	The response will be revised to state: "Monitoring with a Combustible Gas Indicator is required during any confined space entry in accordance with HGL's H&S Procedure 26, Confined Space Entry (Attachment E)."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
10	1268	Health and Safety Monitoring and Action Levels Table, page 14	The text seems to indicate that a combustible gas meter will be used for confined space entries, though the plan did not include guidance language for confined space entries.	Please see response to comment #1264.	The response is acceptable pending EPA's review of the revised PDI Work Plan.

APPENDIX E (Continued from Previous Page)  
 EPA Review of Draft Pre-Design Investigation Work Plan  
 Response to Comments Matrix  
 May 10, 2022

#	Reference No.	Document	EPA's Draft Final PDI Work Plan Comments on February 1, 2022	SIB Response on February 17, 2022	EPA's Draft Final PDI Work Plan Comments on April 5, 2022	SIB Response on May 10, 2022
8	1258	Medical Surveillance				
1	1259	Waste Characteristics, page 4				
2	1260	Work Zones, page 4				
3	1261	Contaminants of Interest, page 8				
4	1262	Stinging Insects, page 11	Instructions should be given for allergic persons to carry an Epi- pen or equivalent if physician directs and alert team to their allergy.	Bullet item 12 of the General Site Rules will be revised to include the following statement: "Field staff with severe allergic reactions to stinging insects shall alert the SSHO and other field staff during the daily Tailgate Safety Meeting and carry an Epi-pen (if prescribed by a physician) with them while on site."

**APPENDIX E**  
**EPA Review of Draft Pre-Design Investigation Work Plan**  
**Response to Comments Matrix**  
**May 10, 2022**

#	Reference No.	Document	EPA Draft PDI Work Plan Comments on August 13, 2021	SIB Response on September 10, 2021	EPA's October 7, 2021 Reply to Suggested Revisions
11	1269	Health and Safety Monitoring and Action Levels Table, page 14	The action levels associated with the use of a dust monitor are not clear and should be revised.	The reference to 10 milligrams per cubic meter (mg/m <sup>3</sup> ) Nuisance dust has been removed from the Action Level Guideline. The action level will be 2 – 2.5 mg/m <sup>3</sup> for visible dust.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
12	1270	AHA Inspections, Surveys, and Sampling from a Watercraft, page 5 of 5	The text should state clearly that a personal flotation device (PFD) is to be worn at all times when working over or near water. The text should also be modified to be more applicable and instructive to the Willamette River.	The text on Page 5 regarding PPE currently states that a Type I or V U.S. Coast Guard-approved PFD is required (when working on or near water). This text will be revised to state "Type I or V U.S. Coast Guard-approved PFDs will be worn at all times whenever working on or near water." In addition, the text pertaining to other PPE (PFDs) under Additional PPE Requirements will be revised to as follows: "Type I (off shore) and V (on shore) personal flotation devices and Waders. To be worn whenever working on or near water."  A flag will be added to this AHA that states: This AHA will be revised and modified daily during the daily Tailgate Safety Meeting to include specific daily weather and river conditions for the portion of the Willamette River where activities will occur."	
13	1271	AHA DPT – Sediment Sampling on Land and Over Water, Slips, trips, and falls Hazard Controls, page 5 of 8	Where it states fall protection is required when exposed to falls greater than 6 feet, this should state 4 feet to comply with the OSHA 29 CFR 1910 General Industry Fall Protection standard.	The text will be revised to state 4 feet.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
<b>Editorial Comments on the Health and Safety Plan</b>					
1	1272		The lack of section numbering makes it difficult to reference or locate specific areas of the HASP. EPA recommends revising the HASP with section numbering for ease of reading.	The HASP has been revised to include numbering for the following Sections: Section 1 General Site Information Section 2 Project-Specific Hazardous Material Summary Section 3 Contaminants of Interest Section 4 General Site Rules Section 5 Activity Hazard Analysis Section 6 Additional PPE Requirements Section 7 Personnel and Responsibilities Section 8 H&E Monitoring Equipment Section 9 Decontamination Procedures Section 10 Hazardous Materials Inventory Section 11 Emergency Contacts Section 12 Medical Emergency Section 13 Contingency Plans Section 14 Health and Safety Plan Approvals	The response is acceptable pending EPA's review of the revised PDI Work Plan.
<b>General Comments on the Emergency Response Plan</b>					
Following are EPA's comments on the HydroGeoLogic, Inc. Emergency Response Plan (ERP), Appendix D of the Draft Pre-Design Investigation Work Plan, prepared by HydroGeoLogic, Inc. on behalf of the Swan Island Basin Remedial Design Group and dated June 2021.					
1	1273	Emergency Medical Treatment and First Aid	The ERP should more clearly state or reference (e.g., HASP instructions) employee instructions for medical treatment or first aid. This is required in an ERP per OSHA's 29 CFR 1910.120(l)(2)(viii).	The following text will be added to Section 1.1 Purpose and Scope: "This plan is to be used in conjunction with HGL's Health and Safety Plan (HASP) for work at the SIB Project Area. Procedures for emergency medical treatment and first aid are specified in the HASP."	The response is acceptable pending EPA's review of the revised PDI Work Plan.
2	1274	Element Compliance	The ERP has been reviewed for compliance with OSHA's 29 CFR 1910.120(l)(2) requirements for elements of an ERP.	No response required.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
<b>Specific Comments on the Emergency Response Plan</b>					
1	1275	Section 1.1 Purpose and Scope, page 1-1	Section states that ERP describes actions necessary in event of personnel injury, however content within speaks to rescue and mitigation operations, but not care steps for an injured employee. This information should be provided or referenced if located in the HASP.	Please see response to Comment #1273.	The response is acceptable pending EPA's review of the revised PDI Work Plan.
