90% REMEDIAL DESIGN CRITERIA REPORT
SWAN ISLAND BASIN PROJECT AREA
PORTLAND HARBOR SUPERFUND SITE
PORTLAND, MULTNOMAH COUNTY, OREGON

1.0 INTRODUCTION

This 90% Remedial Design Criteria Report (DCR) presents the results of the Remedial Design (RD) approach and procedures that will be used to implement the Remedial Action (RA) activities for the Swan Island Basin (SIB) Project Area within the Portland Harbor Superfund Site (PHSS) in Portland, Multnomah County, Oregon. HydroGeoLogic, Inc. (HGL) prepared this DCR on behalf of the SIB RD Group[1] based on the requirements of the PHSS Record of Decision (ROD) (EPA, 2017a) and the Administrative Settlement Agreement and Order on Consent at the Swan Island Basin Project Area (ASAOC) (EPA, 2021a). This DCR includes references to the previously published Pre-Design Investigation (PDI) Evaluation Report (ER), (HGL, 2024a) which was approved by the U.S. Environmental Protection Agency (EPA) in January 2025. References also are made to the Final Sufficiency Assessment Report (SAR) that was submitted to EPA in February 2025 (HGL, 2025a), the Basis of Design Report (BODR) (HGL, 2024b) that was approved by EPA in December 2024, and the Remedial Design Work Plan (RDWP) (HGL, 2025b) that was submitted to and approved by EPA in February 2025.

1.1 PURPOSE AND OBJECTIVES

The purpose and objective of this DCR is to document that the Pre-Final 90% RD meets the requirements of the ASAOC (EPA, 2021a) and the PHSS ROD (EPA, 2017a), including:

- A complete set of certified construction drawings and specifications;
- Updates since the Draft 50% RD either addressing EPA comments and/or refined to reflect the Pre-Final 90% RD details, including:
    - Technical Memoranda: Non-Aqueous Phase Liquid (NAPL), Habitat Impact Evaluation (HIE), Clean Water Act (CWA) Analysis, Cap Design, Dredging Design, Geotechnical Design, Structural Design, and Cost Analysis.
    - Supporting plans: Construction Quality Assurance/Quality Control Plan (CQA/QCP), Waste Designation Memo, Transportation and Off-Site Disposal Plan (TODP), Green Remediation Plan, Institutional Control Implementation and Assurance Plan (ICIAP), Project Area Monitoring Plan (PAMP), and Operation and Maintenance (O&M) Plan, and O&M Manual.
- Additional supporting memoranda: Constructability Assessment and Value Engineering (VE) Study; and
- Updated sufficiency assessment summary table.

[1] Formed under an Administrative Settlement Agreement and Order on Consent to perform the Remedial Design but does not include the Remedial Action.

Per *Remedial Design/Remedial Action Handbook* (EPA, 1995), DCR describes technical parameters used as a basis of design to allow the RA Performing Parties to determine if ROD, applicable or relevant and appropriate requirements (ARARs), and engineering standards and codes are correctly incorporated into site-specific engineering parameters. In accordance with the *Remedial Design/Remedial Action Handbook*, this DCR includes a project description, design requirements and provisions in accordance with ROD Sections 14.2.9 and 14.2.10, and preliminary flow diagrams. Based on the currently proposed design, there are no operation and maintenance provisions with significant influence on the design approach. Any changes to these provisions in the subsequent RD phases will be documented in the O&M Plan and O&M Manual. This DCR also defines the scope and schedule of RA activities, outlines key deliverables, describes the nature of the work to be performed, and identifies major work tasks. These elements will guide the process and work as the design progresses towards the Final 100% RD.

1.2 PROJECT AREA LOCATION AND DESCRIPTION

The SIB Project Area is an active cleanup site located on the northeast side of the Willamette River, spanning approximately 1.1 miles between river miles (RMs) 8.1 and 9.2 (Figure 1-1). This 117-acre area encompasses riverbanks from the top of the bank to the river. A federal navigation channel, with a -45 feet (ft) Columbia River Datum (CRD) authorized depth, exists within the Willamette River and extends from the confluence of the Lower Willamette River with the Columbia River to RM 11.6. The U.S. Army Corps of Engineers (USACE) maintains the navigation channel, which does not extend into the SIB.

As described in Section 2 of the BODR (HGL, 2024b), the SIB Project Area is a roughly rectangular lagoon that is backwatered from the main Willamette River Channel. It is bounded by the uplands of Swan Island to the southwest and Mocks Bottom to the northeast. The entire shoreline was constructed by fill placement and other modifications that occurred over many decades. The Portland Harbor reach of the Willamette River, including the SIB Project Area, has been extensively altered since 1888 (Section 2.1.4 of the BODR; HGL, 2024b). These changes have significantly reshaped the landscape and waterways of the SIB Project Area. Currently, the SIB is an active navigable industrial waterway, and the SIB Project Area hosts light and heavy industrial activities, with limited commercial use. The shoreline supports various industrial structures and activities, reflecting its importance as a hub for industrial operations in the Portland area. This mix of industrial and limited commercial uses characterizes the current state of the SIB Project Area and its immediate surroundings.

Contaminants of concern (COCs) detected above cleanup levels (CULs), remedial action levels (RALs)/practical quantitation limits (PQLs), and/or principal threat waste (PTW) thresholds for the SIB Project Area are described in the PDI ER (HGL, 2024a) and summarized below.

- ROD COCs in sediment included various dioxins/furans, total petroleum hydrocarbons - diesel range hydrocarbons (TPH-Dx), polycyclic aromatic hydrocarbons (PAHs), polychlorinated biphenyls (PCBs), metals, and tributyltin.
- ROD COCs in stormwater samples included PCBs, dioxins/furans, pesticides, PAHs, hexachlorobenzene, metals, and bis(2-ethylhexyl)phthalate (BEHP). COCs in stormwater may also present an important recontamination pathway at the SIB Project Area, as discussed in the SAR (HGL, 2025a).

- ROD COCs in stormwater solids included PCBs, dioxins/furans, pesticides, metals, BEHP, and TPH-Dx. COCs in stormwater solids may also present an important recontamination pathway at the SIB Project Area, as discussed in the SAR (HGL, 2025a).
- ROD COCs present in riverbank soils included PCBs, dioxins/furans, pesticides, metals, BEHP, and TPH-Dx. The extent of riverbank contamination may also present an important recontamination pathway at the SIB Project Area, as discussed in the SAR (HGL, 2025a).

1.3 REPORT ORGANIZATIONAL OVERVIEW

This DCR is organized into the following sections:

- Section 1 presents an introduction, including purpose and objectives, project area location and description, and report organizational overview;
- Section 2 presents the RD project overview, including RD activities completed, additional data and analysis informing RD, permitting, and other regulatory requirements;
- Section 3 provides the SIB RD criteria;
- Section 4 describes the RD Deliverables and Sequencing for the Pre-Final 90% RD and Final 100% RD; and
- Section 5 lists the references cited in this DCR.

This page was intentionally left blank.

2.0 SWAN ISLAND BASIN REMEDIAL DESIGN PROJECT OVERVIEW

This section lists RD activities completed to date, data collections that will be used to inform the RD and permitting, and other regulatory requirements to design and construct the selected remedy.

2.1 REMEDIAL DESIGN ACTIVITIES COMPLETED

This section describes activities conducted and information collected to support the RD for the SIB Project Area. Additional details and results of these activities were documented in the PDI ER (HGL, 2024a), BODR (HGL, 2024b), SAR (HGL, 2025a), and RDWP (HGL, 2025b).

2.1.1 Pre-Design Investigation

The PDI ER, approved by EPA in January 2025, focused on compiling a body of data and analysis to produce a robust, sustainable, and effective remedy for the SIB Project Area. The PDI ER (HGL, 2024a) presented PDI field activities performed to address the existing data gaps and included sediment-related field sampling, porewater upwelling assessment, stormwater and stormwater solids sampling, riverbank evaluation and riverbank soil sampling, bathymetric surveying, geotechnical investigation, structure inspections and condition assessments, utility and debris surveys, hydrodynamics and sediment dynamics surveys, habitat conditions surveys, and facility owner/operator interviews. Each element of the PDI was evaluated to determine whether (1) data gaps previously identified had been adequately addressed and (2) the sufficiency of those results for use in the BODR, SAR, and RD. The evaluation concluded that the data generated during the PDI adequately addressed data gaps and is sufficient to inform the development and evaluation of an RD for the SIB Project Area.

2.1.2 Basis of Design Report

The BODR (HGL, 2024b), approved by EPA in December 2024, refined the conceptual site model, and provided technical underpinnings for the remedial design approach for the SIB Project Area. Considerations included design requirements and performance standards, remedial technology descriptions and considerations for the preferred remedial approach selection, description of the preferred remedial approach, assessment of remediation implementability, and considerations for flood impact, climate change, and habitat impacts. The BODR discussed monitoring and maintenance requirements, an approach to develop conceptual-level quantity and cost analysis, and future design studies and RD sequencing that will be further developed and conducted during the RD. The BODR also provided extensive cap and dredging evaluations that included modeling and design parameters and considerations that will be used as a basis for developing area-specific designs during the RD.

2.1.3 Sufficiency Assessment Report

The SAR (HGL, 2025a) evaluated the upland and in-water pathways to determine whether potential contaminant sources have been adequately investigated and sufficiently controlled so that the RA can proceed with low risk of recontamination. The types of sites identified as potential upland sources of contamination are summarized in Table 2-1. The Final SAR identified the presence of a substantial risk of post-RA recontamination attributable to a combination of sources. The dominant risk of recontamination is the downriver transport of suspended and bedded

sediments containing COCs into the SIB with a notable but much less significant secondary contribution from ongoing stormwater discharges to the SIB. These recontamination risks support the need for EPA and the Oregon Department of Environmental Quality to pursue characterization of uncontrolled sources associated with the identified recontamination pathways followed by implementation of additional source control measures before proceeding with the RA[2].

2.1.4 Remedial Design Work Plan

The RDWP (HGL, 2025b), approved by EPA in February 2025, presented the approach and procedures used to implement the RD activities for the SIB Project Area. It identified plans for implementing RD activities, describes overall management strategy, and proposed a general approach to contracting, construction, operation, maintenance, and monitoring of the RA necessary to implement the RD work. It also described the responsibilities and authority of the organizations and key personnel involved with the development of the RD and describes missing data, upcoming studies, and design phases.

2.2 ADDITIONAL DATA ANALYSES AND EVALUATIONS INFORMING REMEDIAL DESIGN

This section summarizes additional analyses performed, or to be performed, to inform the RD. It also discusses any data insufficiencies, potential problems, and areas requiring clarification.

2.2.1 Sediment Management Area Refinement

EPA's review of the PDI ER prompted additional studies, including archived sediment sample analyses and NAPL testing to support further refinement of the sediment management area (SMA). Section 2.2.1.1 describes archived sediment sample analysis and Section 2.2.1.2 describes NAPL testing that was completed to be responsive to EPA's comments on the PDI ER.

2.2.1.1 Archived Sediment Sample Analysis

In comments on the PDI ER, received from EPA on January 30, 2024 (EPA, 2024), EPA noted that initial PDI sample locations were not analyzed at intervals consistent with identified contamination found at historical cores or in adjacent PDI samples, and as such additional intervals should be taken out of archive and analyzed to accurately bound samples at depth to develop a depth of contamination model and revised SMA boundaries, if applicable. In this comment set, EPA noted a data gap where contaminated intervals may have been omitted and the results of the SMA delineation and associated uncertainty analysis presented in the PDI ER would only be valid if the input data adequately capture the extent of contamination.

Also in this comment set, EPA specified that samples on the Mocks Bottom shoreline, near the head of SIB were only analyzed to a depth of 6 feet (ft) but adjacent cores contained ROD Table

[2] EPA approved the Final SAR on March 28, 2025, with the caveat that the agency does not support the conclusion that additional source control investigation and actions are needed prior to the start of RA. In the comment letter, EPA responded, regarding proceeding with RA, that EPA's assessment is that the deliberately conservative estimates inherent in the SAR must be considered when evaluating recontamination potential. EPA's assessment at this time is that recontamination potential is over-estimated by the SAR, and does not view the SAR results as a reason to delay RD or RA (EPA, 2025a).

21 COCs exceeding RALs/ PTW thresholds to depths between 12 ft and greater than 15 ft. EPA requested, via the comment set, that archived core interval samples located along Mocks Bottom near the head of SIB be analyzed for PCB Aroclors and dioxin/furans (EPA, 2024).

As outlined in field change request form variance number 16 (FCR 16) (HGL, 2024c), a total of 29 samples from the 2022 sediment sampling efforts were retrieved from frozen archive and analyzed for PCB Aroclors and dioxin/furans. No exceedances of RALs/PQLs or PTW thresholds were reported in any of the analyzed samples. The data do not impact the interpolations presented in the PDI ER (HGL, 2024c). Subsequently, there is no change to the SMA boundary for SIB. Further details on the results of the archive sediment sample analysis are provided in Appendix A.

2.2.1.2 Non-Aqueous Phase Liquid Screening

As outlined in the FCR 16, NAPL screening was performed on archived core interval samples where NAPL was observed. The testing was performed to determine the presence of NAPL and, where present, categorically rank the NAPL in accordance with ASTM E3281-21 *Standard Guide for NAPL Mobility and Migration in Sediments – Screening Process to Categorize Samples for Laboratory NAPL Mobility Testing* (ASTM, 2021). Additionally, four archived core interval samples where NAPL was observed were analyzed for ROD Table 21 COCs to support interpretation of the NAPL testing results.

Shake tests were performed on 15 archived sediment core samples. NAPL was not recorded as present in any of the samples. Sheen was observed in 9 of the samples. Following the categorical approach described in ASTM E3281-21 and summarized in FCR 16, the sediment samples are categorized as Category 1 (sample locations with negative shake test results, indicating no sheen or NAPL is present) or Category 2 (sample locations with shake test sheen results, indicating the presence of sheen, but no visible NAPL) because no NAPL layer or blebs were present during the NAPL screen. Based on the screening process described in Step 2 and interpretation of results in Step 3, collection of undisturbed sediment cores for further NAPL mobility testing is not required because the samples were not ranked as Category 3 or 4 (NAPL present). Further details on the results of the NAPL screening are provided in Appendix B.

2.2.2 Habitat Impact Evaluation

This HIE assesses the net effect the RA would have on habitat conditions within the SIB Project Area. The HIE provides the basis for the EPA to determine whether the RA would be "self-mitigating" with respect to impacts to Waters of the U.S. and associated ecological functions. The HIE was conducted to demonstrate that the RA as envisioned in the Draft 50% RD will comply with action-specific or location-specific ARARs pertaining to habitat and ecological functions within the SIB Project Area. The HIE presents the evaluation of the net effect of the RA on habitat conditions by comparing the anticipated post-RA habitat conditions to pre-RA baseline habitat conditions as defined in the PDI ER (HGL, 2024a). Post-RA habitat conditions used in the evaluation reflect the application of required habitat avoidance and minimization measures outlined in the 2021 Programmatic Biological Assessment (BA) (EPA, 2021b), the RDGC (EPA, 2021a), and the PHSS ROD (EPA, 2017a).

The HIE was completed following the guidance in RDGC, in Appendix B Topic 9 – Habitat Mitigation (EPA, 2021a), on how to apply a habitat equivalency analysis (HEA) model approach to perform a quantitative comparison of post-RA habitat conditions to pre-RA baseline habitat conditions. The National Marine Fisheries Service (NMFS) previously prepared a HEA model for the PHSS in cooperation with the Portland Harbor Trustee Council. EPA distributed an updated HEA model template spreadsheet to the SIB RD Team by email on May 20, 2025. The updated HEA model incorporated the time component to ensure that the scoring results consider the temporary functional loss of habitats during RA implementation, and the time required for post-RA habitat conditions to reach full ecological function (0 to 5 years for the habitat types anticipated at the SIB Project Area). The quantitative HEA is the tool EPA uses to evaluate if the RA is "self-mitigating" by comparing pre-RA habitat conditions to post-RA habitat conditions. If the HEA does not confirm that the RA is "self-mitigating," additional compensatory mitigation would be required, and the quantity and type of additional mitigation would be determined by the ecological deficit calculated by the HEA model.

The HEA model reports overall habitat values in units of "Discounted Service Acre Years" (DSAYs), which incorporate consideration of the ecological services provided by specific habitat types, the acreage of habitat that provides those services, and the period over which the services are provided. The results of the baseline habitat condition survey included in the PDI ER (HGL, 2024a) informed the development of inputs to the HEA for pre-RA baseline habitat conditions. Those model inputs include the acreage of habitat units within the SIB Project Area and HEA habitat values for each of those habitat units. Inputs to the HEA model for post-RA habitat conditions were developed based on the Pre-Final 90% RD finished surface conditions superimposed on the map of habitat units. The HEA habitat values for post-RA habitat units were developed using the same approach used for the pre-RA baseline habitat conditions scenario.

Habitat scores based on the HEA methodology were assigned to all habitat areas within the SIB Project Area for a total area of 131.41 acres, which includes both the in-water and riverbank portions of the Project Area. The HEA incorporates changes from pre-RA to post-RA habitat conditions and the variations in habitat score over time related to duration of construction and the time required for post-RA habitats to reach full ecological function (ranges from 0 to 5 years). The HEA score reflecting the post-RA habitat conditions and construction sequence/schedule envisioned by the Pre-Final 90% RD is -36.41 DSAYS.

That HEA result considers the combined effects of RA habitat impacts; impact avoidance, minimization, and mitigation integrated into the RD; and the variability of habitat function over time in response to RA construction duration and the time required for post-RA habitat conditions to reach full function. The negative DSAY score indicates that the remedy as designed is not "self-mitigating" and will require additional compensatory mitigation for impacts to Waters of the U.S. and to Threatened and Endangered Species. The complete HIE Technical Memorandum is included as Appendix C.

The HEA model was used to perform a preliminary evaluation of the habitat impacts and improvements based on the post-RA conditions within the SIB RD as envisioned in the Pre-Fina 90% RD. Design modifications implemented between Pre-Final 90% RD and Final 100% RD may also contribute to improving the HEA score and reducing or eliminating the need for additional compensatory mitigation. If all on-site ecological opportunities are exhausted, and the HEA model

determines there is an ecological deficit, additional compensatory mitigation would be developed either in the form of off-site ecological restoration or through a credit purchase from a mitigation bank.

2.2.3 Flood Impact Evaluation

A flood rise evaluation was performed on the Pre-Final 90% RD to ensure compliance with state regulatory requirements for flood rise management and to be consistent with the Executive Orders for Floodplain Management (Executive Orders 11988 and 13690) and Federal Emergency Management Agency (FEMA) regulations in 44 Code of Federal Regulations (CFR) Part 9 and 44 CFR 60.3(d)(2) and (3). The objective of this evaluation is to ensure the selected remedy does not result in unacceptable flood rise.

Flood impact modeling was conducted using the USACE Hydrologic Engineering Center's River Analysis System (HEC-RAS) and the EPA-approved Corrected Effective Model to evaluate potential flood impact and to demonstrate that the RA in the SIB Project Area does not result in flood rise. Recent changes made to the PHSS HEC-RAS model (CDM Smith, 2024) include:

- Addition of elevation transects to the Existing Conditions Model to capture proposed changes to channel bathymetry as a result of fill in the PHSS remedial areas;
- Calibration of the updated Existing Conditions Model, including assignment of Manning's roughness coefficients and assignment of ineffective flow areas (including SIB); and
- Development of an initial Conservative Future Conditions Model to evaluate potential flood impacts resulting from the combination of all PHSS RAs.

The initial Conservative Future Conditions Model assumed that 3 ft of fill would be applied on current grade to all nearshore SMAs as shown in the ROD, to represent a potential worst-case scenario. From the results of the initial conservative future condition simulations, the updated PHSS Existing and Conservative Future Conditions Model (CDM Smith, 2024) concludes, "*The water surface elevations predicted from this model have a maximum rise of 0.017-feet which is not a cause for concern based on the assumptions included in the simplified conservative future conditions case model.*"

The updated Portland Harbor Existing Conditions Model was used to demonstrate that the proposed RA in SIB is not likely to cause unacceptable flood rise based on the anticipated SIB post-construction elevations. The results of the flood rise analysis are presented as Attachment B of the Riverbank Design Technical Memorandum (RDTM; Appendix D).

2.2.4 Climate Change Impact Assessment

Climate change analysis was performed to confirm resiliency of the cap erosion protection layer to future conditions. The climate change analysis included river conditions and outfall flows. Climate change scenarios for other processes such as winds/wind-waves have not been developed in the industry. Therefore, resiliency of riverbank protection or other cap areas where these processes govern design was ensured through conservatism in the Pre-Final 90% RD, including

use of 100-year return period conditions, and conservative (large) material sizes for bank protection.

Analysis of future river conditions was performed using the U.S. Geological Survey (USGS) Climate Change Model. The USGS model (Delft3D) spans the Pacific Ocean to Oregon City on the Willamette River, and Bonneville Dam on the Columbia River. This model was used to develop boundary conditions for the SIB-nested Delft3D 4 structured hydrodynamic model used during the cap evaluation (Appendix A of RDWP; HGL, 2025b), which provides high resolution hydrodynamics at the SIB. The river discharge inputs from the USGS model were extracted and applied to the SIB-nested Delft3D 4 structured hydrodynamic model. The water levels at the downstream boundary of the nested Delft3D 4 structured hydrodynamic model were taken from the water levels in the USGS model, which predicted how sea level rise affects the Willamette River, both excluding and including higher future river discharges. Modeling included a complete range of scenarios, in terms of higher and lower water levels, as well as current velocities. The modeling scenarios included variants of the following input conditions:

- Pacific Ocean water levels: Typical present-day Pacific Ocean tidal conditions (zero sea level rise), as well as sea level rise of 0.25 meter and 1.0 meter (USACE scenarios included in the USGS model approved by EPA); and
- River discharges: Discharges ranging from zero (pure tidal conditions) to 100-year discharges, for both present-day conditions and future conditions.

The analysis captured the complete range of bed shear stresses resulting from river conditions to ensure that maximum bed shear stresses over cap areas were included in the Pre-Final 90% RD. From each simulation, a maximum bed shear stress map was computed for SIB. The maximum bed shear stress maps were combined to create a map of maximum bed shear stresses from any simulation, which was used to ensure that the erosion protection layer design for caps will be resilient to climate change. These maps are included as figures in the Cap Design Technical Memorandum (CDTM, Appendix E).

Analysis of future City outfall discharge conditions was performed using the Personal Computer Storm Water Management Model (PCSWMM) and Computational Fluid Dynamics (CFD) model (FLOW3D) used in the preliminary cap stability analysis as part of the cap evaluation. The analysis included refinement of the rainfall inputs to the PCSWMM model and use of higher flows to account for future increase in rainfall intensity as input to the CFD model. Conservative water level conditions were used in the outfall CFD modeling (e.g., extreme low water) to ensure cap resiliency under a full range of reasonably anticipated future conditions. Results of the modeling consisted of maximum bed velocity maps that were used to design scour protection around the City outfalls. These maps are included in a figure in the CDTM (Appendix E).

Following analysis of all maximum velocity/bed shear stress calculations for each physical process, the maximum velocity/bed shear stress map computed during the cap evaluation was updated, resulting in a climate-resilient and complete erosion protection design criteria map in the Pre-Final 90% RD. Design criteria for the cap, including climate change effects, are described in the CDTM (Appendix E).

2.2.5 Lagoon Wharf Supplemental Remedial Design

During development of the RD, the SIB RD Team determined that RAOs cannot be achieved with the existing Lagoon Wharf structure in place. Geotechnical issues related to the riverbank (global and local slope stability, liquefaction, and lateral spreading) require a larger solution than modifying or shoring up the existing structure.

- The global stability of the riverbank beneath the existing structure does not meet project design requirements, as the safety factor is well below the required level.
- Similarly, the local stability of the ground beneath the existing structure falls short of project design requirements. Modifying the material beneath the structure—whether adding or removing and replacing—does not result in a stable slope that satisfies design requirements.
- Additionally, the present riverbank configuration fails to meet seismic design standards, and both soil liquefaction and movement towards the water are likely during an earthquake. The existing structure lacks sufficient capacity to withstand these forces.

To mitigate the geotechnical issues while implementing the remedy, the area will require ground improvements and new structures that can stabilize this area.

Upon determining that the Lagoon Wharf needed to be removed and replaced, the facility operator (Vigor) hired their own engineering firm (KPFF) to review the RD Team's findings. This firm's role was expanded to create a cost-effective wharf design that minimizes short- and long-term effects on operations due to implementing the remedy, which requires removing and replacing the existing structure. As KPFF continues design of the replacement wharf structure, the SIB RD team is developing the remedy for the riverbank area beneath the redesigned wharf.

There are two conceptual designs for the Lagoon Wharf replacement structure, one results in a bulkhead wharf and the other a pile supported wharf. Both conceptual designs for the replacement wharf include deep soil mixing and subsequent use of excess deep soil mixing-produced material as backfill in the footprint of the new wharf structure. Additionally, as described in the PDI ER (HGL, 2024a), ROD COCs in riverbank samples collected from beneath Lagoon Wharf are present at concentrations exceeding CULs, RALs, and PTW thresholds. As a supplement to this Pre-Final 90% RD, the RD Team is preparing a technical memorandum that provides the framework for designing deep soil mixing as an effective in situ treatment technology for the range of COCs and concentrations in this location as well as the use of excess deep soil mixing-produced material as environmentally suitable backfill material. The technical memorandum will also provide the details of the riverbank remedy in this location for each conceptual design (e.g., chemical isolation and revetment under pile supported wharf or encapsulation behind bulkhead wharf).

2.3 PERMITTING AND OTHER REGULATORY REQUIREMENTS

CERCLA states that “no federal, state or local permit shall be required for the portion of any removal or remedial action conducted entirely on-site” (42 U.S.C. 9621 (e)). While permits may not be required on-site, proposed remedial activities must nevertheless demonstrate permit equivalency for ARARs identified by EPA. In this case, EPA is the lead agency and is responsible for consulting with Tribes and regulatory stakeholders through the permit equivalency process.

The consultation process enables the agency, Tribes, and stakeholders to review and consider proposals to achieve substantive and demonstrable compliance, consistent with regulatory requirements identified as ARARs.

As discussed in BODR Section 3.2, ARARs are standards set by federal or state environmental laws or facility siting regulations. These requirements must be met during an RA, unless the EPA grants a waiver for a specific ARAR. To Be Considered (TBC) items include advisories, criteria, or guidance developed by the EPA, other federal agencies, or states that may be useful in developing CERCLA remedies (EPA, 2016). TBCs summarized in the RDWP (HGL, 2025b) included EPA Regional Screening Levels (RSLs) for tap water established at a 10^{-6} risk level and Executive Orders on floodplain management and protection of wetlands. ARARs, TBCs, and other standards and requirements are summarized in Tables 25a-c in Appendix II of the ROD (EPA, 2017a) and the application of those to the SIB Project Area are summarized in Table 3-1 of the RDWP (HGL, 2025b). The ROD considers chemical-, location-, and action- specific ARARs and identifies the following 10 key ARARs for the remedy:

1. National Recommended Water Quality Criteria, if more stringent than a promulgated State of Oregon numeric water quality standard, are the required cleanup standards for surface water and groundwater that discharges to the river; they are action-specific standards for minimizing discharges of contaminants during RA construction.
2. Oregon WQSs contain promulgated numeric and narrative water quality standards that protect the designated uses of the river. Relevant numeric standards are CUL for surface water and groundwater discharging to the river. Numeric and narrative water quality standards are action-specific ARARs intended to minimize discharges of contaminants during RA construction.
3. Maximum contaminant levels (MCL) and non-zero maximum contaminant level goals (MCLG) established under the authority of the Safe Drinking Water Act are required CULs for surface water and groundwater discharging to the river. These ARARs are action-specific standards for minimizing discharges of contaminants during RA construction.
4. Oregon Hazardous Substance Remedial Action rules determined the cleanup standards for hazardous substances by establishing acceptable cancer risk levels for human health at $1x10^{-6}$ for individual carcinogens, $1x10^{-5}$ for multiple carcinogens, and an hazard index of 1 for noncarcinogens. These are chemical-specific ARARs.
5. Federal and state solid and hazardous waste regulations such as the Resource Conservation and Recovery Act (RCRA), including land disposal regulations and Toxic Substances Control Act, are action-specific ARARs. They establish standards and best practices for handling, characterizing, treating, storing, transporting, and disposing of dredged sediment off site.
6. The Endangered Species Act (ESA) is an ARAR because listed species migrate through and use the Site, and the Site contains designated critical habitat for such species. Accordingly, the ESA requires reasonable and prudent measures to minimize adverse effects resulting from implementation of the remedy, including the time of year and the duration and extent of in-river work.

7. Section 404 of the CWA is an ARAR because the discharge of dredged or fill material to Waters of the United States during RA construction requires that the remedy avoid or minimize impacts to the aquatic environment and that it mitigate unavoidable impacts.
8. Section 401 of the CWA is an ARAR because remedial activities that displace contaminated sediment cannot entirely avoid releasing contamination to Waters of the United States. Reasonable assurances are required that remedial activity will not violate applicable water quality standards.
9. Section 10 of the Rivers and Harbors Act is an ARAR because it prohibits the creation of any obstruction to the navigable capacity of any waters of the United States, unless affirmatively authorized by Congress.
10. FEMA floodplain regulations are ARARs because they prohibit encroachments that would result in any increase in flood levels during base flood discharge, and they require measures to reduce the risk of flood loss, minimize the impact of floods, and restore and preserve the natural and beneficial values of floodplains.

The sections that follow discuss how the ARARs and TBCs have been incorporated into the RD to ensure substantive compliance with chemical-, location-, and action-specific requirements. Additional discussion is provided for consideration of ARARs related to the CWA Analysis and anticipated permits and access agreements.

2.3.1 Substantive Compliance with Applicable or Relevant and Appropriate Requirements and To Be Considered Items

This section discusses how the RD provides substantive compliance with chemical-, location-, and action-specific ARARs and TBCs. Table 2-2 provides a crosswalk that details which Pre-Final 90% RD components address compliance with ARARs and a general description of how compliance measures are addressed.

2.3.1.1 Compliance with Chemical-Specific ARARs and TBCs

The purpose of the RD/RA effort is to address and mitigate risks to human health and the environment posed by on-site contamination. The ROD documents that CULs were developed in consideration of chemicals-specific ARARs and TBCs, and attainment of CULs over time will achieve compliance with these ARARs and TBCs. Remedial activities at the PHSS will be monitored throughout the RA construction in accordance with the CQA/QCP and post-RA in accordance with the PAMP to track attainment of CULs and thereby document compliance with chemical-specific ARARs and TBCs. Chemical-specific ARARs and TBCs will be achieved at the SIB Project Area over time by implementing a combination of dredging, capping, enhanced natural recovery (ENR), and monitored natural recovery (MNR).

Chemical-specific ARARs and TBCs establish criteria that protects existing and attainable uses of the receiving waters, including identifying Remedial Action Objectives (RAO) and setting standards for the degree of cleanup required for hazardous substances. For COCs in surface water and groundwater, Oregon's numeric water quality standards are applicable as cleanup standards only if they are more stringent than CWA 304(a) recommended criteria; otherwise, the relevant

and appropriate 304(a) criteria are the cleanup standard. As stated in Section 12.2 of the ROD (EPA, 2017a), the ability to meet surface water quality ARARs for some COCs will be limited to the extent that all sources of surface water contamination can be addressed.

The ROD identifies the following chemical-specific ARARs and TBCs to protect surface water, drinking water, and human health and the environment:

- CWA, 33 U.S.C. 1313 and 1314 (Sections 303 and 304); 304{a) list of recommended water quality criteria.
- Safe Drinking Water Act, 42 U.S.C. 300f, 40 CFR Part 141, Subpart 0, App. A. 40 CFR Part 143.
- EPA RSLs for Groundwater, Office of Superfund Remediation and Technology Innovation, Assessment and Remediation Division (November 2015).
- Oregon Environmental Cleanup Law ORS 465.315(b){A) and Oregon Hazardous Substance Remedial Action Rules OAR 340- 122-0040(2)(a) and (c), 0115(2-4).
- Water Pollution Control Act ORS 468B.048 and state-wide numeric water quality criteria set forth in OAR Part 340, Division 41, including, Toxic Substances criterion at OAR Part 340-41-0033 (Tables 30 and 40), and Designated Uses for the Willamette Basin and Numeric Water Quality Criteria specified for the Willamette Basin at OAR 340-041-340 and 340-041-0345.

2.3.1.2 Compliance with Location-Specific ARARs

Location-specific ARARs are evaluated and addressed during design and implementation of the remedy. The following key location-specific ARARs are applicable to RD components at the SIB Project Area:

- ESA and Essential Fish Habitat (EFH) – The remedy will meet the substantive requirements of these ARARs during design, construction, and long-term monitoring. To ensure compliance with ESA and EFH requirements, the RD incorporates habitat avoidance and minimization measures outlined in the 2021 Programmatic BA (EPA, 2021b), the applicable guidelines in the RDGC (EPA, 2021a), and the relevant requirements of the PHSS ROD (EPA, 2017a). In addition, all in-river construction will be coordinated with EPA around fish windows.
- Federal Emergency Management Act – Although not legislated law, federal projects must demonstrate compliance with Executive Order 11988 (Management of Floodplains), as amended by Executive Orders 13690 and 11990 (Protection of Wetlands). FEMA regulations in 44 CFR Part 9 set forth the responsibilities to implement and enforce these executive orders. FEMA regulations found at 44 CFR 60.3(d)(2) and (3) prohibit encroachments that would result in any increase in flood levels during base flood discharge. Section 2.2.3 describes the flood impact evaluation that was performed using the Pre-Final 90% RD details. The objective of the evaluation is to ensure the remedy does not result in unacceptable flood rise, indicating that all substantive requirements of this ARAR will be met during implementation of the remedy.

- Native American Protected Objects and Graves Protection Preparation – During the RI, a cultural resource analysis concluded that Native American archeological artifacts possibly occur at the PHSS, but no gravesites were noted. The remedy will meet the substantive requirements of this ARAR during implementation through coordination and consultation with the Tribes as outlined in a Project Area-specific Archaeological Inadvertent Discovery Plan (AIDP) that will be a required submittal for the RA Contractor as part of the CQA/QCP. If Native American cultural items or gravesites are observed during excavation and other remedial activities at the SIB Project Area, an inventory of such items will be compiled, and following notice and consultation, the items will be returned to the Tribes. If cairn, burial, human remains, funerary objects, or other sacred objects are removed, re-interment will occur under the supervision of the appropriate Tribe. Any proposed excavation by a professional archaeologist of a Native American cairn or burial will require written notification to the State Historic Preservation Office (SHPO)and consultation with the appropriate Tribe. The CQA/QCP (Appendix N, Volume II) includes an example AIDP as an example plan to guide the RA Contractor in developing a Project Area-specific AIDP for the RA to ensure compliance with the substantive requirements of this ARAR. As appropriate, the substantive requirements of this ARAR will be met through development and implementation of the AIDP.
- National Historic Preservation Act (NHPA) and Archaeological Objects and Sites – There are no known historic properties, structures, or objects included in or eligible for the National Register of Historic Places within the SIB Project Area. If there are no eligible properties, structures, or objects within the SIB Project Area the substantive requirements of this ARAR will be met during design and implementation of the remedy. NHPA also protects artifacts, records, and material remains related to a property. The Project Area-specific AIDP for the RA to be prepared by the RA Contractor will guide the process for addressing any cultural resources or other archeological objects discovered during construction. If cultural resources or other archeological objects are discovered that are listed or are eligible for listing on the national register or under state law, it will be necessary to consult with Tribal Historic Preservation Officers (THPO) and the State Historic Preservation Office (SHPO). The SHPO can determine if NHPA applies and can assist in determining if state laws apply under the Oregon Archaeological Objects and Sites requirements.

2.3.1.3 Compliance with Action-Specific ARARs

Action-specific ARARs will be addressed during design, implementation, and as appropriate, as part of long-term monitoring. The ROD identifies the following action-specific ARARs:

- Rivers and Harbors Act – The Rivers and Harbors Act of 1899, Section 10, 33 U.S.C. Section 403 and implementing regulations at 33 CFR Sections 322, 323, and 329 are applicable requirements because work will be conducted in navigable waters of the U.S. This action-specific ARAR will inform development of institutional controls as described in the ICIAP and will guide construction operations in the navigation channel, including placement of pilings and discharge of dredged material that may impair the flow or circulation of waters or the reach of such waters. Remedial actions taken or constructed in the navigation channel cannot interfere permanently with navigational capacity of the river. Contaminated sediments

in the navigation channel must be removed, and a residuals management layer will be placed over the dredged area in a way that does not. interfere with or alter the current navigation depth in the Site area. The SIB Project Area is located outside the federal navigation channel. The federal navigation channel in the Willamette River has an authorized channel depth of -45 ft CRD. While no part of the SIB Project Area extends into the federal navigation channel, RA implementation in SIB will be conducted immediately adjacent to the authorized channel and within the required 50 ft lateral boundary. Contamination at depths greater than the authorized depth of the navigation channel may be capped, and those caps will be constructed below the authorized depth of dredging. This approach will not interfere with future dredging and will be designed to provide an over dredge allowance or buffer zone, as necessary, to protect the remedy from future dredge activities.

- RCRA, Oregon Hazardous Waste and Hazardous Materials, and Toxic Substances Control Act – The substantive requirements of these ARARs will be met through development and implementation of the Waste Designation Memorandum (Appendix F) the TODP (Appendix O, Volume II), and waste-related specifications (Volume III of Pre-Final 90% RD).

  Oregon's hazardous waste and materials regulations are ARARs for the generation, storage, handling, treatment, and disposal of hazardous waste on site and those wastes slated for off-site disposal. Oregon has adopted and incorporates by reference the federal RCRA hazardous waste management program. Any dredged material that will be disposed of in an off-site disposal facility must comply with these standards.

  - General Emissions Standards and Fugitive Emission Requirements – The substantive requirements of these ARARs will be met through implementation of the CQA/QCP (Appendix N, Volume II) and subsequent development of the Air Pollution, Noise, and Light Plan as part of updates to the CQA/QCP to be completed by the RA Contractor. Reasonable precaution to control fugitive emission of air contaminants will be taken in accordance with Oregon regulation OAR 340-226. In addition, emission of airborne particulate matter will be controlled to address OAR 340-208. Dust suppression will be maintained during active operations to minimize air contaminant migration, demonstrating substantive compliance with these ARARs. Air monitoring will be required to ensure that volatile contaminants do not exceed acceptable health-based concentrations for local communities and workers.
  - Marine Mammal Protection Act – The remedy will meet the substantive requirements of the Marine Mammal Protection Act by incorporating into the RD all of the required habitat avoidance and minimization measures outlined in the 2021 Programmatic BA (EPA, 2021b), the applicable guidelines in the RDGC (EPA, 2021a), and the relevant requirements of the PHSS ROD (EPA, 2017a). Adherence to the applicable requirements and guidance in these documents will demonstrate compliance with the ARAR. In addition, EPA's close coordination and communication with the resource agencies throughout the project will ensure that any unforeseen circumstances can be addressed as they arise, and appropriate measures can be taken to ensure minimal disruption to marine mammals and their habitats.
  - Migratory Bird Treaty Act – The substantive requirements of this ARAR will be met by incorporating the required habitat avoidance and minimization measures outlined in the

2021 Programmatic BA (EPA, 2021b), the applicable guidelines in the RDGC (EPA, 2021a), and the relevant requirements of the PHSS ROD (EPA, 2017a). Specific measures relevant to this ARAR focus on the physical configuration and substrate of the active channel margin and establishment of riparian vegetation where feasible on the riverbanks. By complying with these measures, the remedial actions will be carried out in a manner that will avoid adversely affecting migratory bird species.

- Fish and Wildlife Coordination Act – The substantive requirements of this ARAR will be met during design and implementation of the remedy. This statute and implementing regulations require coordination with federal and state agencies to ensure that any modification of a water body affected by any action by a federal agency provides adequate protection of fish and wildlife resources. Compliance with this ARAR will be met through EPA's coordination with the resource agencies.

2.3.2 Clean Water Act Analysis

The CWA Analysis Technical Memorandum (Appendix G) evaluates Project Area-specific requirements of the CWA and State of Oregon water quality standards and how they will be applied to the SIB RD. The analysis is required along with the HIE (Appendix C) to provide EPA with the basis for determining whether the SIB RD requires compensatory mitigation to satisfy CWA requirements. Appendix L of the PHSS Feasibility Study (FS) (EPA, 2016) presents the CWA Section 404(b)(1) evaluation for the PHSS remedial alternatives included in the FS. The SIB Project Area-specific CWA analysis (Appendix G) builds on the Sitewide analysis published in the FS by considering the Project Area-specific baseline habitat conditions reported in the PDI ER (HGL, 2024a) and the Pre-Final 90% RD approach. The SIB Project Area-specific CWA analysis is organized to match the outline of the Sitewide analysis published in the FS to incorporate the FS analysis by reference and, for all applicable sections, amend the Sitewide analysis with Project Area-specific details. The RD applies conventional mitigation sequencing as required by the ROD (EPA, 2017a) and guided by the RDGC (EPA, 2021), in which the design approach considers potential RA impacts to habitats and Waters of the U.S. and seeks to first avoid impacts, then minimize unavoidable impacts, and if unavoidable impacts remain, provide compensatory mitigation. In the ROD and later supported by the RDGC, EPA conveys an expectation that that the RA could be determined to be "self-mitigating" by implementing avoidance and minimization combined with the required nature-based solutions design strategies. Together, the CWA analysis and the HIE assess SIB-specific compliance with CWA and provide a quantitative technical basis for EPA to determine whether the RA will be "self-mitigating" or if compensatory mitigation would be required to address unavoidable net impacts to Waters of the U.S. and associated habitats.

The RD integrates nature-based solutions that will reshape and revegetate degraded riverbanks, mitigate erosion and bank overflow, and allow natural processes to reform the channel and its margins. The RD incorporates elements of all seven Type 3 nature-based solutions, which are those that require the most intense and large-scale interventions or the creation of new habitat: (1) green space; (2) trees and shrubs; (3) soil conservation; (4) blue-green space establishment or restoration; (5) green built environment; (6) natural or semi-natural water storage and transport structures; and (7) infiltration, filtration, and biofiltration structures (European Commission, 2021). Nature-based solutions may be more cost-effective over the long term, more resilient to climate change, and more beneficial to community health and well-being. For these reasons, nature-based solutions are

endorsed by the Council on Environmental Quality and throughout the federal resource and regulatory agencies, including FEMA, USACE, National Oceanic and Atmospheric Administration, and Department of Interior. The CWA Analysis Technical Memorandum concluded that the SIB RD approach includes measures to satisfy requirements for avoidance, minimization, and most of the mitigation needed to address adverse impacts to Waters of the U.S. In parallel with the CWA analysis, the RD includes a HIE (Appendix C) that provides a quantitative HEA that compares baseline pre-RA habitat conditions with anticipated post-RA habitat conditions within the SIB Project Area. The HEA concluded that the Pre-Final 90% RD would result in a negative DSAY score supporting the conclusion that the remedy would need additional compensatory mitigation to address unavoidable impacts. The amount of compensatory mitigation necessary is greatly reduced by the habitat improvements and avoidance and minimization measures incorporated into the Pre-Final 90% RD.

The remedy is designed to meet the substantive requirements of CWA, Section 404 (b)(1), and other applicable federal and state water quality requirements. Section 404 of the CWA "establish[es] a program to regulate discharge of dredged or fill material into waters of the United States, including wetlands. Section 404 requires a permit before dredged or fill material may be discharged into waters of the United States, unless the activity is exempt from Section 404 regulation" (EPA, 2024c). The RD incorporates the following approaches to satisfy the CWA requirements for avoidance, minimization, and mitigation of adverse impacts to Waters of the U.S:

- Design decisions involving dredging and material placement in the water (e.g., caps) consider baseline habitat conditions and avoid impacts by selecting suitable substrates appropriate for those habitats. Within the active channel margin (ACM) and shallow zones, the finished depths and composition of the riverbed substrate are designed to minimize impacts and improve habitat conditions. As feasible, the engineered remedy minimizes the placement of rip rap in the ACM and prioritizes the use and beneficial reuse of local sand and gravel to enhance riverine ecosystems.
- Remediation and stabilization of contaminated riverbank soils requires clearing most of the existing riverbank vegetation to achieve RAOs and satisfy ROD requirements. The portion of the riverbanks located below the ordinary high water (OHW) elevation constitutes the Waters of the U.S. and is subject to avoidance, minimization, and mitigation requirements of CWA Section 404(b)(1). Existing riverbank conditions are ecologically degraded. While riprap is needed to achieve geotechnical stability and meet seismic design requirements on riverbank slopes steeper then 3H:1V, the RD minimizes the placement of riprap on the riverbanks to mitigate erosion and instead promotes a nature-based remedy that regrades and reshapes the banks and establishes native plant communities on stable, dynamic, remediated riverbanks. By incorporating nature-based solutions, the RD minimizes impacts to riverbank habitat and achieves a net ecological improvement to riverbank conditions..
- The PHSS HEA model previously developed by NMFS was used to provide a quantitative comparison of pre-RA baseline habitat conditions and post-RA habitat conditions within the SIB Project Area (Appendix C). The HEA modeling analysis determined that the remedy would result in a negative HEA score indicating that additional compensatory mitigation is needed.

- The RD satisfies the requirements of relevant and applicable CWA and State of Oregon water quality standards by incorporating those standards and integrating best practices and engineering controls in RD drawings, specifications, and plans to protect water quality. The CQA/QCP (Appendix N, Volume II) and PAMP (Appendix P, Volume II) include specific water quality monitoring activities designed to achieve compliance with ARARs during the RA construction and post-remedy.

2.3.3 Anticipated Permits, Access Agreements, Easements and Authorizations Required for Remedial Action

Site access is heavily controlled under the Marine Transportation Security Act and the Port's Security Facility Plan as required by 33 CFR Part 105. The SIB RD Performing Parties established access agreements necessary to conduct the RD activities during the PDI. Separate future access agreements or authorizations will be required for all areas of RA operations. Remedial actions must also be coordinated with shoreline property owners and operators to minimize disruption to their operations.

The State of Oregon owns certain submerged and submersible lands in the Project Area and manages them through the Oregon Department of State Lands (DSL). Remedial actions including the placement of caps or in situ remedial technologies requiring long-term maintenance on state-owned lands will require authorization from DSL, in accordance with OAR Chapter 141- Division 145. Riverbank and submerged and submersible lands in the Project Area not owned by the State of Oregon will require an Easement and Equitable Servitudes (EES).

This page was intentionally left blank.

3.0 REMEDIAL DESIGN CRITERIA

This section describes the engineering design analyses completed in support of the Pre-Final 90% RD. The design components specify performance requirements for project elements where prescriptive requirements are unsuitable. Performance-based specifications outline the criteria that must be met during RA construction, allowing for project-specific methods that leverage contractor expertise and allow for innovation. The RA Contractor will propose these methods in a RA Work Plan (RAWP), subject to EPA approval. This approach encourages creativity and efficiency as well as flexibility during implementation to address changing or unknown conditions while still specifying the criteria that must be met to satisfy project requirements. Prescriptive specifications will be used for inflexible design elements (e.g., minimum cap layer thickness, sequencing, access constraints) and to set project-wide minimum requirements for communications, environmental protection, and health and safety.

This section provides descriptions of the engineering design analyses that are included in this 90% DCR. Plans are included in Volume II of the Pre-Final 90% RD and preliminary drawings and specification are included in Volume III.

3.1 DREDGING DESIGN

The Dredging Design Technical Memorandum (DDTM, Appendix H) describes key criteria and considerations that were made, and analysis that was performed, to develop the 90% dredging design. Criteria and considerations include navigation depth requirements, dredging methodology (mechanical versus hydraulic), equipment selection, water depths and other site access constraints, debris removal, sediment characteristics, and calculated dredging production rates in different areas of the Project Area.

Cap design is also summarized in the DDTM (Appendix H), since the cap overall thickness affects dredging required in navigation areas. The 90% cap design pertaining to dredging efforts consists of a 3-ft cap thickness made up of a chemical isolation layer, erosion protection layer, and habitat layer. See the CDTM (Appendix E) for further details.

Navigation depths are evolving during RD pending results of additional structural and geotechnical analysis. Mechanical dredging is preferred over hydraulic dredging due to a number of factors including:

- The significant quantity and wide distribution of small debris present in SIB which is not likely to be removed during initial debris removal efforts;
- The presence of slurry pipelines during hydraulic dredging which would continuously impact waterway users; and
- The significantly larger dewatering requirements of hydraulic dredging.

Production rates were developed which considered the different equipment and efficiencies of dredging in different areas. Dredging in flat/open areas (low difficulty) was assumed to utilize a larger bucket size, and have a lower cycle time. Dredging in steep areas/banks (medium difficulty) was assumed to require a moderate or small bucket size (depending on reach distance) and have

an average cycle time. Dredging under/around structures (high difficulty) was assumed to require a small or medium bucket size and have a higher cycle time (double that of open water areas). These distinctions ensure the results reflect realistic conditions at the SIB Project Area. The resulting production rate values align with productivity data from published dredging studies.

Three remediation technologies were evaluated. The details within the cap design changed during 90% RD to include two cap types: in shallow water areas, Cap Type 1 consists of 1 ft of sand with granular activated carbon (GAC), followed by 2 ft of habitat gravel; in deep water/navigation areas, Cap Type 2 consists of 1 ft of sand with GAC, followed by 18 inches of angular rock for erosion protection, followed by 6 inches of sand as the habitat layer. The following three technologies were included in the cost comparison exercise (detailed assumptions for cost comparison are provided in the DDTM (Appendix H)):

1. **Dredge to RAL**: This alternative entails dredging 2 ft below the bottom vertical boundary of the SMA to remove COCs at concentrations exceeding RALs. Confirmation sampling and testing will be performed, with the potential for contingency re-dredging being required; however, neither of those costs are included in this alternative due to uncertainty as to whether contingency dredging will be required, and how much will be required. A 1-ft Residuals Management Layer (RML) of clean sand would be placed.
2. **Dredge and Cap**: This alternative entails dredging as needed to achieve appropriate navigation depths and 1-ft FMD clearance. After dredging, the 3-ft cap (either Type 1 or Type 2) will be placed for chemical isolation, erosion protection, and habitat.
3. **Cap Only**: This alternative entails placing the same 3-ft cap (either Type 1 or Type 2) noted above for the Dredge and Cap alternative. The Cap Only alternative would be applied in areas with sufficient existing depth for cap placement while still accommodating navigation and FMD clearance, or in areas with no navigation depth. No cost comparison was made between Cap Type 1 and 2 because they are intended for different locations. If selected, the Cap Only alternative would apply Cap Type 1 near the head of SIB (shallow water, minimal vessel traffic), and Cap Type 2 in SIB navigation areas.

Prior to the analysis, the Dredge to RAL alternative was selected in four distinct polygons within SIB, based strictly on operational purposes. The cost analysis between alternatives was not performed in these Dredge to RAL areas. Results of the assessment included dredging volumes, cap material volumes, costs, and inventory of COCs exceeding RALs removed in each 10-ft by 10-ft grid cell (outside the operationally prescribed Dredge to RAL areas), for each of the three alternatives discussed above. The result of the analysis is a cost-optimized spatial distribution of remedial technologies; however, the optimized spatial distribution is overly complex and requires constructability adjustments, such as removing isolated pockets of one alternative, and avoiding impacts to structures. Therefore, the remedial approaches in the design were further refined based on practical considerations.

The raw calculated (cost-optimized) "quilt" pattern of different technology assignments introduced small, irregular zones where different technology applications would be applied; therefore, the technology assignment map required simplification for constructability purposes. Aside from the operationally prescribed Dredge to RAL areas, the analysis was then repeated using only the

Dredge and Cap, or Cap, as alternatives in each grid cell. Overall results (costs, volumes, COC inventory removed) were very similar to the results when other Dredge to RAL was included.

Unit costs from the cost model were employed in the analysis, including unit costs for dredging, transportation, transload and disposal. Capping costs considered material supply, delivery, and installation. Long-term monitoring/O&M costs were considered and are discussed further in the DDTM, although they were not explicitly used in the alternatives cost comparison. Additional costs that are potentially associated with Dredge to RAL (outside the operationally prescribed Dredge to RAL areas) that were not included in the analysis were incremental impacts to existing structures (a significant factor), confirmation sampling and testing, and contingency re-dredging. The DDTM (Appendix H) includes further details on the cost data used in the analysis.

Analysis shows that a mix of Dredge and Cap (in areas where navigation is needed to support shoreline facility operations) and Cap Only is expected to result in significantly less construction cost and impacts to structures and slopes than Dredge to RAL, due to deep contamination in many areas of SIB. Site-wide application of Cap (rather than Dredge to RAL) outside the operationally prescribed Dredge to RAL areas also removes the need for additional confirmation sampling, testing, and contingency re-dredging, which is anticipated to be a time consuming process within the construction work periods. The reduced amount of dredging and follow-on construction activities associated with the Cap option significantly reduces impacts to businesses operating in the SIB Project Area, while remaining protective of human health and the environment.

The TODP (Appendix O, Volume II) describes the proposed routes for off-site shipments, identification of communities potentially affected by shipments, and plans to minimize impacts to affected communities. Material handling and disposal is further described in the Specifications (Appendix U, Volume III), Specification 35 24 20 – Remedial Dredging, Barge Dewatering, and In-Water Transportation and 35 24 20.01 – Transloading Upland Transportation and Disposal. Process flow diagrams are included in the Drawings (Appendix V, Volume III) to illustrate the sequential steps to dredge material and debris handling and disposal. This includes sediment removal, debris separation, water treatment, and final disposal.

3.2 CAP DESIGN

The CDTM (Appendix E) summarizes cap design efforts and recommendations for the Pre-Final 90% RD. The CDTM details the changes made to the design evaluation approach of area-specific cap assignments. The evolution of the cap design focused on three major areas of:

- Detailed subdivisions of separate riverbank and sediment capping areas;
- Refinements to chemical isolation layer evaluations, considering underlying sediment chemistry, seepage rates, and detailed selection of reactive material sorption parameters; and
- Physical and habitat considerations used in the erosion protection system.

3.2.1 Subdivisions of the Project Area into Certification Units

Between the Draft 50% RD and the Pre-Final 90% RD, underlying sediment concentration considerations were updated to balance the resource-efficiency of the remedy with a conservative design approach. The main update is the shift from Project Area-wide concentrations to area-specific design, as defined by certification units (CUs). CUs were developed in alignment with the Project-Area specific construction verification monitoring, and remedy performance standards (EPA, 2025b; 2025c). CUs were determined using the following chemistry, constructability, and geotechnical considerations:

- **Size:** CUs are not larger in area than 0.5-acre for riverbank certification units (RCUs) and 1.0-acre area for both cap certification units (CCUs) and dredge certification units.

- **Design Concentrations of COCs:** 95th percentile was calculated for all post-dredging analytes. Uniform sediment concentration was assigned for each CU to determine the minimum protective capping alternative using the following considerations:

    - For CUs with maximum reported concentrations of COCs that are less than Project Area-wide 95th percentiles, that maximum concentration of the COC across all depth intervals for ROD Tables 17 and 21 analytes was used in the cap alternative assignments; and

    - For CUs that have COC concentrations exceeding Project Area-wide 95th percentiles, the Project Area-wide 95th percentile value was used instead of the maximum concentration to assign cap alternatives.

- **Requested Navigable Depths and Constructability:** Dredge prisms developed to address requested navigable depths were incorporated into the determination of the 95th percentile values of COCs in sediment and the maximum concentration of COCs within the CUs, alongside other constructability considerations.
- **Physical Design Considerations:** Considerations for CU boundaries were made to include separation based on erosion protection and habitat layer (e.g., unamended habitat mix, revetment, and revegetation).

3.2.2 Chemical Isolation Layer Evaluation

In addition to the CU changes summarized in Section 3.2.1, the inputs to the one-dimensional chemical mass transport modeling were refined to produce a higher degree of efficiency in design. Whereas the 50% RD evaluated whether a particular cap design could contain the maximum sample concentration reported within an area of design, the 90% RD mass transport modeling was used to determine a theoretical maximum contaminant concentration in underlying sediments that each cap alternative could contain for 100 years while remaining protective (maintaining concentrations below the respective CULs).

This produced a performance limit for the particular cap design alternative, such that if the concentrations of any COC exceeded that performance limit, a more protective alternative would be required. This approach allows for a straightforward assignment of the efficient alternative, given area-specific considerations. The changes made for the 90% RD to the underlying sediment

for modeling efforts in evaluating each cap alternative performance include CU-specific chemical concentrations, sediment characteristics (e.g., total organic carbon [TOC], partitioning coefficients), and area-specific upwelling considerations.

3.2.3 Cap Design Alternatives

The 90% RD cap for each CCU is designed to be protective of sediment CULs in the underlying sediment. The cap design evaluation was completed by calculating CUL sediment-porewater equilibrium equivalents (CUL equivalent) using Project Area-specific sediment properties.

The results of the chemical mass transport modeling indicate that a chemical isolation layer composed of 12 inches of 5 percent GAC-amended sand will reliably contain the flux of all modeled COCs at the 95th percentile concentration, including all Table 21 COCs. CUs with lower concentrations of COCs than the 95th percentile values may be effectively addressed with 6 inches of 5 percent GAC-amended sand, 12 inches of unamended sand, or reactive core mats (RCMs) on side slopes.

The following six cap alternatives were assigned based on the CU-specific evaluation:

- **Selected Constructible Alternative 1:** 12 inches of unamended sand with overlying 24 inches of erosion protection layer.
- **Selected Constructible Alternative 2:** 12 inches of 5 percent GAC-amended sand with overlying 24 inches of erosion protection layer.
- **Selected Constructible Alternative 3:** 6 inches of 5 percent GAC-amended sand with overlying 36 inches of stone protection system, including 24 inches of armor and 12 inches of bedding stone.
- **Selected Constructible Alternative 4:** 12 inches of 5 percent GAC-amended sand with overlying 36 inches of stone protection system, including 24 inches of armor and 12 inches of bedding stone.
- **Selected Constructible Alternative 5:** 0.8 inches of RCM with overlying 36 inches of stone protection system in revetment zones, including 24 inches of armor and 12 inches of bedding stone.
- **Selected Constructible Alternative 6:** 1.6 inches of RCM with overlying 36 inches of stone protection system in revetment zones, including 24 inches of armor and 12 inches of bedding stone.

Area-specific cap alternative assignment was completed using a cap assignment matrix that systematically evaluated the protective capability of chemical isolation layer alternatives against CU area-specific concentrations. The matrix analyzed each of the 27 COCs driving cap design in each RCU and CCU, then assigned the minimum protective alternative for each analyte within each CU. After evaluating all assigned alternatives, the matrix identified the most protective alternative for each CU to ensure containment of all analytes.

3.2.4 Erosion Protection Summary

Cap erosion protection requirements are also described in the CDTM (Appendix E) including additional hydrodynamic analysis for conservatism in erosion protection design and evaluation of river currents and water levels including sea level rise and climate change, extreme storm wind-waves over a range of water levels, refined analysis of propeller wash including conservative assumptions to account for future unknown changes in vessel traffic, drydock activities, and future outfall discharges considering climate change. The RD erosion protection analysis also differed from prior analysis presented in the BODR because it was performed using an approximate post-construction elevation surface that was based on preliminary design concepts.

Results of the erosion protection analysis include material stability requirements for in-water cap armor, riverbank armoring at steep slopes, and scour protection requirements surrounding City outfalls. The results are presented in Appendix I in the form of median stable grain sizes of material in different areas (assuming-gravel size materials) for pure static stability of the surface materials, which may not be practical in some areas.

Near the head of SIB, erosion protection and habitat layer consist of a larger-thickness (2-ft) layer of the same material (habitat mix). The habitat mix is <2.5-inch rounded gravel. As a result of changes to the calculation of habitat impacts, the 90% RD applies a habitat layer on top of armor rock. In the SIB bottom capping areas, angular rock-based erosion protection is installed above the chemical isolation layer, but below a habitat layer which consists of 6 inches of imported coarse sand. The bottom-of-basin habitat layer is anticipated to be dynamically stable and provides further protection for the long-term stability of the chemical isolation layer. On side slopes, where a sand layer will not be stable, a rounded rock habitat layer is placed on top of the revetment's angular armor rock.

During Pre-Final 90% RD, erosion protection material types were consolidated into a fewer number of materials being used for several purposes on the project, which are standard Oregon Department of Transportation material specification, for cost efficiency purposes. The erosion protection layer aggregate (approximately 3-inch median diameter angular rock) is a conservative erosion protection solution because the aggregate is larger material than required to resist many of the physical processes, but provides protection against unanticipated anchoring, moving timber/logs in the river, anchor chains being dragged on the bottom, and other unforeseen natural or anthropogenic factors. The 18-inch thickness of the erosion protection layer (rather than 2-ft) allows the introduction of a 6-inch habitat layer into the 3-ft overall cap thickness, preventing further dredging from being required to meet navigation depths and 1-ft future maintenance dredging clearance.

3.2.5 Geotechnical Cap Design Summary

The geotechnical aspects of cap design and the underlying sediment have been considered in the Pre-Final 90% RD. The geotechnical analysis was informed by chemical isolation and erosion protection layer alternatives presented in the CDTM (Appendix E), as well the guidance described in the RDGC (EPA, 2021b) and *Guidance for In-Situ Subaqueous Capping of Contaminated Sediments* (Palermo et al., 1998). Key evaluations for cap stability included bearing capacity analysis, settlement analysis, filter design, liquefaction susceptibility evaluation, and both static

and pseudo-static cap stability analysis. The Geotechnical Design Technical Memorandum (GDTM, Appendix I) presents the results of the analysis.

Bearing capacity of near-surface sediment material was evaluated using methods described in Palermo et al. (1998), based on fundamental bearing failure equations. The analysis provided estimated maximum allowable cap thicknesses for various cap alternatives, all of which had a factor of safety greater than 3.0. Consolidation settlement of the cap supporting sediment material was predicted using the Settle3 model by Rocscience. Settlement analysis indicates that, under a load equivalent to a 3.5-foot lift, approximately 25 inches of consolidation settlement is expected (an increase in the total settlement from the 50% RD). However, time-dependent consolidation analysis estimates that 90 percent of the consolidation settlement will take place over the course of 2.5 years. The filter design analysis results demonstrate that the anticipated cap material types limit the potential for vertical migration of both sediment and cap materials.

The in-water sediment cap slope stability was evaluated using 2D limit-equilibrium analysis with Slide2 by Rocscience, ensuring a minimum static factor of safety of 1.5 and a minimum pseudo-static factor of safety of 1.1. Liquefaction-induced flow failure potential was also assessed using conventional limit equilibrium slope stability analyses. A horizontal seismic coefficient of 0.12 was used for pseudo-static stability analyses, based on half of the mapped peak ground acceleration for a CLE seismic event. The design of in-water caps should follow slope gradients of approximately 3 horizontal to 1 vertical (3H:1V) or flatter. Details of the geotechnical inputs into the cap design are discussed in further detail in the GDTM (Appendix I).

3.3 RIVERBANK DESIGN

The RDTM (Appendix D) summarizes the RD for SIB Project Area riverbanks to reduce migration of COCs in riverbanks to sediment and surface water such that levels are acceptable for human health and ecological exposure (RAO 9). Specifically, the Pre-Final 90% RD evaluates riverbank slopes across the SIB Project Area to understand localized impacts on remedial activities and addresses recontamination risk associated with erosion of contaminated riverbank soil through a combination of soil remediation and riverbank stabilization. The 90% RD accomplishes these objectives using multiple components:

- Removal of a layer of riverbank soils (thickness varies by location);
- Providing a chemical barrier to seepage-based migration of dissolved COCs;
- Placement of vegetation or rock armoring surface treatment, to protect the barrier treatment layer; and
- Long-term monitoring of riverbank areas to assure a protective remedy.

The 90% RD was completed to incorporate the placement of a chemical isolation layer as the long-term barrier to any incidental migration of COCs from riverbank soils. Vegetative covers or rock armoring (depending on location) provide physical protection of the chemical isolation layer.

Additionally, the ROD (EPA, 2017) applies multiple ecological considerations and requirements that have guided the determination of final slope, composition, and surface treatment. The riverbank design must transition continuously to the ACM and in-water remedy elements with

respect to both remedial and ecological requirements and considerations. The RD approach to riverbanks involves removing, grading, and placing material on existing riverbanks, with a focus on maintaining stability both above and below the water level. Significant portions of the existing riverbank slopes are only marginally stable, and slope reconfiguration or stabilization measures will be required to achieve the RAO.

3.3.1 Excavation, Grading, and Backfill Summary

Excavation of the riverbanks is intended to be performed as needed for proper construction of bank remediation. Most areas require an initial removal effort for clearing and grubbing, which entails removal of surface materials such as vegetation, debris, and existing riprap, with no specific excavation depth target. The goal is to develop a smoothly graded slope over which bank protection and planted areas can be constructed.

The design of the slopes of riverbanks is governed by static and seismic geotechnical stability, navigation depth considerations, the presence of in-water structures, and efficient material use. Stability of the structures and slopes was evaluated according to criteria in the RGDC (EPA, 2021b) and is presented in the GDTM (Appendix I). Over the vast majority of the SIB Project Area, the proposed riverbank slope is similar to the existing slope. In these areas, only limited excavation is proposed in some areas to smooth the slope into the design slope from the toe of slope to top of the bank. These slopes typically require modest backfill in some areas as well, resulting in minimal net excavation.

3.3.2 Chemical Isolation Summary

Riverbank concentrations presented in the CDTM (Appendix E) show RAL or PTW threshold exceedances from samples collected within each of the 30 RCUs in the SIB Project Area. Based on Figure 4 of the *Guidelines for Riverbank Characterizations and Evaluations at the Portland Harbor Superfund Site* (RDGC, Appendix D), RCUs will be remediated per ROD Section 14 and design requirements in 14.2.9 (EPA, 2025d).

Groundwater modeling was conducted to support RD of the SIB Project Area riverbanks (see Attachment A of Appendix E). The model predicted higher elevations of the riverbank will experience much less potential seepage of groundwater than the bottom sediments of SIB (due to the total time throughout a year that the riverbank experiences different river surface elevations). The stratigraphy and hydraulic conductivity of riverbank soils may allow exfiltration from the banks at higher flowrates than the bottom of the basin. As a result, the chemical isolation layer for each of the RCUs on the Mocks Bottom riverbank slopes were conservatively designed with the same seepage rates as those used to design the sediment cap for the SIB SMA. However, RCUs on Swan Island riverbank slopes show much less upgradient groundwater head, and those RCUs were designed for approximately 15 percent of the total annual groundwater seepage flux when compared to the Mocks Bottom riverbank slopes.

The CDTM outlines the modeling approach and alternatives evaluated for the chemical isolation layer on riverbanks. The CDTM also presents the assigned cap alternatives for riverbanks based on minimum alternative protectiveness, which includes a geocomposite product that includes a reactive core mat (Cap Alternatives 4 and 5 in Section 3.2).

3.3.3 Permanent Riverbank Erosion Protection Summary

Bank erosion protection is achieved using a combination of rock revetment in the more energetic areas with steeper slopes, up to elevation +20 feet North American Vertical Datum of 1988 (NAVD88) or the approximate OHW elevation. In a few steeper areas, rock revetment is required to extend to top-of-slope. However, the vast majority of the Project Area includes planted vegetation as the bank stabilization for riverbank areas above elevation +20 feet NAVD88.

In areas flatter than 3H:1V and in the low energetic areas predominantly found at the head of the basin, the habitat mix (less than 2-inch rounded gravel) erosion protection layer for the sediment cap extends from deeper water up to elevation +9.4 feet NAVD88, where planted areas begin and continue to top-of-slope. Planted areas include lifts of soil bags wrapped in coir fabric to provide elevation gain and facilitate insertion of flatter areas (5H:1V) above each lift for planting. The lifts themselves are erosion resistant in the short term, due to the bags and coir fabric wrap. In the long term, roots and woody vegetation will provide the structural support and erosion resistance. The planted areas will be covered in jute netting or similar to protect the topsoil during initial plant growth.

3.3.4 Riverbank Habitat Summary

In addition to the primary goal of reducing migration of COCs in riverbank to sediment and surface water, ARARs further shape the riverbank design in the SIB Project Area in terms of habitat goals. The primary habitat goal is to increase marsh area elevations where the river hydrology supports hydrophytic vegetation (between mean daily low water during growing season or +9.4 ft NAVD88 to +15.4 ft NAVD88). Wherever possible, the slopes within these freshwater tidal elevations have been designed as 5H:1V or less to maximize the area that can support hydrophytic wetland vegetation.

Generally, the leave surface of riverbanks will support habitat types in three primary zones that are defined by elevation and the relative access to the water level. These habitat types are: shallows, ACM, and upland riparian riverbank. The elevations are not considered to be a strict boundary, but rather to identify vertical extents on the riverbank where habitat types transition from one to another and maximum species overlap is expected. The placement of the habitat types is guided primarily by the vertical elevation and the associated hydroperiod with adjustments applied horizontally to account for localized site conditions such as stormwater outfalls, groundwater seeps, and proximity to infrastructure.

In the shallows zone, below the mean low water elevation, large wood pieces not including tree tops or root wads are designed to provide cover and foraging for fish. All large wood are placed low on the bank toe and within shallow water zones to ensure submergence throughout most of the year. In the lower ACM, a tidal freshwater wetland marsh is designed for portions of the riverbank where the upper shallows are a minimum of a 5H:1V slope or flatter. This community would include obligate herbaceous species in lower elevations and facultative species in the transition to the scrub-shrub habitat. In the upper ACM, a palustrine scrub-shrub community is designed as the transition between the woody species above OHW and the herbaceous marsh species at the wetted shoreline. The mature height of species in this habitat zone are not expected to exceed 20 ft. Finally, in the riparian riverbank, a riparian tree/shrub community is designed.

This area will be dominated by trees and shrubs, with trees only in the upper portion of the riverbank. An important consideration for this zone is to allow for proper growth of tree roots.

3.4 GEOTECHNICAL DESIGN ANALYSES

Geotechnical analyses were performed to support justification or elimination of the area-specific application of remedial technologies considered during Pre-Final 90% RD and included:

- The geotechnical evaluations required for cap design described in Section 3.2.3, including bearing capacity analysis, settlement analysis, filter design, liquefaction susceptibility evaluation, and both static and pseudo-static cap stability analysis.
- Development of subsurface profiles and cross-sections that illustrate soil stratigraphy and include relevant geotechnical design parameters at key locations throughout the Project Area.
- Development of seismic design parameters for a contingency level event (10% probability of exceedance in 50 years) and other seismic event return periods required for RD.
- Slope stability analysis, static and seismic (pseudo-static), of caps placed on slopes, proposed dredge cuts, and riverbank slopes.
- Seismic hazard analysis, including liquefaction triggering, liquefaction induced settlement, and lateral spreading potential.
- Development of lateral earth pressures for static and seismic loading conditions.

A detailed description of the methodology, assumptions, input parameters, and results of each analysis performed as part of the Pre-Final 90% RD, and geotechnical design recommendations for Pre-Final 90% RD are presented in the GDTM (Appendix I).

3.5 STRUCTURAL DESIGN ANALYSES

The Pre-Final 90% RD includes removal and capping of in situ sediments adjacent to and beneath existing in-water structures and outfalls. At a minimum, localized removal of in situ sediments or existing riprap is required to accommodate capping. Rock revetments constructed from riprap are typically used where capping is placed under structures or on structure-adjacent slopes steeper than 3H:1V. The slope stability impacts due to capping were assessed at each individual structure by examining ground profiles and considering the static and seismic design requirements of the slopes as well as the slope geometry and constructability of the cap. For information regarding the geotechnical design analyses that informed the structural design analyses, please refer to Section 3.4.

The impact on structural performance due to changes in ground-levels around piles and other sub-structure elements was assessed at each individual structure. The Structural Design Technical Memorandum (SDTM) (Appendix J) presents the results of these structural impact analyses. The criteria for assessment of the structures are summarized in Attachment A – Shoreline and Overwater Structures Basis of Design of the SDTM. Structures that were found to be unable to accommodate the proposed capped ground profiles were subject to further assessment comprising one of the following:

- Design of toe walls to accommodate vertical step changes in ground profiles,
- Design of seismic strengthening measures to mitigate increased demands on piles due to changes in ground profiles,
- Design of ground improvements, such as mid-slope pinning walls to resist geotechnical slope failure of steeper slopes, and
- Complete removal and replacement where the existing structure is not considered compatible with the remediated ground profiles.

For this project, a performance-based specifications design approach was used by the RD team to develop design documents for every new or modified structure. The RD documents illustrate and specify the performance requirements for each structural design, and the RA Performing Parties or the RA Contractor (on behalf of the RA Performing Parties) will develop a final detailed design that meets the performance requirements shown in the RD documents. The structural design elements of the Pre-Final 90% RD were presented to shoreline facility owners and operators and are summarized in Attachment B – Structure-Specific Analyses of the SDTM (Appendix J). Drawings and specifications are included in Volume III of the Pre-Final 90% RD.

3.6 GREEN REMEDIATION

The Green Remediation Plan (Appendix Q, Volume II) outlines the evaluation of environmentally responsible remedial actions in accordance with EPA's Principles for Greener Cleanups (EPA, 2009), the Superfund Green Remediation Strategy (EPA, 2010), the ROD (EPA, 2017a), RDGC (EPA, 2021b), and the information described in Appendix M of the Portland Harbor Feasibility Study (EPA, 2016).

The Green Remediation Plan outlines recommendations for best management practices (BMPs) to reduce energy use, air pollutant emissions, water usage, waste output, and habitat impact during RA implementation. A central instrument to evaluate BMPs is the environmental footprint analysis (footprint analysis).

The footprint analysis is the basis for evaluating BMPs that are aimed at achieving the following that can minimize the environmental impact footprint, potentially realize RA cost reductions, and still meet RAOs:

- Increase energy efficiency and reduce energy costs;
- Reduce emissions potentially with the use of construction emission controls and optimizing transportation;
- Reduce water consumption and increase water reuse;
- Increase use of locally sourced and sustainable materials;
- Use of local suppliers where possible;
- Reduce waste generation and identify opportunities for reusing and recycling construction waste;
- Reduce habitat disruptions and impact to aquatic species;
- Increase long-term habitat benefits;
- Restrict machinery and traffic; and

- Reduce land disturbance.

3.7 QUANTITY AND COST ANALYSIS

The Pre-Final 90% RD Cost Analysis Technical Memorandum (Appendix K) provides quantity estimates and cost projection for the RA based on the details of the 90% RD. These cost projections were developed using a probabilistic cost model that helps guide engineering design and strategic decisions throughout the design process, with the level of detail developing as the design progresses.

The Cost Analysis Technical Memorandum details the methodology and assumptions used to analyze costs for the following central work elements:

- Selective dredge and/or cap of submerged sediments;
- Riverbank clearing and excavation to the project limits at the top of bank;
- Dredge water processing and treatment;
- Transport to a transload facility
- Transload processing, upland transport to a disposal site, and disposal;
- Geotechnical stability of all riverbanks;
- Structure replacement and/or removal, where necessary to remediate localized sediments:
  - Lagoon Wharf (removal and new replacement),
  - Berth 306 (removal and new replacement),
  - Berth 307 (removal and new replacement),
  - Berth 308 (removal),
  - U.S. Coast Guard (toe wall, pile sleeves),
  - The Marine Consortium, Inc. Pier (mid-slope pinning walls),
  - Berth 311 (new barge breasting dolphin)
  - Shipyard Commerce Center Floating Dock Bulkhead Wall
  - Port of Portland Dredge Base (new mooring piles for existing barges) ;
- Native vegetation planting on riverbanks where slope stability can be retained;
- Revetment construction on steep banks unable to support vegetation; and
- Indirect costs (engineering, monitoring, administration).

The cost estimate is based on the output of the probabilistic cost model which is intended to capture uncertainty in individual cost and quantity elements in these categories. Uncertainty is represented by an estimated variability of each cost/quantity element and randomized in 10,000 scenarios during model execution. The mean total cost for each element is used for the published cost estimate.

Cost contingency is represented by the upper limits of the cost model's certainty percentage. Instead of a fixed contingency ratio employed by deterministic cost estimates, the probability model narrows the anticipated upper (and potentially lower) cost limits to a range of certainty. The cost model results provide a cost probability distribution that may be used to develop a risk-based cost contingency. For this phase of the design, the highest value within the range of 50% certainty establishes the accepted limit of project contingency.

The Cost Analysis Technical Memorandum also includes a section that lists the current risk register and notes ongoing efforts to assess the conditions, priority and potential cost impact of each risk element.

The factors that most significantly affect cost variability include:

- The quantities and unit costs of dredge material processing;
- Material handling and transport;
- Available transload and disposal sites; and
- Replacement of the Lagoon Wharf structure.

As the design progresses, unit costs for work elements will be continually updated based on the latest cost information available from recent, relevant sources. The risk register is updated in this Pre-Final 90% RD to account for newly recognized risks and includes both a cost analysis of alternatives, as well as an evaluation of each risk register item.

The Pre-Final 90% RD cost projections for the SIB Project Area are based upon a probabilistic cost model and provide a range of possible cost outcomes determined by many factors. The results of the cost analysis are tabulated to show the total projected cost, the subtotals of primary cost categories, and the 95% confidence interval range for cost. The factors that most strongly affect cost uncertainty are structure replacement; and dredge material processing, handling, transport, and disposal.

3.8 VALUE ENGINEERING STUDY

The parameters for conducting a VE Study are documented in EPA memoranda and documents (EPA, 1995 and EPA, 2005). HGL conducted a VE Screening for the Draft 50% RD effort in March 2025. Based on the relatively high cost of several components of the design, the VE Screening report established the need for this formal VE Study. HGL engaged Mike Palermo Consulting, Inc. to conduct the VE Study for the SIB Project Area as part of the Pre-Final 90% RD. Dr. Michael R. Palermo, the sole employee of Mike Palermo Consulting, Inc., conducted the VE Study and prepared the VE Study Report included in Appendix L.

The VE Study Report provides proposed Value Improvement Proposals for the SIB Project Area. The study effort focused on the following aspects of the design:

- Structures - A general review of the approach to protection or demolition of structures;
- Riverbanks - Riverbank stabilization, remediation and restoration;
- Dredging - Debris and sediment material dredging and management; and,
- Capping - Engineered capping material procurement and placement.

A total of 12 Value Improvement Proposals are described in the study report. The proposals were developed based on the review and analysis of the Draft 50% RD and key updated deliverables for the Pre-Final 90% RD and are listed below.

1. Proposal #Structures 1 – Ensure the Specifications allow for use of small-scale spreader or conveyor approaches for placement of capping materials and armor/habitat stone beneath and around structures.

2. Proposal #Riverbanks 1 – Establish an On-Site or Near-Site Combined Materials Staging and Processing Facility for Receipt, Processing, and Distribution of Materials for both Riverbanks and Capping
3. Proposal #Dredging 1 – Modify the Specifications to clarify that contingency dredging requirements only apply to Dredge to RAL DCUs.
4. Proposal #Dredging 2 – Pursue Site-Wide Consortium for Transloading and Transport of Dredged Sediments for Disposal
5. Proposal #Dredging 3 – Require consideration of Redundancy for critical pieces of equipment in all materials handling operations.
6. Proposal #Capping 1 – Modify the Cap Placement Tolerances for the chemical isolation cap layer and apply all tolerances on an area-wide basis for Performance Monitoring Units
7. Proposal #Capping-2 – Modify the Specifications to allow for use of large-scale spreaders for placement of capping materials.
8. Proposal #Capping 3 – Modify the Specifications to allow for Use of Compartmented Bottom Dump Barges or other alternative spreading approaches for placement of armor stone or Habitat stone.
9. Proposal #Capping 4 – Optimize Multi-Purpose Monitoring Stations for Cap Performance Assessment.
10. Proposal #General 1 – Clarify the general sequencing of work.
11. Proposal #General 2 – Advocate for increase in the in-water work periods (IWWPs) or outright elimination of the IWWP restrictions based on a cost comparison plus suggested mitigation and enhancement incentives.
12. Proposal #General 3 – Source Control issues should be resolved by convening an outside expert panel to assess 1) the findings of the SAR as compared to the EPA and State of Oregon comments on the SAR, and 2) the risk of recontamination of the SIB from existing sources.

The complete VE Study Report is included as Appendix L.

3.9 CONSTRUCTABILITY ASSESSMENT

An assessment of constructability considerations identified in the BODR (HGL, 2024b) was conducted on the Pre-Final 90% RD. The assessment specifically reviewed constructability considerations made for technology assignments and construction activity considerations that informed elements of the RD. The following constructability considerations elements were assessed:

- Technology assignments
    - Debris
    - Work around structures
    - Waterways use authorizations and remedial use authorizations requirements
    - Habitat considerations
- Construction activity

  - Construction material
  - Construction equipment
  - Logistics and constraints
  - Dredging productivity
  - Sequencing of the RA

The Constructability Assessment Technical Memorandum (Appendix M) reviewed each element of the RD and discussed those that could exert a significant influence over the success of RA in the SIB Project Area. Summaries are provided of how each of the considerations are addressed in the RD.

3.10 CONSTRUCTION SEQUENCING AND PHASING

The RA work will be sequenced to reduce the likelihood of recontamination of the SIB Project Area during each in-water work period and during the off season between subsequent in-water work periods. The general sequence of work for the RA is expected to start with a pre-construction survey and removal of large debris. Subsequently any required demolition or structural work would occur followed by upland excavation, dredging below the water line, and material placement. A post dredge survey would occur prior to material placement with any necessary re-dredging occurring prior to the placement of material. An end of material placement survey would occur to determine completeness. If additional material placement for the season is not required, the season would culminate with implementation of monitoring and institutional controls to prevent recontamination until the next in-water work window as described in the CQA/QCP (Appendix N, Volume II) and ICIAP (Appendix R, Volume II).

Construction sequence is expected to be specified by the RA Contractor in their RAWP depending on their means and methods, obtaining material, transload capacity, and/or property access. The 90% RA Schedule outlines a potential timeline of work to show feasibility which will be further refined in the Final 100% RA Schedule to provide a feasible sequence of work for the entirety of the RA at the SIB Project Area.

The general sequence expected for RA implementation is expected to be as follows:

- Pre-construction activities
  - Review and incorporation of changes post-100% Remedial Design;
  - Preparation of procurement documents;
  - Procurement activities;
  - Selection of RA Contractor;
  - Development and approval of the RA Contractor's RAWP;
  - Notification to required parties including property owners/operators and agencies;
  - Obtain access agreements, leases, and/or easements;
  - Procurement of placement material and completion of any necessary testing;
  - Pre-construction surveys, inspections, and investigations;
  - Design of contractor-designed elements;
- Construction activities
  - Removal of large debris from the work area;
  - Relocation of floating and temporary structures;

- Structural work (demolition and/or construction);
- Upland excavation (may occur simultaneously with structural work);
- Dredging below 0 ft CRD (+5.28 ft NAVD88) occurring simultaneously with removal of encountered debris, in-water transport, transload of material, disposal, and water treatment and disposal'
- Post-dredge survey;
- Re-dredging and survey, if needed;
- Material placement;
- Post-material placement survey;
- Additional material placement and surveys, if needed;
- Inspections and corrective measures;
- Site cleanup and demobilization of equipment; and
- Project closeout.

Some of the sequenced items may occur simultaneously depending on the means and methods of the RA Contractor, ability of transload site, equipment capabilities, and access to properties.

3.10.1 Remedial Action Schedule

The 90% RA Schedule, illustrated in Figure 3-1, was developed based on estimated dredging production rates from the DDTM (Appendix H) and performing work within the Oregon Department of Fish and Wildlife specified IWWPs. This schedule assumes the availability of necessary materials, equipment, a transload facility, and a disposal facility.
The RA is anticipated to span 2 to 3 years of pre-construction activities, followed by construction work conducted over a minimum of eight IWWPs. The number of IWWPs was estimated using the constraints and assumptions outlined in Section 3.10.2.

To minimize disruption and reduce the risk of recontamination, the work has been sequenced to progress from the head of the basin outward. Demolition and construction of stabilizing infrastructure are grouped by location to streamline operations. The schedule reflects major construction phases identified through experience with similar projects and discussions with contractors. It does not account for potential delays due to unforeseen circumstances at the Project Area.

Effective sequencing of RA activities is critical and will require close coordination among all involved parties. These include, but are not limited to:

- RA Performing Parties
- Remediation Contract Manager
- RA Contractor
- Shoreline facility owners/operators
- Transload site operators
- Entities receiving treated water (if applicable)

- Analytical laboratories
- Material suppliers
- Disposal site operators

The RA schedule sequence was developed using the constraints and assumptions in Section 3.10.2. Where possible, input from shoreline facility owner/operator interviews within the SIB Project Area was incorporated to minimize operational impacts.

3.10.2 Remedial Action Sequence Development

The primary consideration for the RA sequence is to develop a feasible schedule that can be carried out by the RA Contractor that minimizes recontamination of SIB while maintaining efficiency. A framework of constraints and assumptions was developed and is outlined herein. The following constraints were incorporated into the development of the potential sequence and RA schedule:

- IWWP # 1:
    - July 1 through October 31
    - No limitations on work occurring in water or upland
    - 87 working days on average (assuming 5 days per week and excluding Fourth of July and Labor Day)
- IWWP # 2:
    - December 1 through January 31
    - 44 working days on average (assuming 5 days per week and excluding Christmas Day and New Years Day)
    - Work above the approximate OHW mark may continue along with dredging in depths greater than -20 ft National Geodetic Vertical Datum of 1929 (NGVD29).
    - Work in areas between -20 ft NGVD29 and OHW will not be permitted.
- Outside of the two IWWPs the following criteria were implemented:
    - 5-day work week
    - Excludes the following holidays:
        - Memorial Day
        - Thanksgiving Holiday
- Minimum separation requirements:
    - 300 ft between active operations along slopes and or structures.
    - 300 ft between any active dredging and a previously capped area.
    - 900 ft between active operations in open-water areas.

Dredge operations commence at the head of the basin and progress riverward.

Pre-dredge surveys will be conducted immediately prior to dredging activity commencement.

Post-dredge surveys will be conducted prior to cap placement.

The 90% RA Schedule considers the constraints listed above and the development of assumptions to guide the sequencing and schedule of RA activities. Assumptions were applied to outline the guiding principles used in the development of the schedule. The assumptions applied to the 90% RA Schedule include:

- Pre-dredging surveys conducted prior to the start of the IWWPs.
- Structures planned for relocation during dredging activities may be moved prior to the start of the planned IWWP, if possible.
- Placement of revetment, bedding layer, and/or geotextile will only be conducted during the IWWPs.
    - RA Contractor may opt to pause work above the OHW mark to continue working between -20 NGVD29 and OHW during IWWP #1 (July – October) and return to working above OHW outside the IWWPs.
- Structural work occurring over water such as new concrete decks may occur outside of the IWWP.
- Upland restoration, including planting, may occur outside of the IWWP.
- Debris removal and dredging occur concurrently.
- Challenging debris may be removed prior to the start of dredging.
- Timber piles removed prior to dredging.
- Areas of SIB where no dredging will occur must have debris removed prior to cap placement.
- Excavated material, dredged material and debris, will be loaded onto barges (not haul trucks) for the purpose of schedule.
    - Excavated material and production rates were defined as activities occurring from +8 ft NAVD88 to top of bank.
    - Dredged material and production rates were defined as activities occurring below +8 ft NAVD88.
- For the 90% RA Schedule, the excavation and dredge production rates were as follows:
    - 400 cubic yards (cy)/day for excavators on the riverbank (elevation of approximately +8 ft NAVD88 to top of bank);
    - 400 cubic yards (cy)/day for dredger on riverbank or underneath structures;
    - 1,100 cy/day for dredger in the open basin; and
    - Total daily max output of 1,500 cy/day.
    - 1,500 cy/day for dredger was used in Dry Dock 5, Dry Dock 3, and Vigorous areas.
- For the 90% RA Schedule, the capping production rates were as follows:
    - 1,000 cy/day with the following exceptions;
    - 400 cy/day underneath structures

    - 1,500 – 2,000 cy/day in the Dry Dock 5, Dry Dock 3, and Vigorous areas.
- For the 90% RA Schedule, the KPFF B302 to B305 Replacement Study's proposed construction schedules were evaluated. The Bulkhead Wharf option has the shortest durations of four and six years. For the purposes of the 90% RA Schedule, the Accelerated Bulkhead Wharf 4-construction duration was applied. However, the duration for the B302-B305 construction may be longer. All four proposed schedules are outlined below:
    - Baseline Concrete Wharf – 9-year construction duration
    - Accelerated Concrete Wharf – 7-year construction duration
    - Baseline Bulkhead Wharf – 6-year construction duration
    - Accelerated Bulkhead Wharf – 4-year construction duration

3.10.3 Design Considerations

Implementation of the 90% RD was evaluated at each structure by considering the necessary order of work required to successfully execute the RD. An example of the order of work for a structure requiring the demolition and construction with revetment is outlined below:

- Relocate floating structures or barges, if applicable
- Demolition
- Construction of slope stabilizing structures, if applicable
- Excavation and dredging
- Pile driving
- Construction
- Revetment placement
- Capping
- Riverbank restoration

The development of the 90% RA Schedule included the structural work at each location. Structural work includes demolition of a part of a structure or the entirety, construction of new infrastructure, and/or construction of slope stabilizing features. The schedule assumes demolition and/or construction of structures will precede dredging operations.

The following structural work was included in the 90% RA Schedule:

- U.S. Coast Guard
    - Demolition of fender piles
    - Construction of toe wall and fender piles
- Berths 306 and 307
    - Demolition of structure
    - Construction of breasting dolphins and berths
- Berth 308 (demolition only)
- Berth 311
    - Construct berthing dolphin
- Lagoon Wharf (design by others)
    - Demolition of structure

    - Construction of Lagoon Wharf
- Port of Portland Dredge Base
    - Construction (driving piles)
- The Marine Consortium, Inc. Pier
    - Construction of mid-slope pinning wall (2x)
- Shipyard Commerce Center Floating Docks
    - Construct sheet pile wall

3.10.4 Schedule Flexibility

Amendments to certain constraints and assumptions outlined in Sections 3.10.2 and 3.10.3 may permit shortening of the project schedule. Additional dredge floats and cranes incorporated into the project may increase the speed of work completed during each IWWP. Adjusting the delineation line between excavation and dredge production rates may decrease the number of days required as open basin dredge production rates are 1,100 cy/day versus 400 cy/day. Identifying an upland stockpile location within the SIB Project Area in conjunction with an upland transport plan may permit year-round excavation in areas above OHW.

3.10.5 Plan for Obtaining Access/Use Authorizations

The SIB Project Area is located in an area with multiple property owners, privately-owned submerged and submersible land, and submerged and submersible land owned by the State of Oregon, see BODR Figure 2-1 (HGL, 2024b). Site access will be necessary to conduct the RA, which will be accommodated through future access agreements and authorizations. Potentially affected properties have been consulted with during development of the Pre-Final 90% RD.

The RA Performing Parties will coordinate with SIB Project Area property owners and operators to establish access for construction and maintenance of the RA. Depending on the owner and the nature and duration of the access, written agreements or other legal documentation (e.g., leases, easements, deed restrictions) may be required. The RA Performing Parties will engage the State of Oregon, through DSL, and other property owners to identify potential RA constraints and requirements. It is crucial to begin communications early with property owners to avoid potential delays in the RA work.

4.0 REMEDIAL DESIGN DELIVERABLES

This section presents the supporting plans that have been developed with the Pre-Final 90% RD and discusses how the RD deliverables will be refined as the design progresses to the Final 100% RD.

4.1 ENVIRONMENTAL PROTECTION

Plans that address environmental protection measures to be implemented to assure protection of human health and the environment during RA include the CQA/QCP and TODP. Plans are included in Volume II of the Pre-Final 90% RD.

4.1.1 Construction Quality Assurance/Quality Control Plan

The CQA/QCP (Appendix N, Volume II) addresses the following remedy construction QA, water quality, community impact monitoring activities/elements for the SIB Project Area:

- Identify and describe the responsibilities of the organizations and personnel implementing the CQA/QCP;
- Describe the performance standards (PS) required to be met to achieve completing the RA;
- Describe the activities to be performed: (i) to provide confidence that the PS will be met; and (ii) to determine whether PS have been met;
- Describe verification activities, such as inspections, sampling, testing, monitoring, and production controls, under the CQA/QCP;
- Describe industry standards and technical specifications used in implementing the CQA/QCP;
- Describe procedures for tracking construction deficiencies from identification through corrective action;
- Describe procedures for documenting all CQA/QCP activities; and
- Describe procedures for retention of documents and for final storage of documents.

The CQA/QCP provides the organizational hierarchy and QA/QC responsibilities for the RA and discusses what will be measured, how it will be measured, why it is measured, how results of the measurements will be treated (corrective actions for non-conformances), and how the construction monitoring and verification measurements will be documented.

4.1.2 Transportation and Off-Site Disposal Plan

The TODP (Appendix O, Volume II) describes the planned approach to meet the SIB Project Area objectives as they pertain to the safe handling, shipment, and disposition of wastes generated during RA activities. The following objectives are addressed to ensure compliance with the requirements for off-site shipping of RA waste:

- Proposed routes for off-site shipment of material.

- Identification of communities affected by shipment of waste material; and
- Description of plans to minimize impacts on affected communities.

The TODP summarizes waste characterization and designation procedures, and materials and debris handling requirements for the off-site shipment of CERCLA wastes in accordance with applicable state and federal regulations. Potential alternatives for transportation, transloading, and disposal services for dredged and excavated material from the SIB Project Area are presented in the plan as well as route options for transporting dredged material, debris, and water to each of the identified disposal facilities. The TODP identifies the geographical areas outside of the SIB Project Area which would be impacted by transportation of wastes to a disposal facility and the mitigation measures and BMPs to minimize potential impacts.

4.2 REMEDIAL ACTION

Plans described in this section apply to the SIB Project Area post-RA, they include the PAMP, which monitors RA progress towards performance standards and achievement of RAOs; the ICIAP which guides the implementation and continued performance of institutional controls; and the O&M Plan and O&M Manual guide the inspections, reporting, and maintenance activities required to maintain the remedy.

4.2.1 Project Area Monitoring Plan

The PAMP (Appendix P, Volume II) describes the scope and objectives of remedy performance monitoring, including:

- The environmental media to be monitored;
- Data collection parameters, analytical parameters, existing and proposed monitoring devices and locations, and the monitoring schedule;
- Descriptions of how performance monitoring data will be analyzed, interpreted, and reported;
- Descriptions of deliverables that will be generated as part of performance monitoring, including sampling schedules, laboratory records, monitoring reports, and reporting requirement; and
- Descriptions of proposed additional monitoring and data collection actions in the event that results from performance monitoring or other factors indicate changed conditions of significance.

If increasing trends of contaminant concentrations are observed in SIB Project Area performance monitoring media, it may be necessary to perform additional data analyses and/or data collection and monitoring efforts to determine the source of the contamination. The specifics of these efforts will be determined if a recontamination potential assessment is necessary, based on the data gaps and data needs at that time. A summary of these potential activities is included in the PAMP. A summary of Sitewide RAO monitoring is also included in the PAMP to identify the expected RAO monitoring data products that will inform SIB Project Area-specific performance monitoring analysis and objectives.

4.2.2 Institutional Control Implementation and Assurance Plan

The ICIAP (Appendix R, Volume II) presents the institutional control (IC) planning, maintenance, enforcement, modification, and termination for the protection of human health and the environment by limiting exposure to contamination left in place and to protect the long-term integrity of the engineered components of the remedy. The ICIAP is based on the Sitewide ICIAP (City, 2022) and developed in accordance with 1) Institutional Controls: A Guide to Planning, Implementing, Maintaining, and Enforcing Institutional Controls at Contaminated Sites (EPA, 2012a); and 2) Institutional Controls: A Guide to Preparing Institutional Controls Implementation and Assurance Plans at Contaminated Sites (EPA, 2012b) or as amended or superseded.

The ICIAP lists the IC groups, the key elements of planned ICs, a summary of assurance monitoring and reporting, and modifications or termination of ICs.

4.2.3 Operations and Maintenance Plan and Manual

The O&M Plan (Appendix S, Volume II) defines the inspections and any operational and maintenance activities of the constructed remedy components to ensure/demonstrate that they continue to meet their original design specifications. The O&M Plan includes:

- Description of PS required to be met to implement the ROD;
- Description of activities performed to provide confidence in PS being met and to determine if PS have been met;
- Description of records and reports generated during O&M;
- Description of corrective actions in case of system failure; and
- Description of corrective actions in to be implemented in the event that PS are not achieved and schedule for implementing these corrective actions.

The O&M Manual (Appendix T, Volume II), a companion to the O&M Plan, serves as a guide to the purpose and function of the equipment and systems comprising the remedy. The manual discusses O&M components for each element of the remedy, health and safety requirements, and contingency plan for handling abnormal activities (significant natural event).

The O&M Manual and Plan have been updated for the Pre-Final 90% RD and will continue to be updated throughout the RD, as needed. Upon completion of the RA, the O&M Plan and O&M Manual will be updated based on actual operational experience obtained during implementation of the RA. The completed O&M Plan and O&M Manual normally are submitted as part of RA completion when the remedy transitions to O&M. Both documents should continue to be updated during the O&M period as conditions change (EPA, 2017b).

4.3 REMEDIAL DESIGN DELIVERABLES AND SEQUENCING

This section provides an overview of the RD sequencing. The Draft 50% RD and supporting documents was submitted to EPA on March 13, 2025. This section discusses the progression from the Pre-Final 90% to the Final 100% RD.

4.3.1 Lagoon Wharf Supplemental 90% Remedial Design

As noted in Section 2.2.5, the RD Team is preparing a technical memorandum to address the Lagoon Wharf riverbank soil remedy as a supplement to this Pre-Final 90% RD. The timing of this technical memorandum is based on the progression of the third-party engineer firm's design but can be completed in advance of the design. As such, the SIB RD Team anticipates delivery of this memorandum by early 2026.

4.3.2 Final 100% Remedial Design

The Final 100% RD will address EPA comments on the Pre-Final 90% RD and include final versions of all pre-final deliverables for EPA approval. According to the terms of the ASAOC (Section XXVII. Notice of Work Completion), the SIB RD Performing Parties will request that EPA make the determination that all work has been fully performed in accordance with the terms of the ASAOC and provide written notice of this to the SIB RD Performing Parties, the Settling Federal Agencies, and the Settling Public Entities.

Notes:
[1] Site status is indicated as follows:
A = Sources are sufficiently controlled.
B = Sources are conditionally controlled.
C = Sources are not sufficiently assessed or controlled, including: (C[u]) Sources not sufficiently controlled because RPCs are present in site media > CUL and/or RALs, there is a direct pathway, and modeling indicates recontamination potential. Sites may require additional assessment.
(C[a]) Sources not sufficiently assessed.

I = Pathway is incomplete
[2] COCs taken from City of Portland Bureau of Environmental Services, 2014a through 2014f; DEQ, 2016; City of Portland Bureau of Environmental Services NPDES 1200Z SW data; and/or relevant site investigation reports from Environmental Data Management System (DEQ, 2024).
[3] The Site is not in the M-1 drainage area.
Shading indicates sites for which source control decisions / no further action determinations have been issued by DEQ.

-- = input not available/applicable
< = less than
> = greater than
As = arsenic
BEHP = bis (2-ethylhexyl) phthalate
Cd = cadmium
Cr = chromium
cPAHs = carcinogenic polycyclic aromatic hydrocarbons
CSCD = conditional source control decision
Cu = copper
CUL = cleanup level
dba = doing business as
DDD = dichlorodiphenyldichloroethane
DDE = dichlorodiphenyldichloroethylene
DDT = dichlorodiphenyltrichloroethane
DDx = DDD+DDE+DDT
D/Fs = dioxins and furans
DEQ = Oregon Department of Environmental Quality
DTNA = Daimler Truck North America LLC
ECSI = Environmental Cleanup Site Information
EPA = U.S. Environmental Protection Agency
Excluded = No source or incomplete pathway
GW = groundwater
Hg = mercury
HGL = HydroGeoLogic, Inc.
I = incomplete pathway (equivalent to "A" designation), therefore no source control action is needed before remedial action
MRL = method reporting limit
ND = not detected
NE = Pathway was not evaluated by DEQ as part of Joint Source Control Strategy work
NEC = no exposure certification
NFA = no further action
NPDES 1200-Z = National Pollutant Discharge Elimination System 1200-Z Industrial Stormwater Program
OCP = organochlorine pesticides
PAHs = polycyclic aromatic hydrocarbons
Pb = lead
PCE = tetrachloroethene
PDI = Pre-Design Investigation
RAL = remedial action level
RB = riverbank
ROD = record of decision
RPC = recontamination potential chemical
SCD = Source Control Decision
SCE = source control evaluation
SCM = source control measure
SMA = sediment management area
SVOC = semi-volatile organic compound
SW = stormwater
SWPCP = stormwater pollution control plan
TBT = tributyltin
TCE = trichloroethene
TCT = Technical Coordinating Team for Portland Harbor Superfund Site
TPH-Dx = total petroleum hydrocarbons (diesel-range)
Uncontrolled = Sources that are yet uncontrolled with a plan and schedule to be implemented
USCG = United States Coast Guard
VOC = volatile organic compounds
Zn = zinc

Table 2-2
Application of the PHSS ROD ARARs and TBC Regulations/Citations and Documentation Anticipated to Demonstrate Compliance
Pre-Final 90% Remedial Design, Swan Island Basin Project Area, Portland, Oregon

Medium	Regulation/Citation	ARAR or TBC?	Design Deliverable that Address Compliance with ARARs	Compliance Measure Implementation Details
Chemical-Specific ARARs (see ROD Table 25a [EPA, 2017] for further details)				
Protection of surface water	CWA, 33 USC 1313 and 1314 (Sections 303 and 304). Most recent 304(a) list of recommended water quality criteria.	Relevant and Appropriate	- Design Criteria Report, Section 2.3 - CWA Analysis Technical Memronduam - CQA/QCP and WQMP (attachment) - PAMP - O&M Plan - ICIAP - Specification Sections: 01 35 43, 01 41 00, 35 24 00, 35 24 20.01, 35 37 10	Using OAR established water quality standards in the project-specific CQA/QCP which is incorporated in CWA Analysis. Developed monitoring requirements for cap performance and riverbank remedy in PAMP; O&M of remedy in O&M Plan, and controls to protect the remedy in ICIAP. Specifications provide requirements to ensure compliance.
	Water Pollution Control Act ORS 468B.048. Statewide Numeric Water Quality Criteria set forth in OAR Part 340, Division 41, including Toxic Substances criterion at OAR Part 340 41 0033 (Tables 30 and 40), and Designated Uses for the Willamette Basin and Numeric Water Quality Criteria specified for the Willamette Basin at OAR 340 041 340 and 340 041 0345.	Applicable, Relevant, and Appropriate		
Measure of protectiveness of human health and the environment in all media	Oregon Environmental Cleanup Law ORS 465.315(b)(A). Oregon Hazardous Substance Remedial Action Rules OAR 340 122 0040(2)(a) and (c), 0115(2 4).	Applicable		
Protection of potential drinking water sources	Safe Drinking Water Act, 42 USC 300f, 40 CFR Part 141, Subpart O, Appendix A. 40 CFR Part 143.	Relevant and Appropriate	N/A for SIB Project Area RD/RA	Develop action-specific standards for minimizing discharges of contaminants during construction that meet MCL goals.
	EPA RSL for Groundwater. Office of Superfund Remediation and Technology Innovation, Assessment and Remediation Division. November 2015.	TBC		Consider RSLs to establish acceptable risk levels where no MCLs or MCLGs are applicable.
Action-Specific ARARs (see ROD Table 25b [EPA, 2017] for further details)				
Actions that discharge dredged or fill material into navigable waters	CWA, Section 404, 33 USC 1344 and Section 404(b)(1) Guidelines, 40 CFR Part 230 (Guidelines for Specification of Disposal Sites for Dredged or Fill Material)	Applicable	- Design Criteria Report, Section 2.3 - CWA Analysis Technical Memronduam - Habitat Impact Evaluation Technical Memorandum - CQA/QCP and WQMP (attachment) - Specification Sections: 01 35 43, 01 41 00, 35 24 00, 35 24 20.01, 35 37 10	Evaluated habitat impacts for RA approaches to demonstrate consistency with CWA Section 404. Provided inputs for HEA model developed by EPA. EPA determination consistent with comprehensive mitigation framework developed in coordination with NMFS and USFWS. CQA/QCP includes monitoring requirements during RA construction. Specifications provide requirements to ensure compliance.
Actions that discharge pollutants to Waters of the United States	CWA, Section 402, 33 USC 1342	Relevant and Appropriate	- Dredging Design Technical Memorandum - CQA/QCP and WQMP (attachment) - Specification Sections: 01 35 43, 01 41 00, 35 24 00, 35 24 20.01	Dredging design describes BMPs for water management. CQA/QCP (WQMP) provides treatment, monitoring, and discharge requirements during RA construction for EPA Section 401 Water Quality Certification or equivalent. Specifications provide requirements to ensure compliance.
Actions that discharge pollutants to Waters of the United States	CWA, 33 USC 1341, (Section 401), 40 CFR Section, 121.2(a)(3), (4) and (5). Also see OAR 340 048 0015 "When Certification Required" pursuant to Oregon state law.	Relevant and Appropriate		
Actions resulting in discharges to Waters of the State of Oregon, including removal and fill activities	ORS 468B.025 and State water quality standards established by rule: OAR 340 041 0002 through 0059, and Willamette Basin Designated Uses and Basin specific water quality standards at OAR 340 041 340 and OAR 340 041 345.	Relevant and Appropriate		
Actions resulting in discharges from removal and fill activities	ORS 196.825(5) Statutory requirement to mitigate for expected adverse effects of removal and fill activities. Applicable substantive mitigation rules are: OAR 141 085 510, 141 085 680, 141 085 0685, 141 085 0690, 141 085 0710, and 141 085 715.	Applicable	- Design Criteria Report, Section 2.3 - CWA Analysis Technical Memronduam - Habitat Impact Evaluation Technical Memorandum - CQA/QCP and WQMP (attachment) - Specification Sections: 01 35 43, 01 41 00, 35 24 00, 35 24 20.01, 35 37 10	Evaluated habitat impacts for RA approaches to demonstrate consistency with CWA Section 404. Provided inputs for HEA model developed by EPA. EPA determination consistent with comprehensive mitigation framework developed in coordination with NMFS and USFWS. CQA/QCP includes monitoring requirements during RA construction. Specifications provide requirements to ensure compliance.

Table 2-2
Application of the PHSS ROD ARARs and TBC Regulations/Citations and Documentation Anticipated to Demonstrate Compliance
Pre-Final 90% Remedial Design, Swan Island Basin Project Area, Portland, Oregon

Medium	Regulation/Citation	ARAR or TBC?	Design Deliverable that Address Compliance with ARARs	Compliance Measure Implementation Details
Action-Specific ARARs (see ROD Table 25b [EPA, 2017] for further details) (Continued)				
Actions in federal navigation channels	River and Harbors Act of 1899, Section 10, 33 USC Section 403 and implementing regulations at 33 CFR Sections 322(e), 323.3, 323.4(b) (c), and 329.	Applicable	- Design Criteria Report, Section 2.3 - CQA/QCP - TODP - ICIAP - Specificaion Sections 01 11 00, 01 31 00, and 02 21 00, 35 37 10	CQA/QCP identifies areas where dedging and capping are assigned with over dredge allowances or buffer zones as specified in Section 3 of RDGC. TODP addresses potential for transport of materials through the federal navigation channel. ICIAP addresses requirements for controls. Specifications provide additional requirements to ensure compliance.
Actions generating pesticide residue	Hazardous Waste and Hazardous Materials II. Identification and Listing of Hazardous Waste OAR 340 101 0033(6) and (7); OAR 340 100 0010(j); and OAR 340 109 0010(3) and (4).	Applicable	- Design Criteria Report, Section 2.3 - Waste Designation Memorandum - Specification Sections 01 41 00, 02 61 00, 35 24 20.01	Identified pesticide constiuents in Waste Designation Memorandum based on RD characterization efforts. Specifications provide requirements to ensure compliance.
Actions handling PCB remediation wastes and PCB containing material	Toxic Substances Control Act,. 15 USC §2601 et seq., 40 CFR Part 761, Subpart D and OAR 340 110 0065 (1) and (2)	Applicable	- Design Criteria Report, Section 2.3 - Waste Designation Memorandum - Specification Sections 01 41 00, 02 61 00, 35 24 20.01	Identified PCBs in Waste Designation Memorandum based on RD characterization efforts. Specifications provide requirements to ensure compliance.
Risk based limits protective of human health for air emissions associated with soil or sediment removal	Clean Air Act, 40 CFR Parts 50 and 52	Relevant and Appropriate	- Design Criteria Report, Section 2.3 - CQA/QCP - Green Remediation Plan - Specification Sections 01 35 29, 01 35 43, 01 41 00, 02 61 00	Developed and incorporated requirement for air pollution monitoring plan, green remediation and emission control considerations for inclusion in RD. Specifications provide requirements to ensure compliance.
Actions generating air emissions	Oregon Air Pollution Control ORS 468A et seq., General Emissions Standards OAR 340 226	Applicable		
Actions that involve handling of dredged sediment or riverbank soils containing asbestos	National Emission Standards for Asbestos, 40 CFR 61.150(a)(1)(i)(v)	Relevant and Appropriate	- CQA/QCP - Waste Designation Memorandum - Specification Sections 01 35 29, 01 41 00, 02 41 00, 02 42 00	Developed and incorporated requirement for air pollution monitoring plan, Waste Designation Memorandum notes the need for asbestos sampling prior to excavation/transport/disposal. Specifications provide requirements to ensure compliance.
	National Emission Standards for Asbestos, 40 CFR 61.150(b)(1) and (2) and (c)	Applicable		
Actions on the riverbanks that expose and manage on site soils containing asbestos	National Emission Standards for Asbestos, 40 CFR 61.151(a)(2) and (3), 40 CFR 61.151(b)(1)(i) through (iii) and 40 CFR 61.151(b)(2)	Applicable		
Actions generating air emissions	Fugitive Emission Requirements OAR 340 208 0205, 0208, and 0209	Applicable	- Design Criteria Report, Section 2.3 - CQA/QCP - Green Remediation Plan - Specification Sections 01 35 29, 01 35 43, 01 41 00, 02 61 00	Developed and incorporated requirement for air pollution monitoring plan, green remediation and emission control considerations for inclusion in RD. Specifications provide requirements to ensure compliance.
Actions that may alter waterbodies and that may effect fish and wildlife	Fish and Wildlife Coordination Act. 16 USC 662 and 663, 50 CFR 6.302(g)	Applicable	- Design Criteria Report, Sections 2.3 and 3.10 - CWA Analysis Technical Memronduam - Habitat Impact Evaluation Technical Memorandum - Specification Sections 01 11 00, 01 14 00, 35 24 20	Defined construction strategies for adherence to timing windows, including fish exclusion plan. Defined reasonable and prudent measures to minimize impacts of RA on essential habitats. Specifications provide requirements to ensure compliance.
Actions that may affect Endangered Species Act listed and State protected fish and wildlife species	Oregon Department of Fish and Wildlife Fish Management Plans for the Willamette River. OAR 635, div 500	Applicable		
Actions that may affect marine mammals	Marine Mammal Protection Act. 16 USC § 1361 et seq. 50 CFR 216	Applicable		
Actions that may affect migratory birds	Migratory Bird Treaty Act. 16 USC §703 50 CFR §10.12	Applicable	- Design Criteria Report, Section 2.3 - Habitat Impact Evaluation Technical Memorandum	Evaluated migratory bird timing windows and incorporate avoidance strategies in RD.
On-site actions that involve generating, handling, and disposal of hazardous waste	OAR 340 100 0001(3) and OAR 340 100 0002(1)	Applicable	- Waste Designation Memorandum - Specification Sections 01 33 16, 01 35 29, 01 35 43, 01 41 00, 02 41 00, 02 42 00, 02 61 00, 35 24 20.01	Waste Designation Memorandum documents RD characterization efforts. Specifications provide requirements to ensure compliance.

Table 2-2
Application of the PHSS ROD ARARs and TBC Regulations/Citations and Documentation Anticipated to Demonstrate Compliance
Pre-Final 90% Remedial Design, Swan Island Basin Project Area, Portland, Oregon

Medium	Regulation/Citation	ARAR or TBC?	Design Deliverable that Address Compliance with ARARs	Compliance Measure Implementation Details
Action-Specific ARARs (see ROD Table 25b [EPA, 2017] for further details) (Continued)				
Actions generating solid wastes or hazardous wastes for off-site disposal	Solid waste defined in 40 CFR 261.2. Determining if solid waste is hazardous per 40 CFR § 262.11(a c) and OAR 340 102 0011 Hazardous Waste Determination	Applicable	- Waste Designation Memorandum - Specification Sections 01 33 16, 01 35 29, 01 35 43, 01 41 00, 02 41 00, 02 42 00, 02 61 00, 35 24 20.01	Waste Designation Memorandum documents RD characterization efforts. Specifications provide requirements to ensure compliance.
Actions generating dredged material hazardous waste	40 CFR § 261.4(g)	Applicable		
Actions generating RCRA hazardous waste that will be disposed of in a permitted off-site disposal facility	40 CFR § 264.13(a)(1)	Applicable		
Actions generating RCRA hazardous waste	40 CFR § 268.7(a)(1)	Applicable		
	40 CFR § 268.9(a)	Applicable		
Actions generating industrial wastewater	40 CFR § 261.4(a)(2)	Applicable	- Dredging Design Technical Memorandum - CQA/QCP and WQMP (attachment) - Specification Sections: 01 35 43, 01 41 00, 35 24 00, 35 24 20.01	Dredging design describes BMPs for water management. CQA/QCP (WQMP) provides treatment, monitoring, and discharge requirements during RA construction for EPA Section 401 Water Quality Certification or equivalent. Specifications provide requirements to ensure compliance.
Actions requiring temporary storage of hazardous waste	OAR 340 102 0034 40 CFR § 262.34(a); 40 CFR § 262.34(a)(1)(i); 40 CFR § 262.34(a)(2) and (3) 40 CFR § 262.34(c)(1)	Applicable	- Specifications Sections 01 14 00, 01 35 43, 01 41 26, 01 52 00, 01 74 23, 35 24 20.01, 35 37 10	Specifications provide requirements to ensure compliance.
Actions resulting in the storage of solid waste	OAR 340 093 0210 and 0220	Applicable		
	OAR 340 095 0010, 0020, 0030, 0050(1) & (2), 0070(2)	Applicable		
Actions transporting hazardous materials	49 CFR § 171.1(b)	Applicable	- Waste Designation Memorandum - TODP - Specification Sections 01 14 00, 01 35 43, 01 55 26, 02 61 00, 35 24 20, 35 24 20.01	Waste Designation Memorandum documents RD characterization efforts. TODP discusses transportation and disposal of waste. Specifications provide requirements to ensure compliance.
Location-Specific ARARs (see ROD Table 25c [EPA, 2017] for further details)				
Actions that involve storage and treatment of hazardous waste at the transloading facility	40 CFR Part 264, Subparts B, C, F, G, I, J, K, L, M, AA, BB, CC, and DD	Applicable	- Waste Designation Memorandum - TODP - Specification Sections 01 14 00, 01 35 43, 01 55 26, 02 61 00, 35 24 20, 35 24 20.01	Waste Designation Memorandum documents RD characterization efforts. TODP discusses transloading facility. Specifications provide requirements to ensure compliance.
Presence of archaeologically or historically sensitive area	Native American Graves Protection and Reparation Act, 25 USC 3001 3013, 43 CFR 10	Applicable	- CQA/QCP with AIDP template	Includes AIDP example as a guide for the RA contractor that will be responsible for preparing the AIDP in advance of RA construction.
	Indian Graves and Protected Objects ORS 97.740 760	Relevant and Appropriate		
	Archaeological Objects and Sites ORS 358.905 955 ORS 390.235	Relevant and Appropriate		
Presence of archaeologically or historically sensitive area	National Historic Preservation Act. 16 USC 470 et seq. 36 CFR Part 800	Applicable		
	Archaeological and Historic Preservation Act. 16 USC 469a 1	Applicable		
Presence of floodplain as designated on FEMA Flood Insurance map	44 CFR 60.3(d)(2) and (3)	Relevant and Appropriate	- Design Criteria Report, Sections 2.2.3 and 2.3 - CWA Analysis Technical Memorandum	Defines FEMA regulated floodplain as it pertains to SIB Project Area. Conducted flood impact evaluation to demonstrate that RA will not result in unacceptable flood rise or loss of flood storage.
Presence of floodplain as designated on map	FEMA regulations at 44 CFR 9 (which sets forth the policy, procedure and responsibilities to implement and enforce Executive Orders 11988 (Management of Floodplain) as amended by Executive Order 13690 and 11990 (Protection of Wetlands)	Regulations: Relevant and Appropriate Executive Order: TBC		

Table 2-2
Application of the PHSS ROD ARARs and TBC Regulations/Citations and Documentation Anticipated to Demonstrate Compliance
Pre-Final 90% Remedial Design, Swan Island Basin Project Area, Portland, Oregon

Medium	Regulation/Citation	ARAR or TBC?	Design Deliverable that Address Compliance with ARARs	Compliance Measure Implementation Details
Location-Specific ARARs (see ROD Table 25c [EPA, 2017] for further details) (Continued)				
Presence of wetlands	Executive Order for Wetlands Protection. Executive Order 11990 (1977)	TBC	- Design Criteria Report, Section 2.3 - CWA Analysis Technical Memorandum - Habitat Impact Evaluation Technical Memorandum	Reviewed and evaluated SIB Project Area for any nascent wetlands. Discuss in CWA analysis, Habitat Impact Evaluation if present.
Presence of state listed threatened or endangered wildlife species	Protection and Conservation Programs ORS. 496.171 to 496.182. Survival Guidelines OAR 635 100 0135	Relevant and Appropriate	- Design Criteria Report, Section 2.3 - CWA Analysis Technical Memorandum - Habitat Impact Evaluation Technical Memorandum	CWA analysis and Habitat Impact Evaluation discuss state and federally protected species. Discuss preferred habitats and the presence or absence. Define construction strategies for adherence to timing windows, including fish exclusion plan. Define reasonable and prudent measures to minimize impacts of RA on essential habitats.
Presence of essential fish habitat	Magnuson Stevens Fishery Conservation and Management Act. 50 CFR Part.600.920	Applicable		
Presence of federally endangered or threatened species	Endangered Species Act. 16 USC 1536 (a)(2), Listing of endangered or threatened species per 50 CFR 17.11 and 17.12 or designation of critical habitat of such species listed in 50 CFR 17.95	Applicable		

Notes:
EPA, 2017. *Record of Decision, Portland Harbor Superfund Site,* Portland, Oregon. EPA Region 10, Seattle, Washington. January.

AIDP = Archaeological Inadvertent Discovery Plan
ARAR = Applicable or Relevant and Appropriate Requirements
CFR = Code of Federal Regulations
COC = contaminant of concern
CQA/QCP = Construction Quality Assurance/Quality Control Plan
CWA = Clean Water Act
EPA = U.S. Environmental Protection Agency
FEMA = Federal Emergency Management Agency
HEA = Habitat Equivalency Analysis
ICIAP = Institutional Control Implementation and Assurance Plan
MCL = Maximum Contaminant Level
MCLG = Maximum Contaminant Level Goal
N/A = not applicable
NMFS = National Marine Fisheries Service
OAR = Oregon Administrative Rule
ORS = Oregon Revised Statute
O&M = operation and maintenance
PAMP = Project Area Monitoring Plan
PCB = polychlorinated biphenyls
PHSS = Portland Harbor Superfund Site
RA = remedial action
RCRA = Resource Conservation and Recovery Act
RD = Remedial Design
RDGC = Remedial Design Guidelines and Considerations
ROD = Record of Decision
RSL = Regional Screening Level
SIB = Swan Island Basin
SMA = sediment management area
TBC = To Be Considered
TODP = Transportation and Off-Site Disposal Plan
USC = U.S. Code
USFWS = U.S. Fish and Wildlife Service
WQMP = Water Quality Monitoring Plan

ARCHIVED SEDIMENT SAMPLE ANALYSIS TECHNICAL MEMORANDUM
PRE-FINAL 90% REMEDIAL DESIGN
SWAN ISLAND BASIN PROJECT AREA, CERCLA DOCKET NO. 10-2021-001
PORTLAND HARBOR SUPERFUND SITE
PORTLAND, MULTNOMAH COUNTY, OREGON

1.0 INTRODUCTION

This Archived Sediment Sample Analysis Technical Memorandum presents the results of additional sediment samples analyzed to support refinement of the Sediment Management Area (SMA) subject to Remedial Action for the Swan Island Basin (SIB) Project Area within the Portland Harbor Superfund Site in Portland, Multnomah County, Oregon. Pacific Groundwater Group, Mott MacDonald, and HydroGeoLogic, Inc. (HGL) performed the work on behalf of the SIB Remedial Design (RD) Group based on the requirements of the Portland Harbor Superfund Site Record of Decision (ROD) (EPA, 2017) and the Administrative Settlement Agreement and Order on Consent (ASAOC) (EPA, 2021a). The work was performed in accordance with the Pre-Design PDI) Work Plan (HGL, 2022) and field change request form variance number 16 (FCR 16) (HGL, 2024a).

1.1 SCOPE AND OBJECTIVES

During review of the PDI Evaluation Report (ER) (HGL, 2024b), the U.S. Environmental Protection Agency (EPA) commented that initial PDI sample locations were not analyzed at intervals consistent with identified contamination found at historical cores or in adjacent PDI samples, and as such additional intervals should be taken out of archive and analyzed to accurately bound samples at depth to develop a depth of contamination model and revised SMA boundaries, if applicable (EPA, 2024). EPA noted a data gap where contaminated intervals may have been omitted and the results of the SMA delineation and associated uncertainty analysis presented in the PDI ER would only be valid if the input data adequately capture the extent of contamination.

Also in this comment set, EPA specified that samples on the Mocks Bottom shoreline, near the head of SIB were only analyzed to a depth of 6 feet (ft) but adjacent cores contained ROD Table 21 contaminants of concern (COCs) exceeding remedial action levels (RALs)/principal threat waste (PTW) thresholds to depths between 12 ft and greater than 15 ft. EPA requested that archived core interval samples located along Mocks Bottom near the head of SIB be analyzed for polychlorinated biphenyls (PCB) Aroclors and dioxin/furans (EPA, 2024).

This memorandum presents the results of the archived core interval analyses conducted to inform the presence or absence of ROD COC exceedances at depths below 6 ft as well as in surface sediments. The results also inform the surface sediment concentration uncertainty in grid cells along Mocks Bottom as well as the horizontal extent of subsurface sediment contamination to verify the interpolation of the complete sediment dataset that was used to prepare the refined SMA boundary for SIB (HGL, 2024b).

1.2 PROJECT AREA BACKGROUND

The SIB Project Area is the active cleanup area designated in the ROD between approximately River Mile (RM) 8.1 and RM 9.2 on the northeast side of the Willamette River. The SIB Project Area is approximately 1.1 miles in length, 117 acres in size, and includes riverbanks from top of the bank to the river (Figure 1-1).

2.0 SEDIMENT CHEMISTRY TESTING

A total of 29 samples from the 2022 sediment sampling efforts were retrieved from frozen archive for cores B31, B32, B33, B34, and B35 along Mocks Bottom near the head of SIB (Figure 2-1). The archived samples from depth intervals from each core that were analyzed are as follows (in ft):

- B31: 6-7, 7-8, 8-9, 9-10, 10-11, 11-12, 12-13, 13-13.7
- B32: 6-7, 7-8, 8-9
- B33: 6-7, 7-8, 8-9
- B34: 0-1, 6-7, 7-8, 8-9, 9-9.7
- B35: 0-1, 6-7, 7-8, 8-9, 9-10, 10-11, 11-12, 12-13, 13-14, 14-14.7

The analytical laboratories and analyses are as follows:

- Analytical Resources, LLC (ARI) in Tukwila, Washington – PCBs as Aroclors; and
- Cape Fear Analytical, LLC (CFA) in Wilmington, North Carolina – polychlorinated dibenzodioxins (PCDD)/polychlorinated dibenzofurans (PCDF).

The frozen sample volumes were retrieved from archive and analyzed in accordance with the PDI Work Plan (HGL, 2022).

2.1 DATA MANAGEMENT

The laboratory analytical data were reported by analytical laboratories in an Electronic Data Deliverable that is compatible with the Environmental Quality Information System (EQuIS) data management program using the valid values presented in Appendix A of the Program Data Management Plan (EPA, 2021b).

Following data validation, results requiring reporting as totals were calculated in accordance with Section 6 and Table A-2 of the Program Data Management Plan (EPA, 2021b) and imported into the project database[1].

2.2 DATA VALIDATION

The Uniform Federal Policy (UFP)-Quality Assurance Project Plan (QAPP) Worksheet #36 (Appendix B of the PDI Work Plan; HGL, 2022) describes the data validation procedures used to verify and validate analytical data.

[1] The project database and associated analysis uses data submitted to the Portland Harbor Interim Database on December 4, 2024.

Surface and subsurface sediment and sediment elutriate data were validated in accordance with the QAPP (HGL, 2022) by HGL chemists. As a result of validation, data qualifiers were applied to sample results. The data qualifiers include the following:

- UJ: The analyte was analyzed for but was not detected. The associated value is approximate and may be inaccurate or imprecise. The associated value is the adjusted method detection limit or the reported concentration (results qualified as artifacts due to blank contamination).
- U: The analyte was analyzed for but was not detected above the level of the adjusted MDL or the reported concentration (results qualified as artifacts due to blank contamination).
- J: The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
- (no qualifier): The result is a detection above the reporting limit (RL) and is not affected by any QC discrepancies.

In addition to these qualifier definitions, the following key validation qualifier notes were provided in FCR 16 for EPA review and approval and apply to the qualified dataset summarized in this memorandum. PCDD/PCDF analysis of the archived samples was performed outside of the hold time (1 year, frozen to 10 degrees Celsius) and as such were qualified J for detections or UJ for non-detections.

2.3 DATA QUALITY AND USABILITY

The UFP-QAPP Worksheet #37 Data Usability Assessment provides guidelines for evaluating field investigation and laboratory compliance with the requirements listed in the UFP-QAPP and other project planning documents. Samples were collected, analyzed, and managed in compliance with field and laboratory testing criteria, and are acceptable for use in SMA refinement and RD development.

As noted in Section 2.2, PCDD/PCDF results were qualified (J for detections or UJ for non-detections) but are considered to be of sufficient quality to supplement the refinement of the extent of contamination when used in conjunction with PCB Aroclor analysis results, which do not have a hold time.

Analyzed samples with reporting limits of non-detect results exceeding ROD Table 17 cleanup levels (CULs) but below RAL or PTW thresholds include 1,2,3,7,8-PeCDD and 2,3,7,8-TCDD. Since the purpose of this evaluation is to evaluate the data for RAL[2] and PTW threshold exceedances, the reporting limits exceeding CULs do not impact the usability of the data.

[2] The EPA-prescribed PQL values are used in place of the RALs for TCDD and PeCDD (EPA, 2022). EPA published the memorandum "Evaluation of consistently and reliably attainable practical quantitation limits for 2,3,7,8-TCDD and 1,2,3,7,8-PeCDD for use in SMA delineation at the Portland Harbor Superfund Site" dated September 16, 2022 (EPA, 2022). EPA's evaluation found that analytical labs can meet the PQLs of 1 picogram per gram (pg/g) for 2,3,7,8-TCDD and 2.5 pg/g for 1,2,3,7,8-PeCDD. PQLs were attained for all 2,3,7,8-TCDD and 1,2,3,7,8-PeCDD results.

3.0 RESULTS

Table 3-1 presents the results of the laboratory analysis for PCB Aroclors and PCDD/PCDF. The laboratory analytical report is included as Attachment A and the data validation reports are included in Attachment B.

As summarized in Table 3-1, no exceedances of RALs/PQLs or PTW thresholds were reported in any of the analyzed samples. The data do not materially impact the interpolations presented in the PDI ER (HGL, 2024b). Subsequently, there is no change to the SMA boundary for SIB.

Table 3-1
Archived Sediment Sample Analysis Results Summary
Archived Sediment Sample Analysis Technical Memorandum, Swan Island Basin Project Area, Portland, Oregon

Notes:
Concentration exceeds CUL
Laboratory method detection limit exceeds CUL
µg/kg - micrograms per kilogram
pg/g - picogram per gram
CAS - Chemical Abstracts Service
CUL - cleanup level
EPA - U.S. Environmental Protection Agency
J - estimated concentration
NA - not analyzed
NE - none established
PAH - polycyclic aromatic hydrocarbon
PCB - polychlorinated biphenyl
PQL - practical quantitation limit
PTW - principal threat waste threshold
RAL - remedial action level
TCDD - tetrachlorodibenzo-p-dioxin
TEQ - toxic equivalent
U - analyte not detected above laboratory reporting limit
WHO = World Health Organization

RE: Portland Harbor Superfund Site 2024 (Portland Harbor Superfund Site)

Please find enclosed sample receipt documentation and analytical results for samples from the project referenced above.

Sample analyses were performed according to ARI's Quality Assurance Plan and any provided project specific Quality Assurance Plan. Each analytical section of this report has been approved and reviewed by an analytical peer, the appropriate Laboratory Supervisor or qualified substitute, and a technical reviewer.

Should you have any questions or problems, please feel free to contact us at your convenience.

Associated Work Order(s)	Associated SDG ID(s)
24H0046	N/A

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed in the enclose Narrative. ARI, an accredited laboratory, certifies that the report results for which ARI is accredited meets all the requirements of the accrediting body. A list of certified analyses, accreditations, and expiration dates is included in this report.

Release of the data contained in this hardcopy data package has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

Analytical Resources, LLC

Kelly Bottem, Client Services Manager

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

Work Order Case Narrative

Client: HydroGeoLogic, Inc
Project: Portland Harbor
Work Order: 24H0046

Sample receipt

Samples as listed on the preceding page were received August 2, 2024 under ARI work order 24H0046. For details regarding sample receipt, please refer to the Cooler Receipt Form.

PCB Aroclors - EPA Method SW8082A

The sample(s) were extracted and analyzed outside the recommended holding times. The samples were stored frozen at ALS Labs.

Initial and continuing calibrations were within method requirements with the exception of CCV7 which fails low on the front column for aroclor 1248 and CCV8 fails high on the front column for 1260. The other columns are in control in SMH0291.

Aroclor 1260 fails low on front column ICV2, aroclor 1260 fails low for CCV4 front column and 1260 fails low for CCV6 front columnin SMH0341.

ICV2 CCV2 CCV4 for aroclor 1260 fails for first column low in SMH0380.

Internal standard areas were within limits with the exception of HBBP which fails low on one column in samples 24H0046-17 and CCV7 and CCV8 for SMH0291.

Internal standard HBBP fails high in front column ICV1 and HBBP fails high in front column for CCV1,CCV2 in SMH0341.

The surrogate percent recoveries were within control limits with the exception of surrogates flagged on the associated forms. Sample 24H0046-30 was re-analyzed at a dilution with surrogate recoveries in control. Both sets of data have been reported.

The method blank(s) were clean at the reporting limits.

The blank spike (BS/LCS) percent recoveries were within control limits.

The matrix spike/matrix spike duplicate (MS/MSD) percent recoveries and relative percent difference (RPD) were within advisory control limits with the exception of analytes flagged on the associated forms.

Cooler Receipt Form

ARI Client: ALS Enviromental Project Name: K2407814

COC No(s): NA Delivered by: Fed-Ex UPS Courier Hand Delivered Other:

Assigned ARI Job No: 24H0046 Tracking No: 7253 3368 9644 NA

Preliminary Examination Phase:

Were intact, properly signed and dated custody seals attached to the outside of the cooler?	YES	NO
Were custody papers included with the cooler?	YES	NO
Were custody papers properly filled out (ink, signed, etc.)	YES	NO

Temperature of Cooler(s) (°C) (recommended 2.0-6.0 °C for chemistry)

Time 1051 3.6

If cooler temperature is out of compliance fill out form 00070F Temp Gun ID#: 100970

Cooler Accepted by: RL Date: 8-2-24 Time: 1051

Complete custody forms and attach all shipping documents

Log-In Phase:

Was a temperature blank included in the cooler?		YES	NO
What kind of packing material was used?	Bubble Wrap Wet Ice Gel Packs Baggies Foam Block Paper Other:		
Was sufficient ice used (if appropriate)?	NA	YES	NO
How were bottles sealed in plastic bags?	Individually	Grouped	Not
Did all bottles arrive in good condition (unbroken)?		YES	NO
Were all bottle labels complete and legible?		YES	NO
Did the number of containers listed on COC match with the number of containers received?		YES	NO
Did all bottle labels and tags agree with custody papers?		YES	NO
Were all bottles used correct for the requested analyses?		YES	NO
Do any of the analyses (bottles) require preservation? (attach preservation sheet, excluding VOCs)	NA	YES	NO
Were all VOC vials free of air bubbles?	NA	YES	NO
Was sufficient amount of sample sent in each bottle?		YES	NO
Date VOC Trip Blank was made at ARI	NA		

Were the sample(s) split by ARI? NA YES Date/Time: _____ Equipment: _____ Split by: _____

Samples Logged by: _____ Date: 8/2/24 Time: 1149 Labels checked by: _____

Notes and Definitions

*	Flagged value is not within established control limits.
D	The reported value is from a dilution
D1	Surrogate was not detected due to sample extract dilution
H	Hold time violation - Hold time was exceeded.
J	Estimated concentration value detected below the reporting limit.
P1	The reported value is greater than 40% difference between the concentrations determined on two GC columns where applicable.
U	This analyte is not detected above the reporting limit (RL) or if noted, not detected above the limit of detection (LOD).
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference
[2C]	Indicates this result was quantified on the second column on a dual column analysis.

Re: Swan Island Basin Portland Harbor
Work Order: 22893

Dear Mr. Sprott:

Cape Fear Analytical LLC (CFA) appreciates the opportunity to provide the enclosed analytical results for the sample(s) we received on August 01, 2024, September 19, 2022 and July 12, 2022. This original data report has been prepared and reviewed in accordance with CFA's standard operating procedures.

Our policy is to provide high quality, personalized analytical services to enable you to meet your analytical needs on time every time. We trust that you will find everything in order and to your satisfaction. If you have any questions, please do not hesitate to call me at 910-795-0421.

Sincerely,

Cynde Larkins

Comments:

Samples E-31-2-3, E-32-5-6, D-36-4-5, E-35-3-4, D30-3-4, E28-5-6 no 7/12/22, B-31-2-3, all received 3 jars - 2 for sample 1 for MS/MSD (8oz)

1 jar of B31-1-2, 1 jar of F27 4-5 and both jars of F27 2-3 arrived broken. All samples transferred to clean, new jar.

F27-1-2 arrived with cracked lids on both jars.

High Resolution Dioxins and Furans Analysis

Case Narrative

HDOX Case Narrative
HydroGeoLogic, Incorporated (HYGL)
SDG 22893

Method/Analysis Information

Product:	**Dioxins/Furans by EPA Method 1613B in Solids**
Analytical Method:	EPA Method 1613B
Extraction Method:	SW846 3540C
Analytical Batch Number:	56596, 56683
Clean Up Batch Number:	56595, 56681
Extraction Batch Number:	56594, 56680

Sample Analysis

Samples were received within temperature requirements at 5.6 °C (22893001, 22893002, 22893003, 22893004, 22893005, 22893006, 22893007, 22893008, 22893009, 22893010, 22893011), -8.7 °C (22893012, 22893013, 22893014), -1.9 °C (22893015, 22893016, 22893017, 22893018, 22893019) and 5.1 °C (22893020, 22893021, 22893022, 22893023, 22893024, 22893025, 22893026, 22893027, 22893028, 22893029).
The following samples were analyzed using the analytical protocol as established in EPA Method 1613B:

Sample ID	Client ID
12037162	Method Blank (MB)
12037163	Laboratory Control Sample (LCS)
12037164	Laboratory Control Sample Duplicate (LCSD)

22893029 SIB-SC-B35-14-14.7-07/07/2022

The samples in this SDG were analyzed on a "dry weight" basis.

SOP Reference
Procedure for preparation, analysis and reporting of analytical data are controlled by Cape Fear Analytical LLC (CFA) as Standard Operating Procedure (SOP). The data discussed in this narrative has been analyzed in accordance with CF-OA-E-020 REV# 8.

Raw data reports are processed and reviewed by the analyst using the TargetLynx software package.

Calibration Information

Initial Calibration
All initial calibration requirements have been met for this sample delivery group (SDG).

Continuing Calibration Verification (CCV) Requirements
All associated calibration verification standard(s) (CVS) met the acceptance criteria.

Quality Control (QC) Information

Certification Statement
The test results presented in this document are certified to meet all requirements of the 2009 TNI Standard.

Method Blank (MB) Statement
The MB(s) analyzed with this SDG met the acceptance criteria.

Surrogate Recoveries
All surrogate recoveries were within the established acceptance criteria for this SDG.

Laboratory Control Sample (LCS) Recovery
The LCS spike recoveries met the acceptance limits.

Laboratory Control Sample Duplicate (LCSD) Recovery
The LCSD spike recoveries met the acceptance limits.

LCS/LCSD Relative Percent Difference (RPD) Statement
The RPD(s) between the LCS and LCSD met the acceptance limits.

QC Sample Designation
Sample 22893001 (SIB-SC-B31-6-7-07/10/2022)- Batch 56596 was selected for analysis as the matrix spike and matrix spike duplicate. A sample of similar matrix, not associated with this SDG, was selected for analysis as the matrix spike and matrix spike duplicate- Batch 56683.

Matrix Spike (MS) Recovery Statement
The MS recoveries were within the established acceptance limits.

Matrix Spike Duplicate (MSD) Recovery Statement
The MSD recoveries were within the established acceptance limits.

MS/MSD Relative Percent Difference (RPD) Statement
The RPD(s) between the MS and MSD met the acceptance limits.

Technical Information

Holding Time Specifications
CFA assigns holding times based on the associated methodology, which assigns the date and time from sample collection. Those holding times expressed in hours are calculated in the AlphaLIMS system. Those holding times expressed as days expire at midnight on the day of expiration. All samples in this SDG met the specified holding time.

Preparation/Analytical Method Verification
All procedures were performed as stated in the SOP.

Sample Dilutions
The samples in this SDG did not require dilutions.

Sample Re-extraction/Re-analysis
Re-extractions or re-analyses were not required in this SDG.

Miscellaneous Information

Manual Integrations

Certain standards and QC samples required manual integrations to correctly position the baseline as set in the calibration standard injections. Where manual integrations were performed, copies of all manual integration peak profiles are included in the raw data section of this fraction. Manual integrations were required for data files in this SDG.

Sample Preparation

No difficulties were encountered during sample preparation.

System Configuration

This analysis was performed on the following instrument configuration:

Instrument ID	Instrument	System Configuration	Column ID	Column Description
HRP722_2	Primary Dioxin Analysis	Dioxin Analysis	DB-5MS	60m x 0.25mm, 0.25um
HRP757_3	Confirmation Analysis	TCDF Confirmation	DB-225	30m x 0.25mm, 0.25um

Sample Data Summary

Cape Fear Analytical, LLC

3306 Kitty Hawk Road Suite 120, Wilmington, NC 28405 - (910) 795-0421 - www.capefearanalytical.com

Qualifier Definition Report
for

HYGL001 HydroGeoLogic, Incorporated

Client SDG: 22893 CFA Work Order: 22893

The Qualifiers in this report are defined as follows:

U Analyte was analyzed for, but not detected above the specified detection limit.

J Value is estimated

B The target analyte was detected in the associated blank.

* A quality control analyte recovery is outside of specified acceptance criteria

** Analyte is a surrogate compound

K Estimated Maximum Possible Concentration

DL Indicates that sample is diluted.

RA Indicates that sample is re-analyzed without re-extraction.

RE Indicates that sample is re-extracted.

Review/Validation

Cape Fear Analytical requires all analytical data to be verified by a qualified data reviewer.

The following data validator verified the information presented in this case narrative:

Signature:  **Name: Alexis Finks**

Date: 26 AUG 2024 **Title: Data Validator**

Re: Swan Island Basin Portland Harbor
Work Order: 22921

Dear Mr. Sprott:

Cape Fear Analytical LLC (CFA) appreciates the opportunity to provide the enclosed analytical results for the sample(s) we received on August 09, 2024. This original data report has been prepared and reviewed in accordance with CFA's standard operating procedures.

Our policy is to provide high quality, personalized analytical services to enable you to meet your analytical needs on time every time. We trust that you will find everything in order and to your satisfaction. If you have any questions, please do not hesitate to call me at 910-795-0421.

Sincerely,

Cynde Larkins

High Resolution Dioxins and Furans Analysis

Case Narrative

HDOX Case Narrative
HydroGeoLogic, Incorporated (HYGL)
SDG 22921

Method/Analysis Information

Product:	**Dioxins/Furans by EPA Method 1613B in Solids**
Analytical Method:	EPA Method 1613B
Extraction Method:	SW846 3540C
Analytical Batch Number:	56683
Clean Up Batch Number:	56681
Extraction Batch Number:	56680

Sample Analysis

Samples were received within temperature requirements at 4.6 °C.
(22921001,22921002,22921003).
The following samples were analyzed using the analytical protocol as established in EPA Method 1613B:

Sample ID	Client ID
12037217	Method Blank (MB)
12037218	Laboratory Control Sample (LCS)
12037219	Laboratory Control Sample Duplicate (LCSD)
22921001	SIB-SC-B33-6-7-08/21/2022
22921002	SIB-SC-B33-7-8-08/21/2022
22921003	SIB-SC-B33-8-9-08/21/2022

The samples in this SDG were analyzed on a "dry weight" basis.

SOP Reference
Procedure for preparation, analysis and reporting of analytical data are controlled by Cape Fear Analytical LLC (CFA) as Standard Operating Procedure (SOP). The data discussed in this narrative has been analyzed in accordance with CF-OA-E-020 REV# 8.

Raw data reports are processed and reviewed by the analyst using the TargetLynx software package.

Calibration Information

Initial Calibration
All initial calibration requirements have been met for this sample delivery group (SDG).

Continuing Calibration Verification (CCV) Requirements
All associated calibration verification standard(s) (CVS) met the acceptance criteria.

Quality Control (QC) Information

Certification Statement
The test results presented in this document are certified to meet all requirements of the 2009 TNI Standard.

Method Blank (MB) Statement
The MB(s) analyzed with this SDG met the acceptance criteria.

Surrogate Recoveries
All surrogate recoveries were within the established acceptance criteria for this SDG.

Laboratory Control Sample (LCS) Recovery
The LCS spike recoveries met the acceptance limits.

Laboratory Control Sample Duplicate (LCSD) Recovery
The LCSD spike recoveries met the acceptance limits.

LCS/LCSD Relative Percent Difference (RPD) Statement
The RPD(s) between the LCS and LCSD met the acceptance limits.

QC Sample Designation
A sample of similar matrix, not associated with this SDG, was selected for analysis as the matrix spike and matrix spike duplicate.

Technical Information

Holding Time Specifications
CFA assigns holding times based on the associated methodology, which assigns the date and time from sample collection. Those holding times expressed in hours are calculated in the AlphaLIMS system. Those holding times expressed as days expire at midnight on the day of expiration. All samples in this SDG met the specified holding time.

Preparation/Analytical Method Verification
All procedures were performed as stated in the SOP.

Sample Dilutions
The samples in this SDG did not require dilutions.

Sample Re-extraction/Re-analysis
Re-extractions or re-analyses were not required in this SDG.

Miscellaneous Information

Manual Integrations

Certain standards and QC samples required manual integrations to correctly position the baseline as set in the calibration standard injections. Where manual integrations were performed, copies of all manual integration peak profiles are included in the raw data section of this fraction. Manual integrations were required for data files in this SDG.

Sample Preparation

No difficulties were encountered during sample preparation.

System Configuration

This analysis was performed on the following instrument configuration:

Instrument ID	Instrument	System Configuration	Column ID	Column Description
HRP722_2	Primary Dioxin Analysis	Dioxin Analysis	DB-5MS	60m x 0.25mm, 0.25um

Sample Data Summary

Cape Fear Analytical, LLC
3306 Kitty Hawk Road Suite 120, Wilmington, NC 28405 - (910) 795-0421 - www.capefearanalytical.com

Qualifier Definition Report
for

HYGL001 HydroGeoLogic, Incorporated

Client SDG: 22921 CFA Work Order: 22921

The Qualifiers in this report are defined as follows:

U Analyte was analyzed for, but not detected above the specified detection limit.
J Value is estimated
B The target analyte was detected in the associated blank.
* A quality control analyte recovery is outside of specified acceptance criteria
** Analyte is a surrogate compound
K Estimated Maximum Possible Concentration

DL Indicates that sample is diluted.
RA Indicates that sample is re-analyzed without re-extraction.
RE Indicates that sample is re-extracted.

Review/Validation

Cape Fear Analytical requires all analytical data to be verified by a qualified data reviewer.

The following data validator verified the information presented in this case narrative:

Signature:  **Name: Erin Suhrie**

Date: 29 AUG 2024 **Title: Data Validator**

The following Stage 2A review was performed on the requested analyses. No results were rejected, and analytical completeness is 100%.

Narrative and Completeness Review – The case narrative and data package were checked for completeness. The narrative noted internal standard and ICV/CCV discrepancies. All this has been noted but falls outside of a 2A validation.

Qualification: None required.

Sample Delivery and Condition – All samples arrived intact at the laboratory with temperatures between 0-6°C or frozen and were properly preserved. Lab noted cooler arrived without signed and dated custody seals, and without a temperature blank. No additional qualification required.

Qualification: None required.

Holding Times –The narrative noted that PCB Aroclors samples were frozen to extend holding times; this is in accordance with the QAPP archiving protocols. All Aroclor samples were extracted approximately 12 months beyond the 1-year holding time for frozen Aroclors sample preparation. There is no holding time for PCBs in soil/sediment samples and no qualification is required.

Qualification: None required.

Method Blanks – All method blanks were free from contamination.

Qualification: None required.

Rinsate Blanks – Equipment rinse blanks EB01-07/12/2022, EB05-07/26/2022, and EB08-08/21/2022 (results reported in SDGs 22G0258, 22G0436, and 22H0491) are associated with all sample results reported in this SDG. All rinse blanks were free from contamination.

Qualification: None required.

Laboratory Control Sample (LCS) and Laboratory Control Sample Duplicate (LCSD) – All LCS/LCSD %Rs and RPDs were within QAPP control limits. A standard reference material was also reported for each preparation batch; all SRM %Rs met the control limits.

Qualification: None required.

Surrogates – All surrogate %R were within QAPP control limits except for:

- The original analysis of sample SIB-SC-E24-7-8-07/12/2022 showed a high %R for surrogate decachlorobiphenyl on column 1 and a low %R on column 2. All detected results reported for this analysis are reported from column 2 and should be qualified J-SSL. All non-detected results reported for this analysis are reported from column 1 and do not require qualification.
- The 5x diluted analysis of sample SIB-SC-E24-7-8-07/12/2022 had three of the four reported surrogate %Rs below the control limits; no results from this analysis are reported and all results for this analysis should be qualified DNR-EXC.
- Sample SIB-SC-E24-8-9-07/12/2022 had a high %R for surrogate decachlorobiphenyl on column 1 and a low %R for surrogate decachlorobiphenyl on column 2. All detected results reported for

this analysis are reported from column 2 and should be qualified J-SSL. All non-detected results reported for this analysis are reported from column 1 and do not require qualification.

- Sample SIB-SC-J06-8-9-07/26/2022 did not report surrogate values due to intense dilution effects. This sample was analyzed at a 100x dilution.

Qualification: **The following results were adjusted to change the reported_result field from Yes to No: all results from the 5x diluted analysis of sample SIB-SC-E24-7-8-07/12/2022. These results are qualified DNR-EXC.**

The following detected results were qualified J-SSL: Aroclors 1248, 1254, and 1260 for samples SIB-SC-E24-8-9-07/12/2022 and the original analysis of sample SIB-SC-E24-7-8-07/12/2022.

- **Aroclors 1248, 1254, and 1260 for the 5x dilution reanalysis of sample SIB-SC-E24-7-8-07/12/2022 with reason code SSL.**

Matrix Spike/Matrix Spike Duplicate (MS/MSD) – The MS and MSD performed on sample SIB-SC-B31-7-8-07/10/2022 had all %Rs and RPDs in control. The MS and MSD performed on sample SIB-SC-J06-8-9-07/26/2022 had a low %R for Aroclor-1260 in the MS and high %Rs for Aroclor 1016 in the MS and for Aroclors 1016 and 1260 in the MSD; the Aroclor 1260 RPD was above the control limit. The parent sample was analyzed at 100x dilution due to elevated concentrations of multiple Aroclors and matrix effects. The matrix effects confirmed are in the MS/MSD; however, since the parent sample was diluted 100x, these matrix effects should be mitigated and in the judgment of the HGL reviewer, no qualification is required.

The laboratory included a standard reference matrix sample in each preparation batch. All SRM %Rs were in control.

Qualification: None required.

Field Duplicate – A field duplicate was not submitted with the samples in this SDG.

Qualification: None required.

Laboratory Duplicate – A laboratory duplicate was not performed in this SDG.

Qualification: None required.

Compound Quantitation – Analyte results were reported with the associated DL, LOD, and LOQ in the DoD format instead of with the associated MDL and RL. Non-detected results were reported on the hardcopy as <#, where # corresponds to the LOD. The HGL reviewer confirmed that the value associated with non-detected results in the EDD is the MDL, in accordance with the project reporting requirements. Analytes detected between the MDL and LOQ were reported as J-qualified results by the laboratory. These J qualifiers were retained unless superseded by a more severe qualifier.

Qualification: None required.

Qualification Summary Table (concentrations in µg/kg):

Sample	Analyte	Lab Value	Lab Qualifier	Validated Value	Validated Qualifier	Reason Code
SIB-SC-E24-8-9-07/12/2022	Aroclor 1248	101	H, P1	101	J	SSL

The following Stage 2A review was performed on the requested analyses. No results were rejected, and analytical completeness is 100%.

Narrative and Completeness Review – The case narrative and data package were checked for completeness. No completeness issues were noted.

Qualification: None required.

Sample Delivery and Condition – All samples arrived at the laboratory with temperatures within 0-6°C or were frozen. Some sample containers were cracked and the samples were transferred to new containers. Some samples were noted to be missing the dates and times, in which case the laboratory logged these samples in accordance with the information on the custody form.

Qualification: None required.

Holding Times – All samples were frozen. The samples collected in July 2022 were prepared more than 1 year outside of 1 year holding time for frozen samples. Due to the stable nature of PCDD/PCDFs, it is the judgment that all results from July 2022 samples can be accepted with the qualification of J-HTPX (detections) or UJ-HTPX (non-detections). The samples collected in August 2022 were prepared within 2 years of collection and all results from August 2022 should be qualified J-HTP (detections) or UJ-HTP (non-detections).

Qualification: **All results for July 2022 samples are qualified of J-HTPX (detections) or UJ-HTPX (non-detections)**. **All results for August 2022 samples are qualified of J-HTP (detections) or UJ-HTP (non-detections)**.

Method Blanks – The method blank for preparation batch 56594 was contaminated with several analytes, including:

- 0.162 pg/g of 1,2,3,7,8-PeCDD, leading to a qualification limit of 0.81 pg/g
- 1.15 pg/g of 1,2,3,4,6,7,8,9-OCDD, leading to a qualification limit of 5.75 pg/g
- 0.138 pg/g of 1,2,3,4,7,8-HxCDF, leading to a qualification limit of 0.69 pg/g
- 0.104 pg/g of 2,3,4,6,7,8-HxCDF, leading to a qualification limit of 0.52 pg/g
- 0.404 pg/g of 1,2,3,4,6,7,8-HpCDF, leading to a qualification limit of 2.02 pg/g

The following detected results were below the associated qualification limit and should be qualified U:

- The 1,2,3,7,8-PeCDD results for samples SIB-SC-B31-7-8-07/10/2022 and SIB-SC-B32-8-9-07/25/2022
- The 1,2,3,4,6,7,8,9-OCDD results for samples SIB-SC-B31-7-8-07/10/2022, SIB-SC-B31-10-11-07/10/2022, and SIB-SC-B34-0-1-08/22/2022
- The 1,2,3,4,7,8-HxCDF results for samples SIB-SC-B31-7-8-07/10/2022, SIB-SC-B31-8-9-07/10/2022, SIB-SC-B31-9-10-07/10/2022, SIB-SC-B31-11-12-07/10/2022, SIB-SC-B31-13-13.7-07/10/2022, SIB-SC-B32-8-9-07/25/2022, and SIB-SC-B35-0-1-07/07/2022
- The 2,3,4,6,7,8-HxCDF results for sample SIB-SC-B31-7-8-07/10/2022
- The 1,2,3,4,6,7,8-HpCDF result for samples SIB-SC-B31-6-7-07/10/2022, SIB-SC-B31-7-8-07/10/2022, SIB-SC-B31-8-9-07/10/2022, SIB-SC-B31-9-10-07/10/2022, SIB-SC-B31-10-11-07/10/2022, SIB-SC-B31-11-12-07/10/2022, SIB-SC-B31-12-13-07/10/2022, SIB-SC-B31-13-13.7-07/10/2022, SIB-SC-B32-7-8-07/25/2022, SIB-SC-B34-0-1-08/22/2022, SIB-SC-B34-8-9-08/22/2022, SIB-SC-B34-9-9.7-08/22/2022, and SIB-SC-B35-0-1-07/07/2022

The method blank for batch 56680 was contaminated with several analytes, including:

- 0.496 pg/g of 1,2,3,4,6,7,8,9-OCDD, leading to a qualification limit of 2.48 pg/g
- 0.138 pg/g of 1,2,3,7,8-PeCDF, leading to a qualification limit of 0.69 pg/g
- 0.134 pg/g of 2,3,4,7,8-PeCDF, leading to a qualification limit of 0.67 pg/g
- 0.174 pg/g of 1,2,3,6,7,8-HxCDF, leading to a qualification limit of 0.87 pg/g
- 0.288 pg/g of 1,2,3,4,6,7,8-HpCDF, leading to a qualification limit of 1.44 pg/g

The 1,2,3,4,6,7,8-HpCDF results for samples SIB-SC-B35-6-7-07/07/2022, SIB-SC-B35-7-8-07/07/2022, SIB-SC-B35-8-9-07/07/2022, SIB-SC-B35-9-10-07/07/2022, SIB-SC-B35-10-11-07/07/2022, SIB-SC-B35-11-12-07/07/2022, SIB-SC-B35-12-13-07/07/2022, and SIB-SC-B35-14-14.7-07/07/2022 should be qualified U.

Qualification: **The following results were qualified U-MBL; the detect_flag for the affected results is changed from Y to N.**

- **The 1,2,3,7,8-PeCDD results for samples SIB-SC-B31-7-8-07/10/2022 and SIB-SC-B32-8-9-07/25/2022**
- **The 1,2,3,4,6,7,8,9-OCDD results for samples SIB-SC-B31-7-8-07/10/2022, SIB-SC-B31-10-11-07/10/2022, and SIB-SC-B34-0-1-08/22/2022**
- **1,2,3,4,7,8-HxCDF results for samples SIB-SC-B31-7-8-07/10/2022, SIB-SC-B31-8-9-07/10/2022, SIB-SC-B31-9-10-07/10/2022, SIB-SC-B31-11-12-07/10/2022, SIB-SC-B31-13-13.7-07/10/2022, SIB-SC-B32-8-9-07/25/2022, and SIB-SC-B35-0-1-07/07/2022**
- **The 2,3,4,6,7,8-HxCDF result for sample SIB-SC-B31-7-8-07/10/2022**
- **The 1,2,3,4,6,7,8-HpCDF results for samples SIB-SC-B31-6-7-07/10/2022, SIB-SC-B31-7-8-07/10/2022, SIB-SC-B31-8-9-07/10/2022, SIB-SC-B31-9-10-07/10/2022, SIB-SC-B31-10-11-07/10/2022, SIB-SC-B31-11-12-07/10/2022, SIB-SC-B31-12-13-07/10/2022, SIB-SC-B31-13-13.7-07/10/2022, SIB-SC-B32-7-8-07/25/2022, SIB-SC-B34-0-1-08/22/2022, SIB-SC-B34-8-9-08/22/2022, SIB-SC-B34-9-9.7-08/22/2022, and SIB-SC-B35-0-1-07/07/2022**
- **The 1,2,3,4,6,7,8-HpCDF results for samples SIB-SC-B35-6-7-07/07/2022, SIB-SC-B35-7-8-07/07/2022, SIB-SC-B35-8-9-07/07/2022, SIB-SC-B35-9-10-07/07/2022, SIB-SC-B35-10-11-07/07/2022, SIB-SC-B35-11-12-07/07/2022, SIB-SC-B35-11-12-07/07/2022, SIB-SC-B35-14-14.7-07/07/2022 should be qualified U.**

Rinsate Blanks – Equipment rinse blank EB01-07/12/2022 (results reported in SDG 20046) is associated with all sample collected on July 7, 10, and 12, 2022 and equipment blank EB05-07/26/2022 (results reported in SDG 20123) is associated with all samples collected on July 25, 2022. Both equipment blanks were free from contamination.

Equipment rinse blank EB09-08242022 (results reported in SDG 20283) is associated with all samples in this SDG that were collected on 8/22/22. This rinse blank was contaminated with 14 PCDD/PCDFs. The OCDD and 1,2,3,4,6,7,8-HpCDF results are attributable to aqueous preparation batch contamination and are not considered to be the result of cross-contamination in the field; however, this equipment blank was contaminated with 12 other PCDD/PCDF analytes. Due to the differences in preparation factors between aqueous and solid samples, the HGL reviewer determined that a concentration reported as X pg/L in the rinse blank corresponds approximately to a relative soil concentration of X/10 pg/g. The contamination in the equipment blank and the corresponding soil action levels are presented in the following table.

Analyte	Aqueous Concentration (pg/L)	Equivalent Soil Concentration (pg/g)	Soil Qualification Level (pg/g)
1,2,3,7,8-PeCDD	2.36	0.236	1.18
1,2,3,4,7,8-HxCDD	1.58	0.158	0.790
1,2,3,6,7,8-HxCDD	1.58	0.158	0.790
1,2,3,7,8,9-HxCDD	1.84	0.184	0.920
1,2,3,4,6,7,8-HpCDD	1.39	0.139	0.695
1,2,3,7,8-PeCDF	2.78	0.278	1.39
2,3,4,7,8-PeCDF	2.34	0.234	1.17
1,2,3,4,7,8-HxCDF	2.32	0.232	1.16
1,2,3,6,7,8-HxCDF	1.97	0.197	0.985
2,3,4,6,7,8-HxCDF	1.15	0.115	0.575
1,2,3,7,8,9-HxCDF	1.37	0.137	0.685
1,2,3,4,7,8,9-HpCDF	1.37	0.137	0.685

The 1,2,3,7,8,9-HxCDD result for sample SIB-SC-B34-7-8-08/22/2022 and the 1,2,3,6,7,8-HxCDD and 1,2,3,7,8,9-HxCDD results for sample SIB-SC-B34-8-9-08/22/2022 should be qualified U. All other results associated with this equipment rinse blank were non-detections or detected results greater than the qualification level.

Qualification: **The 1,2,3,7,8,9-HxCDD result for sample SIB-SC-B34-7-8-08/22/2022 and the 1,2,3,6,7,8-HxCDD and 1,2,3,7,8,9-HxCDD results for sample SIB-SC-B34-8-9-08/22/2022 are qualified U-EBL.**

Laboratory Control Sample (LCS) and Laboratory Control Sample Duplicate (LCSD) – LCS/LCSD %Rs were within QAPP control limits. All RPDs were within QAPP control limits.

Qualification: None required.

Surrogates – All surrogates were within control limits.

Qualification: None required.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) – An MS/MSD was performed using sample SIB-SC-B31-6-7-07/10/2022. All %Rs and RPDs were within control limits.

Qualification: None required.

Field Duplicate – No field duplicates were submitted with this SDG.

Qualification: None required.

Compound Quantitation – Analyte non-detections were reported as the EDL and qualified U. Analytes detected between the EDL and PQL were reported as J-qualified results by the laboratory. These J qualifiers were retained unless superseded by a more severe qualifier.

If a detected analyte has an ion ratio outside the characteristic ion ratio window, the result is reported as an estimated maximum potential concentration. All results reported as an EMPC (a "K" flag is present in the laboratory qualifier) are qualified J-EMPC unless superseded by a higher priority qualifier.

2,3,7,8-TCDF is not fully resolved on the DB-5MS column; when detected above the PQL on the DB-5MS column, the result was confirmed on a DB-225 column using the instrument ID listed in the case narrative. In cases where two results are reported for 2,3,7,8-TCDF for a sample, the result from the DB-225 column is selected for use and the result from the DB-5MS is qualified DNR-EXC.

Qualification: **The following results are qualified:**

- **All results reported with a laboratory qualifier of only K are qualified J with reason code EMPC. All results reported with a laboratory qualifier of BJK or JK are qualified as simply J to remove non-standard informational qualifiers and to be replaced with a valid final qualifier.**
- **All 2,3,7,8-TCDF results reported from the DB-5MS column that are paired with a 2,3,7,8-TCDF result from the DB-225 column are qualified DNR, reason code EXC; note that the reportable_result field for these results are populated with "Yes" by the laboratory and are changed to "No" for the affected results.**

Qualification Summary Table (results in pg/g):

In addition to the qualifiers assigned below, all detected results <PQL retain the J qualifier assigned by the laboratory. All non-standard qualifiers assigned by the laboratory are removed and are not included as the final qualifier.

Sample	Analyte	Lab Value	Lab Qualifier	Validated Value	Validated Qualifier	Reason Code

The following Stage 2A review was performed on the requested analyses. No results were rejected, and analytical completeness is 100%.

Narrative and Completeness Review – The case narrative and data package were checked for completeness. No completeness issues were noted.

Qualification: None required.

Sample Delivery and Condition – All samples arrived intact at the laboratory with temperatures between 0-6°C or frozen, and were properly preserved. Samples were noted to be missing date & times on arrival to the laboratory and were logged in accordance with information on the custody form.

Qualification: None required.

Holding Times – All samples were frozen and analyzed outside of 1 year holding time for frozen samples, but exceeded holding time by less than 1 additional year. All results should be qualified J-HTP (detections) or UJ-HTP (non-detections).

Qualification: **All results are qualified of J-HTP (detections) or UJ-HTP (non-detections)**.

Method Blanks – The MB for batch 56680 was contaminated with several analytes:

- 0.496 pg/g OCDD, leading to a qualification limit of 2.48 pg/g
- 0.138 pg/g 1,2,3,7,8-PeCDF, leading to a qualification limit of 0.690 pg/g
- 0.134 pg/g 2,3,4,7,8-PeCDF, leading to a qualification limit of 0.670 pg/g
- 0.174 pg/g 1,2,3,6,7,8-HxCDF, leading to a qualification limit of 0.870 pg/g
- 0.288 pg/g 1,2,3,4,6,7,8-HpCDF, leading to a qualification limit of 1.44 pg/g

The following detected results were below the associated qualification limit and should be qualified U:

- The 1,2,3,7,8-PeCDF results for SIB-SC-B33-6-7-08/21/2022
- The 1,2,3,4,6,7,8-HpCDF results for all samples

Qualification: **The following results were qualified U-MBL; the detect flag for the affected results is changed from Y to N.**

- **The 1,2,3,7,8-PeCDF results for sample SIB-SC-B33-6-7-08/21/2022**
- **The 1,2,3,4,6,7,8-HpCDF results for samples SIB-S SC-B33-6-7-08/21/2022, SIB-SC-B33-7-8-08/21/2022, and SIB-SC-B33-8-9-08/21/2022**

Rinsate Blanks – Equipment rinse blank EB08-08/21/2022 (results reported in SDG 20283) is associated with all samples in this SDG (samples collected on 8/21/2022). The rinse blank was contaminated with 4.36 pg/L OCDD. The OCDD result is attributable to aqueous preparation batch contamination and is not considered to be the result of cross contamination in the field.

Qualification: None required.

Laboratory Control Sample (LCS) and Laboratory Control Sample Duplicate (LCSD) – LCS/LCSD %Rs were within QAPP control limits. All RPDs were within QAPP control limits.

Qualification: None required.

Surrogates – All surrogates were within control limits.

Qualification: None required.

Matrix Spike/Matrix Spike Duplicate (MS/MSD) – MS/MSD analyses were not performed for this SDG.

Qualification: None required.

Field Blank – No field blanks were submitted with this SDG.

Qualification: None required.

Field Duplicate – No field duplicates were submitted with this SDG.

Qualification: None required.

Compound Quantitation – Analyte non-detections were reported as the EDL and qualified U. Analytes detected between the EDL and PQL were reported as J-qualified results by the laboratory. These J qualifiers were retained unless superseded by a more severe qualifier.

If a detected analyte has an ion ratio outside the characteristic ion ratio window, the result is reported as an estimated maximum potential concentration. All results reported as an EMPC (a "K" flag is present in the laboratory qualifier) are qualified J-EMPC unless superseded by a higher priority qualifier.

Qualification: **The following results are qualified:**

- **All results reported with a laboratory qualifier of only K are qualified J with reason code EMPC. All results reported with a laboratory qualifier of BJK or JK are qualified as J to remove non-standard informational qualifiers and to be replaced with a valid final qualifier.**

Qualification Summary Table (results in pg/g):

NON-AQUEOUS PHASE LIQUID SCREENING TECHNICAL MEMORANDUM

This page was intentionally left blank.

NON-AQUEOUS PHASE LIQUID SCREENING TECHNICAL MEMORANDUM
PRE-FINAL 90% REMEDIAL DESIGN
REMEDIAL DESIGN SERVICES, SWAN ISLAND BASIN PROJECT AREA
CERCLA DOCKET NO. 10-2021-001
PORTLAND HARBOR SUPERFUND SITE
PORTLAND, MULTNOMAH COUNTY, OREGON

1.0 INTRODUCTION

This Non-aqueous Phase Liquid (NAPL) Screening Technical Memorandum presents the results of NAPL screening conducted on sediment core samples collected and archived in 2022 from 10 locations at the Swan Island Basin (SIB) Project Area within the Portland Harbor Superfund Site in Portland, Multnomah County, Oregon. The HydroGeoLogic, Inc. (HGL) team performed the work on behalf of the SIB Remedial Design (RD) Group. The samples were collected in accordance with the final Pre-Design Investigation (PDI) Work Plan, which the U.S. Environmental Protection Agency (EPA) approved in May 2022 (HGL, 2022) and testing and analysis was performed in general accordance with field change request (FCR) form variance number 16, approved by EPA in July 2024 (HGL, 2024a).

1.1 OBJECTIVES AND SCOPE

In the summer of 2022, the HGL Team conducted a site-specific sediment chemistry investigation consisting of surface grab samples, sediment cores, and bulk sediment and water samples. Sediment samples were collected during a single field mobilization with initial laboratory analysis and archiving of samples for subsequent laboratory analysis. Sediment cores were divided into 1 foot sample intervals and sediment from sample intervals was homogenized and placed into laboratory-provided jars. Samples were analyzed and archived.

Hydrocarbon field screening (visual screening for stains, NAPL, and/or sheens indicative of residual hydrocarbons) was performed for sediment cores during core processing. Sediment descriptions, including visual observations of sheen and NAPL presence/absence were recorded for stratigraphic intervals for each core. Visual observations of NAPL presence occurred at the following locations within the following depths or depth intervals (Table 1-1, Figure 1-1, Attachment A): C20 (2.6-3ft), C27 (2-5.1 ft), D18 (1.6ft), E24 (8-10ft), E33 (3.5ft), F21 (4.2-5ft), G07 (1.6-2.2 ft), I08 (4.6-51ft), J06 (8.7ft), K04 (0.1-3ft) (HGL, 2024b). Observations of NAPL presence were typically described as ‘blebs’ and no clear pattern of NAPL spatially or by depth was observed. These observations were visual descriptions of the sediment core itself. Photographs of the cores are included as Attachment A.

The objective of the screening is to further evaluate sediment samples corresponding to intervals with visual observations of NAPL presence and assign NAPL Categories (1 to 4) to samples in accordance with ASTM E3281-21. ASTM E3281-21 is a four-step process for screening and selection of locations for laboratory NAPL mobility testing. Step 1 is screening using visual observations and was performed in the field during core processing as described above. Step 2 is

screening using shake tests. Step 3 is assignment and ranking using NAPL categories, and Step 4 uses the results of the screening process to select depths and locations for laboratory mobility testing using undisturbed cores via methods outlined in ASTM E3282-22.

In addition to conducting shake tests, analysis of Record of Decision (ROD) Table 21 contaminants of concern (COCs) was performed on four archived sediment core samples on which shake tests were also conducted. The laboratory analysis provides supplemental data of the chemical composition and contamination levels in these samples, further supporting the interpretation of the NAPL mobility screening results.

1.2 PROJECT AREA BACKGROUND

The SIB Project Area is the active cleanup area designated in the ROD between approximately River Mile (RM) 8.1 and RM 9.2 on the northeast side of the Willamette River. The SIB Project Area is approximately 1.1 miles in length, 117 acres in size, and includes riverbanks from top of the bank to the river.

2.0 NON-AQUEOUS PHASE LIQUID SCREENING OF ARCHIVED SEDIMENT SAMPLES

2.1 STEP 1: SCREENING WITH VISUAL OBSERVATIONS

Hydrocarbon field screening (visual screening for stains, NAPL, and/or sheens indicative of residual hydrocarbons) was performed for sediment cores during core processing. Sediment descriptions, including visual observations of sheen and NAPL were recorded for stratigraphic intervals for each core. The visual observations correspond to the following locations and sediment core sampling intervals:

- C20 (2-3 ft)
- C27 (2-3, 3-4, 4-5, 5-5.5 ft)
- D18 (1-2 ft)
- E24 (7-8, 8-9, 9-10 ft)
- E33 (3-4 ft)
- F21 (4-5 ft)
- G07 (1-2 ft)
- I08 (4-5, 5-6 ft)
- J06 (8-9 ft)
- K04 (1-2, 2-3 ft)

2.2 STEP 2: SCREENING USING LABORATORY TESTING

The 17 archived sediment core samples with observed NAPL presence collected in 2022 from 10 locations in SIB (Figure 1-1) were sent to Integrated Geosciences Laboratories, LLC (IGL). Step 2 of ASTM E3281-21 is screening using shake tests. A deviation from FCR 16 occurred during the execution of Step 2 shake tests, when the laboratory inadvertently performed centrifuge analysis on the samples rather than the shake test. The laboratory later performed the requested shake tests on

15 of the 17 samples. Both sets of results are reported here for Step 2 (Tables 2-1 and 2-2). A deviation occurred when the laboratory had inadequate sample volume to perform shakes tests on samples K04 (1-2 ft) and K04 (2-3 ft) following the centrifuge testing. Accordingly, for these two samples, the results of the centrifuge analysis, rather than shake tests, are used for screening per ASTM E3281-21. As discussed below, the centrifuge tests are comparable to shake test results with regards to NAPL presence/absence determination.

2.2.1 Shake Test Method

IGL performed shake tests in accordance with ASTM Method E3281-21 on 15 of the archived sediment core samples. One-hundred gram aliquots of sediment[1] and water, at a 1:2 ratio, were placed in a clear container and gently shaken for 30 seconds[2]. Visual observations of sheen and NAPL were recorded.

NAPL presence was not observed for the 15 shake test samples. The results are presented in Table 2-1; the complete laboratory report is included as Attachment B-1. Sheen was observed in the following samples:

- C20 (2-3 ft)
- E24 (7-8, 8-9, 9-10 ft)
- F21 (4-5 ft)
- G07 (1-2 ft)
- I08 (4-5, 5-6 ft)
- J06 (8-9 ft)

Although blebs were not observed in the shake test results for these samples, the shake tests were performed on homogenized sample intervals rather than at specific depths as described in ASTM E3281-21. This caused the shake tests to be representative of a larger interval than is ideal and may explain the discrepancy between blebs observed in visual field observations versus the shake test results. The fact that NAPL was not observed in shake tests also likely indicates that field-observed blebs are isolated, few, and insignificant.

2.2.2 Centrifuge Method

IGL performed ASTM Method D425 centrifuge testing on all 17 of the archived sediment core samples. In the laboratory method, samples were inserted into centrifuge cups and centrifuged for 1 hour at a force equal to 1000 times that of gravity at a controlled temperature of 20 ± 1 degrees Celsius (°C). Fluids produced during centrifuging were collected and volumes measured in accordance with the laboratory standard operating procedure (IGL, 2019).

---

[1] Due to limited sample volume 60 gram, 60 gram, and 30 gram aliquots were used for samples SIB-SC-D18-1-2-07/19/2022, SIB-SC-E33-3-4-07/25/2022, and SIB-SC-F21-4-5-07/13/2022, respectively.

[2] Note: the shake testing laboratory data package included in Attachment B-1 erroneously reported the shake time in minutes rather than seconds.

Residual fluid saturations were measured using Dean-Stark extraction and sample properties were characterized at completion of the centrifuge run. The results are presented in Table 2-2; the complete laboratory report is included as Attachment B-2. Results are summarized below:

- The archive sediment samples did not show visible presence of NAPL in the expressed fluid.
- For the archived sediment samples expressed water was described as clear with no hydrocarbon odor.
- Although the method returns quantitative measurements of NAPL saturation levels, these measurements are typically made on undisturbed cores collected per ASTM E3282-22, and the samples analyzed were homogenized from core sample intervals and therefore not undisturbed. The NAPL saturation levels, however, did not change following centrifuging.

2.3 STEP 3: ASSIGNMENT OF NAPL CATEGORIES

In Step 3, results from Steps 1 and 2 are used to assign one of four categories per ASTM 3281-21:

- Category 1 – sample locations with negative shake test results, indicating no sheen or NAPL is present
- Category 2 – sample locations with shake test sheen results, indicating the presence of sheen, but no visible NAPL
- Category 3 – sample locations with shake test bleb results, indicating the presence of some visible NAPL
- Category 4 – sample locations with shake test layer results, indicating the presence of relatively more NAPL

If any samples fell into Category 3 or 4, they would be ranked from the most NAPL to the least NAPL. Based on these rankings, undisturbed cores would be collected from the highest ranked intervals from multiple locations to maximize the geographic extent of laboratory testing per ASTM E3282-22 to determine if NAPL is mobile or immobile at the pore scale and, if needed, at the body scale.

Following the categorical approach described in ASTM E3281-21, the sediment samples are categorized as Category 1 or 2 because no NAPL layer or blebs was present following the shake testing and centrifuge testing (Table 2-1).

2.4 STEP 4: SELECTING LOCATIONS AND DEPTH INTERVALS FOR LABORATORY NAPL MOBILITY TESTING

Based on the screening process described in Step 2 and interpretation of results in Step 3, collection of undisturbed sediment cores for further NAPL mobility testing is not required because the samples were not ranked as Category 3 or 4 (NAPL present).

3.0 SEDIMENT CHEMISTRY TESTING

3.1 METHODS

As discussed in Section 2.1, visual observations from field logging correspond to the following locations and sediment core sampling intervals:

- C20 (2-3 ft)
- C27 (2-3, 3-4, 4-5, 5-5.5 ft)
- D18 (1-2 ft)
- E24 (7-8, 8-9, 9-10 ft)
- E33 (3-4 ft)
- F21 (4-5 ft)
- G07 (1-2 ft)
- I08 (4-5, 5-6 ft)
- J06 (8-9 ft)
- K04 (1-2, 2-3 ft)

Sediment samples from these intervals were analyzed as part of the PDI, with the exception of four archived samples: SIB-SC-E24-7-8-07/12/2022, SIB-SC-E24-8-9-07/12/2022, SIB-SC-E24-9-10-07/12/2022, and SIB-SC-J06-8-9-07/26/2022. These four archived sediment samples were analyzed per FCR 16 for ROD Table 21 COCs. The analysis focused on detecting and quantifying key COCs, including polychlorinated biphenyls (PCBs), dioxins/furans, and polycyclic aromatic hydrocarbons (PAHs).

The frozen sample volumes were retrieved from archive and analyzed in accordance with the PDI Work Plan (HGL, 2022). Analyses for organochlorine pesticides and PAHs were conducted by ALS Kelso, analysis of dioxins/furans was conducted by Cape Fear Analytical, LLC, and analysis for PCB Aroclors was conducted by Analytical Resources, LLC. One exception is noted for SIB-SC-J06-8-9-07/26/2022, where the available sample volume for dioxins/furans analysis was delivered to the analytical laboratory from the archived sample repository but was subsequently misplaced and the analysis could not be completed.

Details of the analytical chemistry work are described in the following Uniform Federal Policy – Quality Assurance Project Plan (UFP-QAPP) worksheets (Appendix B of PDI Work Plan; HGL, 2022):

- Analytes, analytical methods, and laboratories (Worksheet #15 and Worksheets #19 and #30);
- Sample containers, preservation, and hold times (Worksheets #19 and #30); and
- Detection and reporting limits (Worksheet #15).

Due to the age of the archived samples, the analysis was performed outside the standard hold time, with the samples having been stored frozen at -10°C. As described in FCR 16, results from the analysis were qualified with J (detections) or UJ (non-detections) qualifiers, indicating that while

detection may be uncertain, the data is still of sufficient quality to support the overall interpretation of the contamination at the site.

These analytical results will be used in conjunction with the NAPL screening data to support the interpretation of the results.

3.2 RESULTS

Table 3-1 presents a summary of exceedances for dioxins/furans, PCB Aroclors, and PAHs for the archived samples analyzed. Table 3-2 presents a comparison of concentrations of the same analytes for samples bounding the preceding and underlying intervals by location (SIB-SC-E24 and SIB-SC-J06). The laboratory analytical report is included as Attachment C and the data validation reports are included in Attachment D.

In sediment core E24, COC concentrations in the archived analysis intervals (7-8, 8-9, 9-10 ft) were similar to those in the preceding shallower interval that was analyzed (5-6 ft) and the underlying interval that was analyzed (11-12, 12-13 ft). Visual observations of sheen or NAPL were not noted in the preceding or underlying intervals (HGL, 2024b).

In sediment core J06, where data were available to compare (see Section 3.1 for discussion of dioxins/furans analysis), the total PCB Aroclor concentration was higher in the archived interval analyzed at 10,200 micrograms per kilogram (µg/kg) than the preceding interval (5-6 ft; 4,860 µg/kg) or the underlying interval (10-11 ft; 5,890 µg/kg). Total PAH and total carcinogenic PAH concentrations increased minimally from the preceding interval but were lower than the underlying interval. Visual observations of sheen or NAPL were not noted in the preceding or underlying intervals (HGL, 2024b).

4.0 REMEDIAL DESIGN IN AREAS WHERE NON-AQUEOUS PHASE LIQUID WAS OBSERVED DURING PRE-DESIGN INVESTIGATION

Of the 10 PDI core locations with visual observations of NAPL (only sheens observed), 6 core locations (C20, C27, K04, J06, G07, I08, J08, K04) will be dredged to below the deepest interval of observed NAPL (Figure 1-1). In these six core locations, dredge depths will also extend below the deepest principal threat waste (PTW) threshold exceedance.

The remaining four core locations with visual observations of NAPL may leave both NAPL-sheened and PTW threshold-exceeding sediments in place. Two of the core locations (E24 and E33) fall outside any proposed dredge area, with the observed impacts several feet below the sediment surface to be capped (Table 1-1; Figure 1-1). At the remaining two core locations, NAPL sheen was observed within intervals that intersect the edges of dredge prisms: the observation of sheen at D18 was between 1 and 2 ft below mudline, with the proposed dredge depth removing 1.6 ft of sediment, and the observation of sheen at F21 was between 4 and 5 ft below mudline, with a design dredge depth of 3.9 ft at that location (Figure 1-1). To address any potential for NAPL transfer to the water column from the post-dredge surface at these two locations, the Remedial Action (RA) Contractor will place 3 inches of organoclay-containing granules within a 50-ft radius centered on these two core locations after dredging.

For precautions regarding NAPL during dredging, the Water Quality Monitoring Plan (WQMP; Attachment C of Volume II, Appendix N) Section 3.2 and Table 1-2 provide triggers and actions to be taken during dredging if visible oil or sheen (NAPL) is encountered during RA. The WQMP further states that the RA Contractor will be responsible for updating the WQMP prior to implementing in-water construction activities to address any additional NAPL considerations. As described in Appendix E Cap Design Tech Memo, if any NAPL is observed at the water surface after dredging activities have been completed in an area, a contingency cap containing organoclay absorbent will be placed on the sediment surface in the area of the NAPL.

Notes:

[1] Horizontal Projection: NAD83 Oregon State Plane North (international ft)

[2] Sheet categories:

Heavy = Heavy sheen with color/iridescence

Moderate = Light to heavy sheen, may have some color/iridescence

Slight = Light, colorless, dull sheen

None = No visible sheen

[3] NAPL column:

Yes = core log is consistent with observations of a separate liquid phase in the sediment sample.

No = no observation of NAPL.

cm = centimeter

ft = feet

mm = millimeter

NAD83 = North American Datum of 1983

NAPL = non-aqueous phase liquid

PDI = Pre-Design Investigation

Notes:
*Analyzed under FCR 16
Concentration exceeds CUL
Concentration exceeds CUL and RAL/PQL
Concentration exceeds CUL, RAL/PQL, PTW threshold
µg/kg - micrograms per kilogram
pg/g - picogram per gram

BaPEq - benzo(a)pyrene equivalent
CALC SUM - summed analyte group
CALC TEQ - results multiplied by TEF to calculate TEQ
CAS - Chemical Abstracts Service
cPAH - carcinogenic polycyclic aromatic hydrocarbon
DDD - dichlorodiphenyldichloroethane
DDE - dichlorodiphenyldichloroethylene
DDT - dichlorodiphenyltrichloroethane
DDx - DDD + DDE + DDT
CUL - cleanup level
HpCDF - Heptachlorodibenzofuran
J - estimated concentration
NA - not analyzed/applicable
NE - none established
PAH - polycyclic aromatic hydrocarbon
PCB - polychlorinated biphenyl
PQL - practical quantitation limit
PTW - principal threat waste
RAL - remedial action level
SIM - selected ion monitoring
TEF - toxicity equivalency factor
TEQ - toxic equivalent
U - analyte not detected above laboratory reporting limit
WHO - World Health Organization

Re: IGS Labs File No: **2410-103**
Project Name: **HGL-SIB-PDI**
Project Number: **DT2002.03.03.01.01**
Site Location: **OR.**

Subject: Final Report: NAPL Sediment – Water Shake Test – ASTM D3282-21a.

Dear Andrea Fletcher,

Please find enclosed report for Physical Properties Analysis conducted on fifteen (15) soil samples received from your **"HGL-SIB-PDI"** project. All analyses were performed by applicable ASTM, EPA, or API methodologies. The samples are currently in storage and will be retained for thirty days past the completion of testing at no charge. Please note that the samples will be disposed of at that time. You may contact me regarding storage, disposal, or return of the samples.

Integrated Geosciences Laboratories appreciate the opportunity to be of service. If you have any questions or require additional information, please contact me or Emeka Anazodo at (713) 316-1800.

Sincerely,

Adebowale Ogunsola
Operations Manager
Integrated Geosciences Laboratories, LLC.

Re: IGS Labs File No: **2408-76**
Project Name: **HGL-SIB-PDI**
Project Number: **DT2002.03.03.01.01**
Site Location: **OR.**

Subject: Final Report: Free Product Mobility Package – mod. ASTM D425, API RP40.

Dear Andrea Fletcher,

Please find enclosed report for Physical Properties Analysis conducted on seventeen (17) soil samples received from your **"HGL-SIB-PDI"** project. All analyses were performed by applicable ASTM, EPA, or API methodologies. The samples are currently in storage and will be retained for thirty days past the completion of testing at no charge. Please note that the samples will be disposed of at that time. You may contact me regarding storage, disposal, or return of the samples.

Integrated Geosciences Laboratories appreciate the opportunity to be of service. If you have any questions or require additional information, please contact me or Emeka Anazodo at (713) 316-1800.

Sincerely,

Adebowale Ogunsola
Operations Manager

Laboratory Test Program Notes

1. Standard TAT for basic analysis is 10-15 business days.
2. Free Product Mobility Package: Applied Centrifugal force demonstrates product mobility; includes residual saturation by Dean Stark, total porosity, grain and bulk density.

Re: Swan Island Basin Portland Harbor
Work Order: 22893

Dear Mr. Sprott:

Cape Fear Analytical LLC (CFA) appreciates the opportunity to provide the enclosed analytical results for the sample(s) we received on August 01, 2024, September 19, 2022 and July 12, 2022. This original data report has been prepared and reviewed in accordance with CFA's standard operating procedures.

Our policy is to provide high quality, personalized analytical services to enable you to meet your analytical needs on time every time. We trust that you will find everything in order and to your satisfaction. If you have any questions, please do not hesitate to call me at 910-795-0421.

Sincerely,

Cynde Larkins

RE: Portland Harbor Superfund Site 2024 (Portland Harbor Superfund Site)

Please find enclosed sample receipt documentation and analytical results for samples from the project referenced above.

Sample analyses were performed according to ARI's Quality Assurance Plan and any provided project specific Quality Assurance Plan. Each analytical section of this report has been approved and reviewed by an analytical peer, the appropriate Laboratory Supervisor or qualified substitute, and a technical reviewer.

Should you have any questions or problems, please feel free to contact us at your convenience.

Associated Work Order(s)	Associated SDG ID(s)

I certify that this data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed in the enclose Narrative. ARI, an accredited laboratory, certifies that the report results for which ARI is accredited meets all the requirements of the accrediting body. A list of certified analyses, accreditations, and expiration dates is included in this report.

Release of the data contained in this hardcopy data package has been authorized by the Laboratory Manager or his/her designee, as verified by the following signature.

Analytical Resources, LLC

Kelly Bottem, Client Services Manager

The results in this report apply to the samples analyzed in accordance with the chain of custody document. This analytical report must be reproduced in its entirety.

*	Flagged value is not within established control limits.
D	The reported value is from a dilution
D1	Surrogate was not detected due to sample extract dilution
H	Hold time violation - Hold time was exceeded.
J	Estimated concentration value detected below the reporting limit.
P1	The reported value is greater than 40% difference between the concentrations determined on two GC columns where applicable.
U	This analyte is not detected above the reporting limit (RL) or if noted, not detected above the limit of detection (LOD).
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference
[2C]	Indicates this result was quantified on the second column on a dual column analysis.

Analytical Report for Service Request No: K2407810
Revised Service Request No: K2407810.01

Andrea Fletcher
HydroGeoLogic, Inc.
6340 Glenwood, Suite 200 Building
#7
Overland Park, KS 66202

RE: HGL-SIB-PDI / DT2002.03.03.01.01

Dear Andrea,

Enclosed is the revised report of the sample(s) submitted to our laboratory July 13, 2022. For your reference, these analyses have been assigned our service request number **K2407810.**

The report was updated to include revised raw data for EPA 1699M samples due to an error for the ICV values.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. The test results meet requirements of the current NELAP standards, where applicable, and except as noted in the laboratory case narrative provided. For a specific list of NELAP-accredited analytes, refer to the certifications section at www.alsglobal.com. All results are intended to be considered in their entirety, and ALS Group USA Corp. dba ALS Environmental (ALS) is not responsible for use of less than the complete report. Results apply only to the items submitted to the laboratory for analysis and individual items (samples) analyzed, as listed in the report.

We apologize for any inconvenience this may have created.

Please contact me if you have any questions. My extension is 3363. You may also contact me via email at karen.melerine@ALSGlobal.com.

Respectfully submitted,

ALS Group USA, Corp. dba ALS Environmental

Karen Melerine

Acronyms

ASTM	American Society for Testing and Materials
A2LA	American Association for Laboratory Accreditation
CARB	California Air Resources Board
CAS Number	Chemical Abstract Service registry Number
CFC	Chlorofluorocarbon
CFU	Colony-Forming Unit
DEC	Department of Environmental Conservation
DEQ	Department of Environmental Quality
DHS	Department of Health Services
DOE	Department of Ecology
DOH	Department of Health
EPA	U. S. Environmental Protection Agency
ELAP	Environmental Laboratory Accreditation Program
GC	Gas Chromatography
GC/MS	Gas Chromatography/Mass Spectrometry
LOD	Limit of Detection
LOQ	Limit of Quantitation
LUFT	Leaking Underground Fuel Tank
M	Modified
MCL	Maximum Contaminant Level is the highest permissible concentration of a substance allowed in drinking water as established by the USEPA.
MDL	Method Detection Limit
MPN	Most Probable Number
MRL	Method Reporting Limit
NA	Not Applicable
NC	Not Calculated
NCASI	National Council of the Paper Industry for Air and Stream Improvement
ND	Not Detected
NIOSH	National Institute for Occupational Safety and Health
PQL	Practical Quantitation Limit
RCRA	Resource Conservation and Recovery Act
SIM	Selected Ion Monitoring
TPH	Total Petroleum Hydrocarbons
tr	Trace level is the concentration of an analyte that is less than the PQL but greater than or equal to the MDL.

Inorganic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
E	The result is an estimate amount because the value exceeded the instrument calibration range.
J	The result is an estimated value.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.
H	The holding time for this test is immediately following sample collection. The samples were analyzed as soon as possible after receipt by the laboratory.

Metals Data Qualifiers

#	The control limit criteria is not applicable.
J	The result is an estimated value.
E	The percent difference for the serial dilution was greater than 10%, indicating a possible matrix interference in the sample.
M	The duplicate injection precision was not met.
N	The Matrix Spike sample recovery is not within control limits. See case narrative.
S	The reported value was determined by the Method of Standard Additions (MSA).
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
W	The post-digestion spike for furnace AA analysis is out of control limits, while sample absorbance is less than 50% of spike absorbance.
i	The MRL/MDL or LOQ/LOD is elevated due to a matrix interference.
X	See case narrative.
+	The correlation coefficient for the MSA is less than 0.995.
Q	See case narrative. One or more quality control criteria was outside the limits.

Organic Data Qualifiers

*	The result is an outlier. See case narrative.
#	The control limit criteria is not applicable. See case narrative.
A	A tentatively identified compound, a suspected aldol-condensation product.
B	The analyte was found in the associated method blank at a level that is significant relative to the sample result as defined by the DOD or NELAC standards.
C	The analyte was qualitatively confirmed using GC/MS techniques, pattern recognition, or by comparing to historical data.
D	The reported result is from a dilution.
E	The result is an estimated value.
J	The result is an estimated value.
N	The result is presumptive. The analyte was tentatively identified, but a confirmation analysis was not performed.
P	The GC or HPLC confirmation criteria was exceeded. The relative percent difference is greater than 40% between the two analytical results.
U	The analyte was analyzed for, but was not detected ("Non-detect") at or above the MRL/MDL. *DOD-QSM 4.2 definition* : Analyte was not detected and is reported as less than the LOD or as defined by the project. The detection limit is adjusted for dilution.
i	The MRL/MDL or LOQ/LOD is elevated due to a chromatographic interference.
X	See case narrative.
Q	See case narrative. One or more quality control criteria was outside the limits.

Additional Petroleum Hydrocarbon Specific Qualifiers

F	The chromatographic fingerprint of the sample matches the elution pattern of the calibration standard.
L	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of lighter molecular weight constituents than the calibration standard.
H	The chromatographic fingerprint of the sample resembles a petroleum product, but the elution pattern indicates the presence of a greater amount of heavier molecular weight constituents than the calibration standard.
O	The chromatographic fingerprint of the sample resembles an oil, but does not match the calibration standard.
Y	The chromatographic fingerprint of the sample resembles a petroleum product eluting in approximately the correct carbon range, but the elution pattern does not match the calibration standard.
Z	The chromatographic fingerprint does not resemble a petroleum product.

Analyses were performed according to our laboratory's NELAP-approved quality assurance program. A complete listing of specific NELAP-certified analytes, can be found in the certification section at www.ALSGlobal.com or at the accreditation bodies web site.
Please refer to the certification and/or accreditation body's web site if samples are submitted for compliance purposes. The states highlighted above, require the analysis be listed on the state certification if used for compliance purposes and if the method/anlayte is offered by that state.

Case Narrative

ALS Environmental—Kelso Laboratory
1317 South 13th Avenue, Kelso, WA 98626
Phone (360)577-7222 Fax (360)636-1068
www.alsglobal.com

Client: HydroGeoLogic, Inc. (HGL)
Project: HGL-SIB-PDI
Sample Matrix: Sediment

Service Request: K2407810
Date Received: 07/13/2022 - 07/27/2022

CASE NARRATIVE

All analyses were performed consistent with the quality assurance program of ALS Environmental. This report contains analytical results for samples for the Tier level IV requested by the client.

Sample Receipt:

Four sediment samples were received for analysis at ALS Environmental on 07/13/2022 - 07/27/2022. Any discrepancies upon initial sample inspection are annotated on the sample receipt and preservation form included within this report. The samples were stored at minimum in accordance with the analytical method requirements.

Semivolatiles by GC/MS:

Method 1699M, 08/06/2024:The upper control criterion was exceeded for 2,4'-DDT and 4,4'-DDT in Laboratory Control Sample (LCS) KQ2411800-03. The analytes in question were not detected in the associated field samples. The error associated with elevated recovery indicated a high bias. The sample data was not significantly affected. No further corrective action was appropriate.
Method 1699M, 08/06/2024:The control criteria were exceeded for some surrogates in several samples due to matrix interference. The presence of non-target background components prevented adequate resolution of the surrogate. Accurate quantitation was not possible. No further corrective action was appropriate.
Method 1699M, 08/20/2024:The internal standard recovery of Pyrene-d10 in the diluted analysis for sample SIB-SC-J06-8-9-07/26/2022 was outside control criteria because of matrix interference.

Method 8270D, 08/05/2024: Benzo(a)pyrene was flagged as outside the control criterion for Continuing Calibration Verification (CCV) KQ2412273-02. In accordance with the EPA Method, 80% or more of the CCV analytes must have passed within 20% of the true value. The remaining analytes are allowed a 40% difference as per the ALS SOP. The CCV met these criteria. No further corrective action was required.
Method 8270D, 08/05/2024: Sample SIB-SC-J06-8-9-07/26/2022 required dilution due to the presence of elevated levels of several target analytes. The reporting limits are adjusted to reflect the dilution.

Approved by Karen Melrose Date 09/23/2024

Cooler Receipt and Preservation Form

Client HGL Service Request K22 08387

Received: 7/27/22 Opened: 7/27/22 By: AR Unloaded: 7/27/22 By: AR

1. Samples were received via? *USPS* *Fed Ex* *UPS* *DHL* *PDX* *Courier* *Hand Delivered*
2. Samples were received in: (circle) *Cooler* *Box* *Envelope* *Other* _____ *NA*
3. Were custody seals on coolers? NA (Y) N If yes, how many and where? 2 front
   If present, were custody seals intact? (Y) N If present, were they signed and dated? (Y) N

Temp Blank	Sample Temp	IR Gun	Cooler #/COC ID / NA	Out of temp Indicate with "X"	PM Notified If out of temp	COC# Tracking Number NA	Filed
2.5		IR07	7 of 6			20220727-STB-SGD	
4.4		IR07	5 of 6				
1.9		IR07	3 of 6				
3.2		IR07	6 of 6				
2.4		IR07	1 of 6			✓	

4. Was a Temperature Blank present in cooler? NA (Y) N If yes, notate the temperature in the appropriate column above:
   If no, take the temperature of a representative sample bottle contained within the cooler; notate in the column "Sample Temp":
5. Were samples received within the method specified temperature ranges? NA (Y) N
   If no, were they received on ice and same day as collected? If not, notate the cooler # below and notify the PM. (NA) Y N

If applicable, tissue samples were received: *Frozen* *Partially Thawed* *Thawed*

6. Packing material: *Inserts* *Baggies* *Bubble Wrap* *Gel Packs* (*Wet Ice*) *Dry Ice* *Sleeves* _____
7. Were custody papers properly filled out (ink, signed, etc.)? NA (Y) N
8. Were samples received in good condition (unbroken) NA (Y) N
9. Were all sample labels complete (ie, analysis, preservation, etc.)? NA (Y) N
10. Did all sample labels and tags agree with custody papers? NA (Y) N
11. Were appropriate bottles/containers and volumes received for the tests indicated? NA (Y) N
12. Were the pH-preserved bottles (*see SMO GEN SOP*) received at the appropriate pH? *Indicate in the table below* (NA) Y N
13. Were VOA vials received without headspace? *Indicate in the table below.* (NA) Y N
14. Was C12/Res negative? (NA) Y N
15. Were 100ml sterile microbiology bottles filled exactly to the 100ml mark? (NA) Y N Under filled Overfilled

Sample ID on Bottle	Sample ID on COC	Identified by:

Sample ID	Bottle Count Bottle Type	Head-space	Broke	pH	Reagent	Volume added	Reagent Lot Number	Initials	Time

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

Matrix Spike and Matrix Spike Duplicate Data is presented for information purposes only. The matrix may or may not be relevant to samples reported in this report. The laboratory evaluates system performance based on the LCS and LCSD control limits.

Results flagged with an asterisk (*) indicate values outside control criteria.

Results flagged with a pound (#) indicate the control criteria is not applicable.

Percent recoveries and relative percent differences (RPD) are determined by the software using values in the calculation which have not been rounded.

Matrix Spike and Matrix Spike Duplicate Data is presented for information purposes only. The matrix may or may not be relevant to samples reported in this report. The laboratory evaluates system performance based on the LCS and LCSD control limits.

U: Undetected at or above MDL
J: Analyte detected above MDL, but below MRL
B: Hit above MRL also found in Method Blank
E: Analyte concentration above high point of ICAL
N: Presumptive evidence of compound

D: Result from dilution
m: Manual integration performed
d: Compound manually deleted
NR: Analyte not reported from this analysis

*: Result fails acceptance criteria
#: Acceptance criteria not applicable
?: Insufficient information to determine acceptance
e: Result >= MRL, but MRL less than low point of ICAL
c: check for co-elution

U: Undetected at or above MDL
J: Analyte detected above MDL, but below MRL
B: Hit above MRL also found in Method Blank
E: Analyte concentration above high point of ICAL
N: Presumptive evidence of compound

D: Result from dilution
m: Manual integration performed
d: Compound manually deleted
NR: Analyte not reported from this analysis

*: Result fails acceptance criteria
#: Acceptance criteria not applicable
?: Insufficient information to determine acceptance
e: Result >= MRL, but MRL less than low point of ICAL
c: check for co-elution

Triple Quadrupole GC/MS System Verification - Tune

Instrument Name	MS42 / US1711V008	**MS Model**	7010B
Tune Date & Time	7/24/2024 2:54:45 PM	**Source**	EI High Efficiency
Tune File	D:\MassHunter\GCMS\1\7010\atunes.eihs.tune.xml Modified		

Instrument Actuals

Ionization mode	EI+		
Source Temp.	280 °C		
MS1 Quad Temp.	150 °C		
MS2 Quad Temp.	150 °C		
Filament Current	100.1 µA		

Vacuum

Rough Vac	1.30E+2 mTorr
High Vac	9.79E-5 Torr
Turbo 1 Speed	100.0 %
Turbo 1 Power	26.8 W

GC Gas Flow

Quench Flow	2.250 mL/min	Column 1	0.800 mL/min
Collision Cell	1.500 mL/min	Column 2	0.000 mL/min

MS1 Checktune Results

	Value	Limit	Result
Low mass assignment (target 69.00, actual 68.90)	0.10	<= 0.20	OK
Mid mass assignment (target 264.00, actual 263.90)	0.10	<= 0.20	OK
High mass assignment (target 502.00, actual 501.90)	0.10	<= 0.20	OK
Low mass isotope position (target 70.00, actual 69.90)	0.10	<= 0.20	OK
Mid mass isotope position (target 265.00, actual 264.90)	0.10	<= 0.20	OK
High mass isotope position (target 503.00, actual 502.90)	0.10	<= 0.20	OK
Low mass isotope ratio	1.14%	>= 0.5% and <= 1.6%	OK
Mid mass isotope ratio	5.69%	>= 4.2% and <= 6.9%	OK
High mass isotope ratio	9.96%	>= 7.9% and <= 12.3%	OK
Ratio of mid mass to low mass	16.82%	>= 5.0%	OK
Ratio of high mass to low mass	3.53%	>= 0.8%	OK
Low mass precursor ratio	0.47%	<= 3.00%	OK
Mid mass precursor ratio	0.18%	<= 6.00%	OK
High mass precursor ratio	0.11%	<= 12.00%	OK

MS2 Checktune Results

Low mass assignment (target 69.00, actual 69.00)	0.00	<= 0.20	OK
Mid mass assignment (target 264.00, actual 264.00)	0.00	<= 0.20	OK
High mass assignment (target 502.00, actual 501.97)	0.03	<= 0.20	OK
Low mass isotope position (target 70.00, actual 70.00)	0.00	<= 0.20	OK
Mid mass isotope position (target 265.00, actual 265.00)	0.00	<= 0.20	OK
High mass isotope position (target 503.00, actual 503.02)	0.02	<= 0.20	OK
Low mass isotope ratio	1.20%	>= 0.5% and <= 1.6%	OK
Mid mass isotope ratio	5.46%	>= 4.2% and <= 6.9%	OK
High mass isotope ratio	9.03%	>= 7.9% and <= 12.3%	OK
Low mass precursor ratio	0.01%	<= 3.00%	OK
Mid mass precursor ratio	0.00%	<= 6.00%	OK
High mass precursor ratio	0.16%	<= 12.00%	OK

Detector

EMV	1267	<= 2900	OK
Maximum gain factor	2233	>= 100	OK

1st 07/30/24
