RIVERBANK CHARACTERIZATION DATA REPORT
SWAN ISLAND BASIN PROJECT AREA
PORTLAND HARBOR SUPERFUND SITE
PORTLAND, MULTNOMAH COUNTY, OREGON

1.0 INTRODUCTION

This Riverbank Characterization Data Report presents the results of riverbank characterization data collection activities conducted as part of the Pre-Design Investigation (PDI) for the Swan Island Basin (SIB) Project Area within the Portland Harbor Superfund Site (PHSS) in Portland, Multnomah County, Oregon. Bridgewater Group and HydroGeoLogic, Inc. (HGL) performed the work on behalf of the SIB Remedial Design (RD) Group based on the requirements of the PHSS Record of Decision (ROD) (EPA, 2017) and the Administrative Settlement Agreement and Order on Consent (EPA, 2021a). The work was performed in accordance with the final PDI Work Plan, which the U.S. Environmental Protection Agency (EPA) approved in May 2022 (HGL, 2022a); the Stormwater and Riverbank Assessment and Sampling Plan (SRASP), which EPA approved in November 2021 (HGL, 2021a); and the Riverbank Sampling Plan, which EPA approved in October 2022 (HGL, 2022b).

1.1 OBJECTIVES AND SCOPE

Riverbank characterization was needed to fulfill three purposes: (1) address data gaps necessary to complete the source control sufficiency assessment, (2) determine the full extent of contamination exceeding the ROD cleanup levels (CULs), remedial action levels (RALs), and principal threat waste (PTW) thresholds, and (3) provide data necessary to support RD for remediation of contaminated riverbank soils (EPA, 2019).

To accomplish these objectives, the following riverbank characterization and chemistry data characterization activities were performed:

- A visual inspection to identify and characterize existing conditions and the types of materials present in the entire riverbank within the SIB Project Area.
- Collection of bank stability analysis input parameters for the Bank Assessment for Non-point Source Consequences of Sediment (BANCS) evaluation, including Bank Erosion Hazard Index (BEHI) and near-bank stress determinations.
- Assembly of available topographic and nearshore bathymetric maps and light detection and ranging (LiDAR) maps to obtain topographic inputs for the BANCS analysis.
- BANCS evaluation to calculate the degree of erodibility of banks.
- A field investigation program consisting of grab soil sample collection from available top of bank (TOB), ordinary high water (OHW) mark, and at or below mean low water (MLW) locations and depth intervals.
- Analytical chemistry testing of riverbank surface soil samples and select depth intervals.

Riverbank characterization was conducted in two mobilizations. The visual assessment was conducted in the first mobilization and was completed in February and May 2022. The field investigation program was conducted in the second mobilization and was completed in October 2022.

Riverbank characterization data will be used to support recontamination analysis as part of the source control sufficiency assessment. The potential for post-Remedial Action erosion of contaminated riverbank material will be evaluated by considering the spatial distribution of contamination combined with the estimated rate of bank erosion. Riverbanks with contaminated soil susceptible to erosion will be addressed in the RD to control this source of potential recontamination.

1.2 PROJECT AREA BACKGROUND

The SIB Project Area is the active cleanup area designated in the ROD between approximately River Miles 8.1 and 9.2 on the northeast side of the Willamette River (Figure 1-1). The SIB Project Area is approximately 1.1 miles in length, 117 acres in size, and includes riverbanks.

1.3 DOCUMENT ORGANIZATION

The report is organized into the following sections:

- Section 1.0 presents an introduction, including the objectives and scope of riverbank characterization;
- Section 2.0 describes the assessment activities and methodology;
- Section 3.0 describes sampling and analyses;
- Section 4.0 summarizes the riverbank analytical results;
- Section 5.0 summarizes the conclusions of the riverbank characterization data collection activities; and
- Section 6.0 lists the references cited in this Riverbank Characterization Data Report.

Supporting information is provided in the following attachments:

- Attachment A – Erodibility Potential Input
    - Attachment A.1 Physical Shoreline Inspection Forms
    - Attachment A.2 BEHI Forms
- Attachment B – Field Investigation
    - Attachment B.1 Riverbank Sample Collection Summary Table
    - Attachment B.2 Sample Deviation Summary Table
    - Attachment B.3 EPA Field Change Request
    - Attachment B.4 Riverbank Grab Sample Logs with Photographic Documentation
- Attachment C – Laboratory Analytical Results
    - Attachment C.1 Laboratory Analytical Results
    - Attachment C.2 Data Validation Reports
    - Attachment C.3 Analytical Data Packages

2.0 SITE BACKGROUND AND EXISTING CONDITIONS

The ROD defines riverbanks as areas from the TOB down to MLW. The *Guidance for River Bank Characterizations and Evaluations at the Portland Harbor Superfund Site* (EPA, 2019) outlines the site-specific riverbank sampling and evaluation process for ROD riverbanks pending characterization, to include collection of physical and chemical characterization data from the TOB down to MLW.[1]

The Sufficiency Assessment Report assigned an initial source control sufficiency status of "uncontrolled" to all shoreline properties[2] because (1) few riverbanks within the SIB Project Area have been adequately characterized (Sufficiency Assessment Report Figure 6-1 [HGL, 2021a]); (2) there is a potential need for Remedial Action on shorelines where contaminants of concern (COCs) are present in soils; and (3) contaminated riverbanks are at risk of erosion and could be uncontrolled sources of recontamination. If an in-river sediment management area does not extend to the toe of the riverbank in portions of the SIB shoreline (i.e., is not contiguous with the riverbank) and the riverbank materials are not erodible, the source control sufficiency status may be downgraded for the riverbank erosion pathway in those areas. Regardless of source control sufficiency status assigned to a particular riverbank, EPA guidance for riverbanks (EPA, 2019) requires the characterization of the entire lateral extent of COCs in the riverbank.

2.1 EVALUATION OF AVAILABLE RIVERBANK DATA

The ROD (EPA, 2017) identified three sections of riverbank within the SIB Project Area as areas with known contamination. The locations of those riverbanks are shown on Figure 2-1. A description of each is below:

- One riverbank along the Project Fleet Owner LLC/Shipyard Commerce Center (SCC)[3] property on the Swan Island peninsula (1,487 lineal feet [ft] of bulkheads, a historical wooden retaining wall, and/or riprap below OHW and vegetated soil above OHW) (Environmental Cleanup Site Information [ECSI] 271) (Ash Creek Associates [Ash Creek], 2012; Oregon Department of Environmental Quality [DEQ], 2013);
- The riverbank along SCC's Dry Dock Basin and Ballast Water Treatment Plant on the end of the Swan Island peninsula (224 lineal ft of engineered bank consisting of riprap below OHW and vegetated soil above OHW) (Ash Creek, 2013; DEQ, 2014); and
- One 911-ft-long riverbank, armored with riprap below OHW and vegetated soil above OHW, along the U.S. Navy and Marine Reserve Center (USNMRC) (ECSI 5109) in the Mocks Bottom portion of the SIB Upland Area.

[1] Figure 3 of *Guidance for River Bank Characterizations and Evaluations at the Portland Harbor Superfund Site* (EPA, 2019), presents riverbank conceptual diagrams as cross sections and includes datum for OHW (20.08 ft North American Vertical Datum of 1988 [NAVD88]), mean high water (10.14 ft NAVD88), and MLW (7.28 ft NAVD88). These datum were used in the planning and execution of SIB riverbank characterization.

[2] The boundaries of shoreline properties generally extend only to OHW, with the exception of Swan Island Dock Company, which extends down to the MLW mark.

[3] Portland Shipyard and Swan Island Upland Facility (SIUF).

Two non-ROD riverbanks were identified based on ROD CUL exceedances in soil during previous investigations: a 713-ft-long unarmored sand riverbank at the head of SIB (Figure 2-1; SIB Grids C-F/37-38), and a 587-ft-long armored bank along the Port of Portland's (port) N. Lagoon Avenue property adjacent to SIB (Figure 2-1; SIB Grids F-G/20-21 and F-G/28-34)).

Characterization data was available for only three shoreline properties in the SIB Upland Area: City of Portland (city) property with a public boat ramp at the head of SIB and two former operable units (OUs) of the SIUF (OU1 at the former Portland Shipyard and OU3 at the port property on N. Lagoon Avenue [part of the former Portland Shipyard]). Detected concentrations of metals, polychlorinated biphenyls (PCBs), and polycyclic hydrocarbons (PAHs) exceeded the ROD CULs at the SCC property, and PCBs exceeded the ROD RAL and ROD PTW threshold. In addition, ROD CULs were exceeded in samples collected at the port's N. Lagoon Avenue property (former SIUF OU3) and the city's property at the head of SIB. Because the lateral extents of the exceedances were not defined and not all ROD COCs were analyzed, these conditions were identified as data gaps for the PDI, and additional characterization was performed as part of the riverbank characterization effort.

2.2 RIVERBANK CHARACTERIZATION – PHASE I

Phase I of the riverbank characterization was performed in February and May 2022. The first phase included an assessment survey of the entire riverbank within the SIB Project Area and completion of a bank stability analysis using the BANCS model, including BEHI and near-bank stress (NBS) determinations (Rosgen, 2001; 2014).

This section describes the results of the first phase of the riverbank assessment. Field staff accessed the SIB riverbanks primarily by boat due to the steepness of the banks and dense vegetation. A total of 126 transects (1 per every 100 lineal ft of riverbank) (transect 000 to transect 125) were visually inspected. Transect locations are shown on Figure 2-2. Transects 000 through 051 are adjacent to SCC. Transects 052 through 057 are adjacent to the port's N Lagoon Avenue property (formerly Portland Shipyard SIUF OU3). Transects 058 through 061 are adjacent to the Freightliner's Wind Tunnel Research & Design facility. Transects 062 through 064 are adjacent to Anchor Park LLC. Transects 065 through 070 are adjacent to the city's Swan Island public boat ramp and parking property. Transects 071 through 086 are on the Swan Island Dock Company (SIDC) property. Transects 087 through 092 are adjacent to ATC Leasing Company LLC (ATC). Transects 093 through 102 are adjacent to the port's Dredge Base. Transects 103 through 111 are adjacent to The Marine Salvage Consortium Inc. Transects 112 through 120 are adjacent to USNMRC. Transects 121 through 125 are adjacent to the U.S. Coast Guard Marine Safety Unit (USCG MSU).

Photographs and field notes were taken at each riverbank transect, estimating slopes, percent vegetation cover and root depth, material types and amount of surface protection, and evidence of slope failure and overland flow. Photographs, field notes, and the results of the survey are documented on Physical Shoreline Inspection Forms included in Attachment A.1.

2.3 ERODIBILITY POTENTIAL ASSESSMENT

The BANCS model uses the quantitative assessment of the BEHI (Rosgen, 2014). The BEHI is a procedure for assessing potential streambank erosion conditions. During the first phase of the riverbank characterization, HGL completed BEHI field forms for each riverbank transect to be used in the completion of a bank stability analysis using the BANCS model (Attachment A.2). The calculation of BEHIs estimate the potential degree of erodibility of the banks based on visual observations. In addition, NBS was estimated using Level III (5) Near-bank maximum depth to bank full mean depth (d_{nb}/d_{bkf}).[4]

2.3.1 Bank Erosion Hazard Index

To evaluate the BEHI, HGL reviewed available LiDAR elevation data for the riverbank transects in conjunction with the data collected during the visual inspection of the riverbank transects to estimate the following characteristics:

- Study bank height (TOB elevation – toe of slope elevation, ft);
- Bankfull height (OHW elevation – toe of slope elevation, ft);
- Root density and depth;
- Type of surface protection (e.g., boulders, cobbles, sand, gravel, silt/clay);
- Vegetation;
- Bank angle (maximum angle between the toe and top of the slope); and
- Condition of bank materials.

Complete BEHI field sheets with ratings for each transect are provided as Attachment A.2. The measured stream bank characteristics were converted to a risk rating system to determine the applied BEHI value for each bank characteristic (Rosgen, 2014). The assessment of the BEHI assigns point values to the following six characteristics:

1. Ratio of bank height to bankfull height,
2. Ratio of root depth to bank height,
3. Weighted root density,
4. Bank angle,
5. Surface protection, and
6. Bank material composition.

The methods for determining each of these characteristics are described in the following subsections.

2.3.1.1 Ratio of Study Bank Height to Bankfull Height

The ratio of study bank height to bankfull height required the identification of the elevations of the TOB and the toe of the slope. The toe of slope elevation was identified as the first significant change in slope below OHW but above mean high water (MHW). Because there were no

[4] More robust slope stability analyses are being performed concurrently by geotechnical and coastal engineers on the SIB RD Project Team.

geomorphic features indicating a change in slope below the OHW but above the MLW, the MHW elevation (10.14 ft NAVD88) was used as the toe of slope for the transects. The study bank height is the difference in elevation from the TOB to MHW. The bankfull height is the OHW elevation minus the MHW (20.08 ft NAVD88 – 10.14 ft NAVD88 = 9.94 ft NAVD88).

2.3.1.2 Root Depth Ratio

Root depth is the ratio of average plant root depth to the bank height, expressed as a percent (e.g., roots extending 10 ft into a 20-ft-tall bank = 0.50 percent). Because of a lack of exposed roots, the root depth was estimated based on reference values for the rooting depth of the plant species present along the bank.

2.3.1.3 Weighted Root Density

Root density is the proportion of the streambank surface covered by plant roots, expressed as a percentage. Rooting density was estimated with the percentage of vegetation on the bank. Weighted root density was calculated by multiplying the root depth ratio and root density.

2.3.1.4 Bank Angle

Bank angle is the maximum angle of the bank from the toe of the slope to the top of the slope. Bank angle was calculated at each transect, using the elevation profile of the bank determined during the 2019 topographic surveys (City of Portland, 2019). The bank angle was measured along the steepest portion of the slope, which is most prone to failure (Rosgen, 2014).

2.3.1.5 Surface Protection

Surface protection is the amount of riverbank covered by plant roots, logs, branches, rocks, etc., expressed as a percentage. This was visually estimated for each transect.

2.3.1.6 Bank Material Composition

Elements of the bank material composition assessed in the field included the observed grain size distribution of the bank material and the presence of stratification.

The following Bank Material Adjustment was applied in the BEHI calculation:

- Bedrock (engineered bank, riprap, or construction debris): (overall very low BEHI);
- Boulders (consisting of slag, metal, riprap, or construction debris): >10 inches (overall very low BEHI);
- Cobble (consisting of rip rap or construction debris): 0.2 inch to 10 inches (subtract 5 or 10 points for uniform medium to large cobble);
- Gravel or composite matrix (consisting of rip rap or construction debris): (add 5 to 10 points, depending on percentage of bank material that is composed of sand);
- Sand: 0.04 inch to 0.2 inch (add 10 points); and
- Silt/clay: 0.0002 inch to 0.04 inch (no adjustment).

2.3.1.7 BEHI Rating Methods

The sum of the six bank characteristics (ratio of bank height to bankfull height, ratio of root depth to bank height, weighted root density, bank angle, surface protection, and bank material composition adjustment) was applied to the BEHI scale to determine the rating for each transect (Attachment A.2). Table 2-1 summarizes the BEHI results from each transect. Figure 2-2 shows the transect ratings around SIB.

The total BEHI value of each transect can be correlated with the BEHI adjective ratings (Rosgen, 2014) as follows:

Total BEHI	BEHI Adjective Rating
5–9.5	Very Low
10–19.5	Low
20–29.5	Moderate
30–39.5	High
40–45	Very High
46–50	Extreme

The total BEHI model rating indicate low to extreme probabilities of riverbank erosion depending on transect location (Table 2-1; Figure 2-2).

2.3.2 Near-Bank Stress

Annual streambank erosion rate predictions include an NBS assessment associated with energy distribution against stream banks (Rosgen, 2001). NBS determinations are divided into seven different options. The NBS variables used in the prediction methodology indicate potential disproportionate energy in the near-bank region (i.e., the 1/3 of the channel cross-section associated with the bank being evaluated), which can accelerate streambank erosion.

HGL generated 15 transects across SIB to estimate NBS risk ratings to calculate erosion rates (Figure 2-3). The cross-section locations were selected to represent the different bathymetric regions adjacent to the riverbank transects in SIB as well as bank morphologies.

The NBS ratings were determined using one or more of the following levels:

Level I (1) Channel pattern, transverse bar, or split channel/central bar creating NBS or high velocity gradient;
Level II (2) Radius of curvature to bank full width (R_c/W_{bkf});
Level II (3) Pool slope to average water surface slope (S_p/S);
Level II (4) Pool slope to riffle slope (S_p/S_{rif});
Level III (5) Near-bank maximum depth to bank full mean depth (d_{nb}/d_{bkf});
Level III (6) Near-bank shear stress to bank full shear stress (τ_{nb}/τ_{bkf}); and
Level IV (7) Velocity profiles/isovels/velocity gradient.

Based on the available data and hydrodynamics of SIB, HGL used the Level III (5) method to estimate NBS. Table 2-2 summarizes input parameters for the Level III (5) NBS calculations. This method calculates the ratio of the near-bank, bankfull maximum depth at a site to the mean depth of the cross-section at the same location (d_{nb}/d_{bkf}).

HGL mapped 15 transects from each side of the SIB riverbank (coincident with groups of transects with similar morphologies and SIB bathymetry) to estimate the bankfull area (A_{bkf}), bankfull channel width (W_{bkf}) and bankfull mean depth (d_{bkf}) (Table 2-2 and Figure 2-3).

Each bankfull channel width (W_{bkf}) transect was divided into thirds to determine the near-bank maximum depth (d_{nb}: max depth of the closest 1/3 bankfull width closest to the study bank) (Table 2-2 and Figure 2-3). The bankfull mean depth was calculated by dividing each transect's cross-sectional area by its width. The near-bank maximum depth (d_{nb}: max depth of the closest 1/3 bankfull width closest to the study bank) was then divided by the bankfull mean depth (d_{bkf}). Table 2-2 presents the ratio value as converted to an NBS rating using Worksheet 3-12 of the River Stability Field Guide (Rosgen, 2014). The calculated ratio values were then converted to the following NBS adjective ratings (Rosgen, 2014) for the Level III (5) Method:

Level III (5) NBS Ratio	NBS Adjective Rating
<1.00	Very Low
1.00 - 1.50	Low
1.51 - 1.80	Moderate
1.81 - 2.50	High
2.51 - 3.00	Very High
>3.00	Extreme

The Level III (5) evaluation calculated low NBS values for all transect groups (Table 2-2).

3.0 RIVERBANK SOIL SAMPLING SUMMARY

EPA guidance for riverbanks (EPA, 2019) requires the characterization of the entire lateral extent of the riverbank. During the second phase of the riverbank characterization in October 2022, riverbank soil sampling for chemical characterization was performed at 119 riverbank transect locations at 3 elevations (e.g., TOB, face [OHW] and toe of bank [MLW]) (Figure 3-1). In accordance with the Riverbank Sampling Plan (HGL, 2022b), three depth intervals were collected: surface soils (0 to 1 ft) and subsurface soils (1 to 2 and 2 to 3 ft), where possible using manual and hand auguring field techniques. Table 3-1 is a summary of riverbank soil sample collection information. Attachment B.1 includes a complete summary of sampling locations, intervals collected, analytical matrix, and deviations from plans. Attachment B.2 is a summary of deviations from proposed riverbank soil sample locations and actual soil sample locations. Attachment B.3 includes EPA-approved Field Change Request Forms and Attachment B.4 includes grab sample field forms and photographs.

3.1 RIVERBANK SOIL SAMPLING LOCATIONS

The results of the first phase of riverbank characterization were evaluated as part of identifying riverbank soil sampling locations. To meet the requirements of EPA's riverbank guidance and the data gaps identified in the PDI Work Plan (HGL, 2022a), HGL sampled all transects with accessible, sampleable materials. Sampleable materials were defined as soil that can be sampled using hand tools and is readily accessed or can be accessed by moving small obstructions that can be handled safely without heavy or mechanized equipment. At each transect, HGL attempted to collect riverbank soil at 3 elevations, including the TOB, OHW, and toe of the bank, where accessible, at 3 depth intervals (0 to 1 ft, 1 to 2 ft, and 2 to 3 ft) for analysis of COCs to determine if CUL, RAL or PTW threshold exceedances were present and need to be addressed as part of RD. Sample locations were determined by a licensed land surveyor demarcation of the OHW location at each transect. Samples were not collected where no potentially erodible material was exposed (e.g., behind the sheetpile along the SCC dry-dock basin from transects 011 through 021) and at or below MLW where fine-grained material was not present (e.g., armoring at MLW at transects 000 through 003, 006 and 007, 009 through 011, 023 through 029, 031 through 033, 035, 043 through -047, 049 through 052, 054 and 055, 059 through 061, 070, 105 through 111, 113 through 116, and 118 and 119).

The following summarizes the total number of samples collected and analyzed from each elevation and depth interval:

Elevation/Depth	0-1 ft	1-2 ft	2-3 ft
TOB	90	40	17
OHW	111	31	10
MLW	75	24	1
Total	276	95	28

3.2 RIVERBANK SOIL SAMPLING ACTIVITIES AND OBSERVATIONS

The following describes the riverbank soil sampling efforts and riverbank morphology observations, including relevant BEHI transect summaries, as presented in Table 2-1 and

illustrated in Figure 2-2. Riverbank soil samples were submitted for laboratory analysis as described in Section 3.5.

Project Fleet Owner LLC/Shipyard Commerce Center, 5555 N Channel Avenue

Transects 000 through 051 are adjacent to the Project Fleet Owner LLC/SCC property on Swan Island peninsula. The riverbank at transects 001 through 011 consisted of an engineered bank with rip rap below OHW and a vegetated bank above OHW in the dry-dock basin (formerly SIUF OU1). Bank angles were between 28 and 38 degrees. Samples were collected from the TOB and OHW at all locations, except transects 012 through 014 where a sheetpile wall was present. MLW (toe of slope) samples were collected at transects 004, 005, and 012 through 014 in this area adjacent to the dry-dock basin. Evidence of slope failure between OHW and TOB was observed at transect 004. Estimated BEHIs for the dry-dock riverbank are low to moderate (Table 2-1; Figure 2-2). A steel sheetpile wall was present from TOB to below MLW between transects 011 and 021. Materials that had accumulated in a vegetated area riverward of the sheetpile wall near MLW was sampled at transects 012 through 014. A sheetpile wall was present from TOB to OHW under the lagoon wharf from transects 023 to 042 adjacent to the lagoon side of Swan Island peninsula; samples under the wharf were collected at OHW at all transects and MLW at transects 022, 030, 034, and 036 to 042. Bank angles ranged from 28 to 45 degrees. Little or no vegetation was present under the wharf. Slope failure was evident at transect 038. Estimated BEHIs for the lagoon wharf area were moderate (Table 2-1; Figure 2-2). Sample depth at SCC was generally limited to the surface interval due to the extent of armoring. Slope failure was evident at transects 044 and 045 near Berth 306. Estimated BEHIs for transects 043 through 051 near Berths 306 and 307 were moderate to high (Table 2-1; Figure 2-2).

Port of Portland, 5420 N. Lagoon Avenue

The riverbank at transects 052 through 057 consisted of an engineered bank with rip rap, a wooden retaining wall structure below OHW, and a well vegetated bank above OHW (formerly SIUF OU3) on Swan Island peninsula. Bank angles ranged from 40 to 48 degrees. The hardness, size of armoring, and lack of fine-grained material limited sampling to the surface interval at the TOB and OHW. MLW was sampled only at transects 053, 056, and 057, where finer-grained materials were exposed and accessible in the rip rap voids. Estimated BEHIs for this riverbank were low to moderate (Table 2-1; Figure 2-2).

Freightliner Wind Tunnel Research and Design Facility, 5160 N. Lagoon Avenue

Transects 058 through 061 are adjacent to the Freightliner Wind Tunnel Research and Design facility on Swan Island peninsula. Rip rap is present below OHW. A wood retaining wall is present above OHW and the TOB and the bank is densely vegetated. Bank angles ranged from 42 to 50 degrees. TOB samples were not collected due to the presence of the retaining wall. Sampling was limited to surface materials at OHW and MLW due to the hardness, size of the armoring, and lack of fine-grained material. Estimated BEHIs for this riverbank were moderate to high (Table 2-1; Figure 2-2).

Anchor Park LLC, 5036 N. Lagoon Avenue

Transects 062 through 064 are adjacent to Anchor Park LLC. The riverbank was armored at transects 062 and 063, limiting sampling depth to the surface at the TOB and OHW. The bank

consisted of sand at transect 064 at the head of the basin. Samples were collected to a depth of 2 ft at MLW at the 3 transects and to a depth of 3 ft at OHW and TOB at transect 064. At low tide, a sand beach was exposed at MLW at transects 063 and 064. Bank angles were 36 degrees (transect 064) and 45 degrees (transects 062 and 063). Estimated BEHIs for this riverbank were moderate to very high (Table 2-1; Figure 2-2).

City of Portland, 3737 N. Emerson Street

Transects 065 through 070 are adjacent to the City of Portland's public boat ramp and parking property and the head of SIB. The riverbank at transects 065 to 068 consists of sand with bank angles of 20 to 32 degrees and evidence of erosion. MLW samples were collected to a depth of 2 ft and OHW and TOB samples were collected to a depth of 3 ft. At low tide, a sand beach was exposed at MLW at transects 065 through 068. Transects 069 and 070 included an engineered bank with rip rap below OHW and vegetation to the TOB with bank angles of 32 and 20 degrees, respectively. Estimated BEHIs for this riverbank were moderate to extreme (Table 2-1; Figure 2-2).

Swan Island Dock Company, 5949 E/N Basin Avenue

Transects 071 through 086 are on the Swan Island Dock Company property on the Mocks Bottom side of SIB. Surface protection ranged from 20 percent at transect 071 to 100 percent at transects 083 through 085. The riverbank is densely vegetated with bank angles of 15 to 41 degrees. Samples were generally collected to a depth of 2 ft where armoring was not present. A sand beach was exposed at MLW at low tide. Samples were generally collected to a depth of 2 ft at MLW, OHW, and TOB with some exceptions (Table 3-1). Estimated BEHIs for this riverbank were moderate to very high (Table 2-1; Figure 2-2).

ATC Leasing Company LLC, 6135 and 6147 N. Basin Avenue

Transects 087 through 092 are adjacent to ATC on the Mocks Bottom side of SIB. Surface protection was 50 percent at transect 092 to 96 percent at transect 091. The riverbank is heavily vegetated with bank angles ranging from 15 to 28 percent. Samples were generally collected to a depth of 2 ft at MLW, OHW, and TOB with some exceptions (Table 3-1). A sand beach was present along the entire riverbank in this area at low tide at MLW. Estimated BEHIs for this riverbank were high to very high (Table 2-1; Figure 2-2).

Port of Portland Dredge Base, 6208 S/N Ensign Street

Transects 093 through 102 are adjacent to the Port of Portland's Dredge Base on the Mocks Bottom side of SIB. Armoring was present below OHW with vegetation observed above OHW to TOB. Surface protection ranged from 25 percent to 75 percent. Bank angles ranged from 15 to 35 degrees. A sand and gravel beach was observed at low tide at MLW between transects 093 and 097 and at 102. Only surface samples were collected at MLW due to the presence of gravel, except at transect 102 where samples were collected to a depth of 2 ft. Most OHW and TOB samples were collected to depths of 2 to 3 ft due to the increased percentage of sand. Estimated BEHIs for this riverbank were low to very high (Table 2-1; Figure 2-2).

The Marine Consortium Inc., 6211 N. Ensign Street

Transects 103 through 111 are adjacent to the Marine Consortium Inc. The riverbank is heavily armored above and below OHW (up to 90 percent armoring) with bank angles ranging from 30 to

38 degrees. Materials could be sampled only to a depth of 1 ft in most locations due to the degree of armoring (Figure 3-1). MLW samples were not collected due to the absence of fine-grained material, except at transects 103, 104, and 110. Estimated BEHIs for this riverbank were low to moderate (Table 2-1; Figure 2-2).

U.S. Navy and Marine Reserve Center, 6735 N. Basin Avenue

Transects 112 through 120 are adjacent to USNMRC. The riverbank was armored (35 to 80 percent) and densely vegetated. Bank angles ranged from 30 to 38 degrees. The amount of armoring and absence of fine-grained materials limited sampling at most locations to the 0 to 1-ft interval with a few exceptions where finer-grained materials were present (Table 3-1). MLW samples were not collected due to the amount of armoring, except at transects 112 and 117. A sand beach was exposed near transect 112 at low tide at MLW. OHW samples were not collected at transects 113 and 116 due to the increased amount of armoring. Estimated BEHIs for this riverbank were low to moderate (Table 2-1; Figure 2-2).

U.S. Coast Guard Marine Safety Unit, 6767 N. Basin Avenue

Transects 121 through 125 are adjacent to the U.S. Coast Guard Marine Safety Unit. Armoring ranged from 0 to 70 percent. It was densely vegetated above OHW. A sand beach was exposed between transects 121 and 125 at low tide at MLW. Bank angles ranged from 30 to 36 degrees. Most samples were collected at the surface interval due to the presence rip rap. Estimated BEHIs for this riverbank were low to high (Table 2-1; Figure 2-2).

3.3 ARCHIVE SAMPLE ANALYSIS

Deeper samples (1-2 and/or 2-3 ft intervals) were collected from 56 transects (Table 3-1). Armoring prevented sample collection at the remaining transects. The deeper samples were initially archived pending receipt of the analytical results for the surface samples. Because most of the surface samples contained at least one CUL exceedance, the available corresponding deeper samples were analyzed to assess the vertical extent of exceedances.

3.4 FIELD QUALITY ASSURANCE/QUALITY CONTROL SAMPLES

Field quality assurance (QA)/quality control (QC) samples were collected with the surface and subsurface sediment samples as specified in Worksheet #20 of the Uniform Federal Policy (UFP)-Quality Assurance Project Plan (QAPP) (HGL, 2022a). Field duplicate and matrix spike (MS)/matrix spike duplicate (MSD) pairs were collected at a rate of approximately 1 per 20 samples. Equipment blanks (EBs) were collected at a rate of approximately one per week and were performed by pouring deionized water over core liners, sampling bowls, and spoons after field decontamination. Note that this is a revision from the specified frequency for EB collection at a rate of 1 per 20 samples, which EPA approved per Field Change Request #8 (HGL, 2022c), which is included in Attachment B.3. Field duplicates, MS/MSD samples, and EBs were collected and shipped to analytical laboratories with a temperature blank. Overall, 5 field duplicates, 20 EBs, and 20 MS/MSD samples were collected. Attachment B.1 provides a summary of collected QA/QC samples and associated parent samples.

3.5 RIVERBANK SOIL CHEMISTRY TESTING

Riverbank soil samples were analyzed for Table 17 COCs with CULs for erodible soil to delineate the horizontal and, to the extent possible, vertical extent of CUL, RAL or PTW exceedances. A total of 276 surface samples (of a proposed total of 286 samples) were collected and analyzed.

Table 3-1 provides a summary, by location, of riverbank soil samples submitted for laboratory analysis. Attachment B.1 provides a complete accounting of samples and sample identifications with analyses performed, QA samples collected, and the associated parent sample information. The analytical laboratories and analyses are as follows:

- ALS Environmental (ALS) in Kelso, Washington – organochlorine pesticides, PAHs, bis(2-ethylhexyl)phthalate (BEHP), total petroleum hydrocarbons (TPH) as diesel range and residual range organics, tributyltin, and total organic carbon;
- Analytical Resources, LLC (ARI) in Tukwila, Washington – PCBs as Aroclors and metals/mercury; and
- Cape Fear Analytical, LLC (CFA) in Wilmington, North Carolina – PCDD/PCDF and PCBs as congeners.

The analytes include the Portland Harbor riverbank soil focused-COCs and COCs specified in Tables 17 and 21 of the ROD (EPA, 2017) and subsequent errata (EPA, 2020). Details of the analytical chemistry work are described in the following UFP-QAPP worksheets (HGL, 2022a):

- Analytes, analytical methods, and laboratories (Worksheet #15 and Worksheets #19 and #30);
- Sample containers, preservation, and hold times (Worksheets #19 and #30); and
- Detection and reporting limits (Worksheet #15).

3.6 DATA MANAGEMENT

The UFP-QAPP Worksheet #35 describes the data verification process used to create the project database. In short, the laboratory analytical data were reported by analytical laboratories in an Electronic Data Deliverable[5] that is compatible with the Environmental Quality Information System data management program using the valid values presented in Appendix A of the Program Data Management Plan (EPA, 2021b).

Following data validation, rules for data averaging and treatment of non-detected values were applied and results requiring reporting as totals were calculated in accordance with Sections 6 and 7, respectively, of the Program Data Management Plan (EPA, 2021b) and imported into the project database.

[5] The reporting limit was set to the method detection limit (or estimated detection limit for PCDDs/PCDFs) in the laboratory Electronic Data Deliverables; however, the analytical data packages (Attachment C.3) also include other laboratory limits such as method reporting limit, limit of detection, limit of quantitation, practical quantitation limit.

3.7 DATA VALIDATION

The UFP-QAPP Worksheet #36 describes the data validation procedures used by third-party contractors to verify and validate analytical data. The following list of contractors describes the division of labor for laboratory sample delivery groups (SDGs):

- Ecochem, Inc., performed data validation on SDGs from CFA and ARI;
- EDS Environmental Services performed data validation on SDGs from ALS; and
- Meridian performed data validation on SDGs from CFA and ALS.

SDGs representing 90 percent of the results received Stage 2A data validation. The remaining SDGs representing 10 percent of the results received Stage 4 validation. Data validation included evaluation of performance criteria and formulas used to evaluate data quality are presented in UFP-QAPP Worksheet #12, with the accuracy and sensitivity requirements presented on an analyte- and matrix-specific basis in the UFP-QAPP Worksheet #15 tables (HGL, 2022a).

3.8 DATA QUALITY AND USABILITY

The UFP-QAPP Worksheet #37 Data Usability Assessment provides guidelines for evaluating field investigation and laboratory compliance with the requirements listed in the UFP-QAPP and other project planning documents. Compliance with laboratory testing procedures, performance criteria, data validation, and data management are provided in Sections 3.6 and 3.7. As documented in those sections, samples were collected, analyzed, and managed in compliance with laboratory testing criteria, and are acceptable for use in source control sufficiency assessment and RD development.

3.8.1 Detection and Reporting Limits Compared to Project Action Limits

Table 3-2 presents a summary of the percent of detections; percent of non-detections; and detections exceeding CULs, RALs/practical quantitation limits (PQLs), and PTW thresholds. The UFP-QAPP referred to CULs, RALs, and PTW thresholds collectively as Project Action Limits (PALs) and provided sensitivity limits (Method Detection Limit [MDL] and Practical Quantitation Limit [PQL]) and PALs in Worksheet #15 tables. As described in the UFP-QAPP, the laboratory MDLs[6] are less than the lowest PAL for an analyte because the analytical methods selected to support this project are the most sensitive methods commercially available in standard use.

EPA published the memorandum "Evaluation of consistently and reliably attainable practical quantitation limits for 2,3,7,8-TCDD and 1,2,3,7,8-PeCDD for use in Sediment Management Area delineation at the Portland Harbor Superfund Site" dated September 16, 2022 (EPA, 2022). EPAs evaluation found that analytical labs can meet the PQLs of 1 picogram per gram (pg/g) for 2,3,7,8-TCDD and 2.5 pg/g for 1,2,3,7,8-PeCDD. The UFP-QAPP PQLs listed in Worksheet #15.9A are 1 pg/g for 2,3,7,8-TCDD and 5.0 pg/g for 1,2,3,7,8-PeCDD, which are higher than the levels EPA found to be reliably attainable. The EPA-prescribed PQL values are used in place of the RALs for 2,3,7,8-TCDD and 1,2,3,7,8-PeCDD (EPA, 2022).

[6] Estimated detection limits for PCDD/PCDFs by EPA Method 1613B.

In practice, due to several factors including matrix effects and blank contamination, target MDLs may not always be attainable. For delineating the nature and extent of contamination, the important consideration for data usability is the frequency of non-detects above PALs. Importantly for non-detect results, the reporting limits are lower than the PALs with following exceptions (percentages): dieldrin (100 percent), 1,2,3,4,7,8-HxCDF (22 percent), 1,2,3,7,8-PeCDD (74 percent), 2,3,4,7,8-PeCDF (55 percent), 2,3,7,8-TCDF (62 percent), 2,3,7,8-TCDD (74 percent), BEHP (2 percent), and TPH diesel (0.4 percent). The reporting limits exceeded PQLs for 1,2,3,7,8-PeCDD and 2,3,7,8-TCDD in 5.3 percent and 6.3 percent of the results, respectively. The reporting limits for these same analytes exceeded PTW thresholds in 5.3 percent and 2.6 percent of samples, respectively. This means the data have appropriate reporting limits relative to PALs for delineating the extent of the contamination.

Other than the exceptions listed above, non-detect results were below PALs. The occurrence of elevated non-detects are noted here because they require additional data treatment methods (e.g., substituting a value for non-detect results such as ½ detection limit) prior to data analysis. Except for dieldrin, most of the elevated reporting limits are due to matrix effects and blank contamination.

The MDL for dieldrin in the riverbank soil samples was elevated above the MDL of 0.011 micrograms per kilogram (µg/kg) listed in the UFP-QAPP, by up to a factor of 65, depending on sample-specific conditions such as subsample size and percent moisture. The elevated reporting limit was due to the nominal mass extracted for solid samples being one-quarter of the mass that was indicated in the laboratory's standard operating procedure included in the UFP-QAPP. The laboratory indicated the discrepancy was due to difficulties in analyzing pesticides from PHSS samples using their normal extraction mass due to the potential for column contamination.

The laboratory stored the samples in a freezer and all samples were still within their holding times when this discrepancy was discovered. HGL identified specific samples where the presence of dieldrin may be a driver, primarily locations with no other COCs detected above PALs, and instructed the laboratory to re-extract and reanalyze a limited list of soil samples. The laboratory reanalyzed and reported the results from these samples from extractions performed using the standard sample mass indicated in the standard operating procedure; however, the laboratory did not use the MDL of 0.011 µg/kg. The reextracted analyses were reported using an MDL of 0.077 µg/kg, modified by up to approximately 50 percent, in some cases depending on sample-specific conditions. Although these MDLs were elevated above the CUL of 0.07 µg/kg, the results were close enough to the CUL for use during development of the RD.

3.8.2 Completeness of Locations

The field investigation achieved the location completeness target of 90 percent for surface soil (0 to 1 ft) sampling, with the collection of 276 out of 286 proposed samples for an overall completeness of 96.5 percent. As discussed in Section 3.1, samples were not collected where no potentially erodible material was exposed (e.g., behind sheetpile) and at or below MLW where fine-grained material was not present (e.g., armoring). For the TOB elevation, 90 out of 95 proposed samples were collected, for an overall completeness of 95 percent. Six planned TOB locations had no sampleable materials and one TOB location that was not planned was identified as sampleable. For the OHW elevation, 111 out of 116 proposed samples were collected, for an

overall completeness of 96 percent. Six planned OHW locations had no sampleable materials and one OHW location that was not planned was identified as sampleable. For the MLW elevation, 75 of 75 proposed samples were collected, for an overall completeness of 100 percent. However, there were 21 unplanned locations that were identified as sampleable, and 21 planned MLW locations had no sampleable materials. Per the Riverbank Sampling Plan (HGL, 2022b), sampleable materials are defined as soil that can be sampled using hand tools and is readily accessed or can be accessed by moving small obstructions that can be handled safely without heavy or mechanized equipment.

At each location where a surface soil (0 to 1 ft) sample was collected, HGL attempted to collect subsurface samples from two depths (1 to 2 ft and 2 to 3 ft) to hold in archive and analyze on a location-specific basis, as needed, based on the extent of surface sample exceedances. Out of 276 possible samples at each depth interval, sampleable material in the 1-to 2-ft depth interval was only identified at 95 locations, for an overall completeness of 34 percent. Sampleable material in the 2- to 3-ft depth interval was only identified at 28 locations, for an overall completeness of 10 percent. In terms of vertical bounding of contamination, RAL/PQL exceedances were detected at 150 surface soil locations, therefore location-specific completeness (number of samples analyzed out of 152 surface soil locations with RAL/PQL exceedances) was 63 percent and 19 percent for the 1- to 2-ft and 2- to 3-ft depth intervals, respectively.

The lack of riverbank subsurface soil data does not represent a substantial data gap. The data set is usable for decision-making in accordance with the project data quality objectives and completeness goals based on the overall completeness of the surface soil sampling program.

3.8.3 Qualified and Rejected Data

Riverbank soil data were validated in accordance with the UFP-QAPP (HGL, 2022a) by HGL chemists and subcontracted data validation firms. As a result of validation, data qualifiers were applied to sample results due to sampling and analysis discrepancies. The data qualifiers include the following:

- R: The result is unusable. The result is rejected due to serious deficiencies in meeting QC criteria. The analyte may or may not be present in the sample.
- UJ: The analyte was analyzed for but was not detected. The associated value is approximate and may be inaccurate or imprecise. The associated value is the adjusted MDL or the reported concentration (results qualified as artifacts due to blank contamination).
- U: The analyte was analyzed for but was not detected above the level of the adjusted MDL or the reported concentration (results qualified as artifacts due to blank contamination).
- J: The result is an estimated quantity. The associated numerical value is the approximate concentration of the analyte in the sample.
- (no qualifier): The result is a detection above the reporting limit and is not affected by any QC discrepancies.

Note that the U and J qualifiers may be applied as a result of a QC issue but may also be applied to results to denote the quantitation. Non-detected results are reported with a U qualifier, which indicates a non-detection at the MDL. Detected results at or above the adjusted MDL but below

the RL are reported with a J qualifier. In both cases, the data have the applicable qualifier applied by the laboratory even in the absence of a QC issue and these qualifiers are retained as reported by the laboratory unless superseded by a more severe qualifier.

The final reduced riverbank soil sample data set includes 34,420 results for target analytes. Of these results, seven were rejected and qualified R during the data validation process and the riverbank soil data set used for decision-making is 99.980% complete. The seven rejected results included the following:

- 6 non-detected Aroclor results rejected for extremely low recovery in an MS and/or MSD
- 1 non-detected 1,2,3,7,8,9-HxCDF result rejected due to an extremely low recovery in the corresponding labeled standard.

An additional nine non-detected Aroclor results reported for sample SIB-088-MLW-0-1-10102022 were rejected in the data validation process; however, this sample is paired with a field duplicate sample that did not have any rejected Aroclor results. During the data reduction process, the field duplicate Aroclor results were used as the definitive results for this sample location and the rejected results do not constitute a data gap.

The rejected results in the riverbank soil data set do not represent substantial data gaps and the data set is usable for decision-making in accordance with the project data quality objectives and completeness goals.

3.8.4 Total PCBs by Aroclor Method

In the EPA RD guidelines and considerations, the preferred method of estimating total PCB concentrations is to sum concentrations of individual congeners using a high-resolution method like EPA Method 1668 (EPA, 2021c). However, the guidance also states that the PCB Aroclor method is acceptable when the reporting limit for each Aroclor is less than 9 µg/kg, which is the total PCB CUL. As documented in the UFP-QAPP, ARI's MDLs and PQLs are below 9 µg/kg for individual Aroclors. In practice, 100 percent of the individual Aroclor results have reporting limits less than 9 µg/kg.

PCB Aroclors analytical methods have been used extensively in existing EPA-approved data sets for the SIB Project Area and PHSS. In EPA's RD guidelines (EPA, 2021c), the rationale supporting analyzing for PCBs as Aroclors is based on a comparative analysis of sediment data collected during the Remedial Investigation. EPA concluded that PCB congener-specific and Aroclor methods "generally produce similar concentration results" (EPA, 2021c).

This page was intentionally left blank.

4.0 RIVERBANK SOIL INVESTIGATION RESULTS

This section summarizes riverbank soil analytical results and spatial distribution of riverbank soil sample collection efforts. A table of the full results is included in Attachment C.1. Data validation reports and analytical data packages containing full results for each sample are presented in Attachments C.2 and C.3, respectively.

One of the primary goals of riverbank soil sampling and analysis was to identify areas where contaminant concentrations exceed CULs, RALs, and PTW thresholds. Table 4-1 presents ROD Table 17 CUL and ROD Table 21 RAL (or PQL) and PTW threshold exceedances by analyte and Table 4-2 presents the most conservative chemical CUL, RAL/PQL, and PTW threshold exceedances by transect. Table 4-3 presents all CUL, RAL/PQL, and PTW threshold exceedances by individual samples collected. Figures 4-1 through 4-3 illustrate the extent of CUL, RAL/PQL, and PTW threshold exceedances.

4.1 CONCENTRATIONS LESS THAN CLEANUP LEVELS

Of the 276 **s**urface (0-1 ft interval) samples analyzed, analytical concentrations were less than ROD CULs in 8 samples (3 percent) (Figure 4-1). Of the 123 deeper samples analyzed, analytical concentrations were less than ROD CULs in 10 of 95 samples (11 percent) in the 1-2 ft interval and 8 of 28 samples (29 percent) in the 2-3 ft interval.

4.2 CONCENTRATIONS EXCEEDING CLEANUP LEVELS

Of the 276 surface (0-1 ft interval) samples analyzed, concentrations exceeded CULs in 268 samples **(**97 percent) (Figure 4-1, Table 4-3). Of the 123 deeper interval samples analyzed**,** 85 of 95 samples in the 1-2 ft interval (89 percent) and 20 of 28 samples in the 2-3 ft interval (71 percent) had concentrations that were detected above CULs, for a total of 105 out of 123 deeper interval samples with CUL exceedances (85 percent) (Figure 4-1, Table 4-3).

The following table provides a summary of the number of samples where select analytes were detected at concentrations that exceeded ROD CULs but did not exceed relevant RALs/PQLs or PTW thresholds, by elevation (TOB, OHW, MLW) and depth interval (Section 3.1).

1,2,3,4,7,8-HxCDF	0-1	1-2	2-3	Mercury	0-1	1-2	2-3

Notes:
DDx = dichlorodiphenyldichloroethane + dichlorodiphenyldichloroethylene + dichlorodiphenyltrichloroethane

4.3 CONCENTRATIONS EXCEEDING REMEDIAL ACTION LEVELS

Of the 276 surface (0-1 ft interval) samples analyzed, 150 samples (54 percent) had concentrations that were detected exceeding RALs/PQLs (Figure 4-2, Table 4-3). Most of these exceedances were detected at OHW (66 samples) and TOB (61 samples). ROD COC concentrations exceeded RALs/PQLs at 102 of the 119 transects sampled (86 percent). The areas without exceedances were primarily along the head of the basin and the east side of SIB (Figure 4-2).

Of the 123 deeper samples analyzed, 26 of 95 samples in the 1-2 ft interval (27 percent) and 8 of 28 samples in the 2-3 ft interval (29 percent) had concentrations that were detected above RALs/PQLs, for a total of 34 out of 123 deeper interval samples with RAL/PQL exceedances (28 percent) (Figure 4-2, Table 4-3).

The following table provides a summary of the number of samples where analytes were detected at concentrations that exceeded ROD RALs (or PQLs) but did not exceed relevant PTW thresholds, by elevation (TOB, OHW, MLW) and depth interval (Section 3.1).

1,2,3,7,8-PeCDD	0-1	1-2	2-3	DDx	0-1	1-2	2-3
TOB	27	6	1	TOB	2	0	0

4.4 CONCENTRATIONS EXCEEDING PRINCIPAL THREAT WASTE THRESHOLDS

Of the 276 surface samples analyzed, 65 samples had concentrations that were detected above PTW thresholds (24 percent) (Figure 4-3). Most of these exceedances were detected at OHW (31 samples) and TOB (21 samples). ROD COC concentrations exceeded PTW thresholds at 54 of the 119 transects sampled (45 percent). The areas without exceedances were primarily along the head of the basin and the east side of SIB (Figure 4-3, Table 4-3).

Of 123 deeper samples analyzed, 6 of 95 samples had concentrations that were detected above PTW thresholds from the 1-2 ft interval (6 percent). No PTW threshold exceedances were detected in the 28 samples collected from the 2-3 ft interval.

The following table provides a summary of the number of samples where analytes were detected at concentrations that exceeded ROD PTW thresholds, by elevation (TOB, OHW, MLW) and depth interval (Section 3.1).

1,2,3,4,7,8-HxCDF	0-1	1-2	2-3

5.0 CONCLUSIONS

Analysis of surface and subsurface riverbank soil samples was completed in accordance with the PDI Work Plan (HGL, 2022a). Collected samples that were not analyzed during initial analysis were archived. As documented in Section 3.0, samples were collected, analyzed, managed, and validated in compliance with laboratory testing criteria, and the data are acceptable for use in source control sufficiency assessment and RD development.

Riverbank soil sampling transects were evenly spaced at 100-ft intervals across the entire riverbank within the SIB Project Area, allowing for sufficient lateral delineation of COC concentrations. Based on sample results for the 399 sample intervals collected from 276 locations, CUL, RAL/PQL, and/or PTW threshold exceedances were detected at 146 of 147 TOB samples (99 percent), 149 of 152 OHW samples (98 percent), and 100 of 100 MLW samples (100 percent).

The concentrations of ROD COCs in riverbank areas adjacent to sediment management areas dictate how they are to be addressed as part of the RD to control this source of potential recontamination as described in *Guidance for River Bank Characterizations and Evaluations at the Portland Harbor Superfund Site* (EPA, 2019). In accordance with the guidance, concentrations are used to screen riverbanks, but COC loading estimates (i.e., COC concentrations combined with erosion rates) will be used to determine recontamination risk and inform selection of remedial technologies for riverbank soils.

The RD will include measures to remediate (i.e., stabilize via capping and/or excavation) riverbanks within the SIB Project Area identified as needing remedial action. These riverbanks will be determined based on the combined results of the first and second phases of the riverbank evaluation in accordance with the criteria specified in the ROD. Though bounding of the vertical extent of COCs was limited, the surficial extent of COCs will be used in conjunction with other PDI data to develop a compliant RD and will be further evaluated in the Basis of Design Report. The selected remedy for riverbanks will minimize erosion and transport of riverbank materials contaminated above CULs, thereby minimizing recontamination potential via this pathway. Remedies that propose alteration of any riverbank will be discussed and coordinated with shoreline property owners during the RD.

Notes

Near-Bank Stress Ratings

Very Low	<1.00
Low	1.00-1.50
Moderate	1.51-1.80
High	1.81 - 2.50
Very High	2.51 - 3.00
Extreme	> 3.00

ft	feet
sf	square feet
NAVD88	North American Vertical Datum of 1988
NBS	Near Bank Stress

See Figure 2-3c for Transect and Transect Section locations.
The first section values apply to transects on the west and northeast sides of SIB.
The third section values apply to transects on the east and southeast sides of SIB.

Notes:

Sample collected but not analyzed due to no exceedances in the interval above it.

ft = feet
bgs = below ground surface
ID = identification
MLW = mean low water
N/A = not applicable
NAD83 = North American Datum of 1983
OHW = ordinary high water
TOB = top of bank

Notes:

Total Concentrations were calculated using 1/2 of value for non-detects.
< = less than
> = greater than
& = and
% = percent
mg/kg = milligrams per kilogram
pg/g = picograms per gram
µg/kg = micrograms per kilogram

1,2,3,4,7,8-HxCDF = 1,2,3,4,7,8-hexachlorodibenzofuran
2,3,4,7,8-PeCDF = 2,3,4,7,8-pentachlorodibenzofuran
BEHP = bis(2-ethylhexyl)phthalate
cPAH = carcinogenic polycyclic aromatic hydrocarbon
CUL = cleanup level
DDD = dichlorodiphenyldichloroethane
DDE = dichlorodiphenyldichloroethylene
DDT= dichlorodiphenyltrichloroethane

DDx = DDT+DDE+DDD
NE = none established
PAH = polycyclic aromatic hydrocarbon
PCB = polychlorinated biphenyl
PeCDD = 1,2,3,7,8-pentachlorodibenzo-p-dioxin
PQL = practical quantitation limit
PTW = principal threat waste
RAL = remedial action level

ROD = Record of Design
TCDD = 2,3,7,8-tetrachlorodibenzo-p-dioxin
TCDF = 2,3,7,8-tetrachlorodibenzofuran
TEQ = toxic equivalent
TPH = total petroleum hydrocarbons

Riverbank Soil Sample Summary
Riverbank Characterization Data Report; Swan Island Basin Project Area, Portland, Oregon

Analyte Group	Chemical	Location	Location ID	Start Depth (feet)	End Depth (feet)	Sample Date	Analytic Method	Reporting Limit	Result Unit	Result	Qualifier	CUL	RAL/ PQL	PTW	Threshold Exceedance
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-031-OHW	SIB-031-OHW-0-1-10252022	0	1	10/25/2022	CALC_SUM		pg/g	101,000	J	9,000	75,000	200,000	COC Exceeds RAL/PQL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-034-OHW	SIB-034-OHW-0-1-10252022	0	1	10/25/2022	CALC_SUM		pg/g	237,000	J	9,000	75,000	200,000	COC exceeds PTW
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-037-MLW	SIB-037-MLW-0-1-10252022	0	1	10/25/2022	CALC_SUM		pg/g	68,100	J	9,000	75,000	200,000	COC Exceeds CUL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-039-MLW	SIB-039-MLW-0-1-10252022	0	1	10/25/2022	CALC_SUM		pg/g	111,000	J	9,000	75,000	200,000	COC Exceeds RAL/PQL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-040-OHW	SIB-040-OHW-0-1-10242022	0	1	10/24/2022	CALC_SUM		pg/g	3,170	J	9,000	75,000	200,000	No Exceedances for Detected COC
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-042-MLW	SIB-042-MLW-0-1-10242022	0	1	10/24/2022	CALC_SUM		pg/g	138,000	J	9,000	75,000	200,000	COC Exceeds RAL/PQL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-044-OHW	SIB-044-OHW-0-1-10242022	0	1	10/24/2022	CALC_SUM		pg/g	89,800	J	9,000	75,000	200,000	COC Exceeds RAL/PQL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-045-TOB	SIB-045-TOB-0-1-10242022	0	1	10/24/2022	CALC_SUM		pg/g	10,200	J	9,000	75,000	200,000	COC Exceeds CUL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-047-TOB	SIB-047-TOB-0-1-10242022	0	1	10/24/2022	CALC_SUM		pg/g	140,000	J	9,000	75,000	200,000	COC Exceeds RAL/PQL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-049-OHW	SIB-049-OHW-0-1-10202022	0	1	10/20/2022	CALC_SUM		pg/g	1,850	J	9,000	75,000	200,000	No Exceedances for Detected COC
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-049-OHW	SIB-049-OHW-1-2-10202022	1	2	10/20/2022	CALC_SUM		pg/g	1,020	J	9,000	75,000	200,000	No Exceedances for Detected COC
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-050-TOB	SIB-050-TOB-0-1-10202022	0	1	10/20/2022	CALC_SUM		pg/g	633,000	J	9,000	75,000	200,000	COC exceeds PTW
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-052-TOB	SIB-052-TOB-0-1-10202022	0	1	10/20/2022	CALC_SUM		pg/g	69,600	J	9,000	75,000	200,000	COC Exceeds CUL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-054-OHW	SIB-054-OHW-0-1-10192022	0	1	10/19/2022	CALC_SUM		pg/g	8,130	J	9,000	75,000	200,000	No Exceedances for Detected COC
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-056-MLW	SIB-056-MLW-0-1-10192022	0	1	10/19/2022	CALC_SUM		pg/g	70,000	J	9,000	75,000	200,000	COC Exceeds CUL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-057-OHW	SIB-057-OHW-0-1-10192022	0	1	10/19/2022	CALC_SUM		pg/g	364,000	J	9,000	75,000	200,000	COC exceeds PTW
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-058-MLW	SIB-058-MLW-0-1-10192022	0	1	10/19/2022	CALC_SUM		pg/g	72,200	J	9,000	75,000	200,000	COC Exceeds CUL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-059-OHW	SIB-059-OHW-0-1-10192022	0	1	10/19/2022	CALC_SUM		pg/g	21,200	J	9,000	75,000	200,000	COC Exceeds CUL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-060-OHW	SIB-060-OHW-0-1-10192022	0	1	10/19/2022	CALC_SUM		pg/g	38,400	J	9,000	75,000	200,000	COC Exceeds CUL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-061-OHW	SIB-061-OHW-0-1-10192022	0	1	10/19/2022	CALC_SUM		pg/g	9,340	J	9,000	75,000	200,000	COC Exceeds CUL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-062-TOB	SIB-062-TOB-0-1-10182022	0	1	10/18/2022	CALC_SUM		pg/g	6,590	J	9,000	75,000	200,000	No Exceedances for Detected COC
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-064-MLW	SIB-064-MLW-0-1-10182022	0	1	10/18/2022	CALC_SUM		pg/g	4,060	J	9,000	75,000	200,000	No Exceedances for Detected COC
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-064-MLW	SIB-064-MLW-1-2-10182022	1	2	10/18/2022	CALC_SUM		pg/g	36,900	J	9,000	75,000	200,000	COC Exceeds CUL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-065-OHW	SIB-065-OHW-0-1-10182022	0	1	10/18/2022	CALC_SUM		pg/g	1,100	J	9,000	75,000	200,000	No Exceedances for Detected COC
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-066-OHW	SIB-066-OHW-0-1-10182022	0	1	10/18/2022	CALC_SUM		pg/g	3,210	J	9,000	75,000	200,000	No Exceedances for Detected COC
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-066-OHW	SIB-066-OHW-1-2-10182022	1	2	10/18/2022	CALC_SUM		pg/g	2,470	J	9,000	75,000	200,000	No Exceedances for Detected COC
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-066-TOB	SIB-066-TOB-1-2-10182022	1	2	10/18/2022	CALC_SUM		pg/g	1,910	J	9,000	75,000	200,000	No Exceedances for Detected COC
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-067-OHW	SIB-067-OHW-0-1-10142022	0	1	10/14/2022	CALC_SUM		pg/g	1,820	J	9,000	75,000	200,000	No Exceedances for Detected COC
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-067-OHW	SIB-067-OHW-2-3-10142022	2	3	10/14/2022	CALC_SUM		pg/g	826	J	9,000	75,000	200,000	No Exceedances for Detected COC
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-068-OHW	SIB-068-OHW-1-2-10142022	1	2	10/14/2022	CALC_SUM		pg/g	36,900	J	9,000	75,000	200,000	COC Exceeds CUL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-068-TOB	SIB-068-TOB-0-1-10142022	0	1	10/14/2022	CALC_SUM		pg/g	1,140	J	9,000	75,000	200,000	No Exceedances for Detected COC
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-069-OHW	SIB-069-OHW-0-1-10142022	0	1	10/14/2022	CALC_SUM		pg/g	3,850	J	9,000	75,000	200,000	No Exceedances for Detected COC
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-070-MLW	SIB-070-MLW-0-1-10132022	0	1	10/13/2022	CALC_SUM		pg/g	21,700	J	9,000	75,000	200,000	COC Exceeds CUL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-071-OHW	SIB-071-OHW-0-1-10132022	0	1	10/13/2022	CALC_SUM		pg/g	25,000	J	9,000	75,000	200,000	COC Exceeds CUL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-072-OHW	SIB-072-OHW-0-1-10132022	0	1	10/13/2022	CALC_SUM		pg/g	38,100	J	9,000	75,000	200,000	COC Exceeds CUL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-072-TOB	SIB-072-TOB-1-2-10132022	1	2	10/13/2022	CALC_SUM		pg/g	130,000	J	9,000	75,000	200,000	COC Exceeds RAL/PQL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-073-MLW	SIB-073-MLW-0-1-10132022	0	1	10/13/2022	CALC_SUM		pg/g	15,400	J	9,000	75,000	200,000	COC Exceeds CUL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-074-MLW	SIB-074-MLW-0-1-10132022	0	1	10/13/2022	CALC_SUM		pg/g	9,390	J	9,000	75,000	200,000	COC Exceeds CUL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-074-OHW	SIB-074-OHW-1-2-10132022	1	2	10/13/2022	CALC_SUM		pg/g	44,100	J	9,000	75,000	200,000	COC Exceeds CUL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-075-MLW	SIB-075-MLW-0-1-10132022	0	1	10/13/2022	CALC_SUM		pg/g	2,150	J	9,000	75,000	200,000	No Exceedances for Detected COC
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-076-MLW	SIB-076-MLW-0-1-10122022	0	1	10/12/2022	CALC_SUM		pg/g	15,300	J	9,000	75,000	200,000	COC Exceeds CUL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-076-MLW	SIB-076-MLW-1-2-10122022	1	2	10/12/2022	CALC_SUM		pg/g	21,900	J	9,000	75,000	200,000	COC Exceeds CUL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-077-OHW	SIB-077-OHW-0-1-10122022	0	1	10/12/2022	CALC_SUM		pg/g	75,300	J	9,000	75,000	200,000	COC Exceeds RAL/PQL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-078-OHW	SIB-078-OHW-1-2-10122022	1	2	10/12/2022	CALC_SUM		pg/g	12,600	J	9,000	75,000	200,000	COC Exceeds CUL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-078-TOB	SIB-078-TOB-0-1-10122022	0	1	10/12/2022	CALC_SUM		pg/g	58,400	J	9,000	75,000	200,000	COC Exceeds CUL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-079-MLW	SIB-079-MLW-0-1-10122022	0	1	10/12/2022	CALC_SUM		pg/g	12,700	J	9,000	75,000	200,000	COC Exceeds CUL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-080-MLW	SIB-080-MLW-1-2-10122022	1	2	10/12/2022	CALC_SUM		pg/g	13,600	J	9,000	75,000	200,000	COC Exceeds CUL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-081-OHW	SIB-081-OHW-0-1-10122022	0	1	10/12/2022	CALC_SUM		pg/g	6,340	J	9,000	75,000	200,000	No Exceedances for Detected COC
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-082-MLW	SIB-082-MLW-0-1-10112022	0	1	10/11/2022	CALC_SUM		pg/g	171	J	9,000	75,000	200,000	No Exceedances for Detected COC
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-082-MLW	SIB-082-MLW-1-2-10112022	1	2	10/11/2022	CALC_SUM		pg/g	69.5	UJ	9,000	75,000	200,000	No Exceedances for Detected COC
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-083-OHW	SIB-083-OHW-0-1-10112022	0	1	10/11/2022	CALC_SUM		pg/g	35,300	J	9,000	75,000	200,000	COC Exceeds CUL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-084-TOB	SIB-084-TOB-0-1-10112022	0	1	10/11/2022	CALC_SUM		pg/g	18,200	J	9,000	75,000	200,000	COC Exceeds CUL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-084-TOB	SIB-084-TOB-1-2-10112022	1	2	10/11/2022	CALC_SUM		pg/g	3,010	J	9,000	75,000	200,000	No Exceedances for Detected COC
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-085-TOB	SIB-085-TOB-0-1-10112022	0	1	10/11/2022	CALC_SUM		pg/g	186,000	J	9,000	75,000	200,000	COC Exceeds RAL/PQL
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-085-TOB	SIB-085-TOB-2-3-10112022	2	3	10/11/2022	CALC_SUM		pg/g	53,300	J	9,000	75,000	200,000	COC Exceeds CUL

Table 4-1 (continued)
Riverbank Soil Sample Summary
Riverbank Characterization Data Report; Swan Island Basin Project Area,
Portland, Oregon

Analyte Group	Chemical	Location	Location ID	Start Depth (feet)	End Depth (feet)	Sample Date	Analytic Method	Reporting Limit	Result Unit	Result	Qualifier	CUL	RAL/ PQL	PTW	Threshold Exceedance
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-087-MLW	SIB-087-MLW-0-1-10102022	0	1	10/10/2022	CALC_SUM		pg/g	2,180	J	9,000	75,000	200,000	No Exceedances for Detected COC
Calculated	Total PCB Congener (Calculated U = 1/2)	SIB-087-OHW	SIB-087-OHW-2-3-10102022	2	3	10/10/2022	CALC_SUM		pg/g	1,090	J	9,000	75,000	200,000	No Exceedances for Detected COC

Notes:
Total Concentrations were calculated using 1/2 of value for non-detects.
µg/kg = micrograms per kilogram
mg/kg = milligrams per kilogram
pg/g = picograms per gram
1,2,3,4,7,8-HxCDF = 1,2,3,4,7,8-hexachlorodibenzofuran
4-PeCDF = 2,3,4,7,8-pentachlorodibenzofuran
A = summed value based on the limited number of analytes
BEHP = bis(2-ethylhexyl)phthalate
CUL = cleanup level
J = estimated concentration
O/P = organochlorine pesticides
PAHs = polycyclic aromatic hydrocarbons
PCDD = 1,2,3,7,8-pentachlorodibenzo-p-dioxin
PCDFs = polychlorinated dibenzofurans
PQL-practical quantitation limit
PTW = principal threat waste
RAL = remedial action level
sVOC = Semi-volatile organic compounds
TCDD-2,3,7,8 = tetrachlorodibenzo-p-dioxin
TCDF = 2,3,7,8-tetrachlorodibenzofuran
TEQ = toxic equivalent
Total Concentrations were calculated using 1/2 of value for non-detects.
TPH = total petroleum hydrocarbons
U = analyte was not detected in the sample at the detection limit
